AdminStudio 2016 Help Library

AdminStudio enables systems administrators to rapidly prepare error-free applications to deploy into their enterprise environment through a structured process built on application management best practices.

The AdminStudio Start Page provides information on major tasks that you can accomplish using AdminStudio, quick access to AdminStudio tools, and links to help resources.

The AdminStudio user documentation contains information about the functionality and features of all of the components of AdminStudio and is presented in the following sections:

Table 1-1 • AdminStudio Help Library

	Topic	Content
	**Getting Started with AdminStudio**	Describes how to use the AdminStudio Start Page tabs—which provide process information on how to perform key tasks using AdminStudio tools—to quickly get started evaluating and using AdminStudio.
	**Product Activation for AdminStudio**	Describes AdminStudio product activation and licensing options.
	**Using the AdminStudio Interface**	Describes the AdminStudio Interface, the central application for AdminStudio. From it, you can launch the AdminStudio tools, create process templates and projects, use AdminStudio Enterprise Server tools, and connect to and create Application Catalogs.
	**Managing Accounts and Directory Services**	Explains how to create an account for each person that you want to have access to AdminStudio, and how to import users or groups of users from a directory service. Also explains how to set up the AdminStudio account, domain account, single sign-on, and guest account login methods.

Table 1-1 • AdminStudio Help Library (cont.)

	Topic	Content
	**Managing Roles and Permissions**	Explains how to create and edit roles to manage access to AdminStudio functionality.
	**Managing Applications and Application Catalog Databases**	Explains how to use **Application Manager** to import applications into the Application Catalog, organize them, and set up automatic import. It also explains how to manage application data, upgrade App-V packages from v4.x to 5.0, and how to convert packages to virtual formats using default settings.
	**Repackaging Legacy Installations Using the Repackaging Wizard**	Explains how to use Repackager's Repackaging Wizard to convert existing legacy installations into Windows Installer (MSI) packages.
	**Converting Legacy Installations Using the Repackager Interface**	Explains how to use the Repackager interface to create and modify Repackager project files, and how to build those files into InstallShield Editor projects or Windows Installer packages.
	**Performing Virtualization and Repackaging Using the Automated Application Converter**	Explains how to use the Automated Application Converter to examine a group of setups and perform automated virtualization of those setups (including performing automated repackaging of those setups that require it).
	**Using the Virtual Package Editor**	Explains how to use the Virtual Package Editor to edit App-V packages and perform tasks such as customizing your App-V applications, resolving virtualization Best Practice issues and application conflicts, and fixing run-time problems.
	**Creating Customized Virtual Applications**	Explains how to use the InstallShield Virtualization Assistants to create customized virtual applications in the Microsoft App-V, VMware ThinApp, and Citrix XenApp virtual application formats.
	**Customizing and Authoring Installations Using InstallShield**	Describes how to use **InstallShield Editor** to create setup packages that utilize Windows Installer technology, while harnessing the flexibility provided by InstallScript. Also explains how to use InstallShield to create virtual applications.
	**Customizing Installations Using Tuner**	Explains how to use Tuner to create a transform file to add to, modify, or remove information from a Windows Installer package.
	**Using Test Center to Perform Package Testing**	Describes how to perform operating system compatibility, browser compatibility, best practices, risk assessment, application conflict, remote application publishing compatibility, and application virtualization compatibility testing on packages in the Application Catalog using Test Center.

Table 1-1 • AdminStudio Help Library (cont.)

	Topic	Content
	**Test Center Tests**	Describes the Test Center tests used to perform operating system compatibility, browser compatibility, best practices, risk assessment, application conflict, remote application publishing compatibility, and application virtualization compatibility testing.
	**Analyzing the Impact of Installing Microsoft Operating System Security Patches**	Explains how to import Microsoft application patches into the Application Catalog and thoroughly test the impact they will have on your environment before they are deployed.
	**Isolating Applications Using Application Isolation Wizard**	Explains how to use the **Application Isolation Wizard** to solve component versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested.
	**Ensuring Package Quality Using QualityMonitor**	Explains how to use **QualityMonitor** to run a series of built-in tests to installed Windows Installer–based products, helping to ensure they run correctly, especially in a locked-down environment.
	**Distributing Applications and Packages**	Explains how to use the Distribution Wizard to publish applications to System Center 2012 Configuration Manager, Citrix XenApp Server, Symantec Altiris Management Server, and AirWatch Server. It also explains how to use the Package Distribution Wizard to distribute packages to a variety of distribution systems.
	**Generating and Viewing Reports in Report Center**	Explains how to use the **Report Center** to report on or view all of the information regarding the applications in your Application Catalog from a single location.
	**AdminStudio Platform API**	Explains how to use the AdminStudio Platform API to integrate your existing .NET applications or scripting environments like Microsoft PowerShell with AdminStudio.

What's New in AdminStudio 2016

Detailed information on the new features in AdminStudio 2016 is available in the AdminStudio Release Notes.

A PDF version of the Release Notes is available in the Documentation Center section of the Flexera Software website:

https://flexeracommunity.force.com/customer/CCDocumentation

You can also view the Release Notes by selecting **ReadMe** from the **Help** menu of the AdminStudio interface or by clicking the **Release Notes** button on the **Support** tab of the Application Manager ribbon.

AdminStudio Editions and Components

AdminStudio is available multiple editions to meet the needs of every organization:

- AdminStudio Full Editions
- AdminStudio Limited Editions

AdminStudio Full Editions

AdminStudio 2016 is available in Standard, Professional, and Enterprise Editions. You can also purchase additional Application Virtualization, Application Compatibility, and/or Mac and Mobile add-on packs.

Table 1-2 • AdminStudio Full Editions

Edition	Add On	Tools	Functionality
Standard	None	**Repackager**	Repackage applications into Windows Installer format Perform basic ISO tagging, including creation of tag files
		Package Distribution Wizard	Prepare packages for distribution
		InstallShield 2015 (Professional Edition)	Customize Windows Installer packages by either directly editing them or by creating transforms ***Note*** • *While InstallShield 2015 is being shipped with AdminStudio 2016, you will be required to use an AdminStudio/InstallShield 2016 license to activate InstallShield 2015. InstallShield 2016 will be provided as part of an upcoming service pack release.*
		Tuner	Customize Windows Installer packages by creating transforms
		Application Isolation Wizard	Resolve component versioning conflicts
	Application Virtualization	**Automated Application Converter (Single Application Version)** **Conversion Wizard (Single Application Version)**	Convert a package to a virtual application in the following formats: • Microsoft App-V (4.x and 5.1) • Citrix XenApp • VMware ThinApp (4.x and 5.x) • Symantec Workspace Convert one package at a time
		Virtual Package Editor	Edit App-V packages
		Microsoft App-V Assistant **ThinApp Assistant** **Citrix Assistant**	Create a customized virtual package from an InstallShield project

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Professional	None	*Same as Standard, plus:*	
		Application Manager / Catalog	Manage applications in an Application Catalog database Manage a package's System Center 2012 Configuration Manager and Symantec Altiris Client Management Suite deployment data View an application's System Center 2012 Configuration Manager deployment status Perform advanced ISO tag file creation, editing, and storage
		Application Manager / Test Center	Perform tests in the following categories: • Windows Installer Internal Consistency Evaluators • Windows Installer Best Practices • Application Conflicts Test and fix one package at a time
		Distribution Wizard	Publish applications to System Center 2012 Configuration Manager and Symantec Altiris Management Server.
		OS Snapshot Wizard	Capture basic operating system configuration in an OS Snapshot, which can be imported into the Application Catalog to check for potential OS conflicts
		QualityMonitor	Perform Windows Installer testing, including testing in a locked down environment
		Automated Application Converter (Single Application Version) **Conversion Wizard (Single Application Version)**	Automatically repackage a legacy package (.exe) into a Windows Installer package (.msi) Repackage one package at a time
		Test on Virtual Machine Wizard	Automatically launch a specified virtual machine and install a selected Windows Installer (.msi) or installation executable (.exe) package for testing.

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Professional (Continued)	**Application Virtualization**	*Same as Standard, plus:*	
		Enhancements to **Application Manager / Catalog**	Import virtual packages into Application Catalog View virtual package data in Application Manager Manage System Center 2012 Configuration Manager deployment data for App-V 4.x and 5.1 packages Manage Citrix XenApp Server deployment data for Citrix XenApp profiles and App-V 4.x packages Manage Symantec Altiris Client Management Suite deployment data for Symantec Workspace and VMware ThinApp packages Manage App-V Server deployment data for App-V 4.x and 5.1 packages
		Enhancements to **Application Manager / Test Center**	Test packages for compatibility to be virtualized to App-V, ThinApp, XenApp, and Symantec Workspace formats Test App-V packages for best practices Test App-V packages for conflicts with other packages
		Enhancements to **Distribution Wizard**	Publish applications containing App-V 4.x and 5.1 packages to Microsoft App-V Server Publish applications containing App-V packages to System Center Configuration Manager and Citrix XenApp Server Publish applications containing Citrix XenApp profiles and App-V 4.x packages to Citrix XenApp Server Publish applications containing Symantec Workspace and VMware ThinApp packages to Symantec Altiris Client Management Suite Server

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Professional (Continued)	**Application Compatibility**	Enhancements to **Application Manager / Test Center**	Test packages for compatibility with the following operating systems: • Windows 7 (32-bit and 64-bit) • Windows 8 (32-bit and 64-bit) • Windows 10 (32-bit and 64-bit) • Windows Server 2008 R2 • Windows Server 2012 On the **Operating System Compatibility** tab of the Test Center **Deployment Type View**, you can see detailed data for only the last package tested; for all other packages in the Application Catalog, this tab is blank (even if the package has been previously tested) Ability to display Microsoft Application Compatibility Toolkit (ACT) database test results on **ACT Summary** tab of the **Test Center Deployment Type View**
	Mac and Mobile	Enhancements to **Application Manager / Catalog**	• Import of the following Mac OS X desktop applications into the Application Catalog: ◦ Apple installer package (.pkg file) ◦ Apple disk image (.dmg file) ◦ Mac App Store app (public store link) • Import of the following mobile app formats into the Application Catalog: ◦ Apple iOS mobile apps (local and public store link) ◦ Google Android mobile apps (local and public store link) ◦ Microsoft Windows Store mobile apps (local and public store link) • Ability to import iOS Enterprise Policy Configuration files, view their settings, and determine the policy compatibility of iOS mobile apps. • Ability to view iOS and Android mobile app reporting on feature use, device compatibility, and OS compatibility.

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Professional (Continued)	**Mac and Mobile** (Continued)	Enhancements to **Application Manager / Catalog** (Continued)	• Ability to customize Apple Installer Package PKG installer settings • Ability to view deployment data for Windows Store mobile apps, including detection methods and framework customizations • Ability to manage AirWatch Server deployment data for both Apple iOS and Google Android mobile apps (local and public store link) • Ability to view and modify Casper deployment settings for Mac OS X desktop applications
		Enhancements to **Application Manager / Test Center**	• Test Apple iOS mobile apps for best practices • Test Apple iOS, Microsoft Windows, and Google Android mobile apps for risk assessment • Test Apple iOS, Microsoft Windows, and Google Android mobile apps for operating system compatibility • Test Mac OS X desktop applications (.pkg, .dmg, and Mac App Store apps) for operating system compatibility and best practices
		Enhancements to **Distribution Wizard**	Ability to publish applications containing the following mobile app formats to System Center 2012 Configuration Manager R2 and AirWatch Server: • Apple iOS mobile apps (local and public store link) • Google Android mobile apps (local and public store link) Ability to publish applications containing the following mobile app format to System Center 2012 Configuration Manager R2: • Windows Store (local and public store link) Ability to publish applications containing the following package formats to JAMF Casper Suite: • Apple installer package (.pkg file) • Apple disk image (.dmg file) • Mac App Store app (public store link)

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Enterprise	None	*Same as Professional, plus:*	
		InstallShield 2015 (Premier Edition instead of Professional Edition)	Advanced customization of Windows Installer packages by either directly editing them or by creating transforms  ***Note*** • *While InstallShield 2015 is being shipped with AdminStudio 2016, you will be required to use an AdminStudio/InstallShield 2016 license to activate InstallShield 2015. InstallShield 2016 will be provided as part of an upcoming service pack release.*
		Application Manager / Report Center	Advanced reports including detailed summary and dashboard reports on Test Center test results, package data, and deployment information
		Platform API	Use to integrate your existing .NET applications or scripting environments like Microsoft PowerShell with AdminStudio
		Software Repository	Secure storage system for AdminStudio package data, including version management

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Enterprise (Continued)	**None**	**Report Center** (Web Tool)	Generate reports on packages stored in the Application Catalog, including reports using custom SQL queries
		Security Console (Web Tool)	Manage AdminStudio user accounts and directory services Manage AdminStudio roles and permissions
		Automated Application Converter (Multiple Application Version) **Conversion Wizard (Multiple Application Version)**	Automatically repackage legacy packages (.exe) into Windows Installer packages (.msi) Ability to perform automated repackaging of multiple packages at a time
	Application Virtualization	*Same as Professional, plus:*	
		Automated Application Converter (Multiple Application Version) **Conversion Wizard (Multiple Application Version)**	Ability to perform automated conversion of multiple packages at a time
		Enhancements to **Application Manager / Report Center**	Includes the Application Virtualization Compatibility Dashboard report Report Center's Application Readiness Dashboard includes an Application Virtualization Compatibility summary chart and App-V Best Practices and App-V Conflicts test results summary charts.

Table 1-2 • AdminStudio Full Editions (cont.)

Edition	Add On	Tools	Functionality
Enterprise (Continued)	**Application Compatibility**	*Same as Professional, plus:*	
		Enhancements to **Application Manager / Test Center**	Ability to test and fix multiple packages or groups of packages simultaneously Ability to view package-level test details for **Operating System Compatibility** and **Browser Compatibility** tests for all packages in the Application Catalog, not just the last one tested Import of web applications and web deploy packages into the Application Catalog Test web applications for compatibility with the following browsers: • Internet Explorer 9 • Internet Explorer 10 • Internet Explorer 11 • Microsoft Edge Test web deploy packages for compatibility with the following platforms: • Windows Server 2012 R2 • Microsoft Azure Application Services Test web deploy packages for best practices. Test web deploy packages for browser compatibility.
		Enhancements to **Application Manager / Report Center**	Display of Microsoft ACT database test results on the Report Center tab
		Enhancements to **Platform API**	Ability to use the `Test-ASPackage` and `Resolve-ASPackage` Platform API commands to perform batch package testing and issue resolution.
	Mac and Mobile	*Same as Professional*	

The AdminStudio 2016 Release Notes also includes a detailed description of the tools and functionality available in each of AdminStudio 2016's Editions and add-on packs. A PDF version of the Release Notes is also available in the Flexera Software Documentation Center:

https://flexeracommunity.force.com/customer/CCDocumentation

Documentation Edition Notes

Documentation on features that are only available in specific Editions or add-on packs include the following notes:

Table 1-3 • Documentation Edition Notes

Edition/Add-On Pack	Note
Standard	***Edition*** • *This feature is included with AdminStudio Standard, Professional, and Enterprise Editions.* This note is only displayed on topics that describe features that are not available in AdminStudio Limited Editions. for more information, see AdminStudio Limited Editions.
Professional	***Edition*** • *This feature is included with AdminStudio Professional and Enterprise Editions.*
Enterprise	***Edition*** • *This feature is included with AdminStudio Enterprise Edition.*
Application Virtualization	***Edition*** • *This feature is included with AdminStudio Application Virtualization.*
Application Compatibility	***Edition*** • *This feature is included with AdminStudio Application Compatibility.*
Mac and Mobile	***Edition*** • *This feature is included with AdminStudio Mac and Mobile.*

AdminStudio Limited Editions

AdminStudio 2016 is also available in the following limited editions.

Table 1-4 • AdminStudio Limited Editions

Edition	Description
Novell ZENworks Editions	The AdminStudio ZENworks Edition for Novell ZENworks Configuration Management (ZCM) 10 and 11 customers includes all of the features of AdminStudio Standard Edition, the basic version of the AdminStudio solution. ***Note*** • *For more information, see About AdminStudio ZENworks Edition.*

Table 1-4 • AdminStudio Limited Editions (cont.)

Edition	Description
Limited Edition for LANDesk Management Suite	The Limited Edition for LANDesk Management Suite includes the following components: • Repackaging Wizard (Customized for LANDesk) • Tuner • Distribution Wizard (Customized for LANDesk)  ***Note*** • *For a description of the customizations made to Repackager and Distribution Wizard in the LANDesk Edition, see About AdminStudio Limited Edition for LANDesk Management Suite.*
Symantec Limited Edition	The Symantec Limited Edition includes the following components: • Repackager • Package Distribution Wizard • WiseScript Editor  ***Note*** • *For more information, see About AdminStudio Symantec Limited Edition.*

About AdminStudio ZENworks Edition

Information about the ZENworks Edition is presented in the following sections:

- ZENworks Edition for ZENworks 10 and 11 Users
- ZENworks Server Connection Requirement

ZENworks Edition for ZENworks 10 and 11 Users

The AdminStudio 2016 ZENworks Edition for Novell ZENworks Configuration Management (ZCM) 10 and 11 customers includes all of the features of AdminStudio Standard Edition, the basic version of the AdminStudio solution. AdminStudio Standard Edition provides a cost-effective way for software packagers to migrate applications to Windows Installer. It enables control over MSI packaging, customization, and distribution activities, helping organizations rapidly and reliably package and deploy applications. For more information, see Standard Edition.

ZENworks Server Connection Requirement

The first time you launch an AdminStudio ZENworks Edition tool, you will be prompted to log in to a ZENworks eDirectory server or a ZENworks Configuration Management server. After a successful login, you will not be prompted to login again.

About AdminStudio Limited Edition for LANDesk Management Suite

AdminStudio 2016 Limited Edition for LANDesk Management Suite is a customized version of AdminStudio that allows system administrators to rapidly prepare reliable Windows Installer (.msi) software packages for distribution across their enterprises. AdminStudio enables companies to take full advantage of the benefits of Windows Installer and reduces total cost of ownership by simplifying the installation, customization, and management of applications.

- LANDesk Edition Components
- LANDesk Edition Customizations
- Evaluating AdminStudio Limited Edition for LANDesk Management Suite

LANDesk Edition Components

AdminStudio 2016 LANDesk Edition includes the following AdminStudio tools:

Table 1-5 • AdminStudio 2016 LANDesk Edition Components

Tool	Description
Repackager	Use the Snapshot method of the Repackaging Wizard to repackage and convert LANDesk files into Windows Installer packages. ***Note*** • *For more information, see Repackager Customizations.*
Distribution Wizard	Prepare a Windows Installer package for LANDesk distribution. In LANDesk distribution, the MSI package along with all the setup files are copied to a network location. ***Note*** • *For more information, see Distribution Wizard Customizations.*
Tuner	Use to quickly create transforms (.mst), including Response File transforms, to customize software already in the Windows Installer format and automatically validate that any changes conform to Microsoft guidelines.

LANDesk Edition Customizations

Additional information about the components available in AdminStudio 2016 Limited Edition for LANDesk Management Suite is presented in the following sections:

- LANDesk Server Connection Requirement
- Repackager Customizations
- Distribution Wizard Customizations
- Application Catalogs
- Projects and Process Templates

LANDesk Server Connection Requirement

The first time you launch an AdminStudio LANDesk Edition tool, you will be prompted to log in to a LANDesk Management Suite Server. After a successful login, you will not be prompted to login again.

Repackager Customizations

In the AdminStudio LANDesk Edition, you can use the Repackaging Wizard's Snapshot method to repackage a legacy installation (**.exe**) and convert it to a Windows Installer package.

However, you need to upgrade to Standard Edition in order to use the Repackager interface to open and modify Repackager project files, convert other legacy installation types to a Repackager project, create an InstallShield Editor project (.ism), build an isolated Windows Installer package, or to configure the exclusions used when repackaging a legacy installation.

***Note** • Repackager projects (**.irp**) allow you to visually analyze the files, **.ini** files, shortcuts, and registry entries captured or changed during the conversion of a legacy setup into a Windows Installer package. You can also exclude files, shortcuts, registry entries, and **.ini** files from the resulting Windows Installer package, without affecting the original setup data.*

Distribution Wizard Customizations

AdminStudio LANDesk Edition includes a customized version of the Distribution Wizard that enables you to distribute a package to a LANDesk server, as an administrative install, to an FTP location, or to a Network location.

Application Catalogs

LANDesk Edition users do not need access to AdminStudio Application Catalog databases. Therefore, in AdminStudio LANDesk Edition, you cannot connect to an Application Catalog or create a new Application Catalog.

Projects and Process Templates

Since the **Process Assistants** tab (formerly the **Projects** tab) and **Process Template Editor** (formerly the **Workflow Templates** tab) in the AdminStudio interface are used primarily to manage application migration projects, they are disabled in the LANDesk Edition.

Evaluating AdminStudio Limited Edition for LANDesk Management Suite

If you have AdminStudio Limited Edition for LANDesk Management Suite, you can choose to evaluate AdminStudio for 45 days (instead of the typical 21 days). Also, the set of tools available to you in evaluation mode depends upon the selection you made on the **Setup Type** panel during installation:

- **Typical**—If you chose this **Setup Type** option during installation, only the tools included in this Limited Edition were installed. Therefore, only those tools will be available to you during your evaluation period.
- **Custom**—If you chose this **Setup Type** option during installation, all of the AdminStudio Enterprise Edition client tools were installed. Therefore, all of those tools will be available to you during your evaluation period.

About AdminStudio Symantec Limited Edition

AdminStudio Symantec Limited Edition enables IT administrators to capture information about applications, customize those applications for their organization's needs, and hand off the prepared applications to Symantec Altiris Management Server for deployment.

Symantec Limited Edition Components

AdminStudio Symantec Edition includes the following AdminStudio tools:

Table 1-6 • AdminStudio 2016 Symantec Limited Edition Components

Tool	Description
Repackager	Use Repackaging Wizard to repackage and convert Symantec files into Windows Installer packages.
Package Distribution Wizard	Use to deliver a final Windows Installer package (.msi) to Symantec Altiris Management Server or to a network location, FTP server, or an administrative location.
WiseScript Editor	Use WiseScript Editor to automate administrative tasks and to create .exe files to use as custom actions in Windows Installer installations. ***Note*** • *WiseScript Editor is installed separately.*

Symantec Altiris Management Server Connection Requirement

The first time you launch an AdminStudio Symantec Limited Edition tool, you will be prompted to log in to a Symantec Altiris Management Server. After a successful login, you will not be prompted to login again.

How to Upgrade AdminStudio Limited Edition to Standard, Professional, or Enterprise Editions

An upgrade feature has been built-in to AdminStudio that allows you to activate features in a higher edition or to add optional Packs without re-installing the application. You just need to enter a Activation Code for the upgrade that you purchased, and the features of that Edition are immediately unlocked and are available to you.

To upgrade AdminStudio, contact AdminStudio Sales and purchase a Activation Code for the desired Edition, and then follow the instructions in Upgrading Your Product Edition.

Activating AdminStudio

When you launch AdminStudio or one of its tools for the first time, you are notified that you are using a time-limited trial version, and you are given the opportunity to evaluate the product or to activate it by entering a valid Activation Code for an AdminStudio Edition.

Task ***To activate AdminStudio:***

1. Install AdminStudio, as described in the *AdminStudio Client Tools Installation Guide*.
2. Launch AdminStudio or one of its tools. A dialog box opens, stating that you are using a time-limited trial version.
3. Select **Activate or Purchase AdminStudio** and click **Next**. The **AdminStudio Product Activation** dialog box opens, prompting you to enter a activation code.
4. Enter the activation code of the edition you purchased and click the **Activate** button. After a few seconds, you will receive a message that activation was successful.
5. Click **Finish**. AdminStudio will launch.

Ports Used in Activation

AdminStudio product activation uses ports 80 (HTTP), 443 (HTTPS), and 8443. If these ports are locked down or if you do not have an available internet connection, you can configure licensing for AdminStudio using one of the following alternative methods:

- **Offline activation**—You can perform offline activation using email.
- **Self-hosted licensing**—Your organization can choose to purchase self-hosted licenses of AdminStudio. A self-hosted license for AdminStudio requires a Flexera Software-generated license file for the machine on which you install AdminStudio, but it does not require activation.

Silent Activation

The AdminStudio installer was created using an InstallShield "Suite" project type, which means that the procedure for installing AdminStudio silently is different from previous releases, which were created using a "Basic MSI" project type.

To install AdminStudio 2016 silently, you need to use the `ASCommandLine` property to pass MSI parameters to the AdminStudio installer (**AdminStudio2016.exe**), along with the `/silent` switch:

```
AdminStudio2016.exe /silent ASCommandLine="[Parameters]"
```

For example:

```
AdminStudio2016.exe /silent ASCommandLine="TRANSFORMS=MyTransform.mst"
```

Note • *You cannot use the* `ASCommandLine` *property to pass the* `ISInstallDir`, `SharedInstallDir`, *or* `PRODUCTID` *command line parameters to the AdminStudio installer; these must be specified explicitly.*

For more information, see *Installing AdminStudio Silently Via Command Line* in the *AdminStudio 2016 Installation Guide*.

Deactivating AdminStudio to Enable Activation on a Different Machine

AdminStudio node-locked licenses are single-machine, single-user licenses according to the end-user license agreement. This means that they can be activated on one machine and accessed by one user.

If moving a license to a new machine is required, the license must first be deactivated from the previous machine before it can be activated on the new machine.

This section includes steps for both online and offline methods of deactivation.

Online Deactivation

To perform deactivation when you have an Internet connection, perform the following steps:

Task ***To perform deactivation via internet:***

1. If you have already uninstalled AdminStudio from the previous machine, reinstall it.
2. Open the **Command Prompt** application.
3. Change the directory to the following path:

   `[AdminStudio_Installation_Directory]\Common`

   For example:

   `C:\Program Files (x86)\AdminStudio\2016\Common`
4. At the command prompt, execute the following command to deactivate the AdminStudio license on this machine:

   TPSconfig /return

   

   Note • *It is recommended that you allow incoming and outgoing traffic to and from* ****.flexerasoftware.com*** *and* ****.installshield.com****, as well as making sure that ports 80, 443, and 8443 are open. The Activation Server URL is:*

   `activationservice.installshield.com`
5. Install AdminStudio on the new machine. You will be permitted to activate it.

Offline Deactivation

To perform deactivation when you do not have an Internet connection, perform the following steps:

Task ***To perform deactivation via email:***

1. If you have already uninstalled AdminStudio from the previous machine, reinstall it.
2. Open the **Command Prompt** application.
3. Change the directory to the following path:

`[AdminStudio_Installation_Directory]\Common`

For example:

`C:\Program Files (x86)\AdminStudio\2016\Common`

4. At the command prompt, execute the following command to generate a request code:

   TPSconfig /return /no_internet

5. E-mail the request code to Flexera Software Support in a text file attachment. A Technical Support Engineer will manually process the deactivation on your behalf.

Note *• For more information, see KB article Q201081: Deactivation of InstallShield and AdminStudio:*

https://flexeracommunity.force.com/customer/articles/en_US/INFO/Q201081

Evaluating AdminStudio

You can choose to evaluate AdminStudio for 21 days. By clicking **Continue to Evaluate AdminStudio** dialog box that opens when you launch AdminStudio, you can begin evaluating the AdminStudio 2016 Enterprise Edition client tools.

Edition *• If you have AdminStudio Limited Edition for LANDesk Management Suite, you can choose to evaluate AdminStudio for 45 days. See About AdminStudio Limited Edition for LANDesk Management Suite for more information.*

Information about evaluating the AdminStudio client tools includes the following topics:

- AdminStudio Client Tools Evaluation Restrictions
- Evaluating AdminStudio Client Tools
- Evaluating AdminStudio's Microsoft App-V Support
- Evaluating the Automated Application Converter "Multiple Application" Option

AdminStudio Client Tools Evaluation Restrictions

When you run AdminStudio in trial/evaluation mode, all of its features are fully available, with the following restrictions:

- **Can create only one Application Catalog**—You are permitted to create only one Application Catalog, and it must be named `AdminStudio Evaluation Catalog`.
- **Ten package import limit**—Only 10 total packages (of one or more deployment types) can be imported into the Application Catalog.
- **Package deletion not permitted**—After you import a package into the Application Catalog, you are not permitted to delete it.
- **AdminStudio Platform API support is disabled**—All platform support is disabled.

Evaluating AdminStudio Client Tools

To evaluate the Enterprise Edition client tools, perform the following steps.

Task ***To evaluate the AdminStudio Enterprise Edition client tools:***

1. Install AdminStudio, as described in the *AdminStudio Client Tools Installation Guide*.
2. Launch AdminStudio. A dialog box opens, stating that you are using a time-limited trial version.
3. If you want to evaluate AdminStudio, select **Continue to Evaluate AdminStudio** and click **Next** (or just wait ten seconds). The product will launch.

   Each time you open AdminStudio while you are in evaluation mode, this dialog box shows you how many days are left in your trial period.

   Note • *If you have installed the AdminStudio Limited Edition for LANDesk Management Suite, and you chose the* **Typical** *option on the Setup type panel during installation, only those tools included in the LANDesk Limited Edition will be available during your evaluation period. See About AdminStudio Limited Edition for LANDesk Management Suite.*
4. If you have five or fewer days left in your trial period, the dialog box remains open, requiring you to click before you can proceed. Do one of the following:
   a. If your trial period is not over, you can continue to use AdminStudio by selecting the **Continue to Evaluate AdminStudio** option and clicking **Next**.
   b. If you have already purchased a activation code or want to purchase one online, select **Activate or Purchase AdminStudio** and click **Next**.

Evaluating AdminStudio's Microsoft App-V Support

While evaluating the AdminStudio Enterprise Edition client tools, you will be able to convert a Windows Installer package to an App-V application using the Automated Application Converter, Conversion Wizard, Repackager, and the InstallShield App-V Assistant. However, an App-V application built using an evaluation version of AdminStudio will display the following message every time it is launched:

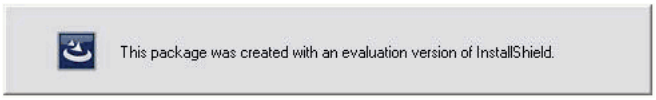

Figure 1-1: Evaluation Version Message

After purchasing the AdminStudio Application Virtualization, you will be able to remove this message by rebuilding the App-V application.

Evaluating the Automated Application Converter "Multiple Application" Option

The "multiple application" option of Automated Application Converter is only available when you purchase Application Virtualization with AdminStudio Enterprise Edition.

***Note** • If you purchase Application Virtualization with AdminStudio Standard or Professional Editions, you will only be able to convert one package at a time, using one virtual machine.*

When using an evaluation version of AdminStudio, you will be able to use Automated Application Converter to convert a directory full of Windows Installer packages into individual virtual packages, but the conversion will be limited to three packages per run, using only one virtual machine. Therefore, only the first three packages that Automated Application Converter encounters will be converted to virtual applications.

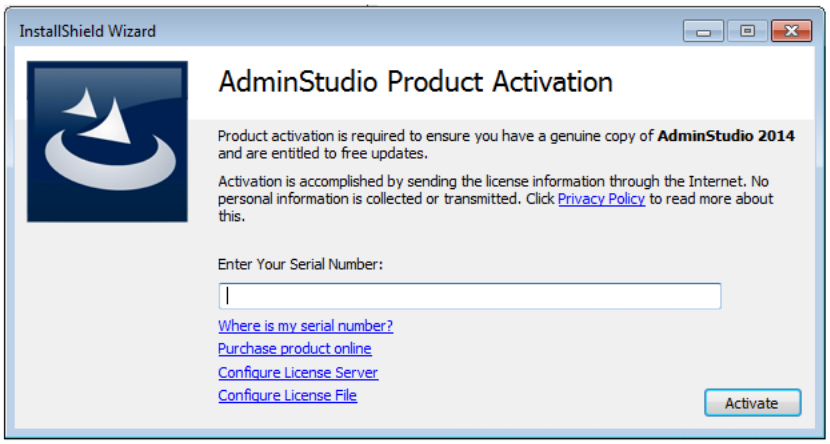
Upgrading Your Product Edition

An upgrade feature has been built-in to AdminStudio that allows you to activate features in a higher edition or in an additional add-on pack without re-installing the application. You just need to enter a Activation Code for the upgrade that you purchased, and the features of that Edition are immediately unlocked and are available to you.

To upgrade, perform the following steps:

Task ***To upgrade your AdminStudio Edition:***

1. Contact an AdminStudio Sales Representative and purchase a Activation Code for the desired edition and/or add-on pack.
2. Launch AdminStudio, Application Manager, Automated Application Converter, Virtual Package Editor, or QualityMonitor.
3. On the **Help** menu, click **About**. The **About** dialog box opens.
4. Click the **Upgrade** button. The **AdminStudio Product Activation** dialog box opens, prompting you to enter the activation code of the edition that you want to upgrade to.



5. Enter the activation code of the edition you purchased and click the **Activate** button. After a few seconds, you will receive a message that activation was successful. The functionality of the upgraded edition and/or add-on pack is immediately available to you.

Using Help

Help is available both from the AdminStudio interface **Help** menu and directly from certain individual interface elements.

When you have questions about this product, first consult the AdminStudio Help Library, which is the complete user's guide for using AdminStudio.

- **Web-based online help**—Web-based online help is available to you 24 hours a day, seven days a week, on our website at:

  http://helpnet.flexerasoftware.com

- **PDF documentation**—AdminStudio documentation is also available in PDF format. Visit the AdminStudio Documentation Center at:

  https://flexeracommunity.force.com/customer/CCDocumentation

Reader Alert Conventions

Reader alerts are used throughout this documentation to notify you of both supplementary and essential information. The following table explains the meaning of each alert.

Table 1-7 • Reader Alert Conventions

Image	Alert Name	Description
	**Note**	Notes are used to draw attention to pieces of information that should stand out.
	**Important Note**	Important notes are used for information that is essential for users to read.
	**Caution**	Cautions indicate that this information is critical to the success of the desired feature or product functionality.
	**Tip**	Tips are used to indicate helpful information that could assist you in better utilizing the desired function or feature.
	**Best Practices**	Best Practices alerts instruct you on the best way to accomplish a task.
	**Edition-Specific Note**	Edition-specific notes indicate that the information applies to a specific edition of a product (such as Professional or Premier edition).
	**Project-Specific Note**	Project-specific notes are used to highlight information that may vary depending on the project type used (such as a Basic MSI or Merge Module project).

Table 1-7 • Reader Alert Conventions (cont.)

Image	Alert Name	Description
	**Version-Specific Note**	Version-specific notes indicate that the information applies to a specific version of a product (such as Version 9.0 or Version 11.0).
	**Windows Logo Guideline**	Windows Logo Guideline alerts accompany Microsoft logo compliance requirements and recommendations.
	**Security**	Security alerts identify security issues.
	**Task**	The Task graphic indicates that procedural instructions follow.
	**Advanced Note**	Advanced notes are used in training manuals to identify information that is for advanced users.
	**Lab**	In training manuals, the Lab graphic indicates that a lab exercise follows.
	**Tutorial**	In training manuals, the Tutorial graphic indicates that a tutorial exercise follows.

Style Conventions

The following style conventions are used throughout this documentation.

Table 1-8 • Style Conventions

Style	Example	Description
User Interface Elements	On the **File** menu, click **Open**.	User interface elements appear in bold when referenced in tasks.
Variables	*FileName*	Variables appear in italics.
Code	`#define HWND_BROADCAST 0xffff`	Code snippets appear in a monospace typeface.
User-Inputted Text	Type **$D(install)** at the prompt.	Text that is to be entered as a literal value is displayed in a monospace typeface, in bold, and in blue.
File Names and Directory Paths	My files are located in the following directory:\ **C:\MyDocuments\SampleCode**	File names and directory paths are presented in a monospace typeface.

Table 1-8 • Style Conventions (cont.)

Style	Example	Description
.INI File Text	Insert the line `LimitedUI=Y` into the .INI file to display only the Welcome dialog box when the Windows Installer package is run.	Text in .INI files is presented in a monospace typeface.
Command-Line Statements	To run the installation silently, enter: `Setup.exe /s/v/qn`	Command-line statements and parameters are presented in a monospace typeface.
Environment Variables	Set the value of the `windir` environment variable.	Environment variables are presented in a monospace typeface.
Examples	Create two groups, one called **Admins** and the other called **General**.	Examples are presented in bold.
Functions	**FeatureAddItem** adds a new feature to a script-created feature set.	Functions are presented in presented in bold.
Properties	In the **Name** property, enter a name for this custom control that is unique among all of the controls in your project.	Properties are presented in bold.
Screen Output	If you type an incorrect parameter, the message `The system cannot find the path specified.` is displayed.	Screen output (from a log file or from the console) is displayed in a monospace typeface, and in blue.
Links	Obtain the latest modules, white papers, project samples, and more from: http://www.yourcompany.com/downloads.htm	Links appear in blue.

Product Activation for AdminStudio

Product activation confirms the authenticity of your AdminStudio software. This is done to protect you from the adverse effects of pirated software. The process also verifies that AdminStudio has not been activated on more machines than allowed by the AdminStudio End-User License Agreement (EULA).

Licensing Options

Two different licensing models are available for AdminStudio:

- **Node-locked licensing**—With this model, the product license is tied to a specific user and machine. This model is the traditional option and the one that is most often purchased.

  A node-locked license for AdminStudio requires a product activation code to activate the product.

If you are using the node-locked type of license, it is your responsibility to maintain your license on your machine. Sharing this type of license between multiple users does not comply with Flexera Software products' end-user license agreements (EULAs).

- **Self-hosted licensing**—With this model, the product license is tied to a specific user and machine.

  A self-hosted license for AdminStudio requires a Flexera Software-generated license file for the machine on which you install AdminStudio.

  If you are using the self-hosted type of license, it is your responsibility to maintain your license on your machine. Sharing this type of license between multiple users does not comply with Flexera Software products' end-user license agreements (EULAs).

- **Concurrent licensing**—This model enables sharing or floating of AdminStudio licenses among a maximum number of simultaneous users; it is also sometimes called *floating licensing*.

  If your organization purchases concurrent licenses for a Flexera Software product, you need to connect your product to the licensing server that your organization sets up.

To learn more about these different licensing models and determine which option best fits your requirements, contact your AdminStudio sales representative.

Overview of the Life Cycle of a Node-Locked License

The node-locked licensing model requires that you activate AdminStudio on your machine. Activation verifies that AdminStudio has not been activated on more machines than allowed by the AdminStudio EULA. If you are using the node-locked type of license, it is your responsibility to maintain your license on your machine.

The following information describes product activation, as well as different events that may occur for a license.

Product Activation

After you first launch AdminStudio, the activation wizard opens. The wizard guides you through a series of steps to activate AdminStudio. You enter a product activation code, which is used to authenticate the AdminStudio license and unlock the product. The wizard first attempts an online activation. If online activation is unsuccessful, the wizard enables you to use the offline method (activation through a Web page that you can access from a different machine).

If you do not activate AdminStudio the first time that you launch it, you have a limited number of days to use it before activation is necessary. The activation wizard shows the number of days that are left in your trial period.

Sometimes activation is not successful. The most common reason is that the activation code was used to activate AdminStudio on another machine. The activation wizard protects the license in this case, preventing users from activating AdminStudio on more machines than allowed by the EULA.

Moving a License

If you obtain a new replacement machine, you can move your license from your old machine to your new machine.

In order to move your license to your new machine, you must first return your license to your account on the activation server. This process is sometimes referred to as *deactivation*. Returning the license makes it available again so that you can use your activation code for activation on a different machine. To learn how to return your license, see Returning a License to Your Account on the Activation Server.

Once you have returned your license, you can use the same activation code to activate the product on your new machine.

Permanently Transferring a License

In some cases, it may be necessary to permanently transfer your license to a different user and machine in an organization. For example, if your responsibilities are changing and someone else will be creating installations in AdminStudio, you may need to transfer your license to that employee. In order to transfer your license, you must first return your license to your account on the activation server. Returning the license makes it available again so that the new user can use your activation code for activation on a different machine. Note that the new user will need to activate AdminStudio on their machine after they have installed it.

If a license is being permanently transferred to you, ensure that you contact your AdminStudio sales or support representative and give them the updated registration information for the license. The registration information update is required in order to best serve you and to notify you about product updates and special offers.

Evaluating AdminStudio Before Activating It

If you have not purchased a license for AdminStudio, you can still install AdminStudio and use it for a limited number of days without activating it. The activation wizard that AdminStudio displays whenever you launch AdminStudio in trial mode shows you how many days are left in your trial period. In addition, the About AdminStudio dialog box in AdminStudio shows the number of days remaining. To access the About AdminStudio dialog box: On the Help menu in AdminStudio, click About AdminStudio.

If you do not activate AdminStudio within the trial period, AdminStudio will stop working when the trial period has ended. You can activate AdminStudio at any time before or after the trial period has ended.

To obtain a copy of AdminStudio that you can evaluate, visit the Flexera Software website.

Purchasing an AdminStudio License

You can purchase AdminStudio through several methods:

- For information on how to purchase AdminStudio, visit the Flexera Software website:

  http://www.flexerasoftware.com/enterprise/purchase/

- Contact your AdminStudio sales representative.
- Purchase from a reseller. Visit the Flexera Software website for a list of resellers in your country.

When you purchase AdminStudio, you receive a activation code that you can use for activation.

Activating Through the Internet

Online activation through the Internet is a quick process. Online activation occurs when you enter your activation code in the activation wizard and click the Activate button.

Task ***To activate AdminStudio through the Internet:***

1. Launch AdminStudio. Before AdminStudio starts, the activation wizard opens. If you have more than 5 days left in your trial period, the wizard automatically disappears after a few seconds.

   If you have 5 or fewer days left in your trial period, the wizard remains, requiring you to click before you can proceed. If your trial period is not over, you can select the **Continue to Evaluate AdminStudio** option and then click the **Next** button on the wizard to use AdminStudio without activating it.

2. When you are ready to proceed with activation, select the **Activate or Purchase AdminStudio** option in the activation wizard and then click the **Next** button. AdminStudio displays a dialog that requests the activation code.

3. Enter your activation code, and then click the **Activate** button.

The activation wizard transmits the activation request to the activation server. When the server receives your activation request, it validates the request. If the activation request is valid, the server automatically transmits the activation response text to the activation wizard, which then activates AdminStudio.

Note that the activation code that you enter must be in the proper format (XXXX-XXXX-XXXX-XXXX; that is, 4 sets of 4 characters); otherwise, the activation wizard displays an error. If it is not in the proper format, it may be necessary to register your activation code and obtain an activatable activation code. To learn more, see Registering Your Activation Code.

Activating Through a Web Page

If you do not have an Internet connection on the machine that has AdminStudio or if you are having problems completing the online activation process, the activation wizard gives you the option of performing offline activation through a self-service Web page on a different machine.

Task ***To activate AdminStudio through a Web page:***

1. Attempt to activate AdminStudio through the Internet. If it cannot be completed, the activation wizard displays a message explaining why it could not occur.

2. Click the **Proceed with offline activation** button. The **Offline Activation** dialog opens. The **Request text** box contains your request text. The request text starts with **<?xml version**, and it ends with **</Request>**.

3. To save the request text to a text file that you can upload from a machine with an Internet connection, click the Save button. The wizard lets you save the text as a **.request** file.

4. Visit the Offline Activation web page—a part of the Flexera Software Product and License Center—and follow the instructions to browse to the **.request** file that you saved.

   https://flexerasoftware.flexnetoperations.com/control/inst/offlineActivation

When you click the button on the Offline Activation web page to submit the activation request and obtain the activation response file (**.xml**), you are prompted for a place to save the **.xml** file. Save it and make it available on the machine on which you initiated the activation process.

5. When you have the activation response file (**.xml**) and you are ready to complete the activation process, launch AdminStudio to open the activation wizard.
6. Proceed to the **Offline Activation** dialog, which has a **Response text** box.
7. Click the **Load** button. The **Open** dialog opens.
8. Browse to the activation response file (**.xml**), and then click the **Open** button. The **Open** dialog box closes, and the wizard writes the response text in the **Response text** box. The response text starts with `<?xml version`, and it ends with `</Response>`.

***Note** • As an alternative for step 8, you can copy the response text to your Clipboard and then use the Paste button to paste the Clipboard contents into the **Response text** box.*

9. Click the **Activate** button.

The activation wizard activates AdminStudio.

***Tip** • The aforementioned procedure is also used to perform an offline return of a license.*

Registering Your Activation Code

Registration entitles you to product updates and special offers. If you try to activate AdminStudio but your activation code has not been registered, the activation wizard that is displayed when you launch InstallShield prompts you to register online. If you received a activation code in the format XXXXXXX-XXX-XXXXXXXXXX (7 characters, followed by 3 characters, followed by 10 characters), you need to register your activation code to obtain a activation code in the proper format (XXXX-XXXX-XXXX-XXXX; that is, 4 sets of 4 characters); this latter format is the one that you can use to activate the product.

To register your activation code, visit http://flexerasoftware.force.com/register.

The following table lists the different activation code formats.

Table 2-1 • Activation Code Formats

Format	Description
XXXX-XXXX-XXXX-XXXX **(4 sets of 4 characters)**	Activation codes in this format are used to activate the product.

Table 2-1 • Activation Code Formats

Format	Description
XXXXXXX-XXX-XXXXXXXXXX **(7 characters, followed by 3 characters, followed by 10 characters)**	This format is used as the order number for some purchases of the product. Activation codes in this format must be registered in order to obtain a activation code that can be used to activate the product. To register a activation code in this format, visit: http://flexerasoftware.force.com/register

Uninstalling and Reinstalling AdminStudio

If you need to move your AdminStudio license from one of your machines to another machine in your organization, or if you need to permanently transfer your license to a different user in your organization, you must first return your license to your account on the activation server. This process is sometimes referred to as *deactivation*. This typically occurs automatically if your machine is connected to the Internet when you uninstall AdminStudio from the original machine. Returning the license makes it available again so that you can use your activation code for activation on your other machine.

In some cases, it is not possible to automatically return a license during uninstallation. For example, if your machine is not connected to the Internet when you uninstall AdminStudio, your license cannot be returned. Therefore, if you want to return your license to make it available for activation on a different machine, the recommended method is to first return the license, as described in Returning a License to Your Account on the Activation Server, and then uninstall AdminStudio.

Returning a License to Your Account on the Activation Server

If you have activated AdminStudio on a machine but you no longer want it to be activated on that particular machine, you can return your license to your account on the activation server by uninstalling the application.

Specifying the Location of the Concurrent License Server

If your organization purchased concurrent licenses for AdminStudio, you need to first install the FlexNet License Server. Then, each time you install AdminStudio, you need to identify the location of the FlexNet License Server.

Task ***To specify the license server:***

1. Launch AdminStudio. Before AdminStudio starts, the activation wizard opens.
2. Select the **Configure AdminStudio to get license information from a license server** option and then click the **Next** button. AdminStudio displays the **Specify License Server** dialog.
3. In the **Server** box, enter the path to the license server, or click the **Browse** button to navigate to the server.
4. If the server is not configured to use the default port, specify the server port number in the **Port** box.
5. Click the **Test Connection** hyperlink.

The wizard connects your machine with the license server.

Tip *• For more information about the license server, see the documentation that is provided to you when you purchase your concurrent licenses.*

Troubleshooting Activation Issues

General Troubleshooting Tips

The following tips may help you resolve issues that may occur during the activation process.

- If you try to activate AdminStudio but your activation code has not been registered, the activation wizard that is displayed when you launch AdminStudio prompts you to register online. To register your activation code, visit:

  http://flexerasoftware.force.com/register

- Ensure that you are entering the activation code correctly, and that it is in the format XXXX-XXXX-XXXX-XXXX (4 sets of 4 characters).
- If you or someone in your organization previously activated AdminStudio on another machine, you must first return your AdminStudio license on that machine through a full uninstallation before it can be activated on the new machine. To learn more, see Uninstalling and Reinstalling AdminStudio.

Activation Errors

If you encounter an activation error, see Activation Errors for help with resolving it. For the latest troubleshooting information, see the Flexera Software Knowledge Base:

https://flexeracommunity.force.com/customer/CCKnowledgeBase

Offline Activation

If you are unable to activate AdminStudio through the automatic online method, offline activation is required. You can perform offline activation on a different machine that has Internet access. For more information, see Activating Through a Web Page.

Further Assistance

For more information about activating AdminStudio, visit https://flexeracommunity.force.com/customer/.

If you have tried all of the aforementioned suggestions and you still have not been able to activate AdminStudio, contact AdminStudio Support at https://flexeracommunity.force.com/customer/CCContactSupport.

Activation Errors

The following table contains tips on how to resolve errors that may occur when your try to activate AdminStudio.

Table 2-2 • Activation Errors

Error Number	Description	Troubleshooting Information
20653	The number of activations allowed for this account has been exceeded.	The AdminStudio end-user license agreement allows you to install and activate AdminStudio a limited number of times. This error occurs if that limit has been exceeded. To resolve this error, try one of the following solutions: • Uninstall AdminStudio on one machine; doing so returns your license to your account on the activation server, allowing you to activate on a different machine. • Contact your AdminStudio sales representative to purchase an additional AdminStudio license. • Ensure that no one else in your organization is already using the same activation code for their activated copy of AdminStudio.
20660	The Activation Code that you entered has been disabled.	The activation code that you entered has been disabled. One example of when this may occur is if you returned your copy of AdminStudio and then later tried to use your activation code to activate AdminStudio. If you encounter this error, ensure that you entered the activation code correctly. If you did enter it correctly, contact AdminStudio Support so that they can re-enable your activation code if it is allowed: https://flexeracommunity.force.com/customer/CCContactSupport Once the activation code has been re-enabled, you can proceed with activation.

Table 2-2 • Activation Errors

Error Number	Description	Troubleshooting Information
20661	The activation code you purchased requires product registration prior to activation code activation.	If you try to activate AdminStudio but your activation code has not been registered, the activation wizard that is displayed when you launch AdminStudio prompts you to register online. To register your activation code, visit: http://flexerasoftware.force.com/register If you did not purchase AdminStudio through a reseller, ensure that you entered the activation code correctly.
20676	The license has been transferred between computers more times than is allowed.	There is a limit to the number of times that you can transfer your AdminStudio license from one machine to another in your organization. This error occurs if that limit has been exceeded. To resolve this error, contact your AdminStudio sales representative to purchase an additional AdminStudio license.

Table 2-2 • Activation Errors

Error Number	Description	Troubleshooting Information
50018	An unexpected error occurred.	This error may occur when the automatic online activation attempt fails. If you do not have an internet connection or are unable to complete the automatic verification process online due to a firewall or proxy, the verification wizard gives you the option to perform offline verification through email.  ***Performing offline verification:*** **1.** Click the **Proceed with offline verification** option. The **Offline Verification** dialog opens. The **Request** text box contains your request text. The request text starts with **<?xml version**, and it ends with **</Request>**. **2.** Save the request text to a text file. **3.** Click the **Save** button. The wizard lets you save the text as a **.request** file. **4.** Attach the **License.request** file to your e-mail reply. Your **License.request** file should allow us to try to generate a **License.response** file, which should allow you to complete the verification process. **5.** When you receive the email message from Flexera Software Support and you are ready to complete the verification process, launch InstallShield or AdminStudio to open the verification wizard. **6.** Proceed to the **Offline Verification** dialog, which should have a **Response** text box. **7.** Copy the response text that is included in the email message from Flexera Software Support to your clipboard. The response text starts with **<?xml version**, and it ends with **</Response>**. In the wizard, click the **Paste** button. As an alternative for step 7, you can copy the response text and paste it into a text file. Change the name of the text file to **License.response**. In the **Offline Verification** dialog, click the **Load** button, and then select the **License.response** file. **8.** Click the **Verify** button. The verification wizard verifies your activation code.

Table 2-2 • Activation Errors

Error Number	Description	Troubleshooting Information
50020	The response text you entered is invalid.	This error occurs if you are attempting offline (email) activation and the response text that you entered in the activation wizard is incorrect. Ensure that you correctly entered the response text. The response text starts with the following string: **<?xml version** The following string marks the end of the response text: **</Response>**
50040	An unexpected error occurred.	This error may occur if an online activation attempt fails. For example, if your machine does not have an Internet connection, online activation cannot occur. If you do not have an Internet connection or if you are having problems completing the online activation process, the activation wizard gives you the option of performing offline activation through email. For information on how to activate offline through email, see Activating Through a Web Page.
50041	Failed to connect to the license server	This error may be received during the installation of an InstallShield or AdminStudio product. It means that the activation API used in the InstallShield or AdminStudio product needs to contact the activation server. • Check your Internet connection, and then try activation again. • For a temporary amount of time, disable any firewalls or proxy settings. Certain firewall and proxy configurations can prevent the verification from communicating with Flexera Software's servers. We recommend temporarily disabling firewalls and proxies while installing and uninstalling in order to allow full communication with our servers. • If you are unable to modify these services and these steps do not resolve the issue, then an email activation may be required. See Activating Through a Web Page.

Activation FAQs

Following are frequently asked questions and answers about the activation process for AdminStudio.

Questions

- What is product activation?
- What happens during activation?

Answers

What is product activation?

Product activation is a quick and anonymous process that confirms the authenticity of your software. This is done to protect you from the adverse effects of pirated software. The process also verifies that AdminStudio has not been activated on more machines than allowed by the AdminStudio End-User License Agreement (EULA).

After you first launch AdminStudio, the activation wizard opens. After a few seconds, the activation wizard disappears if you have not clicked on it, and AdminStudio is launched as a trial product. If you want to activate AdminStudio right away, you can select the Activate or Purchase AdminStudio option, and then click the Next button. The wizard guides you through the activation process, and in seconds, AdminStudio is activated.

What happens during activation?

You go through a series of easy steps to activate AdminStudio, usually through the Internet (or offline, through a Web site that you can access on a different machine). You enter a product activation code, which is used to authenticate the AdminStudio license, thus unlocking the product. The entire process takes only a few seconds.

What information is required for activation?

Activation requires your AdminStudio activation code. No personal information is needed.

Does activation affect my software or my computer?

No. Activation has no effect on the performance of your computer or software.

How do I activate AdminStudio?

After purchasing AdminStudio (and subsequently receiving your activation code), you simply enter the activation code in the designated field that is displayed in the activation wizard when you launch AdminStudio, and then click the Activate button.

Typically, activation is completed in just a few seconds through the Internet (online activation). In some cases, offline activation is required. If so, this is accomplished through a Web site that you can access from a different machine. To learn more, see Activating Through a Web Page.

How long does it take to activate AdminStudio?

Internet activation (online activation) typically takes seconds to complete. It is dependent on the type of Internet technology that you are using. The amount of data being transmitted is very small, so high-speed connections are not required.

How soon must I activate AdminStudio?

You have a limited number of days to activate AdminStudio after the first launch. The activation wizard shows the number of days that are left in your trial period. The activation wizard is displayed every time that you launch AdminStudio during the trial period (before you have activated AdminStudio). In addition, the About AdminStudio dialog box in AdminStudio shows the number of days remaining. To access the About AdminStudio dialog box: On the Help menu in AdminStudio, click About AdminStudio.

Can I install AdminStudio without activating it?

Yes. After installation, you can use AdminStudio for a limited number of days without activating it.

After that trial period has ended, you need to activate AdminStudio in order to use it.

What happens if I do not activate AdminStudio?

AdminStudio will stop working at the end of the trial period if you do not activate it.

How can I obtain a activation code for activation?

When you purchased and downloaded AdminStudio from the AdminStudio online store, you should have received your activation code through email. If you cannot find your activation code, contact your AdminStudio sales representative.

What is the difference between product activation and product registration?

Product activation is a mandatory, anonymous process that verifies the activation code for your copy of AdminStudio. Product registration is a process that entitles you to product updates and special offers.

Can I uninstall my copy of AdminStudio on one machine and reinstall it on my other machine?

Yes. The recommended method is to first return your license on the current machine and install the product on a new machine. Once you have installed it on the new machine, you must activate AdminStudio on the new machine.

For more information, see Returning a License to Your Account on the Activation Server.

What if I upgrade or get a new machine, and I forget to return my license on my old machine?

If you are planning to upgrade or get a new machine, it is important that you first return your license. If you do not do this, your account on the activation server still reflects that your license is activated on your old machine. As a result, when you install the product on your new machine, you will not be able to activate it, and you will need to contact AdminStudio Support. If this situation has occurred frequently, you may be denied another activation.

Can I share my copy of AdminStudio with others?

No, AdminStudio should not be shared with other users. Do not share the activation code that you used for activation.

Will I be able to reinstall and reactivate AdminStudio if my hard drive crashes?

Yes. However, in most cases, the AdminStudio license will still be activated. If you attempt to reactivate but it fails, contact AdminStudio Support at:

https://flexeracommunity.force.com/customer/CCContactSupport

Do I always need to be online to use AdminStudio?

Once you have activated AdminStudio, you do not need to be online to use it.

What does Flexera Software do with the AdminStudio activation information?

The information that is used to activate AdminStudio is used within the capacity outlined by the AdminStudio End-User License Agreement (EULA). For additional information, review the privacy policy on the Flexera Software website:

http://www.flexerasoftware.com/enterprise/company/terms/tab/privacy

3

Getting Started with AdminStudio

The AdminStudio Start Page, which is designed to help you quickly get started evaluating and using AdminStudio, provides process information on how to perform key tasks using AdminStudio tools. Information is organized into the following tabs:

Table 3-1 • AdminStudio Start Page Organization

Icon	Start Page Tab	Description
	**Getting Started**	Describes the main tasks that you can use AdminStudio to accomplish, and provides links to additional information. See Getting Started Tab.
	**Test for Application Compatibility**	Provides a flowchart that outlines how to use Application Manager to test applications for compatibility with Microsoft Windows 7 (32-bit and 64-bit), Windows 8 (32-bit and 64-bit), Windows Server 2008 R2, Windows Server 2012, Apple iOSÂ 6, Apple iOS 7 (32-bit and 64-bit), Apple iOS 8 (32-bit and 64-bit), and Google Android (4.1, 4.2, 4.3, and 4.4) operating systems. It also outlines how to use Application Manager to test web applications for compatibility with Internet Explorer 8, 9, 10, and 11. See Test for Application Compatibility Tab.
	**Migrate to Application Virtualization**	Provides a flowchart that outlines the steps required to migrate your application portfolio into virtual applications that are ready for deployment within the enterprise. See Migrate to Application Virtualization Tab.
	**Migrate to Windows Installer**	Provides a flowchart that outlines the steps required to migrate legacy setups (such as **.exe** files) to deployable Windows Installer packages (**.msi**). See Migrate to Windows Installer Tab.

Table 3-1 • AdminStudio Start Page Organization

Icon	Start Page Tab	Description
	**Set Up Infrastructure**	Lists the infrastructure setup steps that you need to perform prior to using AdminStudio for the first time: connect to an Application Catalog, configure virtual machines, set e-mail notification settings, and specify server/database connection settings. See Set Up Infrastructure Tab.

Getting Started Tab

The **Getting Started** tab of the AdminStudio Start Page describes the main tasks that you can use AdminStudio to accomplish, and provides links to additional information. It also provides a link to information on setting up AdminStudio infrastructure.

To quickly get started evaluating and using AdminStudio, click on the link of the task you want to accomplish:

Table 3-2 • Getting Started Tab

Link	Description
Test for Application Compatibility	Test applications for compatibility with Microsoft Windows 7 (32-bit and 64-bit), Windows 8 (32-bit and 64-bit), Windows Server 2008 R2, Windows Server 2012, Apple iOSÂ 6, Apple iOS 7 (32-bit and 64-bit), Apple iOS 8 (32-bit and 64-bit), and Google Android (4.1, 4.2, 4.3, and 4.4) operating systems. Test web applications for compatibility with Internet Explorer 8, 9, 10, and 11.
Migrate to Application Virtualization	Automatically repackage and convert Windows Installer packages, as well as setups in other formats, into virtual applications in Microsoft App-V, VMware ThinApp, Citrix XenApp, and Symantec Workspace formats.
Migrate to Windows Installer	Capture, repackage, and customize installations, analyze packages for conflicts with target applications, and prepare packages for distribution.
Set Up Infrastructure	Create/connect to a Microsoft SQL Server Application Catalog database. Prepare virtual machines for use in automated repackaging and testing.

Test for Application Compatibility Tab

Edition • *Support for performing operating system compatibility testing included with AdminStudio Professional Edition with Application Compatibility. Support for performing browser compatibility testing is included with AdminStudio Enterprise Edition with Application Compatibility.*

The flowchart on this tab outlines how to use Application Manager to test applications for compatibility with Microsoft Windows 7 (32-bit and 64-bit), Windows 8 (32-bit and 64-bit), Windows Server 2008 R2, Windows Server 2012, Apple iOS 6, Apple iOS 7 (32-bit and 64-bit), Apple iOS 8 (32-bit and 64-bit), and Google Android (4.1, 4.2, 4.3, and 4.4) operating systems. It also outlines how to use Application Manager to test web applications for compatibility with Internet Explorer 8, 9, 10, and 11.

To test applications for operating system and browser compatibility, perform the following steps:

- Import Packages, Web Applications, and Mobile Apps
- Select Tests to Run and Set Default Fix Option
- Perform Testing and View Results

Import Packages, Web Applications, and Mobile Apps

For instructions on how to import packages, web applications, and mobile apps, see the following help topics:

Table 3-3 • Import Packages, Web Applications, and Mobile Apps

#	Step	Description
1	**Import Windows Installer packages into Application Catalog.**	For instructions on how to import Windows Installer packages into the Application Catalog, see: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager
2	**Import web applications into Application Catalog.**	For instructions on how to import web applications into the Application Catalog, see: • Importing Web Applications
3	**Import mobile apps into Application Catalog.**	For instructions on how to import mobile apps into the Application Catalog, see: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager • Importing Links to Public Store Applications

Select Tests to Run and Set Default Fix Option

For instructions on how to select the tests to run and set the default fix option, see the following help topics:

Table 3-4 • Select Tests to Run and Set Default Fix Option

#	Step	Description
4	**Select the Test Center tests that you want to run.**	For instructions on how to select Test Center tests to run, see: • Selecting Tests to Execute
5	**Set the default fix option for selected tests: basic fix, advanced fix, or do not fix.**	For instructions on how to set the default fix option, see: • Setting Automatic Fix Preferences for Operating System Compatibility and Browser Compatibility Tests

Perform Testing and View Results

For instructions on how to perform testing and view results, see the following help topics:

Table 3-5 • Perform Testing and View Results

#	Step	Description
6	**Click Execute Tests to test Windows Installer packages, mobile apps, and web applications (statically).**	For information on executing tests, see: • Performing Compatibility, Best Practices, and Risk Assessment Testing • Performing Static Testing of Web Applications
7	**Click Launch Web Test to test web applications interactively.**	For information on testing web applications interactively, see: • Performing Dynamic Testing of Web Applications
8	**View test results.**	For information on viewing test results, see: • Viewing and Filtering Test Results • Filtering Test Results by Suppressing Errors/Warnings
9	**Click Resolve Issues to automatically resolve issues.**	For information on resolving issues, see: • Resolving Issues

Migrate to Application Virtualization Tab

The flowchart on this tab outlines the steps required to migrate your application portfolio into virtual applications that are ready for deployment within the enterprise.

Note • *Prior to performing these steps, you should have already set up infrastructure as outlined in the Set Up Infrastructure Tab.*

To migrate a Windows Installer or legacy application to a virtual package, perform the following steps:

- Identify Packages to Virtualize
- Convert to Virtual Formats
- Test and Distribute Converted Packages

Identify Packages to Virtualize

For instructions on how to identify the packages to virtualize, see the following help topics:

Table 3-6 • Identify Packages to Virtualize

#	Step	Description
1	**Import packages into Application Catalog.**	For instructions on how to import Windows Installer and legacy applications into the Application Catalog, see: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager • About Legacy Installer Packages
2	**View each package's Application Virtualization Compatibility test results.**	For instructions on how to view a package's Application Virtualization Compatibility test results, see Viewing Application Virtualization Compatibility Test Results.
3	**Identify candidates for virtualization.**	Based upon the virtualization readiness information reported, decide which of the imported applications to select for virtualization.

Convert to Virtual Formats

For instructions on how to convert a package to a virtual format, see the following help topics:

Table 3-7 • Convert to Virtual Formats

#	Step	Description
4	**Import candidate packages into Automated Application Converter.**	For instructions on how to import candidate packages into Automated Application Converter, see: • Adding Packages from an AdminStudio Application Catalog • Adding Packages from a Local Machine or Network
5	**Convert to virtual packages.**	For instructions on convert selected packages to virtual packages, see Performing a Conversion Using the Application Conversion Wizard.
6	**Test launch virtual packages.**	For instructions on how to test the virtual packages that you have just created, see Testing Packages.
7	**Publish virtual packages to Application Catalog.**	For instructions on how to publish converted packages to the Application Catalog, see Importing Converted Packages into the Application Catalog.

Test and Distribute Converted Packages

For instructions on how to test and distribute converted virtual packages, see the following help topics:

Table 3-8 • Test and Distribute Converted Packages

#	Step	Description
8	**Perform virtualization best practice testing.**	For instructions on how to validate App-V packages against virtualization best practice rules, see Performing Compatibility, Best Practices, and Risk Assessment Testing.
9	**Perform conflict testing.**	For instructions on how to perform conflict analysis of an App-V packages against other packages, see Performing Application Conflict Testing.
10	**Edit App-V packages (if necessary).**	To resolve any warnings or errors that were found during testing, you can edit the App-V package in the Virtual Package Editor, as described in Using the Virtual Package Editor.
11	**Distribute to enterprise for user acceptance testing and production.**	For instructions on how to distribute an App-V package to your enterprise, see Distributing Applications and Packages.

Migrate to Windows Installer Tab

The flowchart on this tab outlines the steps required to migrate legacy setups (such as **.exe** files) to deployable Windows Installer packages (**.msi**).

Note • *Prior to performing these steps, you should have already set up infrastructure as outlined in the Set Up Infrastructure Tab.*

To migrate a legacy setup to a Windows Installer package, perform the following steps:

- Repackage Legacy Package
- Import Into Application Catalog
- Test Repackaged Applications and Resolve Issues
- Distribute Repackaged Applications

Repackage Legacy Package

For instructions on how to repackage a legacy package, see the following help topics:

Table 3-9 • Repackage Legacy Package

#	Step	Description
1	**Select legacy packages (.exe).**	For instructions about how to get started with repackaging, see About Repackaging.
2	**Repackage to Windows Installer package (.msi).**	For instructions on how to repackage a Windows Installer package, see Repackaging Legacy Installations Using the Repackaging Wizard.
3	**Edit packages in Repackager.**	For instructions on how to edit a Repackager project, see Working With Repackager Projects.

Import Into Application Catalog

For instructions on how to import a package into the Application Catalog, see the following help topics:

Table 3-10 • Repackage Legacy Package

#	Step	Description
4	**Import Windows Installer package into Application Catalog.**	For instructions on how to import a Windows Installer package into the Application Catalog, see Importing a Single Package File.

Test Repackaged Applications and Resolve Issues

For instructions on how to test a repackaged application and resolve issues, see the following help topics:

Table 3-11 • Test Repackaged Applications and Resolve Issues

#	Step	Description
5	**Perform Windows Installer best practices and OS compatibility testing.**	For instructions on how to perform Windows Installer best practice and OS compatibility testing, see Performing Compatibility, Best Practices, and Risk Assessment Testing.
6	**Perform application conflict testing.**	For instructions on how to perform conflict testing, see Performing Application Conflict Testing.
7	**Review test results in Test Center.**	For information on viewing test results, see: • Viewing and Filtering Test Results • Filtering Test Results by Suppressing Errors/Warnings
8	**Perform automatic issue resolution.**	For information on resolving issues, see: • Resolving Issues

Distribute Repackaged Applications

For instructions on how to distribute a repackaged application, see the following help topics:

Table 3-12 • Distribute Repackaged Applications

#	Step	Description
9	**Distribute repackaged application via System Center Configuration Manager or using another distribution method.**	For instructions on how to distribute a package, see Distributing Applications and Packages.

Set Up Infrastructure Tab

To get started using AdminStudio, you need to connect to a Microsoft SQL Server Application Catalog database, and prepare virtual machines for use in automated repackaging and testing.

- Create/Connect to an Application Catalog
- Configure Virtual Machines
- Set E-Mail Notification Settings
- Enter Server/Database Connection Settings

Create/Connect to an Application Catalog

For instructions on create a new Application Catalog or connect to an existing one, see the following help topics:

Table 3-13 • Create/Connect to an Application Catalog

Step	Description
Create/Connect to an Application Catalog	For instructions on how to create or connect to an Application Catalog, see Creating New Application Catalogs or Connecting to an Existing Application Catalog.
Enable Software Repository	For instructions on enabling the Software Repository, see Using the Software Repository.
Set Default Application Catalog	For instructions on setting the default Application Catalog, see Specifying a Default AdminStudio Application Catalog.

Configure Virtual Machines

For instructions on how to configure virtual machines for use with Automated Application Converter, see the following help topics:

Table 3-14 • Configure Virtual Machines

Step	Description
Run Virtual Machine Preparation Setup to Enable Auto Login	For instructions on how to run the virtual machine preparation setup, see Preparing Your Virtual Machines for Use With the Automated Application Converter and Running the Virtual Machine Preparation Setup.
Create a Snapshot	For instructions on how to create a snapshot on your virtual machine, see Taking a Snapshot.
Install VMware VIX	For instructions on how to install VMware VIX, see VMware VIX API Requirement on the AdminStudio Machine.
Test Virtual Machine Setup by Converting a Simple Package	For instructions on how to test a virtual machine setup, see Using the Application Conversion Wizard to Perform Automated Package Conversion.

Set E-Mail Notification Settings

For instructions on how to set e-mail notification settings, see the following help topics:

Table 3-15 • Set E-Mail Notification Settings

Step	Description
Set SMTP Notification Settings	For instructions on setting SMTP notification settings, see Setting E-Mail Notification Settings.

Enter Server/Database Connection Settings

For instructions on how to enter connection settings to enable AdminStudio to communicate with your distribution systems and the Flexera Service Gateway, see the following help topics:

Table 3-16 • Enter Server/Database Connection Settings

Step	Description
Configure Multiple Named Connections to Distribution Systems	For information on entering connection information for System Center Configuration Manager, Citrix XenApp, Symantec Altiris, and AirWatch distribution systems, see Creating Multiple Named Connections to Distribution Systems.
Connecting to the Flexera Service Gateway	For information on connecting to the Flexera Service Gateway—which enables communication with FlexNet Manager Platform, Workflow Manager, and App Portal—see Integrating with Other Flexera Software Applications via the Flexera Service Gateway.

4

Using the AdminStudio Interface

The AdminStudio interface is the central application for AdminStudio. From it, you can launch AdminStudio tools, set AdminStudio options, set Application Catalog properties, create workflows and projects, and connect to and create Application Catalogs. You can launch the AdminStudio interface from the Windows Start menu.

AdminStudio interface documentation is presented in the following sections:

Table 4-1 • AdminStudio interface Documentation

Section	Description
Configuring the AdminStudio Interface	Includes information on customizing the AdminStudio Interface, including setting shared directories.
Working with Tools	Explains how to configure AdminStudio tools and also external tools necessary to perform workflow tasks.
Workflows and Projects	Explains how to use workflow functionality to define repeatable processes to accomplish your goals.
Frequently Asked Questions	A list of questions frequently asked by AdminStudio users, with links to the appropriate help topics.
AdminStudio Interface Reference	This section contains an exhaustive description of each dialog box, Wizard, and UI element in AdminStudio.

Configuring the AdminStudio Interface

This section explains how to configure and customize the AdminStudio interface. The following topics are discussed:

Table 4-2 • Topics on AdminStudio Interface Configuration

Category	Topics
Launching Applications	• Launching AdminStudio Applications
Configuring Application Catalog Settings	• Specifying the AdminStudio Shared Location
Setting Interface Preferences	• Setting E-Mail Notification Settings • Setting the Workflow Task Help Page Location • Configuring How Often AdminStudio Checks for Updates • Configuring AdminStudio to Stay on Top • Generating a Debug Log for AdminStudio

Launching AdminStudio Applications

Individual AdminStudio applications, such as InstallShield Editor or Repackager, can be launched from the Windows Start menu or by double-clicking on the tool icon in the Tools Gallery on the Tools Tab.

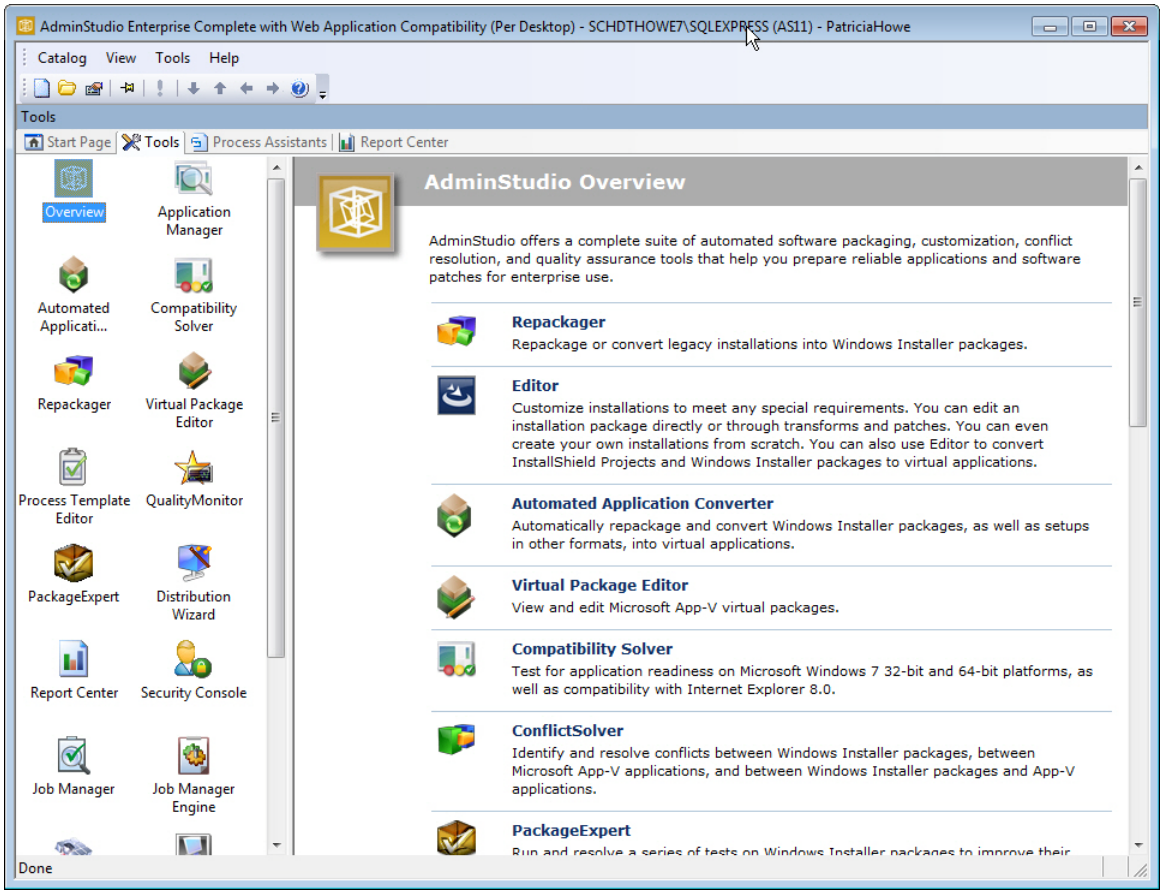

Figure 4-1: Tools Gallery on the Tools Tab

Note • *If a core AdminStudio tool is not in the Tools Gallery or available from the menu, it may mean that either you are not assigned to a Role that has permission to use that Tool, or that the Tool is not available in your Edition of AdminStudio.*

Specifying the AdminStudio Shared Location

The AdminStudio Shared directory (also referred to as the AdminStudio Shared location) contains shared information for repackaging and conflict identification, and other AdminStudio functions. The AdminStudio Shared Directory contains the following:

- The Shared **AdminStudio.ini** file, which specifies default Application Catalog database settings
- Application Manager duplicate package identifier options
- Repackager **isrepackager.ini** exclusion list
- OS Snapshot **issnapshot.ini** file
- User-defined ACEs used in conflict analysis
- Distribution Wizard Distribution Type templates and **.ini** files

If you are working in a team environment, the AdminStudio Shared Directory should be set to a centralized network location, accessible by all AdminStudio users at your organization, rather than on your local machine. Follow the steps below to specify the location of the AdminStudio Shared Directory.

Note • *To maintain consistency when creating workflows, it is recommended that you set the AdminStudio Shared Directory the same for each AdminStudio user.*

Task ***To specify the location of the AdminStudio Shared Directory:***

1. Launch the AdminStudio Interface.
2. From the **Tools** menu, select Options. The **Options** dialog box opens.
3. In the **Options** dialog box, select the **Locations** tab.
4. Enter or browse to the directory for the **AdminStudio Shared Location**.
5. Click **OK** to close the **Options** dialog box.

Setting E-Mail Notification Settings

To enable AdminStudio to send you e-mail notifications during various processes, you need to configure your SMTP notification settings.

Note • *Currently, e-mail notifications are sent when soft time-outs are encountered while using Automated Application Converter to repackage an application on a virtual machine.*

To set your e-mail notification settings, perform the following steps:

Task ***To set e-mail notification settings:***

1. Launch the AdminStudio interface.
2. From the **Tools** menu, select **Options**. The **Options** dialog box opens.
3. Select the **Notification Settings** tab.
4. On the **Notification Settings** tab, enter the following information:

Option	Description
SMTP Server	Enter the address of your e-mail server, such as: **smtp.yourcompany.com**

Option	Description
Authentication	Specify how your e-mail is authenticated by selecting one of the following options: • **Server Authentication**—Select this option if you want to perform server authentication on your AdminStudio e-mail. • **Anonymous**—Select this option if you do not want to perform authentication on your AdminStudio e-mail.
Domain	Enter the Domain of the user account listed in the **User Name** field.
User Name	Enter the name of an existing user account in the Domain specified in the **Domain** field. This user must have permission to send e-mail.
Password	Enter the password of the user account defined in the **User Name** and **Domain** fields.  ***Note*** *• If your network domain requires that user passwords are changed periodically, you will have to open this dialog box again to update this account's password. To avoid this, try to obtain a user account that has a password that does not expire.*
From E-Mail ID	Enter the e-mail address to serve as the identity of AdminStudio. All e-mails sent by AdminStudio will have this e-mail address in the **From** field.
To E-Mail ID(s)	Enter the e-mail address to serve as the system account for AdminStudio e-mail. All e-mails sent to AdminStudio will be sent to this address.  ***Note*** *• Use a semi-colon to separate multiple e-mail addresses in the* ***To E-Mail ID(s)*** *field.*
SMTP Server Port	Enter the port of your SMTP server.
Use SSL	Select this option if you want to use SSL security for the AdminStudio e-mail account.

5. Click **OK**.

Setting the Workflow Task Help Page Location

The **Task Help Page Location** is the directory where you want to store all HTML pages that serve as workflow task instructions.

Task ***To specify the location of task help pages:***

1. Launch the AdminStudio interface.
2. From the **Tools** menu, select **Options**.The **Options** dialog box opens.
3. Select the **Locations** tab.
4. Enter or browse to the **Task Help Page Location**, the location where workflow task help pages are stored.
5. Click **OK** to close the **Options** dialog box.

Configuring How Often AdminStudio Checks for Updates

You specify how often you want AdminStudio to check for updates on the **Updates** tab of the **Options** dialog box.

Task ***To configure how often AdminStudio checks for updates:***

1. Open AdminStudio.
2. On the **Tools** menu, click **Options**. The **Options** dialog box opens.
3. On the **Updates** tab, select the frequency that AdminStudio will check for software updates:
   - Once every 15 days
   - Once every 30 days
   - Once every 60 days
   - Never
4. Click **OK** to close the **Options** dialog box.

Configuring AdminStudio to Stay on Top

When you launch AdminStudio tools, you can specify whether they open in front of or behind the AdminStudio interface. If you select **Always on Top** from the **View** menu, application will always open behind the AdminStudio interface.

Task ***To configure AdminStudio to stay on top of other applications:***

1. Launch the AdminStudio interface.
2. From the **View** menu, select **Always on Top**.

Generating a Debug Log for AdminStudio

To create a debug log for AdminStudio, perform the following steps.

Task ***To generate a debug log for AdminStudio:***

Use the following registry value to turn debugging on. Once this debugging is turned on, a log file will be created in the same location as the **.exe** file.

[HKLM\Software\InstallShield\AdminStudio] DebugLogLevel="3"

Levels 0, 1, 2, 3, 4, and 5 are supported with 5 being the highest. Default is level 0.

Working with Tools

Topics in this section involve adding, configuring, and associating tools in the **Tools Gallery** on the Tools Tab. This section contains the following topics:

- Adding New Tools to the Tools Gallery
- Editing Properties for an Existing Tool
- Adding Command-Line Configurations for an Existing Tool
- Modifying Command-Line Configurations for an Existing Tool
- Deleting Command-Line Configurations from an Existing Tool
- Associating Tools with Tasks
- Running Associated Tools in Projects
- Deleting Existing Tools
- Limiting Tool Accessibility

Adding New Tools to the Tools Gallery

To add a new tool to the Tools Gallery, perform the following steps.

Task ***To add a new tool to the Tools Gallery:***

1. From the **Tools Tab**, right-click in the Tools Gallery and select **Add Tool**. The **Add Tool Wizard** opens.
2. On the **Welcome Panel**, click **Next**. The **Tool Properties Panel** opens.
3. On the **Tool Properties Panel**, provide the necessary details about the tool. Click **Next**. The **Command-Line Configuration Panel** opens.
4. If there are command-line options you want associated with the tool, do so from the **Command-Line Configurations Panel**. Each tool can have multiple command-line options associated with it for different purposes.
5. Click **Finish**.

After using the **Add Tool Wizard**, the new tool appears in the Tools Gallery and is available for use in workflows and projects.

Note • *In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Editing Properties for an Existing Tool

To edit the properties of a Tool in the Tools Gallery, perform the following steps.

Task ***To edit an existing tool's properties:***

1. From the **Tools Tab**, right-click the tool in the Tools Gallery and select **Properties**. The **Tool Properties** dialog box is displayed.
2. Click the **Properties** tab.
3. Modify tool properties as necessary.
4. Click **OK** to apply the changes.

Note • *In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Adding Command-Line Configurations for an Existing Tool

To add command-line configurations for an existing Tool, perform the following steps:

Task ***To add a command-line configuration to an existing tool:***

1. From the **Tools Tab**, right-click the tool to which you want to add a configuration from the Tools Gallery and select Properties. The **Tool Properties** dialog box is displayed.
2. Click the **Configuration** tab.
3. Click Add. The **Command-Line Properties** dialog box is displayed.
4. Enter a description and the command-line configuration.
5. Click **OK** to close the **Command-Line Properties** dialog box.
6. Click **OK** to close the **Tool Properties** dialog box.

Note • *In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Modifying Command-Line Configurations for an Existing Tool

To modify command-line configurations for an existing Tool, perform the following steps:

Task ***To edit and existing tool's command-line configurations:***

1. From the **Tools Tab**, right-click the tool in the Tools Gallery and select Properties. The **Tool Properties** dialog box is displayed.
2. Click the **Configuration** tab.
3. Select the command-line configuration you want to edit and click **Modify**. The **Command-Line Properties** dialog box appears.
4. Modify the description and/or command line.
5. Click **OK** to dismiss the **Command-Line Properties** dialog box.
6. Click **OK** in the **Tool Properties** dialog box to apply the changes.

Note *• In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Deleting Command-Line Configurations from an Existing Tool

To delete command-line configurations from an existing Tool, perform the following steps.

Task ***To delete a command-line configuration from an existing tool:***

1. From the **Tools Tab**, right-click the tool from which you want to remove the configuration in the Tools Gallery and select **Properties**. The **Tool Properties** dialog box is displayed.
2. Click the **Configuration** tab.
3. Select the configuration you want to remove and click **Delete**.
4. Click OK to close the **Tool Properties** dialog box.

Note *• In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Associating Tools with Tasks

To associate a Tool with a Workflow task, perform the following steps.

Task ***To associate a tool with a task:***

1. Open the **Process Template Editor**.
2. In the **Workflows** tree, expand a Workflow to display all of its tasks.
3. From the **Workflows** tree, select the task with which you want to associate the tool. The **Task Properties** are displayed.
4. From the **Tool** list, select the tool you want to associate with the task. If the necessary tool is not listed, select **<New Tool...>** from the list to add the tool.
5. In the **Tool Configuration** list, select the configuration you want to use with the tool. If the configuration is not listed, click **Configure** to create the new configuration.

Note • *In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Running Associated Tools in Projects

To run associated Tools in Projects, perform the following steps.

Task ***To run a tool associated with a task:***

1. Select the **Process Assistants** tab from the Interface.
2. Expand a Project in the **Projects** tree to display all of its tasks.
3. Right-click the task with which the tool is associated and select **Run Task** from the shortcut menu.

Note • *In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Deleting Existing Tools

To delete a Tool from the Tools Gallery, perform the following steps.

Task ***To delete an existing tool from the Tools Gallery:***

1. From the **Tools Tab**, right-click the tool you want to delete from the Tools Gallery and select **Delete**.
2. Confirm the deletion.

***Note** • In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Limiting Tool Accessibility

***Edition** • AdminStudio Enterprise Server is included in AdminStudio Enterprise Edition.*

Accessibility of tools is determined by a user's assigned Roles. If you want to modify an existing Role so that users assigned to that Role can no longer access a specific tool, see Viewing or Changing an Existing Role in the Managing Roles and Permissions section.

Workflows and Projects

Workflows, which can be created and modified using the **Process Template Editor**, are the basis for all projects in AdminStudio. These workflows consist of defined tasks, with which instructions (in the form of HTML files) and tools can be associated. Users can then create projects based on these workflows, and execute them—following the specific steps defined in the workflow. This allows you to create specific, repeatable procedures to accomplish your application migration goals.

***Important** • Starting with AdminStudio 10, the **Workflow Templates** tab of the AdminStudio interface has been moved into its own tool named **Process Template Editor**, which can be launched from the **Tools** tab or the **Tools** menu. All functionality remains the same. Also, the former **Projects** tab of the AdminStudio interface has been renamed to **Process Assistants**.*

***Tip** • If you update a workflow, all projects based on that workflow will reflect the changes made to the workflow.*

The following topics relate to workflows and projects:

- Creating and Editing Workflows
- Creating and Using Projects
- Saving Workflow and Project Changes
- Workflow Project Example: Using the New Workflow Project Wizard
- Workflows, Projects, and Permissions

Creating and Editing Workflows

Workflows serve as templates upon which projects are based. Typically, only a few individuals create workflows, while others create projects and execute the projects to accomplish the workflow goal.

The following topics relate to creating and executing workflows:

Creating New Workflows

To create a new workflow, perform the following steps.

Task ***To create a new workflow:***

1. Open the **Process Template Editor** by clicking its icon on the Tools tab. You are prompted to connect to an Application Catalog.
2. Enter the Application Catalog connection information and click OK. The Process Template Editor interface opens.
3. Right-click in the Workflows tree pane and select New Workflow. A new Workflow is listed.
4. Provide a name for the workflow.

Renaming Workflows

To rename a workflow, perform the following steps.

Task ***To rename an existing workflow:***

1. Open the **Process Template Editor**.
2. Right-click the workflow you want to rename and select **Rename** from the shortcut menu.
3. Provide a new name for the workflow.

Filtering Workflows

To display a specific workflow, perform the following steps.

Task ***To display a specific workflow:***

1. Open the **Process Template Editor**.
2. From the drop-down menu above the Workflows tree, select the workflow you want to display.

Deleting Workflows

To delete a workflow, perform the following steps.

Task ***To delete an existing workflow:***

1. Open the **Process Template Editor**.
2. From the Workflows tree, right-click the workflow you want to delete and select **Delete** from the shortcut menu.
3. Confirm the deletion by clicking Yes in the resulting dialog box.

Creating New Tasks

To create a new task, perform the following steps.

Task ***To create a new task:***

1. Open the **Process Template Editor**.
2. Right-click the workflow to which you want to add the task and select New Task. Alternatively, right-click on a task and select New Task to create a subtask.

   A new task appears named NewTask*nn*, and the Task Properties view for that task is displayed.
3. Enter a name for the new task.
4. Modify properties for the task.

Modifying Task Properties

To modify task properties, perform the following steps.

Task ***To modify properties for an existing task:***

1. Open the **Process Template Editor**.
2. From the Workflows tree, select the task you want to modify. The Task Properties view for the selected task is displayed.
3. Change Task Properties as necessary for the task.

Creating Notes for a Task

To create notes for a task, perform the following steps.

Task ***To create notes for a task:***

1. Select the **Process Assistants** tab in the Interface.
2. From the Projects tree, select the task to which you want to add notes. The Project Task Properties view appears for the selected task.
3. Enter notes in the Notes field.

Tip • *You can also add notes to a task in the* ***Process Template Editor****. If you do, all projects based on that workflow will use the notes you enter as the default notes for the specific task.*

Note • *There is a 255 character limit on notes.*

Renaming Tasks

To rename a task, perform the following steps.

Task ***To rename an existing task:***

1. Open the **Process Template Editor**.
2. Right-click the task you want to rename and select **Rename** from the shortcut menu.
3. Provide a new name for the task.

Reordering Tasks

To reorder a task, perform the following steps.

Task ***To change the task order:***

1. Open the **Process Template Editor**.
2. In the Workflows tree, select the task you want to move.
3. From the toolbar, click Move Up or Move Down to change the order in which tasks are performed. Click Move Right to make a task a subtask of another task; click Move Left to promote a task.
4. Repeat the previous steps as necessary.

Associating Help Files with Tasks

To associate a help file with a task, perform the following steps.

Task ***To associate a help file with a task:***

1. Open the **Process Template Editor**.
2. From the Workflows tree, select the task with which you want to associate the help file. The Task Properties view appears for the selected task.
3. In the Help File field, enter the name and location of the help file, or click Browse and navigate to it.
   - The help file can either be local, or you can use a URL (for example, http://www.mycompany.com/myURL.htm).
   - You can also click the Edit HTML button to the right of the Browse button to open a default HTML page in an HTML editor as a starting point.

Note • *Help files must be in HTML format.*

Deleting Tasks

To delete a task, perform the following steps.

Task ***To delete an existing task:***

1. Open the **Process Template Editor**.
2. In the Workflows tree, right-click the task you want to remove and select Delete.
3. From the resulting dialog box, click Yes to confirm the deletion.

Adding New Tools from the Process Template Editor

To add a new tool to the Tools list from the Process Template Editor, perform the following steps.

Task ***To add a new tool to the Tools list from the Process Template Editor:***

1. Open the **Process Template Editor**.
2. From the Workflows tree, select the task with which you want to associate the new tool. The Task Properties view appears for the selected task.
3. From the Tool list in the Task Properties view, select <Add Tool ...>. The Add New Tool dialog box opens.
4. In the **Add New Tool** dialog box, enter properties about the tool.
5. Click OK.

Creating and Using Projects

Projects, which are based on existing workflows, are the procedures followed to accomplish a set goal. Projects may include instructions describing what to do, and perhaps links to tools necessary to perform tasks. They also allow you to provide notes to help document issues that may arise during a project.

Tip • *If you update a workflow, all projects based on that workflow will reflect the changes made to the workflow.*

The following topics relate to creating and using projects:

- Creating Projects with the New Workflow Project Wizard
- Filtering Projects
- Executing Projects
- Running Associated Tools in Projects
- Deleting Projects

Creating Projects with the New Workflow Project Wizard

To create a new project, perform the following steps.

Task ***To create a project using the New Workflow Project Wizard:***

1. Launch AdminStudio.
2. Click the **Process Assistants** tab.
3. Right-click in the Projects tree and select **New Project**. The **New Workflow Project Wizard** launches.
4. From the **Welcome Panel**, click **Next**. The **Workflow Selection Panel** appears.
5. From the **Workflow Selection Panel**, select the workflow on which you want to base the new project.

6. Provide a name for the new project and click **Next**. The **Source Package** panel appears.
7. From the **Source Package Panel**, specify the name and location of the source package used in this project. Alternatively, click Browse to navigate to it.
8. Click **Next**. The **Target Directory and Filename** panel appears.
9. From the **Target Directory and File Name Panel**, specify the Target Directory in which you want to store all files associated with this project.
10. In the **Target File Name** field, provide a name for the output file. Depending on the task being executed, the appropriate extension will be added to the file name.
11. Click **Finish**. The new Project is now listed.

Filtering Projects

To display a specific project, perform the following steps.

Task ***To display a specific project:***

1. From the Interface, click the **Process Assistants** tab.
2. From the drop-down menu above the Projects tree, select the project you want to display.

Executing Projects

To execute a project, perform the following steps.

Task ***To execute a project:***

1. From the Interface, click the **Process Assistants** tab.
2. Display the project you want to execute. If you want to only display that project, use the filter above the Projects tree.
3. Click the first task in the project.
4. Perform the task.
5. When finished with the task, click the box to the left of the task.
6. Repeat for subsequent tasks in the project.

Running Associated Tools in Projects

To run associated tools in projects, perform the following steps.

Task ***To run a tool associated with a task:***

1. Select the **Process Assistants** tab from the Interface.
2. Expand a Project in the Projects tree to display all of its tasks.
3. Right-click the task with which the tool is associated and select **Run Task** from the shortcut menu.

Note • *In AdminStudio, tools are any external application or file that you can launch from a workflow or project. This typically is an application, but can be a simple document or batch file necessary to completing the project.*

Deleting Projects

To delete a project, perform the following steps.

Task ***To delete an existing project:***

1. Click the **Process Assistants** tab in the Interface.
2. From the **Projects** tree, right-click the project you want to delete and select **Delete Project** from the shortcut menu.
3. Confirm the deletion by clicking **Yes** in the resulting dialog box.

Saving Workflow and Project Changes

Because AdminStudio uses a database (the Application Catalog) to store information involving Workflows and Projects, all changes are stored immediately. There is no need to "save" your modifications; AdminStudio performs this automatically.

Workflow Project Example: Using the New Workflow Project Wizard

The following basic example covers creating a workflow and project which takes advantage of command-line functionality available in AdminStudio.

Prior to creating projects, you must create a workflow on which to base the project. This workflow might involve few steps, or it might cover as broad of a task as repackaging a legacy installation, editing it in InstallShield Editor, customizing it in Tuner, performing application isolation, identifying and resolving conflicts, distributing it, and entering information about it into a third-party tracking system.

In this example, you are going to create a basic workflow involving three steps: repackaging a legacy installation, building a Windows Installer package in Repackager, and then importing that package into Application Manager..

Creating a New Workflow

To create a new workflow, perform the following steps.

Task ***To create a new workflow:***

1. Open the **Process Template Editor**.
2. Right-click in the **Workflows** tree pane and select **New Workflow**. A new workflow is created.
3. Name the workflow **My Workflow Example**.
4. Right-click **My Workflow Example** and select **New Task**, and name the task **Repackage a legacy setup**.
5. With the **Repackage a Legacy Setup** task selected, make the following selections in the **Task Properties** pane:
   a. From the **Tool** list, select **Repackaging Wizard**.
   b. From the **Tool Configuration** list, select **Repackage a legacy setup**.

   Note • *Selecting this tool configuration associates the following predefined command lines with this task:*

   ```
   -app "[SourcePackage]" -pp "[TargetFileName]" -o "[TargetDir]"
   -sb -app "[SourcePackage]" -pp "[TargetFileName]" -o "[TargetDir]"
   -sn -app "[SourcePackage]" -pp "[TargetFileName]" -o "[TargetDir]"
   ```
6. Right-click **My Workflow Example** and select **New Task**, and name the task **Build a Windows Installer package**.
7. Right-click **My Workflow Example** and select **New Task**, and name the task **Import package into Application Catalog**.
8. With the **Import package into Application Catalog** task selected, make the following selections in the **Task Properties** pane:
   a. From the **Tool** list, select **Application Manager**.
   b. From the **Tool Configuration** list, select **Import Package**.

   Note • *Selecting this tool configuration associates the following predefined command lines with this task:*

   ```
   -app -iwiz "[SourcePackage]"
   ```

Creating a Project Based on the Workflow

To create a project based on a workflow, perform the following steps.

Task ***To create a project based on your new workflow:***

1. Open AdminStudio and open the **Process Assistants** tab.
2. In the **All Projects** list, right-click and select **New Project**. The **Welcome** panel of the **New Workflow Project Wizard** opens.

3. Click **Next**. The **Workflow Selection** panel opens.
4. In the **Provide a name for the new project** field, enter **My Sample Project** and click **Next**. The **Source Package** panel opens.
5. Select **My Workflow Example** and click **Next**. The **Source Package** panel opens.
6. From the **Source Package Panel**, click **Browse** and select a legacy (**.exe**) installation program.

Note *• This value (the directory and package name) are stored in the* `SourcePackage` *variable, which is used by the command line in Repackager set when you created the workflow.*

7. Click **Next**. The **Target Directory and Filename** panel opens.
8. In the **Target Directory** field, browse to the directory where you want to store files associated with your project. For this example, use **C:\AdminStudio Shared\Test\WorkflowExample**.

Note *• This value is written to the* `TargetDir` *variable used in the command line set for InstallShield Editor when creating the workflow.*

9. Set the **Target File Name** to **WorkflowProjectEx**.

Note *• This value is written to the* ***TargetFileName*** *variable used in the command line set for InstallShield Editor when creating the workflow.*

10. Click **Finish**. The new Workflow Project is now listed.

Running the Workflow

To run the workflow, perform the following steps.

Task ***To run the workflow:***

1. Expand the workflow **My Workflow Example** in the **Projects** tree.
2. Right-click on the **Repackage a Legacy Setup** task and select **Run Task** on the shortcut menu. The Repackaging Wizard opens.

Note *• When Repackager launches, it reads the value* `SourcePackage` *to determine the file to repackage. It also reads* `TargetDir` *and* `TargetFileName` *to determine where to place the output and what to call the output file.*

3. On the **Welcome** panel, click **Next**.
4. On the **Method Selection** panel, select **Installation Monitoring** and click **Next**.
5. On the **Collect Product Information** panel, if a company name is not yet listed, enter a **Company Name**, such as **My Company** and click **Next**.

6. On the **Set Target Project Information and Capture Settings** panel, click **Start**. The **Repackaging** panel opens and repackaging begins.
7. When repackaging is complete, the new `WorkflowProjectEx.irp` file opens in the Repackager interface.
8. Return to the **Process Assistants** tab and mark the **Repackage a legacy setup** step complete.
9. Return to the Repackager interface and select **Repackaged Output** in the tree to open the **Repackaged Output** view.
10. Click **Build**. The Repackager project is built into a Windows Installer package.
11. Return to the **Process Assistants** tab and mark the **Build a Windows Installer package** step complete.
12. Right-click on the **Import package into Application Catalog** task and select **Run Task** on the shortcut menu. Application Manager opens and the Import Wizard is launched.
13. Proceed with the steps in the Import Wizard to import the following package into the Application Catalog:

    `AdminStudio Shared\Test\WorkflowExample\MSI_Package\WorkflowProjectEx.msi`

    The **WorkflowProjectEx** application is now listed in the Application Manager tree.
14. Return to the **Process Assistants** tab and mark the **Import package into Application Catalog** step complete.

Summary

This is just a brief example of how AdminStudio tools can be made aware of each other during a project. When crafting workflows, create command lines to streamline your projects.

Workflows, Projects, and Permissions

AdminStudio interface functionality (including workflows, projects, and the Tools Gallery) is directly influenced by user authorization and permissions. For example, Administrators can see all users and projects assigned to those users in AdminStudio. In the case of NT Groups, Administrators can see individual members of those groups in the **Process Assistants** tab. Further, Administrators can assign projects to users when running the **New Workflow Project Wizard**.

An example of how permissions affect workflows and projects is the availability of the **Process Template Editor**, which requires the **View Workflow Tab** permission. Likewise, only users with the **Create Project** permission can create projects. Even if you have permission to view and create workflows, you can only associate tools which you are permitted to use with tasks you create. If you are executing projects, you can only launch tools you have permissions to use, regardless of whether they are associated with a task in the workflow.

For more information, see Managing Roles and Permissions.

Frequently Asked Questions

The following is a list of questions frequently asked by AdminStudio users, including a link to the appropriate help topic.

General & Workflow

- How do I add a new tool to the Tools Gallery? See Adding New Tools to the Tools Gallery.

- How do I add a command line configuration to a tool? See Adding Command-Line Configurations for an Existing Tool.
- How do I specify a default Application Catalog? See Specifying a Default AdminStudio Application Catalog.

Application Isolation Wizard

- How do I isolate applications? See Isolating Applications Using Application Isolation Wizard.
- How do I modify the default isolation recommendations? See Modifying the Default Isolation Recommendations.

Application Manager

- What types of conflicts can the Conflict Wizard detect? See Application Conflicts Tests.
- How do I change which conflicts are checked? See Selecting Tests to Execute.
- How do I perform best practices testing? See Performing Compatibility, Best Practices, and Risk Assessment Testing.
- How do I identify conflicts? See Performing Application Conflict Testing.
- How do I automatically resolve issues? See Resolving Issues.

Tuner

- What should I do If MSI prevalidation fails? See Handling Invalid Windows Installer Packages.
- How do I prevent a feature from displaying during custom installation? See Changing a Feature's Visibility.
- When should I use the Dialogs View instead of MSI command-line options? See Dialogs View vs. Command-Line Options.
- How do I create a **setup.exe** file for my package and transform? Creating a Setup.exe File for the Package and Transform.
- When do I use Tuner vs. InstallShield Editor? See Customizing Installations Using Tuner.

Repackager

- Why do people use a Repackager? See Repackaging Legacy Installations Using the Repackaging Wizard.
- Why is a “clean” system important for repackaging? See About Repackaging on Clean Systems.
- Should I repackage a Windows Installer (.msi) setup? See Repackaging Wizard Best Practices.
- How do I repackage a non-Windows Installer setup? Repackaging Legacy Installations Using the Repackaging Wizard and Converting Legacy Installations Using the Repackager Interface.
- How can I speed up repackaging? See Repackaging Wizard Best Practices.
- What can I do with a repackaged setup? See Repackaging Legacy Installations Using the Repackaging Wizard and Converting Legacy Installations Using the Repackager Interface.
- Where does Repackager store my repackaged files and the MSI packages it builds? See Set Target Project Information and Capture Settings Panel.

- How do I identify and fix WinINSTALL conversion problems? See Troubleshooting Guidelines for WinINSTALL Conversion.
- How do I identify and fix SMS conversion problems? See Troubleshooting Guidelines for SMS Conversion.
- What do I do if I receive a `ISDEV: fatal error -5023: Error building table file` error while using Repackager? See Resolving an "Error Building Table File" Error.

Distribution Wizard

- How do I create an administrative installation? See Creating Administrative Installations for Packages.

OS Snapshot Wizard

- Why do I need an OS Snapshot? See Taking OS Snapshots.

InstallShield Editor

Answers to common questions regarding InstallShield Editor can be found under **Frequently Asked Questions** in the InstallShield Editor Help Library.

AdminStudio Interface Reference

The AdminStudio interface reference is organized into the following areas:

- AdminStudio Start Page
- Tools Tab
- Process Assistants Tab
- Report Center Tab
- Enterprise Server Tab
- Workflow Manager Tab
- Process Template Editor
- AdminStudio Menus and Toolbar
- Dialog Boxes
- Wizards
- Log Files

AdminStudio Start Page

The AdminStudio Start Page provides quick access to product information, to recently opened files, and to InstallShield resources.

AdminStudio Start Page Tabs

The AdminStudio Start Page, which is designed to help you quickly get started evaluating and using AdminStudio, provides process information on how to perform key tasks using AdminStudio tools. Information is organized into the following tabs:

- **Getting Started**—Describes the main tasks that you can use AdminStudio to accomplish, and provides links to additional information. See Getting Started Tab.
- **Migrate to Application Virtualization**—Provides a flowchart that outlines the steps required to migrate your application portfolio into virtual applications that are ready for deployment within the enterprise. See Migrate to Application Virtualization Tab.
- **Migrate to Windows Installer**—Provides a flowchart that outlines the steps required to migrate legacy setups (such as **.exe** files) to deployable Windows Installer packages (**.msi**). See Migrate to Windows Installer Tab.
- **Set Up Infrastructure**—Lists the infrastructure setup steps that you need to perform prior to using AdminStudio for the first time: connect to an Application Catalog, configure virtual machines, and set e-mail notification settings. See Set Up Infrastructure Tab.
- **Help & Support**—Provides sources for user documentation, support, and product information.

AdminStudio Views

The AdminStudio interface is organized into the following tabs, which appear across the top of the Start Page:

Figure 4-2: AdminStudio Interface Tabs

Click on these tabs to access the following AdminStudio views:

- **Start Page**—Initial view of AdminStudio.
- **Tools**—The Tools Tab includes the Tools Gallery and information on the selected tool.
- **Process Assistants**—On the Process Assistants Tab, you can create, execute, and delete projects, and access existing projects, which are the procedures followed to accomplish a set goal.
- **Report Center**—On the Report Center Tab, you can view the Application Readiness Dashboard. This dashboard report provides a snapshot of the current status of packages in your Application Catalog including deployment type breakdown, virtualization readiness, and package quality and conflict testing summary information.
- **Enterprise Server**—On the Enterprise Server Tab, you can use Report Center to generate reports. You can also manage Users, Roles, and Permissions. If you have also purchase Workflow Manager, you will also be able to access it on the Enterprise Server tab.

Tools Tab

The Tools tab, which is accessed from the AdminStudio **Start Page**, includes the Tools Gallery and the Content Pane.

Tools Gallery

You can launch each tool in the AdminStudio suite by double-clicking on the appropriate icon in the Tools Gallery. Individual AdminStudio applications can also be launched by clicking on the tool in the Tools Gallery on the **Start Page**:

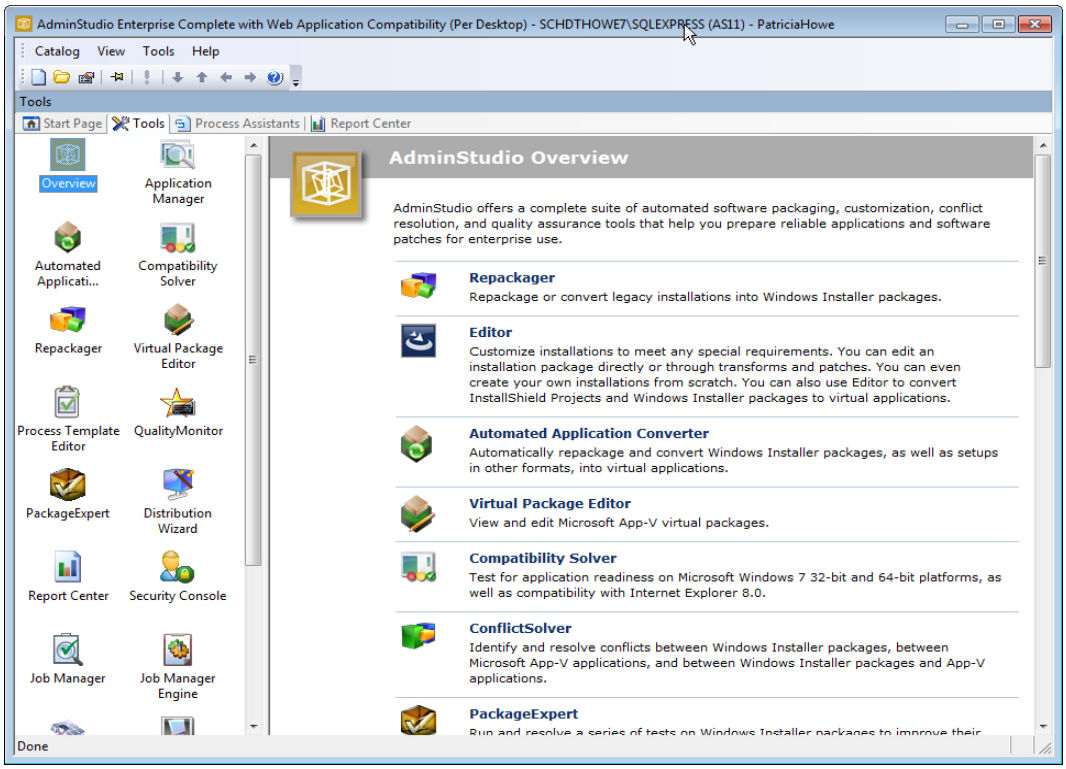

Figure 4-3: Tools Gallery on the Tools Tab

Note • *If a core AdminStudio tool is not in the Tools Gallery or available from the menu, it may mean an administrator has restricted tool access based on user permissions.*

By right-clicking in the Tools Gallery, you can launch the **Add Tool Wizard**, from which you can add new tools into the gallery and make them available for task assignments in workflows and projects.

Content Pane

The first icon in the Tools Gallery, Overview, is selected by default. When selected, the Content Pane lists a description of each of the AdminStudio tools. If you single-click on an AdminStudio tool icon in the Tools Gallery on the **Tools** tab, additional information about the selected tool is displayed in the Content Pane.

Process Assistants Tab

Purpose

From the Process Assistants tab, you can create, execute, and delete projects. You can also access existing projects. The drop-down filter above the Project pane allows you to view all available projects, or only a specific project.

Each project must be based on an existing workflow. In this way, projects are similar to photocopies from a master instruction sheet—all planning and design of the procedure is done to the workflow. The project is a copy of that workflow, and multiple projects can be based on the same workflow if you are performing the same procedure.

Integration with AdminStudio Workflow Manager

AdminStudio Workflow Manager is a Web-based application that manages the application lifecycle, incorporating standards (data) and methodologies (process). AdminStudio Workflows and Workflow Manager Workflows can be integrated, so that an AdminStudio Project can be a Workflow Phase in a Workflow Manager Workflow.

When an AdminStudio Project is linked to a Workflow Manager Workflow, please note the following indications on the Process Assistants tab:

- When an integrated AdminStudio project is selected on the Process Assistants tab, the name of its associated Workflow Manager Application is displayed in the Project Properties.
- When an AdminStudio Project is linked to a Workflow Manager Workflow and the workstation is not currently connected to the Workflow Manager Server, the following icon appears in the bottom right of the Process Assistants tab view:

Report Center Tab

On the **Report Center** tab, AdminStudio provides a wide array of reports containing Application Catalog summary information on the Windows Installer and App-V packages in your Application Catalog, giving you insight into the readiness of those packages for distribution and for conversion to virtual packages.

These reports include test results from operating system compatibility and browser compatibility testing, best practices testing, and application conflict testing. They also include information about the App-V packages in your Application Catalog, as well as Microsoft System Center Configuration Manager deployment information.

For more information, see Viewing Application Testing and Analysis Reports on the Report Center Tab.

Enterprise Server Tab

Edition • *The* ***Enterprise Server*** *tab is available in AdminStudio Enterprise Edition.*

AdminStudio Enterprise Server is a security console and set of Web tools that are closely integrated with AdminStudio. The Enterprise Server tools include the Security Console, Report Center, and Workflow Manager. For more information, see the following topics:

- Generating and Viewing Reports in Report Center
- Managing Roles and Permissions
- Managing Accounts and Directory Services

Workflow Manager Tab

AdminStudio Workflow Manager is a Web-based application that manages the application lifecycle, incorporating standards (data) and methodologies (process). AdminStudio Workflows and Workflow Manager Workflows can be integrated, so that an AdminStudio Project can be a Workflow Phase in a Workflow Manager Workflow.

If you have purchased AdminStudio Enterprise Edition and Workflow Manager, the Workflow Manager icon will be displayed in the AdminStudio Tools Gallery on the AdminStudio Tools tab and will be available as a tab on the AdminStudio Enterprise Server interface.

***Note** • For more information on Workflow Manager, see **Using Workflow Manager to Manage Enterprise Software Packaging** in the AdminStudio Enterprise Server Help Library.*

Process Template Editor

Workflows, which can be created and modified using the Process Template Editor, are the basis for all projects in AdminStudio. These workflows consist of defined tasks, with which instructions (in the form of HTML files) and tools can be associated. Users can then create projects based on these workflows, and execute them—following the specific steps defined in the workflow. This allows you to create specific, repeatable procedures to accomplish your application migration goals.

Tasks

Once you create a workflow, you can add tasks to it. Tasks are discrete steps in your overall process. Each task has the following configurable options:

Table 4-3 • Task Options

Option	Description
Tool	If needed, you can pick a tool to associate with the task. When a user runs the workflow, the tool can be launched from the workflow step. By default, the AdminStudio tools are included in this list. If you have added tools to the Tools Gallery, they also appear in this list. If you want to add a tool directly from the Process Template Editor, select the <New Tool> option to display the Add New Tool dialog box. This adds the tool to the Tools Gallery and makes it available for the current task. ***Note** • If, after adding a new tool for a task that is not included in the Tools Gallery, you assign a different tool or no tool to the task, the tool you added will no longer be available. To avoid this, when possible, add tools to the Tools Gallery*
Tool Configuration	This list contains all available command-line configurations for the selected tool. If you do not need a configuration, select <None>. Click Configure to add new configurations to the tool, which you can then select from this list.

Table 4-3 • Task Options (cont.)

Option	Description
Help File	You can associate a help file (in HTML format) with the task to provide instructions for performing the task. Enter the path and help file in this field, or use the Browse button to navigate to it. If you have yet to create an HTML page, click the Edit HTML button to the right of the Browse button to open a default page in an HTML editor.
Notes	Add any notes you want associated with this task. This field can only hold 255 characters, so additional information should be added to your help file.

AdminStudio Menus and Toolbar

The following commands and toolbar buttons are available in the AdminStudio interface.

Table 4-4 • AdminStudio Menus and Toolbar

Menu	Command	Shortcut	Button	Description
Catalog	**Connect**	Ctrl+O		Displays the Connect Application Catalog Dialog Box, where you can open an existing SQL Server Application Catalog or the AdminStudio Enterprise Server Application Catalog.
Catalog	**Create**	Ctrl+N		Displays the Application Catalog Wizard, where you can create a new SQL Server Application Catalog database.
Catalog	**Disconnect**	Ctrl+D		Closes the currently open Application Catalog.
Catalog	**Change AES Password**			Change the password of the current user to log in to the AdminStudio Enterprise Server.
Catalog	**Logout**			Log out of the AdminStudio Enterprise Server.
Catalog	**Exit**	Alt+C+X		Exits AdminStudio and returns you to the Windows desktop.
View	**Toolbar**	Alt+V+T		Toggles the Toolbar.
View	**Status Bar**	Alt+V+S		Toggles the Status Bar.
View	**Always On Top**	Alt+V+A		When checked, the AdminStudio Interface remains on top of all other windows.
View	**Start Page**			Select to open the AdminStudio Start Page.
View	**Tools**			Select to open the Tools tab, which includes the Tools Gallery and information on the selected tool.

Table 4-4 • AdminStudio Menus and Toolbar (cont.)

Menu	Command	Shortcut	Button	Description
View	**Process Assistants**			Select to open the Process Assistants tab.
Tools	**Check for Updates**	Alt+T+U		Determine if there any updates or messages available for AdminStudio.
Tools	**Options**	Alt+T+O		Displays the **Options** dialog box, from which you can configure the location of shared resources and the frequency AdminStudio checks for updates.
Help	**Contents**	Alt+H+C		Launches the online Help Library and displays the Contents tab.
Help	**Index**	Alt+H+I		Launches the online Help Library and displays the Index tab.
Help	**Search**	Alt+H+S		Launches the online Help Library and displays the Search tab.
Help	**Support Central**	Alt+H+U		Connects to the AdminStudio Support website.
Help	**Web Community**	Alt+H+M		Connects to the AdminStudio Web Community.
Help	**ReadMe**	Alt+H+R		Displays the AdminStudio Release Notes file.
Help	**Feedback**	Alt+H+F		Connects to an online form, through which you can provide feedback about AdminStudio.
Help	**Flexera Software on the Web**	Alt+H+W		Connects to the Flexera Software website.
Help	**About AdminStudio**	Alt+H+A		Displays the About dialog box with version information for AdminStudio.
Shortcut Menu	**New Workflow**			Create a new Workflow.
Shortcut Menu	**New Task**			Create a new Task.
Shortcut Menu	**Rename**			Rename selected Workflow or Task.
Shortcut Menu	**Delete**			Delete selected Workflow or Task.

Table 4-4 • AdminStudio Menus and Toolbar (cont.)

Menu	Command	Shortcut	Button	Description
Shortcut Menu	**New Project**		Ctrl-P	Create a new Project.
Shortcut Menu	**Del Project**			Delete selected Project.
Shortcut Menu	**Run Task**			Runs the tool associated with the selected task in the project.
Shortcut Menu	**Move Up**			Moves the selected task up in the task order.
Shortcut Menu	**Move Down**			Moves the selected task down in the task order.
Shortcut Menu	**Move Left**			Moves the selected task left in the task order.
Shortcut Menu	**Move Right**			Moves the selected task right in the task order.

Dialog Boxes

The following dialog boxes can be opened from the AdminStudio Interface:

- About Dialog Box
- Add New Tool Dialog Box
- Command Line Properties Dialog Box
- Options Dialog Box
- Tool Properties Dialog Box

About Dialog Box

The **About** dialog box can be opened by selecting **About** from the **Help** menu of AdminStudio, Application Manager, Automated Application Converter, Virtual Package Editor, or QualityMonitor.

This dialog box displays information about your installed version of AdminStudio, including the full version number (essential if you need technical support), and information on the edition and add-on packs that you have purchased.

The **About** dialog box includes the following information:

Table 4-5 • About Dialog Box Properties/Buttons

Properties/Buttons	Description
AdminStudio tool	The name of the specific AdminStudio tool that you have open is listed at the top of the **About** dialog box, such as Application Manager, Automated Application Converter, etc.
Product name, edition, and add-on pack name	Below the AdminStudio tool name, the AdminStudio product name and edition is listed along with the add-on pack that was purchased (if any): • **Edition**—The edition can be Standard, Professional, or Enterprise. • **Add-on packs**—Add-on packs can be Application Virtualization, Application Compatibility, Complete (which is Application Virtualization plus Application Compatibility), or Mobile.
Version	Lists the version of AdminStudio that you have installed.
Activation code	Lists the activation code that was used to activate AdminStudio.
OK	Click this button to close the dialog box.
Help	Click this button to open the AdminStudio help library page that describes this dialog box.
System Info	Click this button to open the Microsoft **Windows System Information** dialog box, which shows details about your computer's hardware configuration, computer components, and software (including drivers).
Upgrade	Click this button to open the AdminStudio **Product Activation** dialog box, where you can enter an activation code to upgrade your AdminStudio tier. For more information, see Upgrading Your Product Edition.

Add New Tool Dialog Box

The Add New Tool dialog box is displayed if you select <New Tool> from the Tool list while designing a workflow. This dialog box allows you to provide information about a tool you want accessible from AdminStudio, particularly to use in workflow tasks.

This dialog box contains the following options:

Table 4-6 • Add New Tool Dialog Box Options

Option	Description
Target	Enter the location of the tool or Browse to the application or file you want added to the tools pane for use in AdminStudio.
Name in Tools Gallery	This description is used as the display name for the application in the Tools Gallery.

Table 4-6 • Add New Tool Dialog Box Options

Option	Description
Command Line Arguments	Enter any command-line arguments for the tool. Because you may have different uses for applications, you can add the same application multiple times to the tools pane, with each instance using different command line arguments.
Working Directory	If this tool requires a working directory, enter it here or click Browse to locate it.
Comments	Enter any comments about this tool in this field.
HTML Explanation File	Enter the location and name of an HTML file you want displayed when you single-click on the tool in the tools pane. Alternatively, click Browse and navigate to it. If you have yet to create one, click the Edit HTML button () below the field to open a default page in an HTML editor:
Add to Tools Gallery Check Box	When this box is checked, the tool will be added to the Tools Gallery. If unchecked, it is only available for the task where it was added.

Command Line Properties Dialog Box

The Command Line Properties dialog box is displayed when you create or edit a command-line configuration for a tool.

The Command Line Properties dialog box has two configurable options:

Table 4-7 • Command Line Properties Dialog Box Options

Option	Description
Description	Provide a description for the configuration. This assists you in differentiating similar command-line options.
Command Line	Provide the actual command-line parameters for the tool. The arrow to the left allows you to select one of the following variables to include in the command-line: • **InstallLocation**—The location where AdminStudio is installed. • **DevLocation**—The location where InstallShield Editor is installed. • **SharedPoint**—The AdminStudio shared directory. • **SourcePackage**—The name and location of the source package. • **TargetDir**—The directory where output from the selected project is stored. • **TargetFileName**—The name of the output file. • **ProjectName**—The name of the current project.

Options Dialog Box

From the **Options** dialog box, you can configure settings including application catalog settings, shared locations settings, and the frequency AdminStudio checks for updates. The dialog box consists of the following tabs:

- Locations Tab
- Updates Tab
- Quality Tab: Customer Experience Improvement Program
- Notification Settings Tab

Locations Tab

On the **Locations** tab of the AdminStudio **Options** dialog box, you specify the location of the AdminStudio Shared directory and the task help pages.

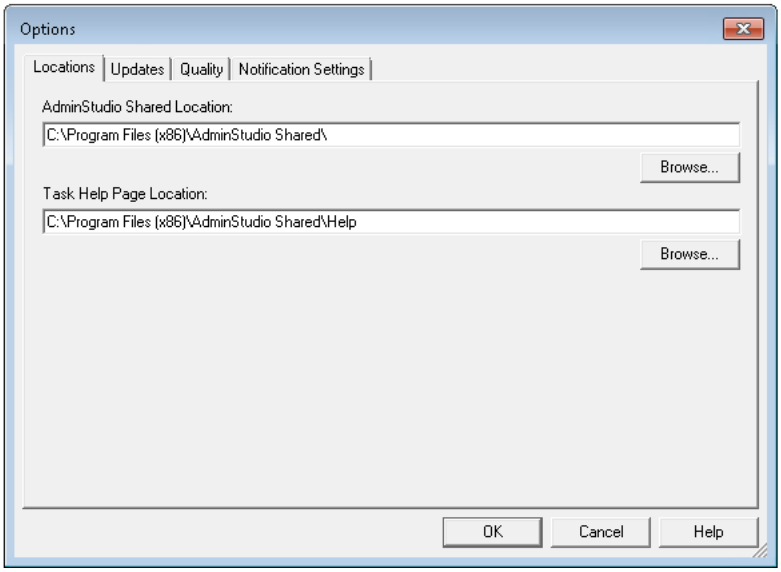

Figure 4-4: Options Dialog Box / Locations Tab

The **Locations** tab includes the following options:

Table 4-8 • Options Dialog Box/Locations Tab Options

Option	Description
AdminStudio Shared Location	Enter or browse to the shared location for AdminStudio. This location will contain shared information for repackaging and conflict identification. To maintain consistency when creating workflows, it is recommended that you set this shared location the same for each AdminStudio seat. ***Tip*** • *The* ***AdminStudio Shared Location*** *is defined during installation and normally does not need to be changed. It is usually assigned to a network folder, preferably a UNC path.*

Table 4-8 • Options Dialog Box/Locations Tab Options (cont.)

Option	Description
Task Help Page Location	Enter or browse to the directory where you want to store all HTML pages that serve as workflow task instructions.

Updates Tab

On the **Updates** tab of the AdminStudio **Options** dialog box, you can specify how frequently to check for AdminStudio software updates.

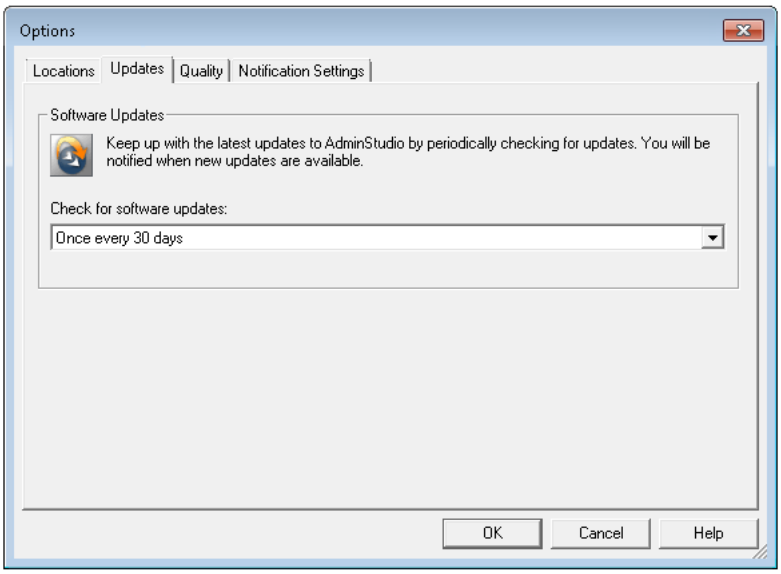

Figure 4-5: Options Dialog Box / Updates Tab

The **Updates** tab includes the following options:

Table 4-9 • Options Dialog Box/Updates Tab Options

Option	Description
Check for software updates	Specify how often you want AdminStudio to check for updates. Your options are: • Never • Once every 15 days • Once every 30 days (default) • Once every 60 days

Quality Tab: Customer Experience Improvement Program

The Customer Experience Improvement Program (CEIP) helps AdminStudio improve the quality, reliability and performance of our software and services.

If you choose to participate in the Customer Experience Improvement Program, we will collect anonymous information about how you use AdminStudio. This information helps us identify trends and usage patterns.

All information collected is anonymous, and this data collection will not affect the performance of AdminStudio tools. You will never be prompted to complete a survey, and no one from our company will contact you. You can continue working with AdminStudio without interruption.

Your membership status in the Customer Experience Improvement Program is specified on the **Quality** tab of the AdminStudio **Options** dialog box. If you initially select to participate but later you change your mind, you can opt-out of this program by changing the selection on the **Quality** tab.

Participation in the Customer Experience Improvement Program is not mandatory, but your input is appreciated.

For more information on the Customer Experience Improvement Program, visit the AdminStudio website.

Notification Settings Tab

On the **Notification Settings** tab, you can configure your SMTP notification settings. This will enable AdminStudio to send you e-mail notifications during various processes.

Currently, e-mail notifications are sent when soft time-outs are encountered while using Automated Application Converter to repackage an application on a virtual machine.

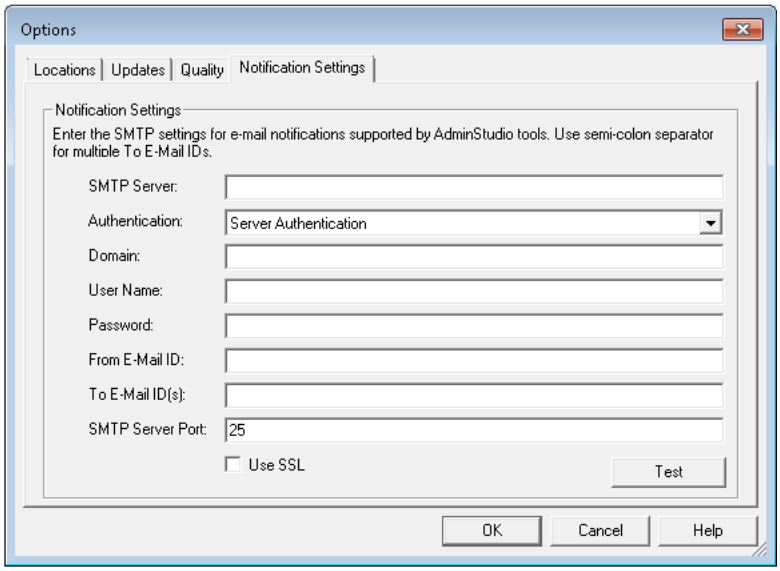

Figure 4-6: Notification Settings Tab of the Options Dialog Box

The **Notification Settings** tab of the **Options** dialog box has the following options:

Table 4-10 • Notification Settings Tab of the Options Dialog Box

Option	Description
SMTP Server	Enter the address of your e-mail server, such as: **smtp.yourcompany.com**

Table 4-10 • Notification Settings Tab of the Options Dialog Box

Option	Description
Authentication	Specify how your e-mail is authenticated by selecting one of the following options: • **Server Authentication**—Select this option if you want to perform server authentication on your AdminStudio e-mail. • **Anonymous**—Select this option if you do not want to perform authentication on your AdminStudio e-mail.
Domain	Enter the Domain of the user account listed in the **User Name** field.
User Name	Enter the name of an existing user account in the Domain specified in the **Domain** field. This user must have permission to send e-mail.
Password	Enter the password of the user account defined in the **User Name** and **Domain** fields.  ***Note*** • *If your network domain requires that user passwords are changed periodically, you will have to open this dialog box again to update this account's password. To avoid this, try to obtain a user account that has a password that does not expire.*
From E-Mail ID	Enter the e-mail address to serve as the identity of AdminStudio. All e-mails sent by AdminStudio will have this e-mail address in the **From** field.
To E-Mail ID(s)	Enter the e-mail address to serve as the system account for AdminStudio e-mail. All e-mails sent to AdminStudio will be sent to this address.  ***Note*** • *Use a semi-colon to separate multiple e-mail addresses in the* ***To E-Mail ID(s)*** *field.*
SMTP Server Port	Enter the port of your SMTP server.
Use SSL	Select this option if you want to use SSL security for the AdminStudio e-mail account.

Tool Properties Dialog Box

The Tool Properties dialog box is displayed when you right-click on a tool in the Tools gallery and select Properties. This dialog box contains the following tabs:

- Properties Tab
- Configuration Tab

Properties Tab

The **Properties** tab of the **Tool Properties** dialog box contains information about the tool, including the name and location of the executable, the name of the tool as it appears in the Tools gallery, and the help file associated with it (if any).

The following options can be configured:

Table 4-11 • Tool Properties Dialog Box/Properties Tab Options

Option	Description
Target	Enter the location of this tool's executable. Alternatively, click Browse and navigate to it.
Name in Tools Gallery	Provide a name for the tool as it will appear in the Tools gallery.
Command Line Arguments	Enter any default command line arguments for this tool.
Working Directory	If this tool requires a working directory, enter it here or click Browse to locate it.
Comments	Provide any comments about this tool.
HTML Explanation File	Enter the location and name of an HTML file you want displayed when you single-click on the tool in the tools pane. Alternatively, click Browse and navigate to it. If you have yet to create one, click the Edit HTML button below the field (shown below) to open a default page in an HTML editor: 

Configuration Tab

From the **Configuration** tab of the Tool Properties dialog box, you can **Add**, **Modify**, or **Delete** command-line configurations associated with the tool. Each tool can have multiple configurations associated with it, for different uses.

Table 4-12 • Tool Properties Dialog Box/Configuration Tab Options

Option	Description
Command Line List	Listing of all command lines defined for this tool.

Table 4-12 • Tool Properties Dialog Box/Configuration Tab Options (cont.)

Option	Description
Add	Click to open the Command Line Properties Dialog Box, where you can add a new command line. In the Description field, you provide a description for the configuration. This assists you in differentiating similar command-line options. In the Command Line field, you provide the actual command-line parameters for the tool. The arrow to the left allows you to select one of the following variables to include in the command-line: • **InstallLocation**—The location where AdminStudio is installed. • **DevLocation**—The location where InstallShield Editor is installed. • **SharedPoint**—The AdminStudio shared directory. • **SourcePackage**—The name and location of the source package. • **TargetDir**—The directory where output from the selected project is stored. • **TargetFileName**—The name of the output file. • **ProjectName**—The name of the current project.
Modify	Click to open the Command Line Properties Dialog Box, where you can modify the selected command line.
Delete	Click to delete the selected command line.

Note • *Most AdminStudio Tools have one or more command-line configurations already defined. Although you can change or remove these configurations, there is no way to automatically reset them to their default values.*

Ways to Assign a Command Line to a Tool

There are three ways a user can assign a command line to a tool:

- **Tool Properties Panel of Add Tool Wizard**—When you add a tool, you can assign a command line on the **Tool Properties Panel** of the **Add Tool Wizard**.
- **Properties Tab of the Tool Properties Dialog Box**—When you view the tool's properties, you can assign a command line on the **Properties Tab** of the **Tool Properties** dialog box.
- **Configuration Tab of the Tool Properties Dialog Box**—Using the **Configuration Tab** of the **Tool Properties** dialog box, you can create *multiple* command lines and can use AdminStudio variables in these command lines. Then, when you go to the Workflow tab and create a new Workflow, you can associate a Tool with a task and also select which command line configuration they want to use. Once you have done that, you can go to Project tab and create a new Project. When you create a new Project, you will have to specify the Source Package and the target directory and file name. Once the Project is created, when you execute the task, AdminStudio will execute the command line configuration you previously selected by replacing the AdminStudio variables in the command line.

***Note** • A command Line entered by the user in **Properties Tab** of the **Tool Properties** dialog box play no role in the Workflow and Project tab. This command line is used only when you run the tool from the Tools Tab.*

Wizards

The AdminStudio interface includes the following Wizards:

- Add Tool Wizard
- New Workflow Project Wizard

Add Tool Wizard

The Add Tool Wizard allows you to add new tools that appear in the AdminStudio Tools gallery. You can specify the tool's executable, provide command-line options for the tool, and provide a link to information about the tool.

The Add Tool Wizard includes the following panels:

- Welcome Panel
- Tool Properties Panel
- Command-Line Configurations Panel

Welcome Panel

The Add Tool Wizard allows you to add new tools that appear in the AdminStudio Tools gallery. You can specify the tool's executable, provide command-line options for the tool, and provide a link to information about the tool.

Click **Next** to proceed to the **Tool Properties Panel**.

Tool Properties Panel

From the Tool Properties panel of the Add Tool Wizard, you can enter information about the tool you are adding to the gallery.

You can configure the following options:

Table 4-13 • Add Tool Wizard/Tool Properties Panel Options

Option	Description
Target	Enter the location and name of this tool's executable. Alternately, click Browse and navigate to it.
Name in Tools Gallery	Provide a name for the tool as it will appear in the Tools Gallery.
Command Line Arguments	Enter any default command line arguments for this tool.

Table 4-13 • Add Tool Wizard/Tool Properties Panel Options (cont.)

Option	Description
Working Directory	If this tool requires a working directory, enter it here or click Browse to locate it.
Comments	Provide any comments about this tool.
HTML Explanation File	Enter the location and name of an HTML file you want displayed when you single-click on the tool in the tools pane. Alternatively, click Browse and navigate to it. If you have yet to create one, click the Edit HTML button below the field (shown below) to open a default page in an HTML editor: 

Command-Line Configurations Panel

From this panel, you can add command-line configurations for the tool. Each tool can have multiple command-line configurations for different tool uses.

Click **Add** to add a new option from the **Command-Line Properties** dialog box. You can also click Modify to edit the selected command-line option, or Delete to remove the selected option.

Click **Finish** to add the tool to the Tools Gallery; click Back to return to the **Tool Properties Panel**.

New Workflow Project Wizard

The New Workflow Project Wizard assists you in creating a new project based on an existing workflow. The values you specify in this Wizard are stored in variables that can be accessed from tools, allowing for greater interoperability in AdminStudio. The New Workflow Project Wizard includes the following panels:

- Welcome Panel
- Workflow Selection Panel
- Source Package Panel
- Target Directory and File Name Panel

Welcome Panel

The New Workflow Project Wizard assists you in creating a new project based on an existing workflow. The values you specify in this Wizard are stored in variables that can be accessed from tools, allowing for greater interoperability in AdminStudio.

Workflow Selection Panel

From the Workflow Selection panel, you can specify the workflow on which you want to base this project. Available workflows appear in the workflows window.

Select the workflow you want to use, and provide the name for the new project (which is stored in the ProjectName predefined variable).

Source Package Panel

From the Source Package panel, you can specify the name and location of the source package used in this workflow. If you are creating a repackaging project, this is usually an executable, such as Setup.exe. The source package name and location is stored in the predefined variable SourcePackage.

***Note** • You must specify the name and location of a source package if it is required in the workflow (by using the SourcePackage variable). For example, if the workflow specifies to launch a package with certain command-line parameters, AdminStudio needs to know what package to launch.*

Source packages can also be non-setup files. For example, if you are creating a simple workflow that involves editing a Notepad file, the source package may be a .txt file.

Target Directory and File Name Panel

From the **Target Directory and File Name** panel, specify the **Target Directory** and **Target File Name** used in this project.

All output files (such as an INC file from Repackager or an MST file from Tuner) associated with the project will be stored in the Target Directory, and the value for this directory can include a predefined variable such as `SharedPoint`. The Target File Name is the name used for all files created by project tasks in this project, with the appropriate extension appended to it depending on the file type. The Target Directory is stored in the predefined variable TargetDir and the output file name is stored in the variable `TargetFileName`.

***Note** • If any workflow tasks use the TargetDir or TargetFileName variables, you must specify the target directory and package name. For example, if the workflow specifies to save a task's output, AdminStudio needs to know where to save it and what to call it.*

Click **Finish** to close the Wizard.

Log Files

AdminStudio tools generate the following log files:

Table 4-14 • AdminStudio Log Files

Log File	Location
AdminStudio.log	`C:\Program Files\AdminStudio\2016`
distributer.log	`C:\Program Files\AdminStudio\2016\Common`
islc.log	`C:\Program Files\AdminStudio\2016\Repackager`

5

Managing Accounts and Directory Services

You can create an account for each person that should have access to Workflow Manager / AdminStudio Enterprise Server, or you can import accounts from a Windows Active Directory or Novell eDirectory directory service.

You can also configure various login methods to best suit your needs: account login, domain account login, and single sign-on login.

Information is presented in the following main sections:

- Managing Accounts
- Managing Directory Services Connections
- Managing Account Logins
- Accounts and Directory Services Reference

Managing Accounts

There are several ways to grant people access to Workflow Manager / AdminStudio Enterprise Server. You can:

- **Create an account**—Manually create an account for each person. See Creating a New Account.
- **Import directory service accounts**—Set up a Windows Active Directory or Novell eDirectory directory service connection, and import accounts from that directory service. See Importing Directory Services Accounts and Groups.
- **Import directory service group**—Set up a Windows Active Directory or Novell eDirectory directory service connection and import a group from that directory service. This allows you to provide dynamic access to all of the members of that group as the membership changes. For more information, see Importing Directory Services Accounts and Groups.

***Note** • For more information on the methods for logging into Workflow Manager / AdminStudio Enterprise Server, and how authentication is performed, see Managing Account Logins.*

Sample Workflow Manager Users

There are two main categories of Workflow Manager users: *consumers*, who make requests; and *administrators*, who perform the tasks to complete those requests. Consumer and administrator companies group these users.

- **In an internal environment**, the administrator company may be the IT department of a corporation, and consumer companies may be departments within that corporation.
- **In a consulting environment**, the administrator company is the organization performing the requested tasks, and the consumer companies are its clinets that make requests.

One administrator company usually does work for multiple consumer companies (or internal departments).

A user's assigned roles determine how much functionality is available to that user. Permissions for all of Workflow Manager's functions are assigned to roles, as described in Managing Roles and Permissions, and roles are assigned to users. The tasks that administrators and consumers can perform depend upon the permissions of their assigned roles.

To help you get started using Workflow Manager, sample users are automatically created during installation. The names of the users along with their assigned roles demonstrate typical Workflow Manager users.

Table 5-1 • Sample Workflow Manager Users With Their Assigned Roles

User Type	User Name	Role	How They User Workflow Manager
Consumer Company Users	user@company.com user@requester.com	User Application User	• Submit workflow requests • Monitor the progress of their workflow requests
	lm@company.com	License Manager	• Manage a company's license compliance
	cm@company.com	Configuration Manager	• Manages a company's software distribution.
	pm@requester.com	Project Manager	• Monitor the progress of all of the workflow requests submitted by his company
	tester@requester.com	UA Tester	• User acceptance tester.

Table 5-1 • Sample Workflow Manager Users With Their Assigned Roles

User Type	User Name	Role	How They User Workflow Manager
Administrator Company Users	repackager@servicer.com	Repackager	• Perform workflow request tasks • Create and view reports • Create and view issues
	techlead@servicer.com	Tech Lead	• Same permissions as the **Repackager** role but also has the permission to assign work
	admin@servicer.com	SCAdmin	• Assign work • Monitor the progress of all of the workflow requests that his company is working on • Create new consumer companies, and create new consumer and administrator user accounts • Create roles, projects, and templates • Assign permissions to roles • Assign roles to consumers and administrators for each workflow request • Communicate with customers via Workflow Manager

Filtering by Account Status

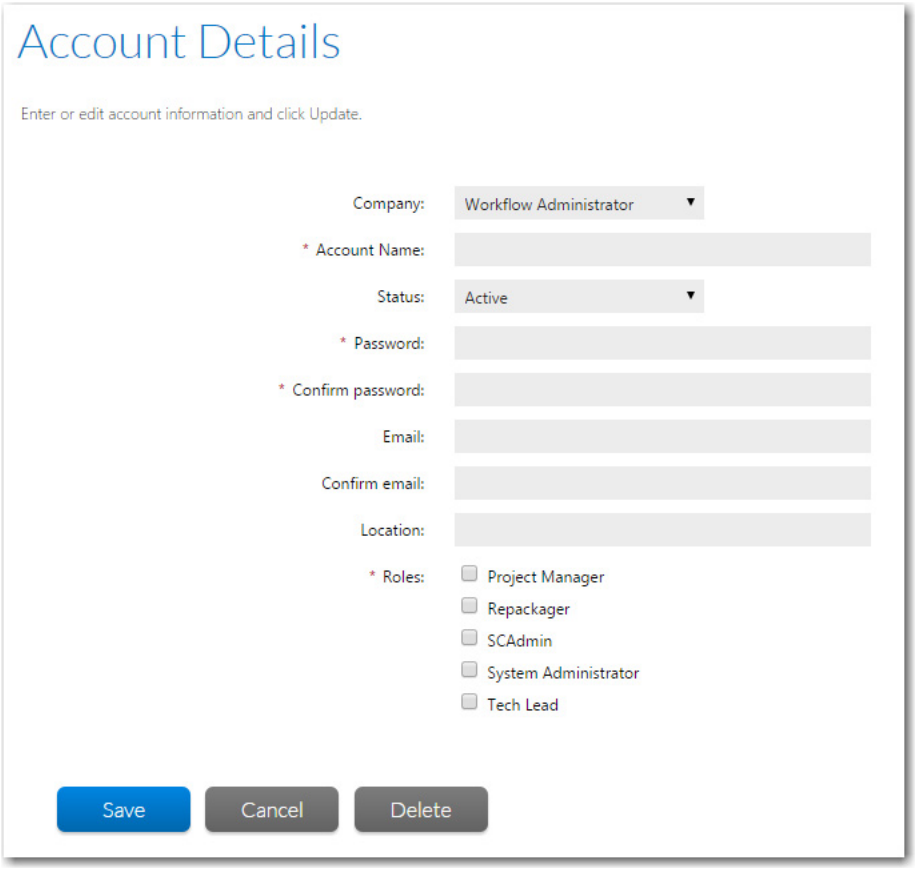
Some accounts may be disabled or inactive, meaning they can no longer access the system (see Disabling an Account). You may filter the **Account Administration** grid by this account status, by selecting either **Active**, **Inactive** or **All** (show all accounts, regardless of the status) from the **Status** list. The grid will automatically refresh once you make your choice.

Creating a New Account

If the people accessing Workflow Manager / AdminStudio Enterprise Server are not represented in a directory service, you will need to create login accounts for them manually.

Task ***To create a new account:***

1. On the **Settings** menu, click **Accounts and Groups**. The **Account Administration** page opens.
2. Click **Add**. The **Account Details** page opens.



3. Enter information to identify your new account as described on in Account Details Page.
4. Click **Save**.

Importing Directory Services Accounts and Groups

If you have defined a directory service connection, as described in Creating a New Directory Service Connection, you can choose to import accounts or groups from that directory service into Workflow Manager / AdminStudio Enterprise Server.

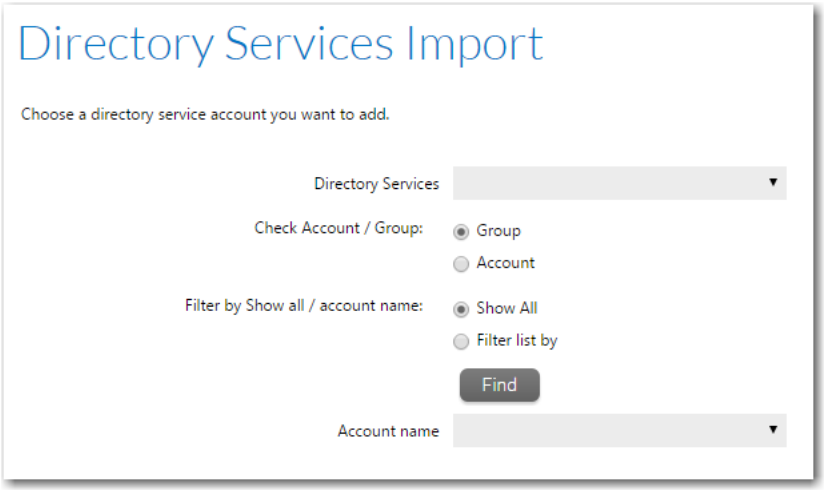
When an account is added to Workflow Manager / AdminStudio Enterprise Server from a directory service, only information that uniquely identifies the user in the directory service is stored. Information such as telephone number and email address will always be queried at run time, so that the most current details are obtained.

Workflow Manager / AdminStudio Enterprise Server supports Windows Active Directory and Novell eDirectory directory services.

Note • *For more information on support for directory services, see Managing Directory Services Connections and Managing Account Logins.*

Task ***To import accounts or groups from a directory service:***

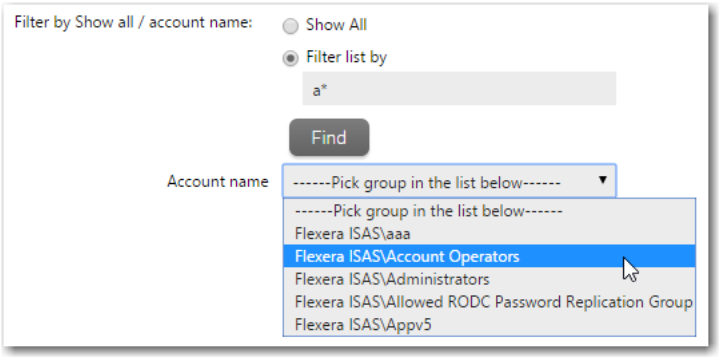
1. On the **Settings** menu, click **Accounts and Groups**. The **Account Administration** page opens.
2. Click the **Directory Service Import** button. The **Directory Services Import** page opens.



3. Choose the directory service containing the account or group you want to import from the **Directory Service** list.
4. Next to **Check Account / Group**, select the **Account** (to import a single account) or **Group** option.
5. Next to **Filter by Show all / account name** list, select one of the following:
   - **Show All**—Select this option to select your account from a list of all accounts and groups in the directory service.
   - **Filter list by**—Select this option to only return accounts and groups which match the criteria you specify, and enter your criteria in the associated text box.

     Click **Find** to filter the list of accounts and groups. For example, to search for all of the users that start with the letter P, use the asterisk wildcard character (*****) and enter **P*** in the **Filter list by** box.

   In either case, click **Find** to return your chosen list of accounts and groups.



6. From the **Pick group/user in the list below** list, select the group or account to import into Workflow Manager / AdminStudio Enterprise Server. The **Account Details** page opens, providing a read-only view of the imported account or group's account name and password.

   If you import an account that is a member of a previously-imported group, that account inherits its group's roles. You can then assign additional roles to that account.

   See Account Details Page for more information about the **Account Details** page.

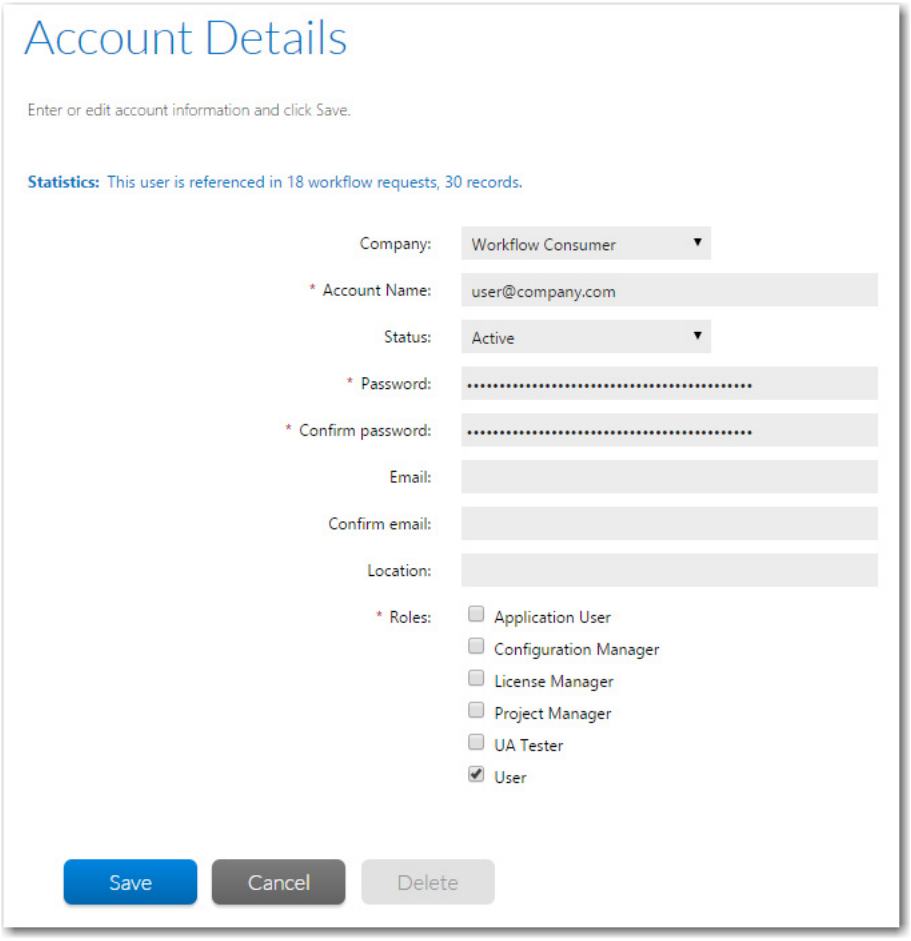
7. Click Save. The **Account Details** page closes and your new account or group appears in the list on the **Account Administration** page.

Viewing or Changing an Existing Account

You may view or update the details of any of the accounts visible on the **Account Administration** page.

Task ***To view or update an existing account:***

1. On the **Settings** menu, click **Accounts and Groups**. The **Account Administration** page opens.
2. Locate the account that you want to work with.
3. Click the user name to open the **Account Details** page.



4. View or update the account as required. See Account Details Page for more details.
5. Click **Save**.

Disabling an Account

Accounts may have a status of **Active** or **Inactive**. Inactive accounts:

- Cannot log in.
- Cannot be assigned any work.
- Are not listed on the **Account Administration** page.
- Do not get any email notifications.
- Cannot be selected as a **Consumer Contact** or **Administrator Contact** for a project.

Deleting vs. Disabling a User Account

If an account is not associated with a workflow request, you can delete that account. This means that if you create an account by accident, you can delete the account before it has a chance to interact with Workflow Manager / AdminStudio Enterprise Server. See Disabling an Account for details.

If a person is associated in any way with an open or completed workflow request, or with a project or workflow template, you cannot delete that person's account from the system. This is because Workflow Manager / AdminStudio Enterprise Server stores references to such accounts for historical, tracking and reporting purposes. If you no longer wanted this account to interact with the product, you would instead disable it by setting its **Status** to **Inactive**.

Task ***To disable a user account:***

1. Open the chosen account for editing, as described in Viewing or Changing an Existing Account.
2. On the **Account Details** page for that account, set the **Status** to **Inactive**, then click **Save**.

Deleting an Account

If an account is not referenced by any workflow requests or templates in the product, you can remove it from the system.

Task ***To delete an account:***

1. On the Settings menu, click **Accounts and Groups**. The **Account Administration** page opens.
2. Locate the account that you want to work with.
3. Click the user name to open the **Account Details** page.
4. Click **Delete**. You are prompted to confirm the deletion.

   Tip • *The **Delete** button will not be visible if the account is referenced by a workflow request or template.*
5. Click **SAve**. The **Account Details** page closes and the account you deleted is no longer listed on the **Account Administration** page.

Managing Directory Services Configuration

Workflow Manager / AdminStudio Enterprise Server can be integrated with Windows Active Directory and Novell eDirectory. This enables you to set up automatic login with the product based upon directory service authentication.

All directory service-related tasks can be managed starting from the **Directory Services** page, which you can access clicking **Directory Services** on the **Settings** menu.

Information about managing directory services is presented in the following sections:

- **Directory service connections**—If you import a directory services group, all members of that group can login to Workflow Manager / AdminStudio Enterprise Server without requiring you to import them individually. Workflow Manager / AdminStudio Enterprise Server can then retrieve attributes, such as email address or telephone number, from the directory service dynamically. For information on integrating with directory service users and groups, see Managing Directory Services Connections.

- **Directory service attributes**—[Workflow Manager only] You may add data elements to your workflow templates which, for accounts imported from directory services, will be directly populated from directory service attributes (such as account name, email address or location). For information on enabling the use of Directory Service Attributes, see Managing Directory Services Attributes.

Note *• For more information about Directory Services and Lightweight Directory Access Protocol (LDAP), see Lightweight Directory Access Protocol (LDAP) Overview on the Microsoft TechNet website.*

Managing Directory Services Connections

Rather than manually creating an account for each person who will use Workflow Manager / AdminStudio Enterprise Server, you can import accounts from Windows Active Directory or Novell eDirectory directory services. To integrate Workflow Manager / AdminStudio Enterprise Server with a directory service individual account or group, you need to set up a directory service connection.

This section includes the following topics:

- Creating a New Directory Service Connection
- Viewing or Changing an Existing Directory Service Connection
- Deleting an Existing Directory Service Connection

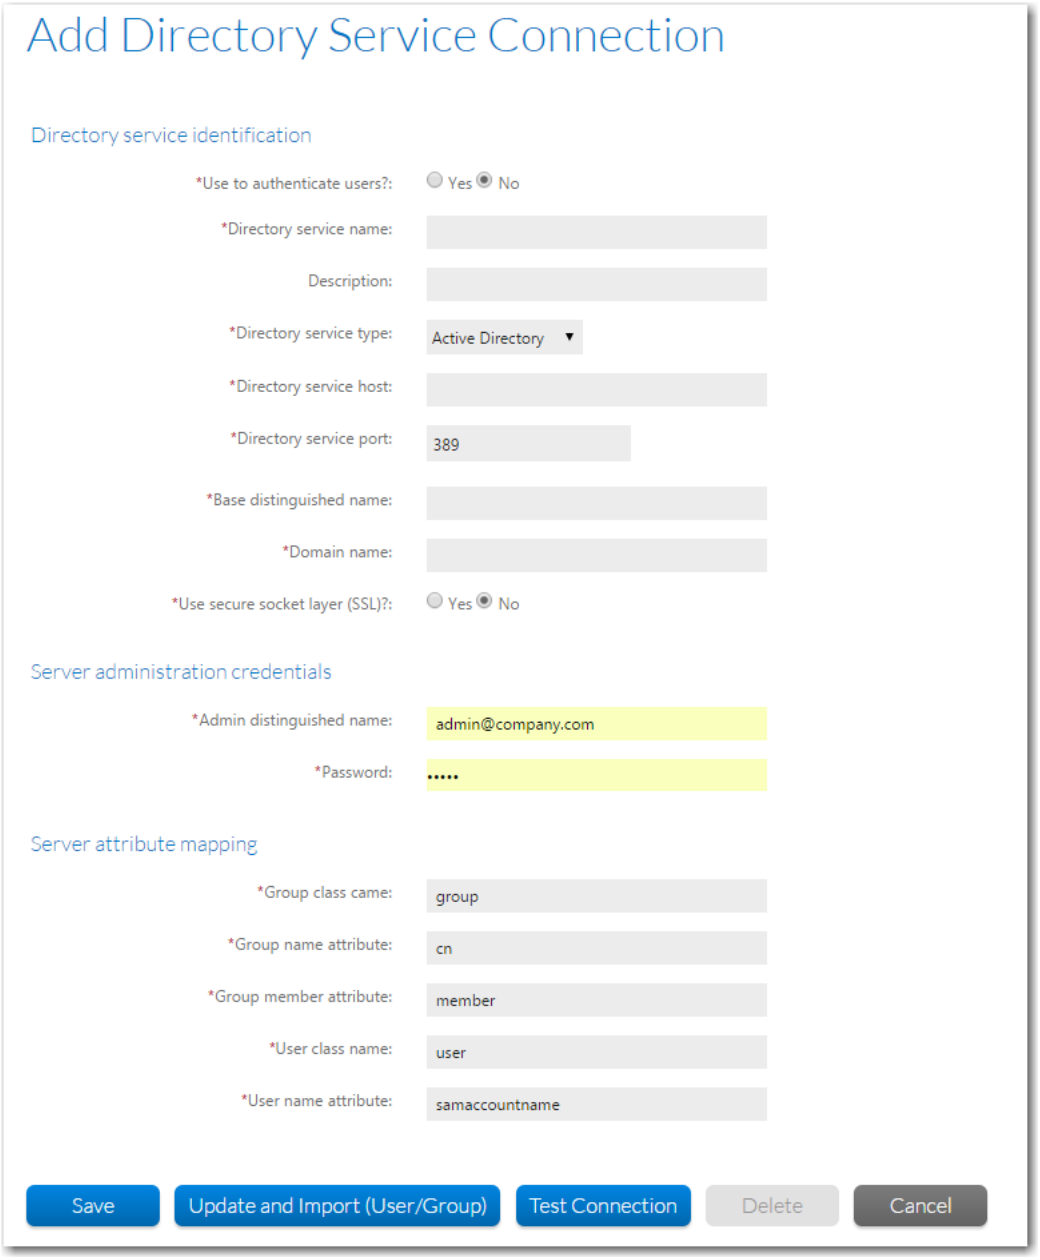
Creating a New Directory Service Connection

Directory services connections are used to import accounts into Workflow Manager / AdminStudio Enterprise Server, so as to authenticate Active Directory or eDirectory account-holders logging into Workflow Manager / AdminStudio Enterprise Server.

You can choose to have a directory service listed in the **Domain** list on the Workflow Manager / AdminStudio Enterprise Server login page. This enables people with accounts in the directory service to login to Workflow Manager / AdminStudio Enterprise Server using their enterprise network credentials

Task ***To add a Directory Service connection:***

1. On the **Settings** menu, click **Directory Services**. The **Directory Services Administration** page opens.
2. Click **Add**. The **Add Directory Service Connection** page opens.



3. Enter the relevant connection details. See Add Directory Service Connection Page for more information.
4. Click the **Test Connection** button to ensure the settings you entered can be used to successfully connect to this directory service.
5. Once your connection is successful, do one of the following:
   - Click **Save** to save your new connection and return to the **Directory Services Administration** page
   - Click **Update and Import (User/Group)** to save your new connection and open the **Directory Services Import** page, where you can immediately import an account for your connection. See Importing Directory Services Accounts and Groups for more information.

Viewing or Changing an Existing Directory Service Connection

You may view or update the details of any existing directory service connection.

Task ***To view or update an existing directory service connection:***

1. On the **Settings** menu, click **Directory Services**. The **Directory Services Administration** page opens.
2. Locate the directory service connection that you want to work with.
3. Click the directory service name to open the **Add Directory Service Connection** page opens.
4. View or update the connection as required. See Add Directory Service Connection Page for more information.
5. If you update the connection details, click the **Test Connection** button to ensure the settings you entered can still connect successfully to your directory service.
6. Do one of the following:
   - Click **Save** to save your new connection and return to the **Directory Services Administration** page.
   - Click **Update and Import (User/Group)** to save your new connection and open the **Directory Services Import** page, where you can immediately import an account for your connection. See Importing Directory Services Accounts and Groups for more information.
   - Click **Cancel** to close the **Add Directory Service Connection** page without saving your changes.

Deleting an Existing Directory Service Connection

In order to delete a directory service connection, all references to the directory service must be removed from Workflow Manager / AdminStudio Enterprise Server. If there are any accounts imported from the directory service or attributes associated with it, you will be unable to delete the connection.

Task ***To delete an existing directory service connection:***

1. Open the **Directory Service Administration** page by clicking **Directory Services** on the **Settings** menu.
2. Locate the directory service connection that you want to remove. The **Add/Edit Directory Service Connection** page opens.
3. Click **Delete**. You are prompted to confirm the deletion.

   Tip • *The **Delete** button will be disabled if your connection is referenced by an account or attribute.*
4. Click **OK**. The **Add/Edit Directory Service Connection** page closes, and the connection you deleted is no longer listed on the **Directory Services Administration** page.

Managing Directory Services Attributes

When creating a Workflow Manager template, you can assign a **Data Element** the **Data Type** of **Directory Service**. This means that when a directory service-authenticated account completes the workflow step requesting that particular data element, information is pulled from the directory service to automatically populate the field, such as that account's name, email address, or location.

Each piece of information that can be returned from the directory service is referred to as an attribute. Workflow Manager allows you to select which of the many directory service attributes you want available for use as data elements in workflow templates.

Figure 5-1: Example of Fields Populated With Directory Services Attributes

Note *• If a person is using Workflow Manager through an account not authenticated from a directory service, such fields will be enabled and left blank, ready for manual entry.*

Information about managing directory service attributes is organized in the following topics:

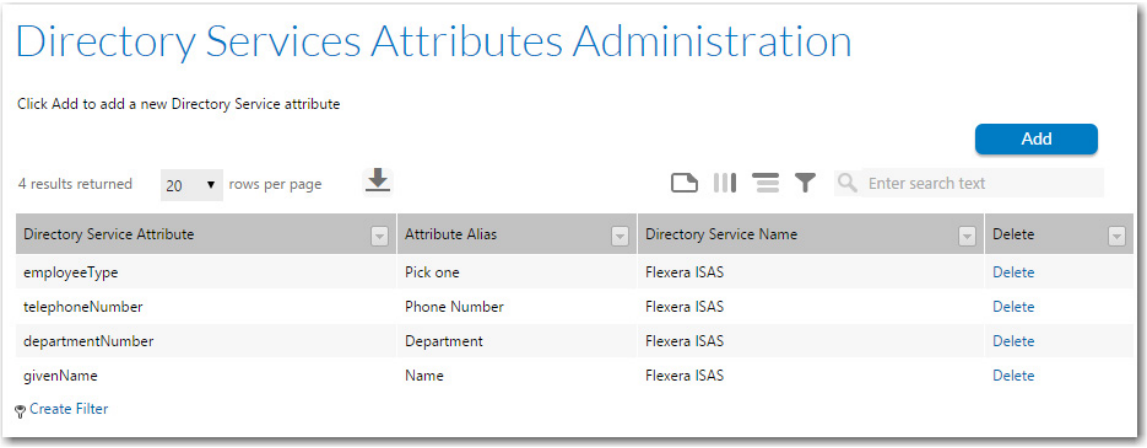
- Setting Up a New Directory Service Attribute
- Deleting an Existing Directory Service Attribute

Setting Up a New Directory Service Attribute

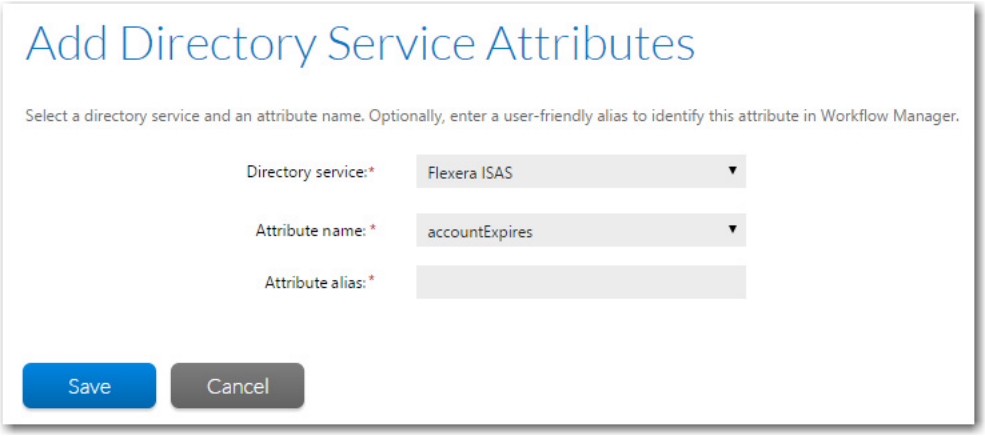
To make a new directory service attribute available for use in workflow templates, do the following.

Task ***To set up a new directory service attribute:***

1. Open the **Directory Service Attributes Administration** page by clicking **Directory Service Attributes** on the **Settings** menu. The **Directory Services Attributes Administration** page opens.



2. Click **Add**. The **Add Directory Service Attributes Page** page opens.



3. Select the directory service whose attribute you want to make available to workflow templates from the **Directory service** list. Refer to Creating a New Directory Service Connection for more information about setting up connections to your directory services.

4. The **Attribute name** field lists all of the directory service attributes from the chosen directory service. Select the one you want to add to the Workflow Manager database. An example of a directory service attribute might be `employeeNumber` or `documentAuthor`.

5. Enter a more user-friendly identifier for the attribute in the **Attribute alias** field. For example, you may want to identify the `documentAuthor` attribute as **Author** in Workflow Manager.

6. Click **Save** to register the attribute with Workflow Manager.

Tip • *If Workflow Manager is unable to connect to the server (so no attributes can be retrieved), the* ***Save*** *button is disabled.*

Deleting an Existing Directory Service Attribute

In order to delete a directory service attribute, all references to that directory service attribute must be removed from Workflow Manager. If there are any references to the directory services attribute, you will be unable to delete it.

Task ***To delete an existing directory service attribute:***

1. On the **Directory Services** page, click **Manage Directory Services Attributes**. The **Directory Services Attributes Administration** page opens
2. Locate the attribute that you want to remove.
3. Click the **Delete** hyperlink in the **Delete** column to the right of your chosen attribute. The attribute will be removed without prompting, so be sure you select the correct one.

Managing Account Logins

Workflow Manager / AdminStudio Enterprise Server allows you to login either with your domain account or with a different named account.

Each method is discussed in this section, as is how to set the session timeout value.

- Login Methods
- Using Account Login
- Using Domain Account Login
- Using Single Sign-On Login

Login Methods

There are multiple ways you can log in to the application:

Table 5-2 • Login Methods

Method	Description	Related Topics
Using Workflow Manager / AdminStudio Enterprise Server account	Login using an account created specifically for Workflow Manager / AdminStudio Enterprise Server.	• Using Account Login • Creating a New Account

Table 5-2 • Login Methods (cont.)

Method	Description	Related Topics
Using domain account credentials	Login using your domain account credentials. To set this up, you need to import accounts from a directory service (Active Directory or Novell eDirectory) into Workflow Manager/ AdminStudio Enterprise Server. ***Note*** *• To login using your domain account, ensure the* ***Anonymous Access*** *option on the IIS Manager* ***Authentication*** *view is set to* ***Enabled****. For more information, see Setting the Anonymous Authentication Option in IIS Manager to Enable Single Sign-On.*	• Using Domain Account Login • Creating a New Directory Service Connection • Importing Directory Services Accounts and Groups
Using single sign-on login	Be automatically logged in to Workflow Manager / AdminStudio Enterprise Server, based on your domain account credentials. This is referred to as *single sign-on* login. If you set up this option, IIS performs account authentication; in all other cases, authentication is the role of Workflow Manager / AdminStudio Enterprise Server itself. ***Note*** *• To login using the single sign-on method, ensure the* ***Enable anonymous access*** *option on the* ***IIS Authentication Methods*** *dialog box is not selected. For more information, see Setting the Anonymous Authentication Option in IIS Manager to Enable Single Sign-On.* ***Note*** *• Single sign-on is not supported for Novell eDirectory accounts.*	• Using Single Sign-On Login • Creating a New Directory Service Connection • Importing Directory Services Accounts and Groups
Using guest account login	Login using an anonymous guest account, set up to view a restricted set of Workflow Manager features – such as viewing reports or searching for a request.	• Using Guest Account Login • Setting Up a Guest Account • Logging in as a Guest

Setting the Anonymous Authentication Option in IIS Manager to Enable Single Sign-On

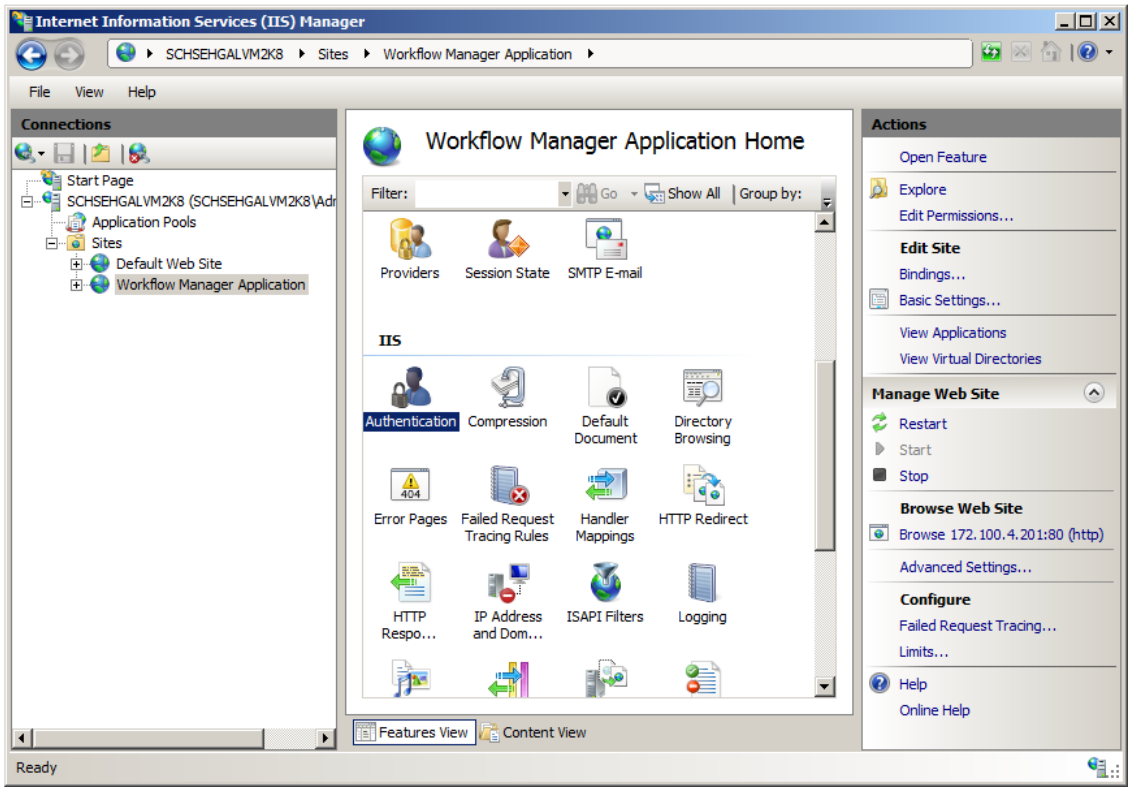
If you wish to login to Workflow Manager / AdminStudio Enterprise Server using your domain account or using the single sign-on method (as described in Login Methods), you may need to update the **Anonymous Authentication** option in IIS Manager.

Note • *The instructions in this topic explain how to set the* ***Anonymous Authentication*** *option in IIS 7. The instructions for setting this option in IIS 6 are slightly different. Refer to the Internet Information Services Manager 6 help for more information.*

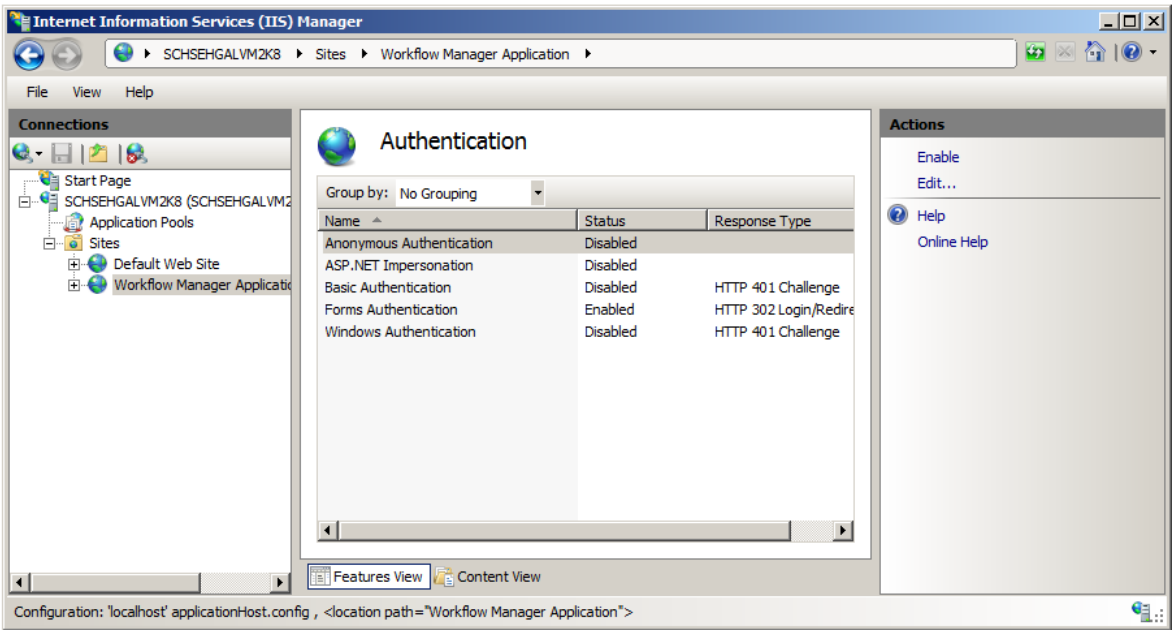
Important • *For single-sign on to work, In addition to performing these steps you must also select the Use to authenticate users? option on the* ***Add/Edit Directory Services Connection*** *page for that directory service.*

Task ***To set the Anonymous Authentication option in IIS Manager:***

1. Open the Internet Information Services (IIS) Manager. For instructions, refer to the following MSDN help topic, *Opening IIS Manager,* at http://msdn.microsoft.com/en-us/library/ms525920(v=vs.90).aspx
2. In the IIS tree view, select **Sites > Workflow Manager Application**. The **Workflow Manager Home** view opens.



3. Under **IIS**, double-click **Authentication**. The **Authentication** view opens.



4. Do one of the following:

   - **To login using your domain account**, set the **Anonymous Authentication** option to **Enabled** by selecting it and then clicking **Enable** in the **Actions** menu on the right.
   - **To login using the single sign-on method**, set the **Anonymous Authentication** option to **Disabled** by selecting it and then clicking **Disable** in the **Actions** menu on the right.

   ***Important** • If you disable the **Anonymous Authentication** option, make sure that the **Windows Authentication** option is set to **Enabled**.*

5. Make sure that the **Forms Authentication** option remains set to **Enabled**.

Using Account Login

You may wish to manually specify account names and passwords for all people logging in to Workflow Manager / AdminStudio Enterprise Server.

- **To set up account logins**—Follow the steps in Creating a New Account to manually create an account (**Account Name** and **Password**) for each person that you want to have access to Workflow Manager / AdminStudio Enterprise Server.
- **To login using an account login**—Once accounts have been created, people may login by entering their assigned **Account Name** and **Password** on the Workflow Manager / AdminStudio Enterprise Server login page. Workflow Manager / AdminStudio Enterprise Server will be responsible for authenticating the supplied details.

Using Domain Account Login

You may want to use your usual domain credentials to login to Workflow Manager / AdminStudio Enterprise Server.

Setting Up Workflow Manager / AdminStudio Enterprise Server to Use Domain Credentials

To set up Workflow Manager / AdminStudio Enterprise Server to use domain credentials, perform the following steps:

Task ***To set up Workflow Manager / AdminStudio Enterprise Server to use domain credentials:***

1. Set up a Windows Active Directory or Novell eDirectory directory service connection. See Creating a New Directory Service Connection for more information.
2. On your Workflow Manager / AdminStudio Enterprise Server server, open IIS Manager and enable the **Anonymous Authentication** option. This specifies that Workflow Manager / AdminStudio Enterprise Server will be responsible for authenticating login attempts. Refer to Setting the Anonymous Authentication Option in IIS Manager to Enable Single Sign-On for further details.
3. Import relevant accounts into Workflow Manager / AdminStudio Enterprise Server from your directory service. See Importing Directory Services Accounts and Groups for more information.

Logging in Using Your Domain Account Login

If your account has been imported from a directory service, or belongs to an imported group, you may then enter your usual domain account name and password on the Workflow Manager / AdminStudio Enterprise Server login page. Workflow Manager / AdminStudio Enterprise Server will connect to the relevant directory service, and pass through the supplied account name and password so that it can authenticate you.

Note • *When entering your account name, it is not necessary to specify the directory service domain name.*

Using Single Sign-On Login

With single sign-on, you will be automatically logged in to Workflow Manager / AdminStudio Enterprise Server using your domain credentials, as long as your domain account has been imported into the system.

Note • *Single sign-on is not supported for Novell eDirectory accounts.*

Setting Up Single Sign-On

To set up single sign-on for Workflow Manager / AdminStudio Enterprise Server, perform the following steps:

Task ***To set up single sign-on for Workflow Manager / AdminStudio Enterprise Server:***

1. Set up a Windows Active Directory directory service connection. See Creating a New Directory Service Connection for more information.
2. On your Workflow Manager / AdminStudio Enterprise Server server, open IIS Manager and disable the **Anonymous Authentication** option. This specifies that IIS will be responsible for authenticating login

attempts. Refer to Setting the Anonymous Authentication Option in IIS Manager to Enable Single Sign-On for further details.

3. Import relevant accounts into Workflow Manager / AdminStudio Enterprise Server from your directory service. See Importing Directory Services Accounts and Groups for more information.

Logging in Using Single Sign-On

Once single sign-on has been set up and your account has been imported, when you next open Workflow Manager / AdminStudio Enterprise Server, the IIS web server checks to see if your domain credentials are valid in the Active Directory domain server. If they are, you will automatically be logged in to Workflow Manager / AdminStudio Enterprise Server. Workflow Manager / AdminStudio Enterprise Server does not need to directly connect to the Active Directory server.

Using Guest Account Login

Rather than creating an account for each person using Workflow Manager, you may instead choose to create a generic guest account, with restricted access to some lower-risk features.

This section describes how to setup a guest account and how to login using a guest account:

- Setting Up a Guest Account
- Logging in as a Guest

Setting Up a Guest Account

The Workflow Manager administrator can set up a guest account to permit people without login credentials to access features such as viewing a report or searching for a workflow request. By using a guest account, administrators do not have to create separate accounts for people who only need very limited functionality.

Task ***To configure a guest account:***

1. Manually create a new account in Workflow Manager to use as the guest account. See Creating a New Account for further information.
2. Assign your new account to roles with limited permissions. See Managing Roles and Permissions for more information.

   Tip • *Be very careful about assigning your account to roles with access to advanced features, since these features will then be available to every person who logs in as a guest.*

3. Update the **web.config** file, located in the Workflow Manager web application **wwwroot** directory. Enter the name of the your new account in the following location of the **web.config** file:

   ```
   <!-- Guest System Access -->
   <add key="GuestAccount" value="username@companyname.com" />
   ```

   After a guest account key is added to the **web.config** file, the **Guest Access** option will appear on the Login page.

Note • *If the account name specified in the* `GuestAccount` *key does not exist in the Workflow Manager database, Workflow Manager will display an error when an operator tries to log in as a guest. A* `GuestAccount` *key with a blank value (that is, with* `value = ""`*) will be ignored.*

Note • *Every Workflow Manager portal has its own* ***web.config*** *file. You may update a different* `GuestAccount` *key for each portal by updating its local* ***web.config*** *file. Workflow Manager portals will use the* `GuestAccount` *key configured at the portal site to log in guests. If a* `GuestAccount` *value is not configured (the key is missing, or has blank value), Workflow Manager will instead use the* `GuestAccount` *key from the parent site.*

Logging in as a Guest

Before anyone can log on to Workflow Manager anonymously, a guest account needs to be configured, as described in Setting Up a Guest Account. If a guest account is set up, and if single-sign on authentication is not configured, users can log on to your Workflow Manager site as a guest. When the Workflow Manager **Login** page opens, a user would select the **Guest Access** option to log in anonymously.

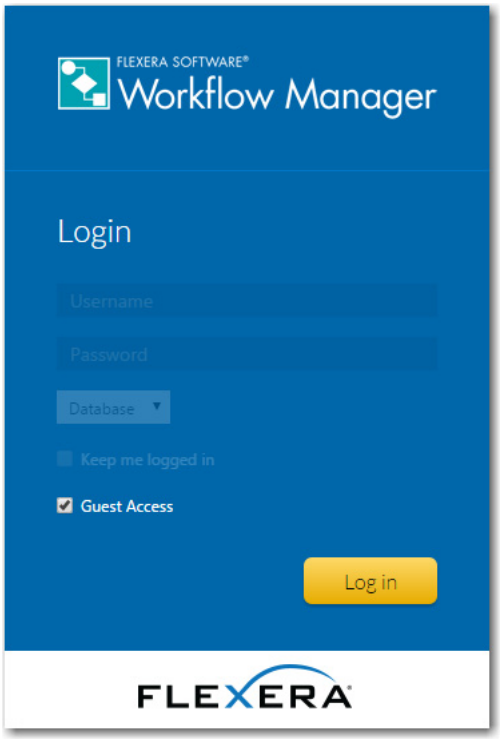


Figure 5-2: Logging in Using Guest Access Option

Important • *If single-sign on authentication is configured, the* ***Guest Access*** *option is not available.*

Tip • *The* ***Guest Access*** *option will not be available on the login page unless the* `GuestAccount` *key is present in the* `web.config` *file, with a non-empty* `value` *(that is, the key does not have* `value = ""`*). See Setting Up a Guest Account for more information.*

Accounts and Directory Services Reference

This section details the contents of the Workflow Manager / AdminStudio Enterprise Server pages that are used to manage users and directory services:

Table 5-3 • Accounts and Directory Services Reference

Page	Subpages
Account Administration Page	• Account Details Page • Directory Services Import Page
Directory Services Administration Page	• Add Directory Service Connection Page
Directory Services Attributes Administration Page	• Add Directory Service Attributes Page

Account Administration Page

The **Account Administration** page lists the accounts defined in Workflow Manager / AdminStudio Enterprise Server. You can view this page by clicking **Accounts and Groups** in the **Settings** menu.

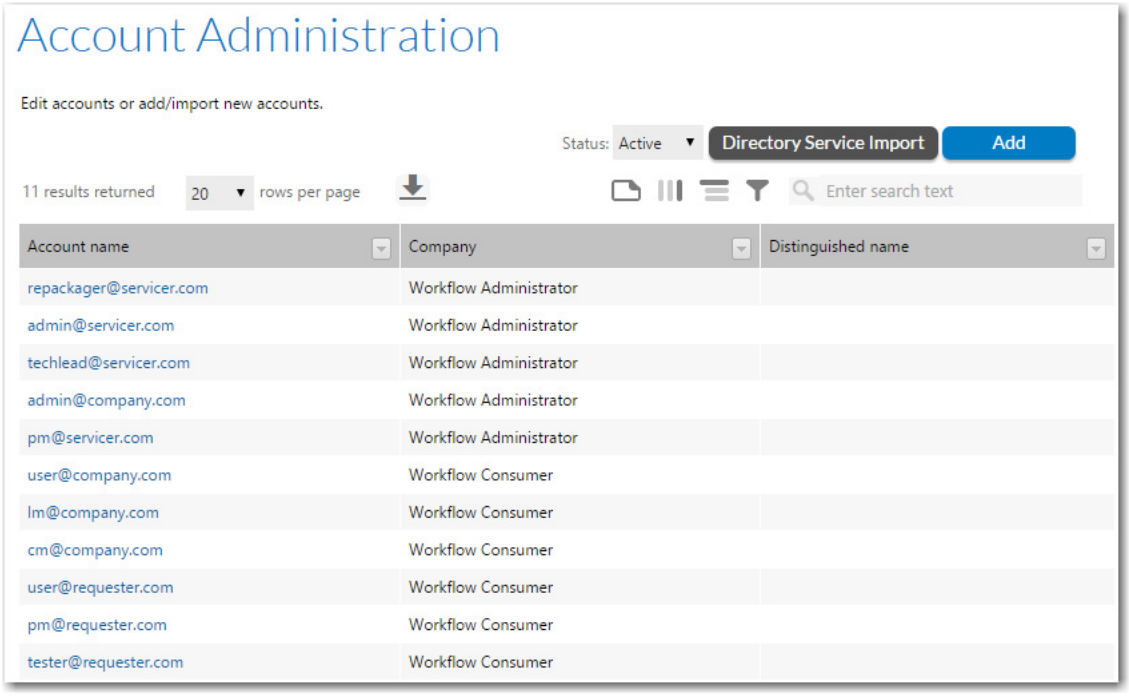

Figure 5-3: Account Administration Page

Tip • *This page will only list accounts associated with the company that your own login account belongs to. To view accounts belonging to all companies (and also to view the* `suams` *super user account), you will need to log in with a super user account, assigned the* ***System Administrator*** *role. For more information, see*

Use the **Account Administration** page to:

- Drill through to a page showing the details of a single existing account, where you may either update (see Viewing or Changing an Existing Account), disable (see Disabling an Account) or delete (see Deleting an Account) that account.
- Create a new account (see Creating a New Account).
- Import accounts or groups from a directory service (see Importing Directory Services Accounts and Groups).
- Filter the lists of visible accounts by status (see Filtering by Account Status).

Note • *For more information on the methods for logging into Workflow Manager / AdminStudio Enterprise Server and how authentication is performed, see Managing Account Logins.*

The **Account Administration** page lists the following account details, some of which are hidden by default:.

Table 5-4 • Account Administration Page Options

Option	Description
Add	Click to access the Account Details Page, where you can add a new account.

Table 5-4 • Account Administration Page Options (cont.)

Option	Description
Directory Service Account/Group Import	Click to access the Directory Services Import Page, where you can import an account or group from a directory service.
Account Name	The login name that will be used to access Workflow Manager / AdminStudio Enterprise Server. Typically, account names are in the format of `accountname@companyname.com`. If the account represents a directory services group, the group's name will instead be listed in this column.
Company	The company within your organization which this account belongs to.

Account Details Page

The **Account Details** page allows you to view and update the details of an individual account, either manually created or imported from a directory service. The **Account Details** page is opened by either clicking a user name or the **Add** button on the **Account Administration** page.

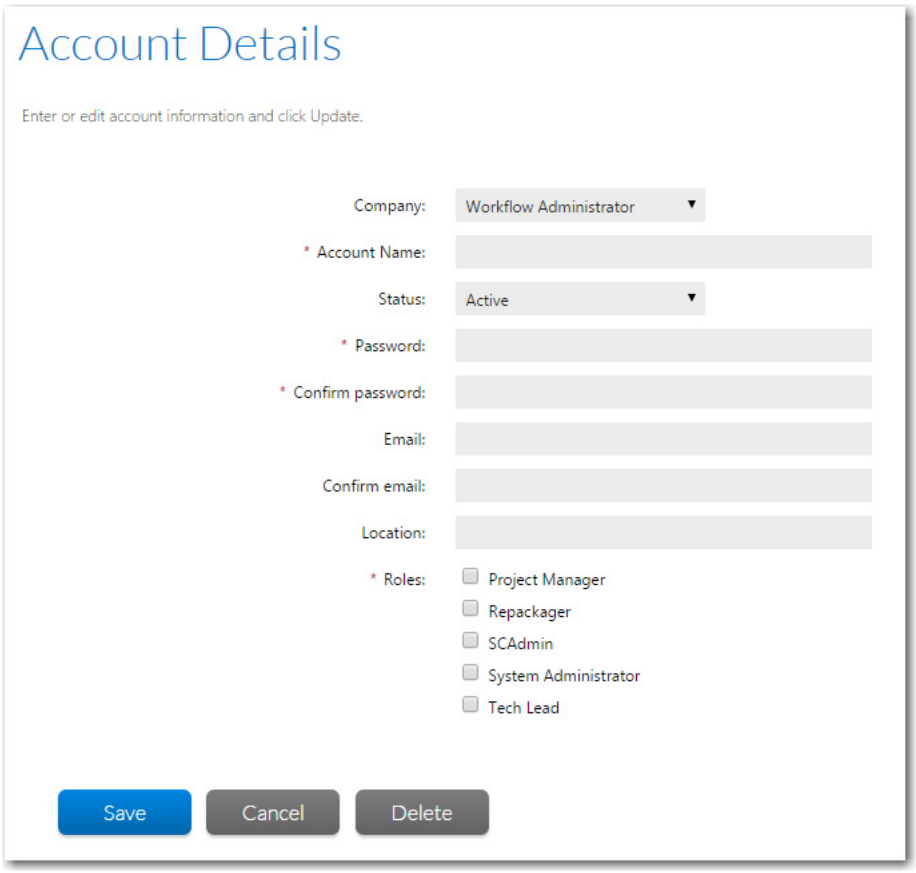

Figure 5-4: Account Details Page

Tip • *You may not delete an account which is referenced by any workflow requests or templates. Instead, you may disable such an account if it is no longer required. See Filtering by Account Status for details.*

The following fields are available on the **Account Details** page:

Table 5-5 • Account Details Page Fields

Field	Description
Company	[Workflow Manager only] Select the company that this account belongs to. If you update this field, the list of roles at the bottom of this page will dynamically update to show only those belonging to the selected company.
Account Name	Enter a unique login name to identify this account. You will use this account name to login to Workflow Manager / AdminStudio Enterprise Server. To ensure that you can easily identify which company your account belongs to, it is good practice to create an account name of the form: `username@companyname.com`. ***Note*** • *This field will be disabled for any account or group imported from a directory service.*
Status	If you wish this account to interact with Workflow Manager / AdminStudio Enterprise Server, select **Active**. The **Inactive** option disables this account. See Disabling an Account for further information.
Password **Confirm password**	Enter a password for this account. To ensure you did not misspell the password you entered in the **Password** field, re-enter it in the **Confirm password** field. You will be unable to save your changes unless you enter matching passwords in the **Password** and **Confirm Password** fields. ***Note*** • *This field will be disabled for any account or group imported from a directory service.*
Email **Confirm email**	If the person using this account is to receive notifications when his input is required to complete a workflow, enter a valid email address in this field, and reenter it in the **Confirm email** field. ***Note*** • *This field only does not appear for an account or group imported from a directory service, because this information is retrieved dynamically when needed.*
Location	Optionally, enter a geographic location that you can use to group accounts together, such as **New York Office** or **Midwest Region**.
Roles	Select the roles you wish this account to belong to. These roles will determine how the account may interact with Workflow Manager / AdminStudio Enterprise Server. Only those roles belonging to the selected company are displayed. See Role Permission Lists for more information.

Directory Services Import Page

If you have defined a directory service connection, as described in Creating a New Directory Service Connection, you can choose to import accounts or groups from that directory service into Workflow Manager / AdminStudio Enterprise Server. You import those accounts or groups using the **Directory Services Import** page, which is opened by clicking **Directory Service Account/Group Import** on the **Account Administration** page.

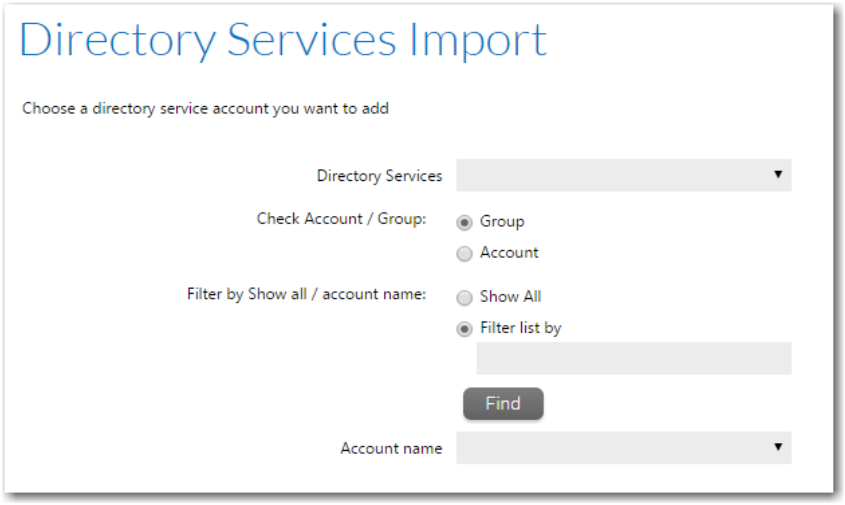

Figure 5-5: Directory Services Import Page

Note • *Workflow Manager / AdminStudio Enterprise Server supports Windows Active Directory and Novell eDirectory directory services.*

The following options are included:

Table 5-6 • Directory Services Account/Group Add View

Option	Description
Select a Directory Service	Choose the directory service containing the account or group you want to import. ***Note*** • *For information on defining a Directory Service Connection, see Creating a New Directory Service Connection.*
Select Group or User	Specify whether you are importing a **User** (a single account) or a **Group**.

Table 5-6 • Directory Services Account/Group Add View (cont.)

Option	Description
Filter Directory Service List	Select one of the following: • **Show All**—Select this option to select your account from a list of all accounts and groups in the directory service. • **Filter list by**—Select this option to only return accounts and groups which match the criteria you specify, and enter your criteria in the associated text box. For example, to search for all of the users that start with the letter P, use the asterisk wildcard character (*) and enter **P*** in the **Filter list by** box. In either case, click **Find** to return your chosen list of accounts and groups.
Pick group/user in the list below	Select the group or account to import into Workflow Manager / AdminStudio Enterprise Server. The **Account Details** page opens, providing a read-only view of the imported account or group's account name and password.  ***Note*** • *If you import an account that is a member of a previously-imported group, that account inherits its group's roles. You can then assign additional roles to that account.*

The selected user or group is then opened in the Account Details Page.

Directory Services Administration Page

Workflow Manager / AdminStudio Enterprise Server can be integrated with Windows Active Directory and Novell eDirectory. This enables you to set up automatic login with Workflow Manager / AdminStudio Enterprise Server based upon directory service authentication.

Directory services connections are used to import users and groups into Workflow Manager / AdminStudio Enterprise Server, and to authenticate Active Directory or Novell eDirectory users logging into Workflow Manager / AdminStudio Enterprise Server. If you import a group, all members of that group can then login to Workflow Manager / AdminStudio Enterprise Server without requiring you to import them individually. Workflow Manager / AdminStudio Enterprise Server can then retrieve attributes, such as email address or telephone number, from the directory service dynamically.

You can choose to have a directory service listed in the **Domain** list on the Workflow Manager / AdminStudio Enterprise Server login page. This enables users in this directory service to login using their enterprise network credentials.

You may also add data elements to your workflow templates which, for accounts imported from directory services, will be directly populated from directory service attributes (such as account name, email address or location).

Directory Services tasks can be managed starting from the **Directory Services Administration** page, which you can open by clicking **Directory Services** on the **Settings** menu.

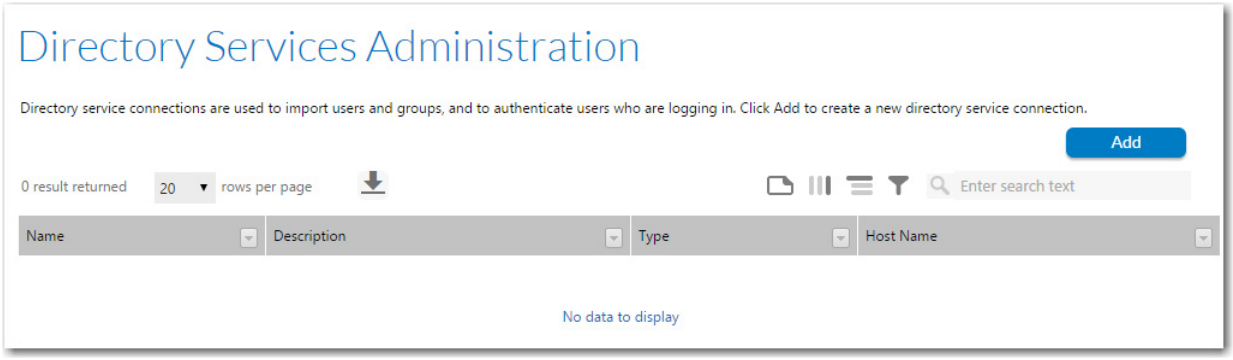

Figure 5-6: Directory Services Administration Page

The **Directory Services Administration** page lists the following information about each connection:

Table 5-7 • Directory Services Administration Page Options

Option	Description
Name	A unique identifier for the directory service connection. You might like to enter the domain name as the description, since that should be unique for your organization.
Description	A more detailed description of the directory service.
Type	Identifies this directory service as either Windows Active Directory or Novell eDirectory.
Host Name	The name or IP address of the server on which this directory service is running.

Note • *For more information about Directory Services and Lightweight Directory Access Protocol (LDAP), see Lightweight Directory Access Protocol (LDAP) Overview on the Microsoft TechNet website.*

Add Directory Service Connection Page

The **Add Directory Service Connection** page allows you to view and update the settings required to connect to a directory service. You can also use this page to remove a connection which is no longer required.

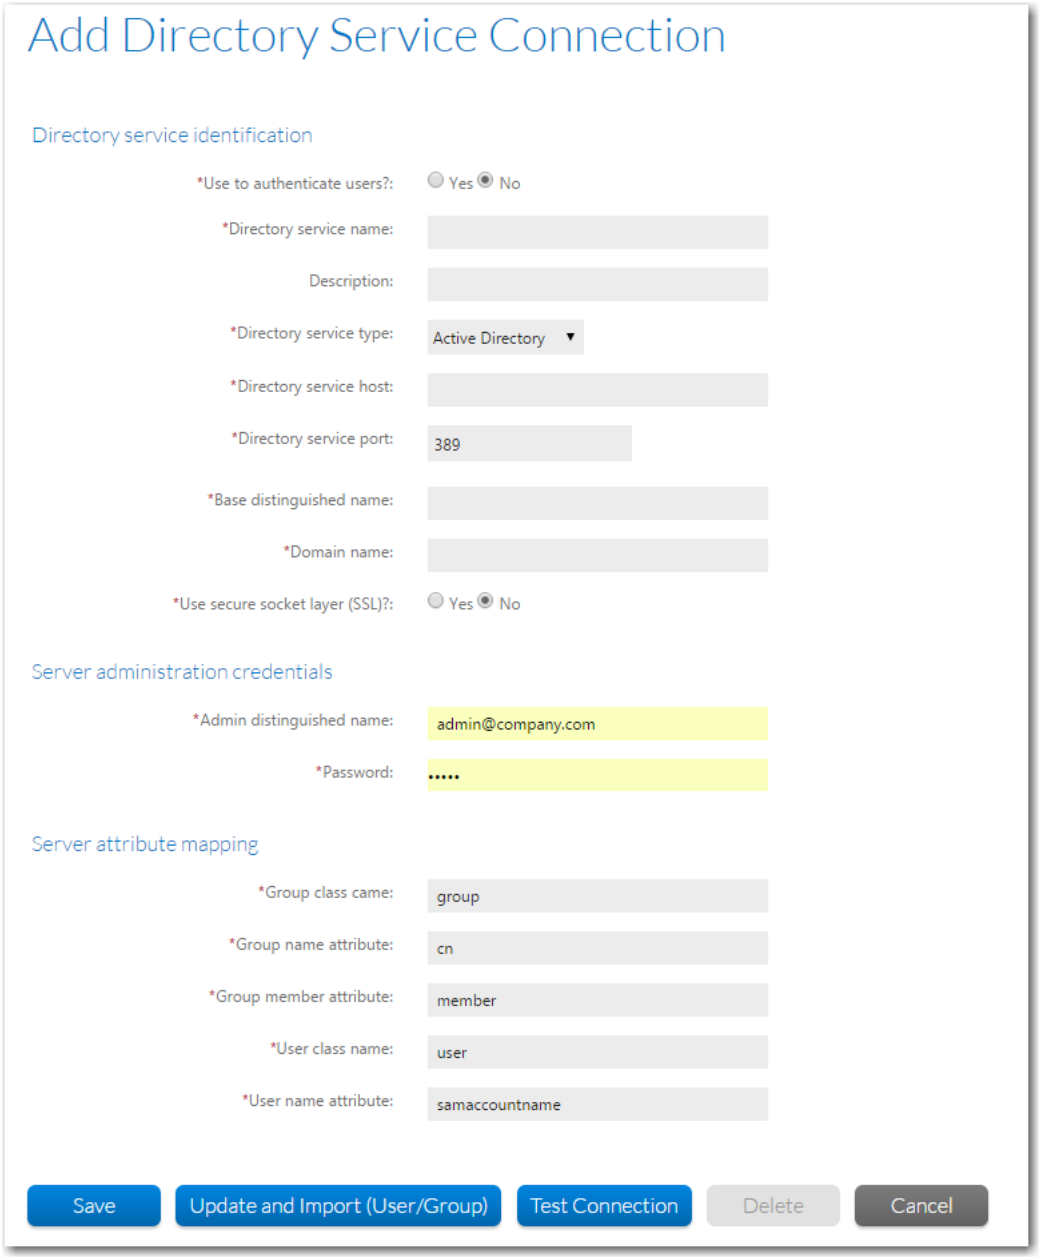

Figure 5-7: Edit Directory Service Connection Page

The following fields are available on the **Add/Edit Directory Service Connection** page:

Table 5-8 • Add/Edit Directory Service Connection Page Fields

Option	Description
Use to authenticate users?	Select **Yes** to include this directory service in the **Domain** list on the Workflow Manager / AdminStudio Enterprise Server login page. This enables people to login to Workflow Manager / AdminStudio Enterprise Server using their enterprise network credentials. You can create multiple directory service connections, but only those connections that have this field set to **Yes** will be listed in the **Domain** list.  ***Note*** • *This option must be selected in order to enable single sign-on, which means that users are automatically logged on to Workflow Manager using their enterprise network credentials, bypassing the Login screen. However, to enable single sign-on, you must also perform the steps listed in Setting the Anonymous Authentication Option in IIS Manager to Enable Single Sign-On.*  ***Note*** • *In an enterprise, there is usually only one directory service that is responsible for authenticating accounts. However, you can create additional directory service connections to import accounts and groups.*
Directory service name	Enter a name to identify this directory service in the domain list on the Workflow Manager / AdminStudio Enterprise Server login page. You may wish to use the domain name associated with the directory service.
Description	Some further information about this directory service. You may wish to identify which parts of the organization use this directory service for authentication, for example.
Directory service type	Select the type of directory service you are integrating with. The following options are available. • **Active Directory** • **Novell eDirectory**
Directory service host	The name or IP address of the server on which this directory service is running.
Directory service port	Enter the port number of the server on which the directory service is running, to which Workflow Manager / AdminStudio Enterprise Server should connect in order to send LDAP queries. The default port number is **389**.
Base distinguished name	Enter the base distinguished name (DN) to identify the root node of this directory service. For example, for MyCompany, the base DN could be: **dc="MyCompany", dc="com"**
Domain name	Enter the domain name of this directory service.

Table 5-8 • Add/Edit Directory Service Connection Page Fields (cont.)

Option	Description
Use secure socket layer (SSL)?	Select **Yes** if this directory service is configured to use Secure Socket Layer (SSL).
Connect anonymously?	Select **No** if you do not want to permit anonymous connections. If you select **Yes** to permit anonymous connections, Workflow Manager / AdminStudio Enterprise Server may not be able to authenticate directory service users and may not be able to add directory service users/groups into Workflow Manager / AdminStudio Enterprise Server.
Admin distinguished name	Enter the distinguished name of an operator who has permission to retrieve account/group information and authenticate an account against this directory service, in the **domainName\userName** format.
Password	The password associated with the credentials specified in **Admin Distinguished Name**.
Group class name	Enter the object class name used to identify groups in this directory service. Default values are: • For Active Directory: **group** • For Novell eDirectory: **groupofnames**
Group name attribute	Enter an attribute used by this directory service to name groups. The default value for both Active Directory and Novell eDirectory is **cn**.
Group member attribute	Enter an attribute used by this directory service to define member groups. Default values are: • For Active Directory: **member** • For Novell eDirectory: **uniquemember**
User class name	Enter the object class name used by this directory service for user accounts. Default values are: • For Active Directory: **user** • For Novell eDirectory: **inetorgperson**
User name attribute	Enter the attribute used by this directory service to identify user accounts. Default values are: • For Active Directory: **samaccountname** • For Novell eDirectory: **uid**
Save	Click to save your entries and return to the Directory Services Administration Page.
Update and import (User/Group)	Click to save your entries and open the Directory Services Import Page.

Table 5-8 • Add/Edit Directory Service Connection Page Fields (cont.)

Option	Description
Test Connection	Click to test to see if the settings that you entered can be used to successfully connect to this directory service.

Directory Services Attributes Administration Page

Edition • *This feature applies to Workflow Manager only.*

The **Directory Services Attributes Administration** page lists all attributes which you have chosen to make available in workflow templates. You can view this page by clicking **Manage Directory Services Attributes** on the **Directory Services** page.

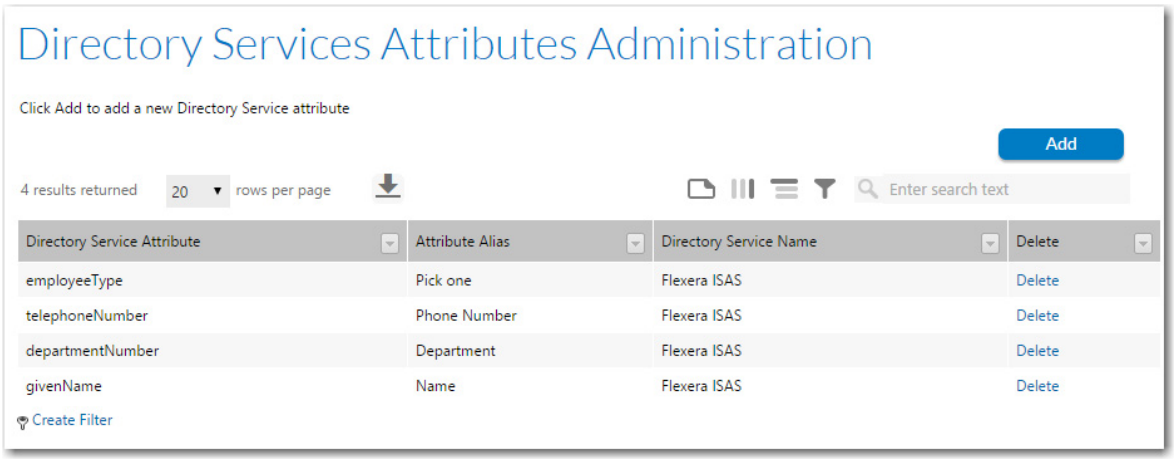

Figure 5-8: Directory Services Attributes Administration Page

Directory service attributes can be used when defining data elements. When a data element is defined as a directory service attribute, when this data element appears during a data entry step in a workflow, information about the logged in user will be pulled from the directory service to populate those fields, such as: department, location, employee number, etc.

The **Directory Services Attributes Administration** page lists the following information about each attribute:

Table 5-9 • Directory Services Attributes Administration Page Options

Option	Description
Directory Service Attribute	The name of an attribute available from one of your defined directory services. Attributes are used in directory services protocol to access information directories, such as `employeeNumber` or `documentAuthor`.
Attribute Alias	A more user-friendly name for a directory service attribute. For example, you may choose to give a directory service called `homePhone` the friendly name **Home telephone number**.

Table 5-9 • Directory Services Attributes Administration Page Options (cont.)

Option	Description
Directory Service Name	The directory service this attribute belongs to.

Add Directory Service Attributes Page

Edition • *This feature applies to Workflow Manager only.*

When you click **Add** on the **Directory Services Attributes Administration** page to add a new directory service attribute into the database, the **Add Directory Service Attributes** page opens.

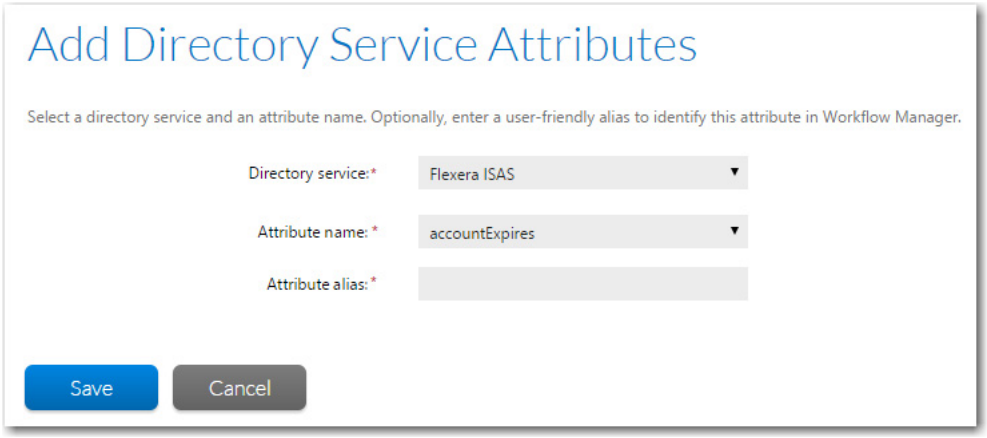

Figure 5-9: Add Directory Service Attributes Page

The **Add Directory Service Attributes** page includes the following options:

Table 5-10 • Add Directory Service Attributes Page Options

Option	Description
Directory service	Select the directory service whose attribute you want to make available to workflow templates from the **Directory Servic**e list. Refer to Creating a New Directory Service Connection for more information about setting up connections to your directory services.
Attribute name	Lists all of the directory service attributes from the chosen directory service. Select the one you want to add to the Workflow Manager database. An example of a directory service attribute might be `employeeNumber` or `documentAuthor`.
Attribute alias	Enter a more user-friendly identifier for the attribute in the **Attribute Name** field. For example, you may want to identify the `documentAuthor` attribute as **Author** in Workflow Manager.

Table 5-10 • Add Directory Service Attributes Page Options (cont.)

Option	Description
Save	Click to register the defined directory service attribute. ***Tip*** • *If Workflow Manager is unable to connect to the server (and no attributes are retrieved), the* ***Save*** *button is disabled.*

When a data element is defined as a directory service attribute during Workflow Manager template creation, when this data element appears in the workflow, information will be pulled from the directory service to populate those fields, such as:

Figure 5-10: Example of Fields Populated With Directory Services Attributes

However, if the user is not connected using Directory Service authentication, then the fields will be left blank and will be enabled.

6

Managing Roles and Permissions

All of the Workflow Manager / AdminStudio Enterprise Server permissions are related to roles. The people using and administering Workflow Manager / AdminStudio Enterprise Server are granted access based on the roles they belong to.

Information on using roles and permissions is presented in the following sections:

- AdminStudio and Workflow Manager Roles and Permissions
- Role Management
- Roles Reference

AdminStudio and Workflow Manager Roles and Permissions

Each role consists of a set of permissions to allow access to different features or areas of AdminStudio and Workflow Manager. Every person who needs to work with these applications or administer the system is then assigned to one or more roles, and the set of features he can access is a combination of the permissions supplied by all of his roles.

This section includes the following topics:

- Role Permission Lists
- System Roles

Role Permission Lists

Permissions to perform all AdminStudio and Workflow Manager functions are assigned using roles. A user has permission to perform only those tasks that are explicitly selected in the role(s) that the user is assigned to.

This section describes all of the AdminStudio and Workflow Manager permissions:

- Administration and Report Center Permissions

Administration and Report Center Permissions

AdminStudio Enterprise Server and Workflow Manager have the following permissions:

Table 6-1 • AdminStudio Enterprise Server and Workflow Manager Permissions

Feature	Right	This right grants permission to...
Approval	**View**	See the **Approval Administration** page.
	Edit	Modify an existing approval template, including adding or removing users.
	Add	Add/delete an approval template.
Directory Services	**View**	See the **Administration/Directory Services** tab and view the **Directory Services** page, the **Directory Services List** page, and the **Directory Services Attributes Administration** page.
	Edit	Modify an existing directory service.
	Add	Create a new directory service.
	Delete	Remove an existing directory service.
Email Templates	**Edit**	Modify email templates.
External Data Sources	**Edit**	View and modify the settings on the **External Data Sources** tab.
Global Email Administration	**View**	See the **External Email Address Administration** page.
	Edit	Modify the settings on the **External Email Address Administration** page.
People	**View**	See the **Account Administration** and **Account Details** pages.
	Edit	Modify an existing account.
	Add	Create a new account and import accounts from a directory service.
	Delete	Remove an existing account.

Table 6-1 • AdminStudio Enterprise Server and Workflow Manager Permissions

Feature	Right	This right grants permission to...
Roles	**View**	See the **Role Administration** and **Role Details** pages.
	Edit	Modify an existing role.
	Copy	Duplicate an existing role.
	Add	Create an existing role.  ***Note*** • *You must have this permission in order to be able to upgrade an existing Application Catalog.*
	Email Notify Enabled	Enable email notification.
Report Center / All Reports	**Edit**	Modify an existing custom report.
	Add	Create a new custom report by making a selection under **Custom Reports** on the **Reports** menu.
	Delete	Remove an existing custom report.
Report Center / Package Reports	**View**	See the **Search Packages** page and view Package Reports.

Workflow Manager Permissions

The Workflow Manager category covers general access to Workflow Manager, allowing you to specify precisely which areas of the product people may use.

Table 6-2 • Workflow Manager Permissions

Category	Right	This right grants permission to...
Workflow Request	**View**	See the **Properties** and **Issues** tabs on the **Workflow Request** page for an existing workflow request.
	Edit	Modify an existing workflow request.
	Copy	Duplicate an existing workflow request.
	Add	Create a new workflow request.
	Delete	Remove an existing workflow request.
	Monitor Workflow Progress	See the **Progress** tab of the **Workflow Request** page, and complete workflow steps.
	View Related Workflows	See the **Related Workflows** tab of the **Workflow Request** page.
	Add Related Workflows	Link one workflow request to another on the **Related Workflows** tab
	Deleted Related Workflow Links	Unlink related workflows.
	Edit Workflow Due Period	Modify the **Workflow due period** field on the **Properties** tab of the **Workflow Request** page.
	View Properties	See the **Properties** tab of the **Workflow Request** page.
	View Uploaded Files	See the **Uploaded Files** tab of the **Workflow Request** page.
	View Downloadable Files	See the **Downloadable Files** tab of the **Workflow Request** page.

Table 6-2 • Workflow Manager Permissions

Category	Right	This right grants permission to...
Workflow Request (Continued)	**View Documents**	See the **Documents** tab of the **Workflow Request** page.
	Upload Documents	Upload documents on the **Documents** tab of the **Workflow Request** page.
	Delete Documents	Delete documents on the **Documents** tab of the **Workflow Request** page.
	Download Documents	Download documents on the **Documents** tab of the **Workflow Request** page.
Calendar Settings	**View**	See the **Calendar Settings Administration** page.
	Edit	Modify calendar settings.
Consumer Company	**View**	See the list of existing consumer companies, and view their details.
	Edit	Update details of an existing consumer company.
	Add	Create a new consumer company.
	Delete	Remove an existing consumer company.
Issues	**View**	See the **Issues** tab of the **Workflow Requests** page, and drill through to see details of an individual issue.
	Respond	Respond to an existing issue.
	Add	Create a new **E-mail** or **Knowledge Base** issue.
	Close	Close an existing **E-mail** or **Knowledge Base** issue.
	Add/Close Critical Issue	Create and close **Critical** issues.
My Notifications	**View**	See the **My Notifications** pages: **My Default Project Notifications** and **My Workflow Notifications**.
	Edit	Modify settings on the **My Default Project Notifications** and **My Workflow Notifications** pages.
Workflow and Template Permissions	**View**	See the permission and email settings on the **Template Details** and **Project Details** pages.
	Edit	Modify the permission and email settings on the **Template Details** and **Project Details** pages.

Table 6-2 • Workflow Manager Permissions

Category	Right	This right grants permission to...
Projects	**View**	See the **Project Administration** page, and see (but not update) project details on the **Project Details** page.
	Edit	Update details of an existing project.
	Add	Create a new project.
	Delete	Remove an existing project.
Search	**Simple Search**	Enter keywords in search box on the **Home** page to search for a workflow request by name.
	Advanced Search	Search for workflow requests by specifying multiple criteria on the **Filter Your Search** menu.
Task Approval	**Approve on Behalf**	Enables user to approve a workflow step with a **Step Type** of **Approval Task** on behalf of any and all users.
Templates	**View**	See the **Template Administration** page, view template details on the **Template Details** page, and add an external data source by clicking **External Data Sources** on the **Settings** menu.
	Copy	Duplicate an existing template.
	Add	Modify an existing template and create a new one.
Terminology	**View**	See and modify system terminology.
Work Assignment	**View**	See a list of existing work assignments on the **View Assignments by Account** page.
	Assign	Assign work on the **Assign Work** page.
Workflow Administrator Company	**View**	See the list of existing administrator companies, and view and update administrator company details.
	Add	Create a new administrator company.

Table 6-2 • Workflow Manager Permissions

Category	Right	This right grants permission to...
Workflow Status Management	**View**	See the **Workflow Status Administration** page and see (but not modify) workflow status details on the **Edit Workflow Status** page.
	Edit	Update workflow status details on the **Edit Workflow Status** page.
	Add	Create a new workflow status.
	Delete	Remove an existing workflow status.

AdminStudio Client Tools Permissions

The AdminStudio client tools have the following permissions:

Table 6-3 • AdminStudio Client Tools Permissions

Category	Right	This right grants permission to...
AdminStudio Client Interface Process Assistants Tab	**Edit**	View and edit the projects on the **Process Assistants** tab that are assigned to him.
	Create	Create new projects and assign them to users. Users with the **Create** permission see a list of all users and their associated Projects on the **Process Assistants** tab. Users with only the **Edit** permission cannot create new projects and can only view and edit projects that are assigned to him.
	Delete	Delete a project from the **Process Assistants** tab.
AdminStudio Client Interface Process Template Editor	**View**	View existing workflows using the **Process Template Editor**.
	Edit	Modify existing workflows using the **Process Template Editor**.
	Create	Create a new workflow using the **Process Template Editor**.
	Delete	Delete a workflow from the **Process Template Editor**.
AdminStudio Client Interface Tools Tab	**Add**	Add a new tool to the **Tools** tab.
	Edit	Modify the properties of an existing tool on the **Tools** tab.
	Delete	Delete an existing tool on the **Tools** tab.

Table 6-3 • AdminStudio Client Tools Permissions

Category	Right	This right grants permission to...
AdminStudio Client Interface General	**Modify Tools Options Dialog**	Set options on the **Locations**, **Updates** and **Quality** tabs of the AdminStudio **Options** dialog box. Users without this permission can view the **Options** dialog box but cannot make any changes.
	Change Default Application Catalog	Permits user to edit the **Make this the default shared Application Catalog** option on the **Connect Application Catalog** dialog box
Application Manager / Conflict Solver	**Select Tests to Execute**	Permits user to edit the selections on the **Select Tests to Execute** dialog box.
Application Manager / Conflict Solver Conflicts	**Run Analysis**	Perform conflict analysis on a package.
	Resolve	Resolve any automatically resolvable conflicts found during conflict analysis on a package.
	Modify Rules	Open the **Rules Viewer** and create and edit new rules.
	Modify Data	Create new groups, rename existing groups, and modify group properties. • Permits user to cut and paste a group to a new location. • Permits user to copy/cut and paste a package into a new group. • Permits user to modify options on the **Resolution Options** dialog box. • Permits user to edit a package **Description** on the **Products View.**
Application Manager / Conflict Solver Package	**Delete**	Delete a package from the Application Catalog.
	Import	Import a package into the Application Catalog.
	Modify Extended Attributes	Modify a package's metadata on the Extended Attribute view.
	Delete History	Delete a package's history log (which contains a record of any operation that materially changes a software package or the data associated with it).

Table 6-3 • AdminStudio Client Tools Permissions

Category	Right	This right grants permission to...
Application Manager **Other**	**Run Merge Wizard**	No longer used.
	Run Validation	Validate a Windows Installer package against custom actions written by Microsoft which can be executed to determine if an installation package is built according to Windows Installer standards.
	Scan for Dependencies	Generate a list of all of a package's files that have dependencies with files used by other products or operating systems in the Application Catalog.
	Run Directory Monitoring	Use **Package Auto Import** to monitor a directory location on the network (or a local directory) and automatically import or re-import packages in that directory.
	Run Best Practices	Use Test Center to evaluate source packages to see if they meet Windows Installer best practices rules.
	Modify Tools Options Dialog	Open the Application Manager **Options** dialog box and set options.
	Change Application Catalog	Connect to a different Application Catalog by selecting **Connect** on the **Application Manager** menu. Without this permission, this selection is disabled.
OS Security Patch Wizard	**Import Patch**	Use **Import Wizard** to import Windows operating system patches into the Application Catalog.
	Run Analysis	Use the **Patch Impact Analysis Wizard** to analyze the impact of installing an OS Security patch on user machines.
Software Repository	**Overwrite**	Import a duplicate package into the Software Repository, overwriting the existing version.

System Roles

AdminStudio is installed with default **System Roles** which cannot be modified. These roles were created based upon the typical needs of people accessing the product, and have only the permissions that these people would require to perform their day-to-day tasks. You can assign these system roles to people within your enterprise, or can copy and then modify these roles to customize them for your organization.

Any new roles that you create, either manually or by copying and modifying system roles, are considered *user roles*. These can be freely modified.

Copied system roles or new roles that you create have a **Role Type** of **Account** (user roles), while default roles created during installation have a **Role Type** of **System** (system roles). A role's **Role Type** is listed on the **Role Administration** page and cannot be changed.

Information about system roles is organized in the following sections:

- Super User Role: AMSSuper
- Default System Roles
- Default System Accounts

Super User Role: AMSSuper

The default **AMSSuper** role has full rights to administer and use AdminStudio Enterprise Server and AdminStudio. During installation, the following super user account is created and assigned the **AMSSuper** role:

- **User Name**: `suams`
- **Password**: `suams`

Important • *Upon first login using the* `suams` *account, it is important that you change the password.*

This role is unique in that it allows the user to manage roles and accounts from all companies. All other roles are associated with a specific company within your organization, and so grant access only to roles, accounts and other entities belonging to that company.

An operator assigned the **AMSSuper** role can create administrator companies. All other tasks should be performed by a person belonging to a workflow administrator role.

Note • *The* ***AMSSuper*** *role is not listed on the* ***Role Administration*** *page unless you are logged on using the* `suams` *account.*

Default System Roles

When Workflow Manager / AdminStudio Enterprise Server is installed, the following system roles are created:

Table 6-4 • Default System Roles

Role Name	Company Name	Description
Configuration Manager	**Workflow Consumer**	Use for people managing the software configuration of computers in the enterprise, whose responsibilities may include deployment of software.
License Manager	**Workflow Consumer**	Use for people managing the license compliance of software throughout the enterprise.
Consumer Project Manager	**Workflow Consumer**	Use for people managing the requests submitted by workflow consumers.
Workflow Project Manager	**Workflow Administrator**	Use for people managing the completion of the submitted requests.

Table 6-4 • Default System Roles

Role Name	Company Name	Description
Repackager	**Workflow Administrator**	Use for people performing software application repackaging in your organization.
System Administrator	**Workflow Administrator**	Use for people who configure Workflow Manager or take action on workflow requests submitted by workflow consumers.
Tech Lead	**Workflow Administrator**	Use for people performing technical infrastructure tasks in your organization.
UA Tester	**Workflow Consumer**	Use for people performing user acceptance testing in your organization.
User	**Workflow Consumer**	Use for general workflow consumers; employees in your organization who will submit workflow requests related, for example, to installation of new software.

Note • *If you did not purchase Workflow Manager, the roles associated with the workflow consumer company are not listed.*

You can view the permissions of each of these roles by selecting the role on the **Role Administration** page, and then expanding the **Role Permissions** list.

Default System Accounts

When Workflow Manager / AdminStudio Enterprise Server is installed, an account is created for each of the system roles.

To see what functionality one of these default system accounts has, select the associated role on the **Role Administration** page, and then expand the **Role Permissions** list.

Note • *By default, the password for each of these default system accounts is the same as the text prior to the @ sign (such as **lm** for* `lm@company.com`*).*

Role Management

This section describes how to review and manage the roles created for your organization.

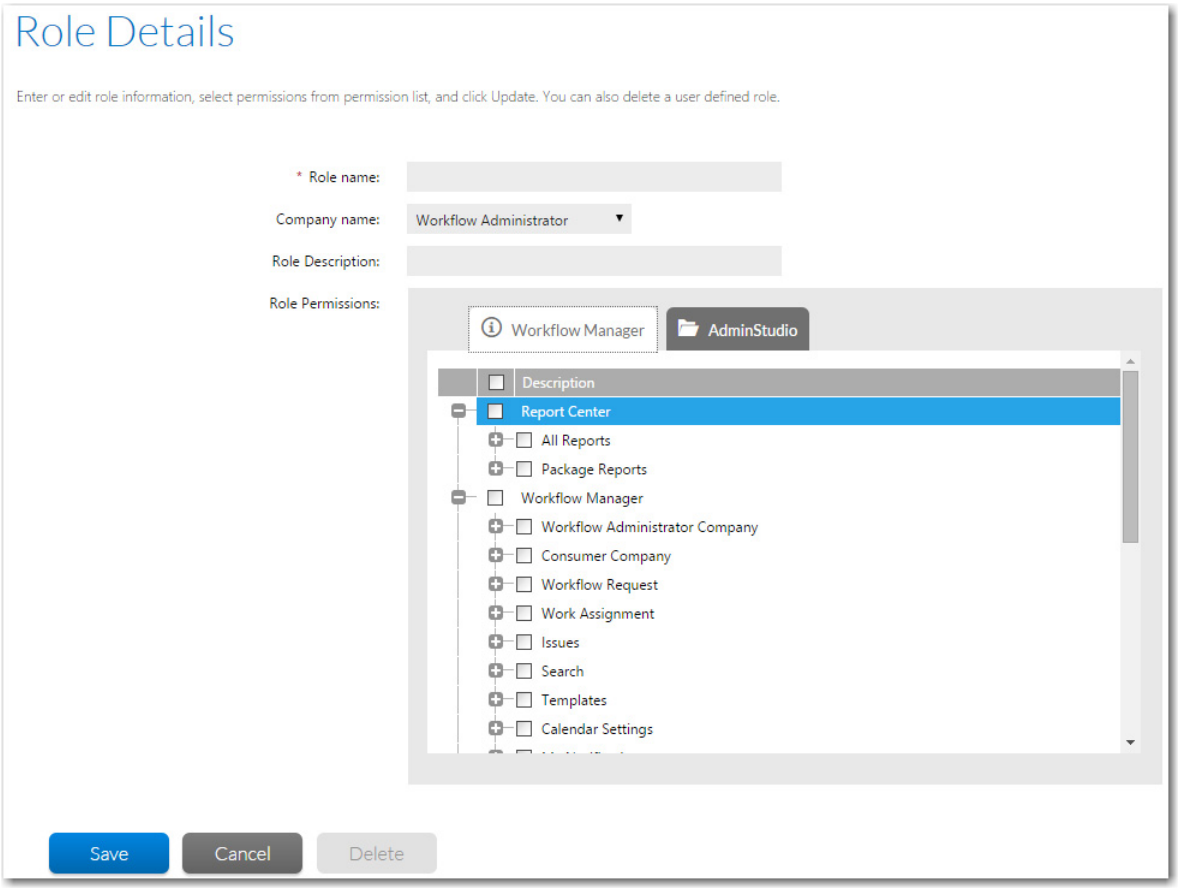
- Creating a New Role
- Viewing or Changing an Existing Role
- Copying an Existing Role
- Deleting a Role

Creating a New Role

If the default system roles aren't flexible enough to cover all security requirements in your enterprise, you may need to create new roles.

Task ***To create a new role:***

1. Click **Roles** on the **Settings** menu. The **Role Administration** page opens.
2. Click the **Add** button. The **Role Details** page opens.



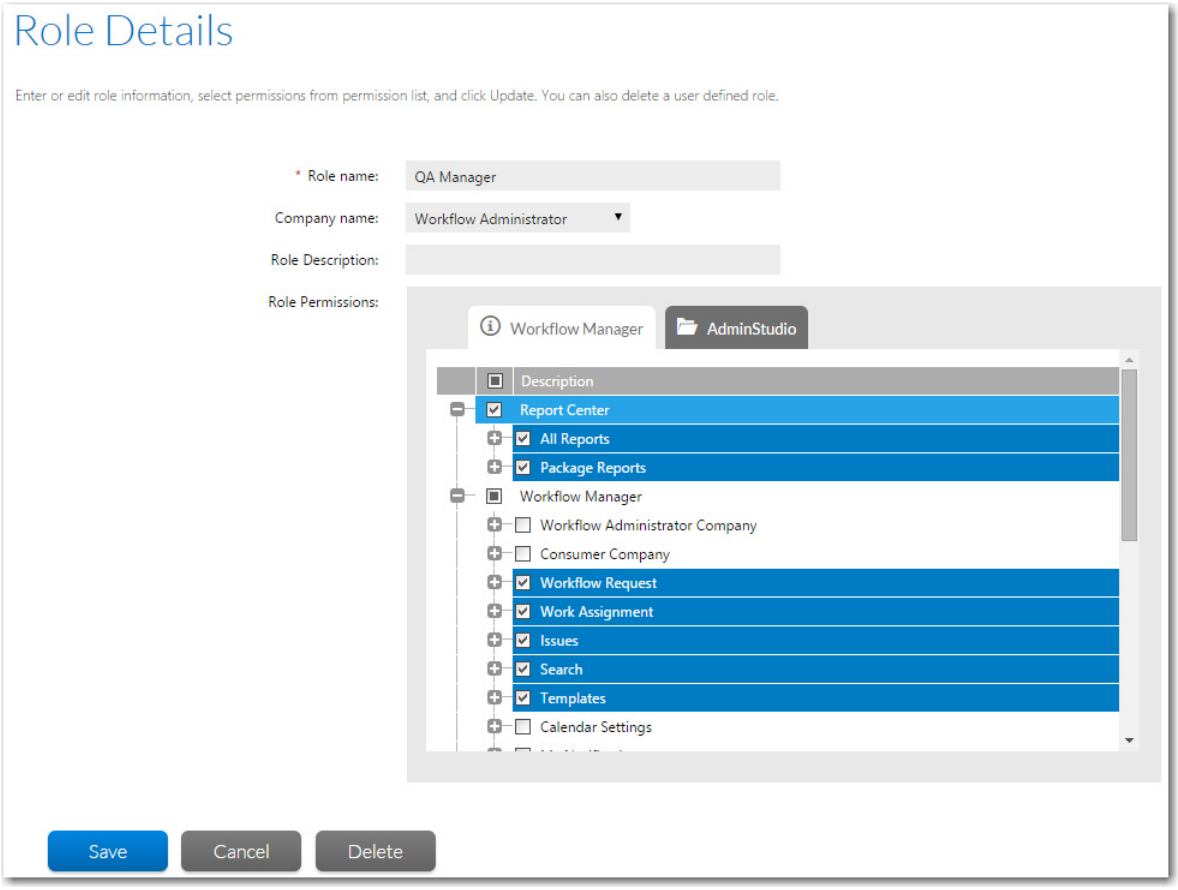
3. Enter details to identify the role, and assign appropriate permissions. For more information, see Role Details Page and Role Permission Lists.
4. Click the **Save** button. The **Role Details** page closes, and the new role now appears in the list on the **Role Administration** page.

Viewing or Changing an Existing Role

You may view the details of any role listed on the **Role Administration** page, but cannot update any of the default system roles.

Task ***To view or update an existing role:***

1. Click **Roles** on the **Settings** menu. The **Role Administration** page opens.
2. Locate the role that you want to work with.
3. Click role you want to edit. The **Role Details** page for that role opens.



4. View or update the role as required. For more information, see Role Details Page and Role Permission Lists.
5. Click **Save** to save your changes and return to the **Role Administration** page. To exit without making any changes, click **Cancel**.

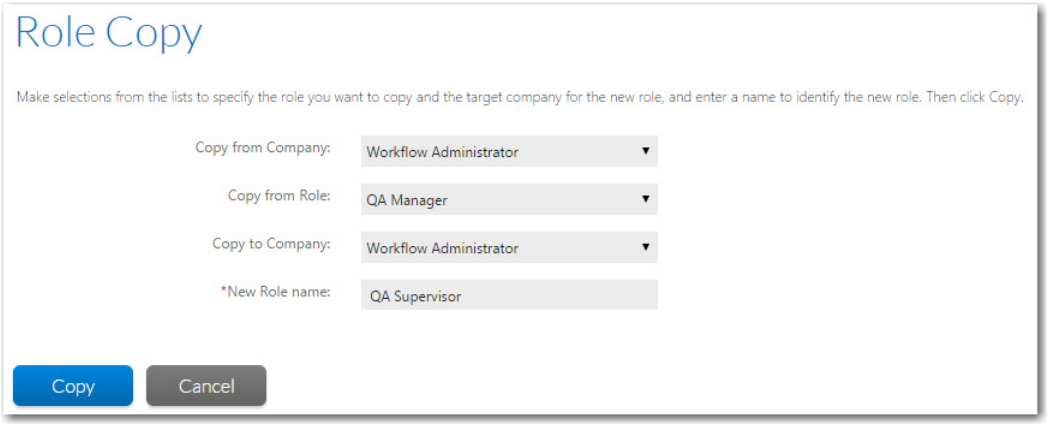
Tip • *The **Save** button will be disabled if you are viewing a system role.*

Copying an Existing Role

You can make a copy of any existing role, and then customize it for your organization. This is particularly useful for tweaking system roles, since you cannot modify them directly. Because people may only be assigned to roles created for their specific company, you may also want to copy roles if they are common to more than one of the companies defined in your organization.

Task ***To copy an existing role:***

1. Click **Roles** on the **Settings** menu. The **Role Administration** page opens.
2. Click the **Copy** button. The **Role Copy** page opens.



3. Select the name of the company whose roles you want to copy from the **Copy from Company** list.
4. Select the role you want to copy from the **Copy from Role** list.
5. Select the name of the company you are creating the new role for from the **Copy to Company** list. You may select the same company that your original role belongs to.
6. Enter a name in the **New Role Name** field to uniquely identify this role.

Note • *You are not permitted to have two roles in the same company with the same name. You can, however, use the same role name in more than one company.*

7. Click the **Copy** button. The **Role Copy** page closes, and the new role appears in the list on the **Role Administration** page.
8. If you want to edit the new role's **Role Description** or modify its permissions, perform the steps listed in Viewing or Changing an Existing Role.

Deleting a Role

If a role is no longer relevant to your organization, you can choose to delete it. You cannot remove any of the default system roles.

Task ***To delete an existing role:***

1. Click **Roles** on the **Settings** menu. The **Role Administration** page opens.
2. Click the role that you want to delete. The **Role Details** page for that role opens.
3. Click **Delete**. You are prompted to confirm the deletion.

***Tip** • The **Delete** button will be disabled if you are viewing a system role.*

4. Click **OK**. The **Role Details** page closes and the role you deleted is no longer listed on the **Role Administration** page.

Roles Reference

Reference information for roles is presented in the following sections:

- Role Administration Page
- Role Copy Page
- Role Details Page

Role Administration Page

The **Role Administration** page lists roles defined in the system. You can view this page by clicking **Roles** in on the **Settings** menu.

Use this page to:

- Drill through to a page showing the details of and permissions associated with a single existing role, where you may either update (see Viewing or Changing an Existing Role) or delete (see Deleting a Role) that role.
- Create a new role (see Creating a New Role).
- Copy an existing role (see Copying an Existing Role).

***Tip** • This page will only list roles associated with your account's company. To view all roles, you will need to log in with the super user account, assigned the **AMSSuper** role.*

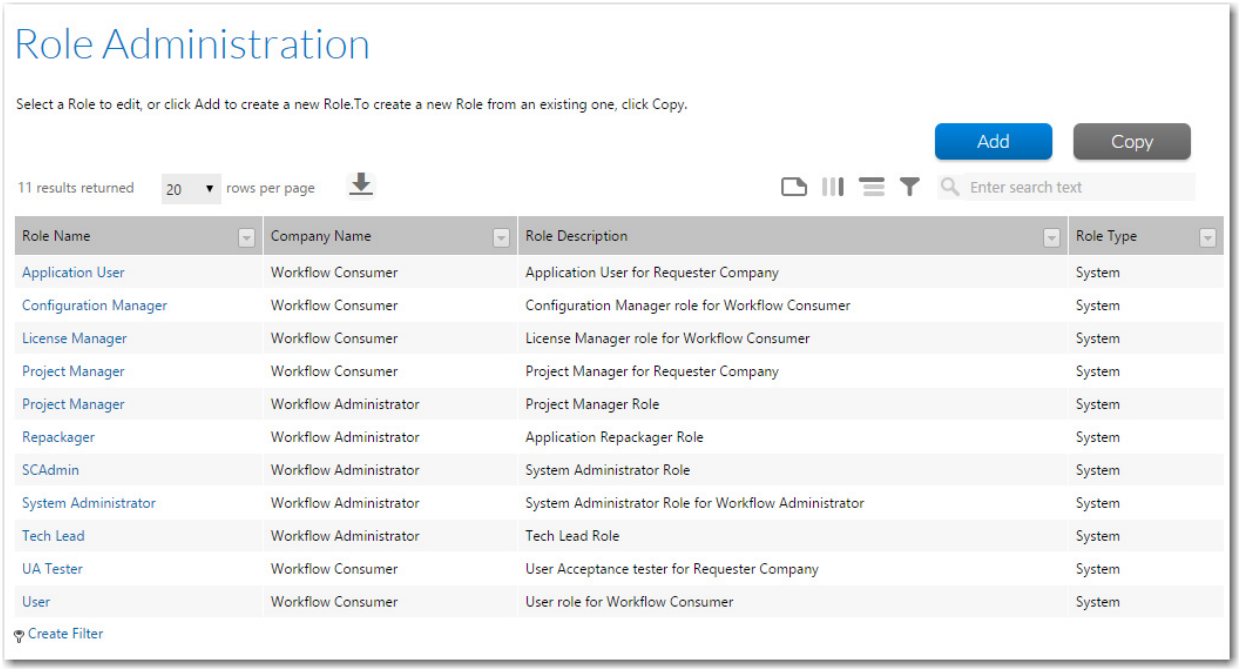


Figure 6-1: Role Administration Page

The **Role Administration** page lists the following role details, some of which are hidden by default:

Table 6-5 • Role Administration Page

Option	Description
Role Name	A brief identifier for the role.
Company Name	Only people belonging to this company can be assigned to this role.
Role Description	A more detailed description of the role's purpose.
Role Type	Identifies this role as one of the following: • **System**—Role was created during installation and cannot be deleted or modified. However, it can be copied and modified to create an **Account** role. • **Account**—Role created by an administrator either by copying an existing system role or by creating a new role. For more information, see System Roles.

Role Copy Page

Use the **Role Copy** page to copy an existing **System** or **Account** role.

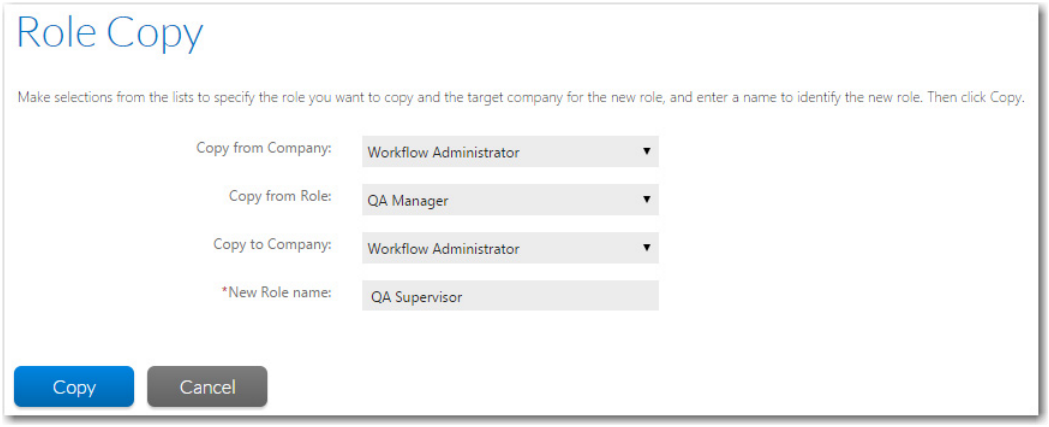

Figure 6-2: Role Copy Page

The following fields are available on the **Role Copy** page:

Table 6-6 • Fields on the Role Copy Page

Field	Description
Copy from Company	Select the name of the company that has a role that you want to copy.
Copy from Role	Select the name of the role that you want to copy. You can copy either System or Account roles.
Copy to Company	Select the name of the company that this new role is being created for.
New Role Name	Enter a name to identify this new role.

Role Details Page

The **Role Details** page allows you to view and update the details of an individual role, and to set the specific features in Workflow Manager / AdminStudio Enterprise Server that are accessible by people assigned the role. Also use this page to remove an existing role which is no longer required.

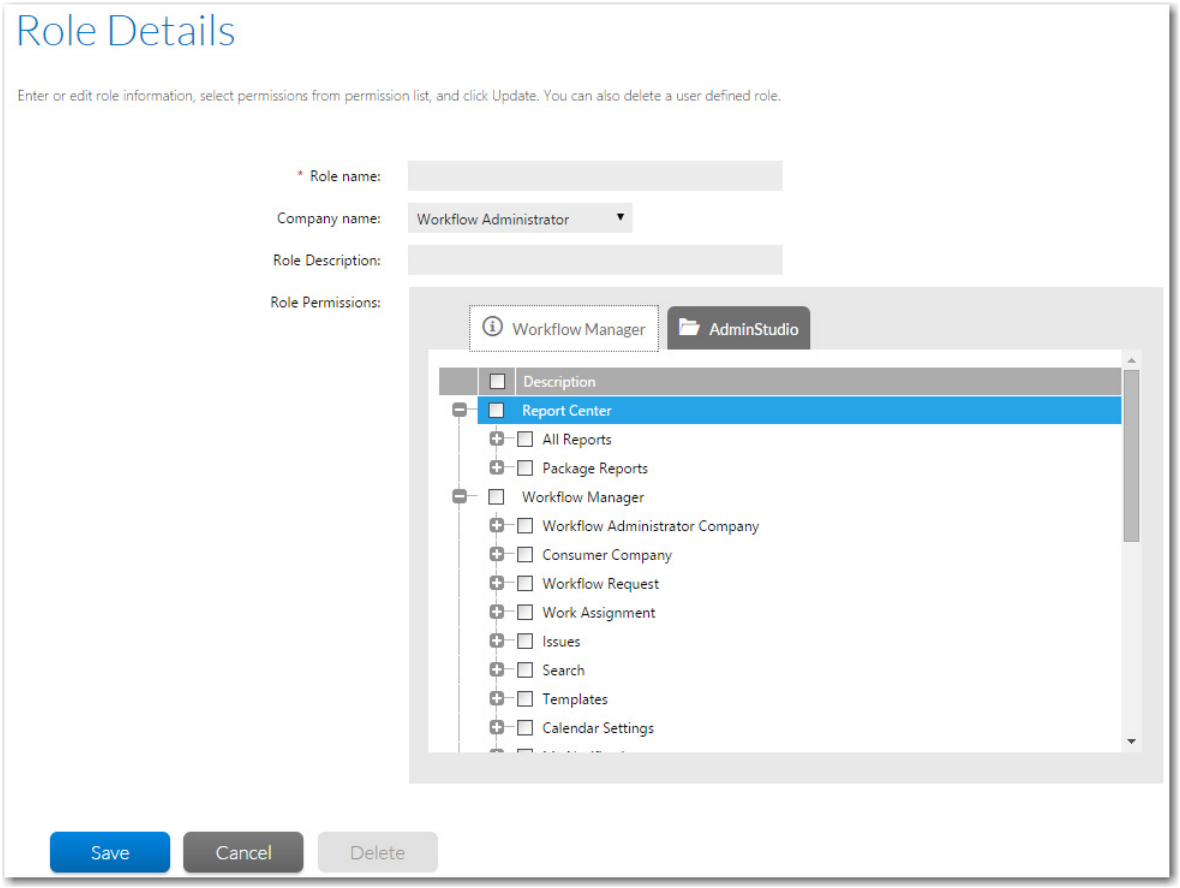

Figure 6-3: Role Details Page

The following fields are available on the **Role Details** page:

Table 6-7 • Fields on the Role Details Page

Field	Description
Role name	A brief description of the role. Roles belonging to a given company must all have distinct names.
Role company	The company that the role belongs to. This field is read-only except when you are creating a new role.
Role Description	Identify the purpose of the role.
Role Permissions list	Select the specific areas of the product that this role is to access. Expand out the tree for detailed information about the permissions available. • Selecting a check-box automatically selects all child check-boxes. • Similarly, deselecting any check-box automatically deselects all children. • You can enable access to all features in the product by clicking the **Select All** button, or remove all access by clicking **Clear All**. For more information about available permissions, see Role Permission Lists.

7

Managing Applications and Application Catalog Databases

Edition • *Application Manager is included with AdminStudio Professional and Enterprise Editions.*

The Application Catalog serves as the central repository for applications in all formats.You use Application Manager to manage your applications and their deployment types in the Application Catalog. Tasks you perform to manage your Application Catalog include importing applications and packages, setting up automatic package import, organizing packages into groups, viewing and editing application and package data, and viewing reports on Application Catalog data.

Information about using Application Catalogs is organized into the following sections:

Table 7-1 • Topics Regarding Using Application Catalogs

Section	Description
About the AdminStudio Host Process	Describes the AdminStudio Host Process, which is where most of Application Manager's core functionality resides.
Managing Application Catalogs	Explains how to create, connect to, search for, organize, view information about, and delete packages from an Application Catalog.

Table 7-1 • Topics Regarding Using Application Catalogs (cont.)

Section	Description
Importing	Explains how to import the following deployment types into the Application Catalog: • Windows Installer packages (**.msi)** with any associated transforms (**.mst**) or patches (**.msp**) • Applications and packages from Microsoft System Center Configuration Manager • Virtual applications in Microsoft App-V, Citrix XenApp, VMware ThinApp, and Symantec Workspace formats • Mobile apps in Apple iOS, Google Android, and Windows Store formats • Mac OS X desktop applications in **.dmg**, **.pkg**, and Apple Mac App Store app formats • Installation packages (**.exe**), both legacy installers and complex installer executables that may contain bundled packages • Merge modules (**.msm**) • OS snapshots (**.osc**) • Web applications • Web deploy packages (**.zip**)
Automatically Importing Packages from a Network Directory	Describes how to automatically import packages from one or more network directories using the Package Auto Import feature. Includes support for batch import of Microsoft Security Patch files (**.msu**) and iOS Enterprise Policy Configuration Files (**.mobileconfig** or **.plist**).
Viewing Application Testing and Analysis Reports on the Report Center Tab	Describes the available Application Manager reports that are displayed on the Report Center tab, and explains how to create your own custom reports.
Managing System Center 2012 Configuration Manager Application Model Data	Describes how to view metadata for applications in Application Manager.
Managing Mac OS X Desktop Application Metadata	Describes how to view extracted metadata for Mac OS X desktop applications.
Managing Mobile App Metadata	Explains how to view extracted mobile app data, how to manage iOS Enterprise Policy Configuration files, and how to view mobile app reports.
Managing App Portal Application Information	Describes how to view and edit the information used when an application is added to the App Portal catalog: title, descriptions, categories, template, and keywords.

Table 7-1 • Topics Regarding Using Application Catalogs (cont.)

Section	Description
Enabling Application Extended Attributes	Explains how to record custom data for applications by defining custom extended attributes, and displaying those attributes on a new **Extended Attributes** tab of the **Application View**.
Managing System Center 2012 Configuration Manager Package Deployment Data	Describes how to view and edit data related to the deployment of packages to Microsoft System Center 2012 Configuration Manager.
Managing App-V Package Deployment Data	Describes how to view and edit data related to the deployment of App-V 5.0 packages.
Managing Casper Package Deployment Data	Describes how to view and edit data related to the deployment of Mac OS X packages to JAMF Casper Server.
Managing Citrix XenApp Package Deployment Data	Describes how to view and edit data related to the deployment of packages to Citrix XenApp Server.
Managing Altiris Package Deployment Data	Describes how to view and edit data related to the deployment of packages to Symantec Altiris Server.
Managing AirWatch Package Deployment Data	Describes how to view and edit data related to the deployment of packages to AirWatch Server.
Managing App-V Virtual Environments	Explains how to create App-V virtual environments for App-V 5.0 packages for both Microsoft App-V Servers and Microsoft System Center 2012 Configuration Manager Servers.
Viewing Additional Package Data	Describes how to view and edit package metadata for Windows Installer and App-V packages in Application Manager.
Using the Conversion Wizard	Explains how to upgrade an App-V 4.6 package in your Application Catalog to App-V 5.0 format. Also explains how to use the Conversion Wizard to perform conversion of Windows Installer or legacy packages to specified virtual formats or to perform repackaging.
Using Test on Virtual Machine Wizard	Explains how to use this wizard to quickly launch a specified virtual machine and install a selected Windows Installer (.msi) or installation executable (.exe) package (both legacy installers and complex installation executables) for testing.
Using the Software Repository	Explains how to manage a software package's associated installation files using the Software Repository.
Taking OS Snapshots	Explains how to create OS Snapshots using the OS Snapshot Wizard.

Table 7-1 • Topics Regarding Using Application Catalogs (cont.)

Section	Description
Reference	Describes the Application Manager interface, and the views, wizards and dialog boxes related to managing Application Catalog databases.

About the AdminStudio Host Process

Most of Application Manager's core functionality resides in the AdminStudio Host Process, separate from its user interface.

Using a host process gives AdminStudio better scalability and enables the development of clients that use Application Manager's core functionality. For example the Application Manager user interface and the Platform PowerShell APIs are now clients to this AdminStudio Host process.

- Ability to Run as a Windows Process or a Windows Service
- Opening the AdminStudio Host Dialog Box
- Changing AdminStudio Host Run Modes

Important • *AdminStudio Host must be running in order to use Application Manager or the Platform API.*

Ability to Run as a Windows Process or a Windows Service

AdminStudio Host can run either as a standalone Windows Process (the default setting) or as a Windows Service running under a given account (which is, by default, the `LocalSystem` user account).

- **Run as Windows Process to use Windows Authentication**—It is more advantageous to run AdminStudio Host as a Windows Process than as a Windows Service because, while running as a current user, any code executed by this server component will run under the current user's context. This enables Application Manager to use Windows Authentication to automatically connect to System Center Configuration Manager, a System Center Configuration Manager publishing location, or an SQL Server.
- **Run as a Windows Service to configure Application Manager as a server application**—If you set up Application Manager as a server application on a server machine, you could then run AdminStudio Host as a Windows Service using one central user account, eliminating the need for user logins.

Note • *The ability to set up Application Manager as a server application will be included in a future release.*

Opening the AdminStudio Host Dialog Box

When Application Manager is launched, the AdminStudio Host process is automatically started, and its icon is added to the System Tray.

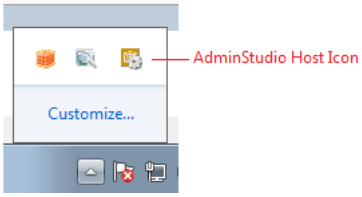

Figure 7-1: AdminStudio Host Icon in System Tray

To open the **AdminStudio Host** dialog box double-click its icon in the System Tray:

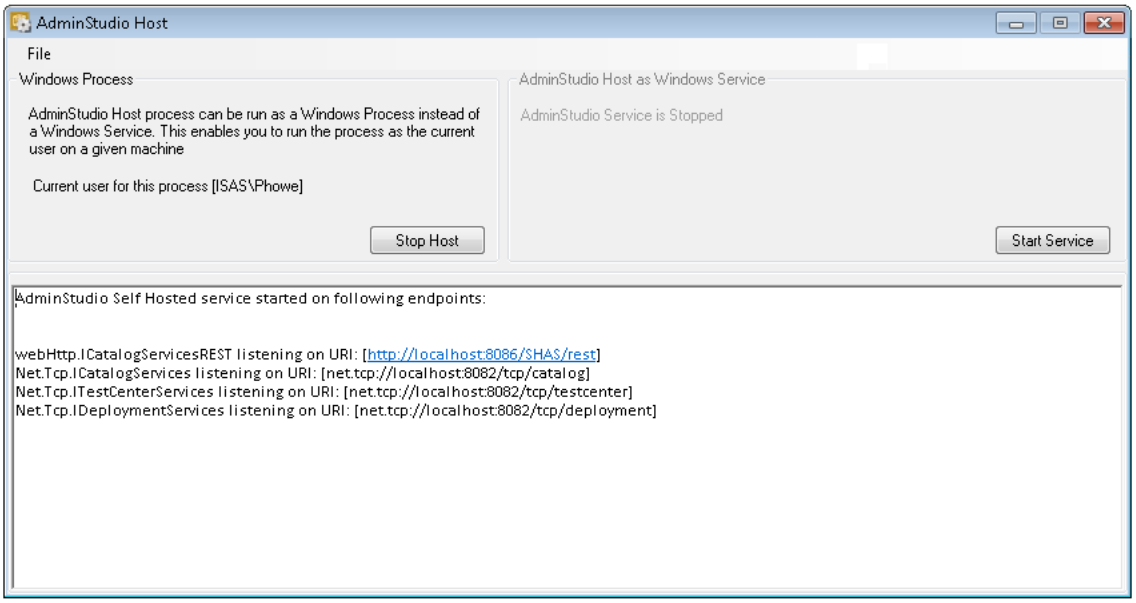

Figure 7-2: AdminStudio Host Dialog Box

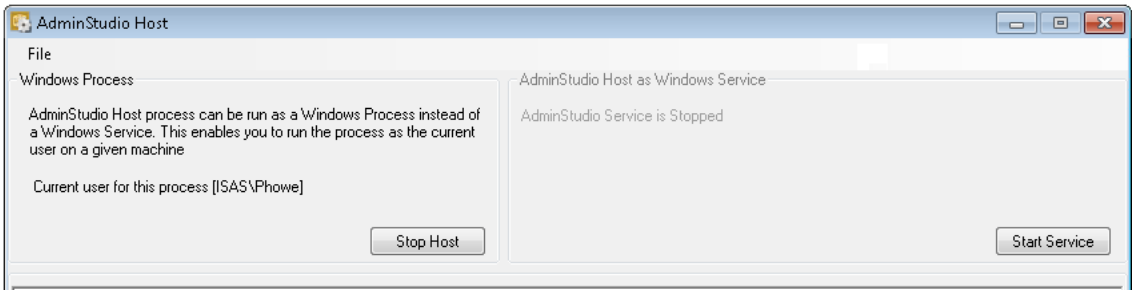
Changing AdminStudio Host Run Modes

AdminStudio Host can run in two modes: as a Windows Process or a Windows Service. If you want to switch the AdminStudio Host run mode, perform the following steps.

Task ***To change the AdminStudio Host run mode:***

1. Launch Application Manager. The AdminStudio Host process is automatically started, and its icon is added to the System Tray.
2. Double-click the AdminStudio Host icon in the System Tray. The **AdminStudio Host** dialog box opens. The top portion of the dialog box indicates whether AdminStudio Host is running as a **Windows Process** or a **Windows Service**:



3. Do one of the following:
   - **To change from Process to Service**—First click **Stop Host**, and then click **Start Service**.
   - **To change from Service to Process**—First click **Stop Service**, and then click **Start Host**.

Managing Application Catalogs

Package information is stored in Application Catalogs. When you use Application Manager, you will either automatically be logged into an Application Catalog, or you will have to connect to an existing catalog. Once you have connected to a catalog, you can manipulate data in Application Manager, including creating and organizing groups and entering extended attribute data.

The following topics relate to Application Catalog management:

- About AdminStudio Application Catalogs
- About the Application Manager Ribbon Interface
- Connecting to an Application Catalog for the First Time
- Connecting to an Existing Application Catalog
- Creating New Application Catalogs
- Upgrading an Existing Application Catalog
- Specifying a Default AdminStudio Application Catalog
- Creating Multiple Named Connections to Distribution Systems
- Integrating with Other Flexera Software Applications via the Flexera Service Gateway
- Managing an Application's Flexera Identifier
- Entering Microsoft ACT Database Connection Settings
- Searching an Application Catalog
- Disconnecting from an Application Catalog
- Organizing Your Application Catalog Using Groups
- Deleting Packages and Applications
- Browsing to Package Location from Application Manager Tree

About AdminStudio Application Catalogs

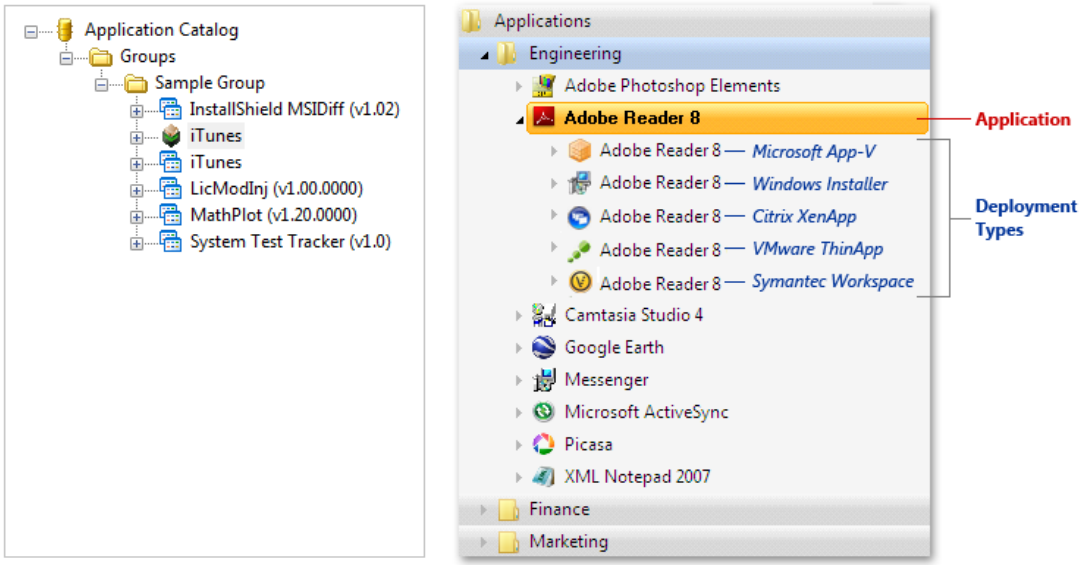
This section provides the following information:

- Application Manager Organization and Structure
- Overview of Application Catalogs
- Standalone Application Catalog vs. the AdminStudio Enterprise Server Application Catalog
- Required Permissions on Application Catalog Databases

Application Manager Organization and Structure

In earlier releases, AdminStudio's Application Catalog was organized into packages of multiple deployment types, categorized into user-defined groups. Since the Version 10.0 release, AdminStudio has used an application-centric organization model. The tree has been restructured to display multiple deployment formats under a parent **Application** node. One application can have multiple packages (or deployment types) such as Windows Installer, Microsoft App-V, Citrix XenApp, VMware ThinApp, Symantec Workspace, Apple iOS, Google Android, etc.

The following image illustrates how Application Manager's tree structure has changed.



AdminStudio 9.5
"Package Centric" Model

AdminStudio 2014
"Application Centric" Model

Figure 7-3: AdminStudio's Application Model

Application Manager's application-centric structure uses the following icons to represent applications and their deployment types:

Table 7-2 • Application Manager Tree Icons

Icon	Description
	Group

Table 7-2 • Application Manager Tree Icons

Icon	Description
	Application (Default)  ***Note*** • *For most applications, an icon included in the application files is used to represent it in the tree. If an application does not include an icon, this default icon is used.*
	Windows Installer package (**.msi**)
	Microsoft App-V 4.x (**.sft**) and Microsoft App-V 5 (**.appv**) virtual packages
	Citrix XenApp virtual package (**.profile**)
	VMware ThinApp virtual package (**.exe**)
	Symantec Workspace virtual package (**.xpf**)
	Apple iOS mobile app (**.ipa**)
	Apple iOS mobile app (link to public store)
	Google Android mobile app (**.apk**)
	Google Android mobile app (link to public store)
	Windows Store mobile app (**.appx**)
	Windows Store mobile app (link to public store)
	Legacy application (**.exe**)
	Web application

Deployment types (packages) are grouped under Application nodes, and Applications are grouped into Groups.

Overview of Application Catalogs

To perform enterprise level testing, it is very efficient if the data can be consolidated into a single database. The AdminStudio Application Catalog database consolidates data from many installation packages in a single location.

Application Catalogs can contain the contents of: Windows Installer (**.msi**) packages; Merge Module (**.msm**) packages; OS snapshots (**.osc**); virtual packages in Microsoft App-V, Citrix XenApp, VMware ThinApp, and Symantec Workspace formats; and mobile apps in Apple iOS, Google Android, and Windows Store formats. Depending upon the import options that are set, an Application Catalog can also include binary records. Application Catalogs can also store application, workflow, permissions, Microsoft Patch, and Workflow Manager data.

Sharing Application Catalogs

In multi-user environments, the AdminStudio Application Catalog is typically shared. The AdminStudio Administrator can make a shared catalog the default catalog, which results in all AdminStudio users who use the same shared location using the same shared Application Catalog. If the shared Application Catalog is changed, users will automatically open up the new shared Application Catalog. For more information, see Specifying a Default AdminStudio Application Catalog.

Sharing Application Catalog Data

You can use the **Package Auto Import** feature to automatically import or re-import all packages in a specific directory into your Application Catalog.

For detailed information, see Automatically Importing Packages from a Network Directory.

Standalone Application Catalog vs. the AdminStudio Enterprise Server Application Catalog

***Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.*

***Edition** • AdminStudio Enterprise Server Tools are included with AdminStudio Enterprise Edition.*

You can connect to any standalone SQL Server Application Catalog, or you can connect to the AdminStudio Enterprise Server Application Catalog:

- **Standalone**—A Standalone Application Catalog is not associated with the Enterprise Server tools. The AdminStudio client tools connect directly to the database server hosting the standalone Application Catalog.
- **AdminStudio Enterprise Server**—All of the AdminStudio Enterprise Server tools—Security Console, Report Center, and Workflow Manager—are connected to the AdminStudio Enterprise Server Application Catalog. AdminStudio client tools can also connect to this Application Catalog, allowing you to store all data generated on a package in the same location, and to link packages in this Application Catalog to Workflow Manager workflow requests.

  ***Note** • AdminStudio Enterprise Tools are always connected to the AdminStudio Enterprise Server database.*

For more information on using Application Catalogs, see the following:

- Connecting AdminStudio Client Tools to a Standalone Application Catalog
- Connecting AdminStudio Client Tools to the AdminStudio Enterprise Server Application Catalog

Required Permissions on Application Catalog Databases

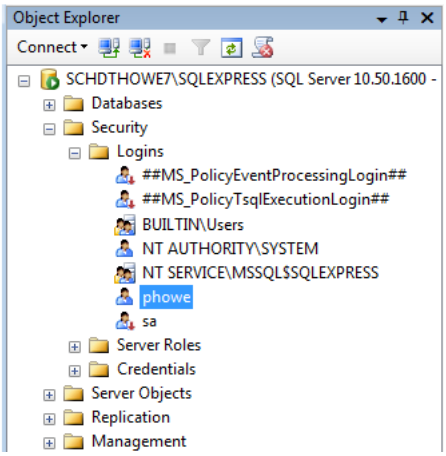
In order to connect to an AdminStudio Application Catalog database, users require the following permissions on the database:

- `db_datareader`
- `db_datawriter`
- `alter`
- `execute`

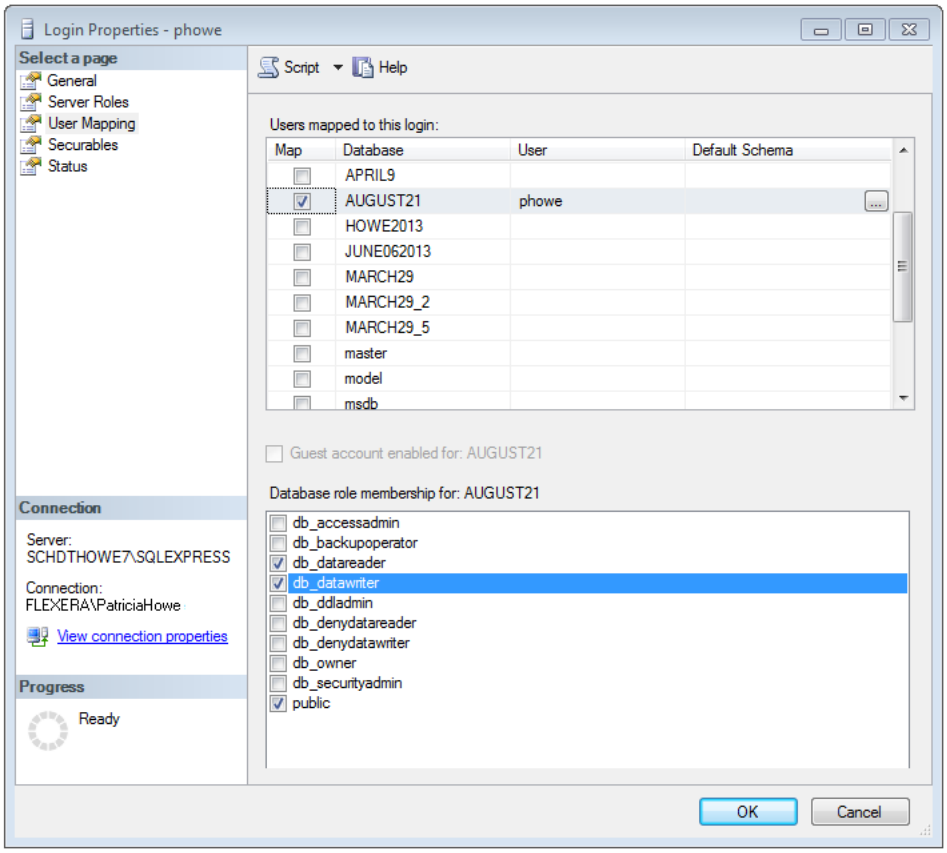
To assign these required permissions, perform the following steps:

Task ***To assign required permissions to an AdminStudio Application Catalog:***

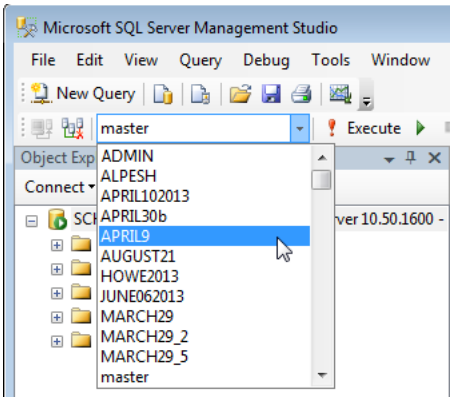
1. Open Microsoft SQL Server Management Studio.
2. In the **Object Explorer**, open the **Security > Logins** node and right-click on the user account or user group that you want to assign permissions to.



3. Select **Properties** from the shortcut menu. The **Login Properties** dialog box opens.
4. Select **User Mapping** in the tree. The **User Mapping** view of the **Login Properties** dialog box opens.



5. In the **Users mapped to this login** list, select the database that you want to assign permissions to.
6. In the **Database role membership for: [DatabaseName]** list, select `db_datareader` and `db_datawriter`.
7. Click **OK** to close the **Login Properties** dialog box.
8. In the toolbar, open the drop-down list and select the name of the AdminStudio database that you want to assign permissions to.



9. Next, click the **New Query** button in the toolbar to open the **Query Editor**.
10. Enter the following query:

```
grant execute to [username]
```

```
grant alter to [username]
grant references to [username]
```

For example:

```
SQLQuery1.sql - SCHDTHOWE7\...52))*
  grant execute to [phowe]
  grant alter to [phowe]
  grant references to [phowe]
```

11. Click the **Execute** button in the toolbar. The following message will be displayed:

```
Command(s) completed successfully.
```

About the Application Manager Ribbon Interface

Application Manager includes a ribbon interface to provide quick and easy access to Application Manager tasks.

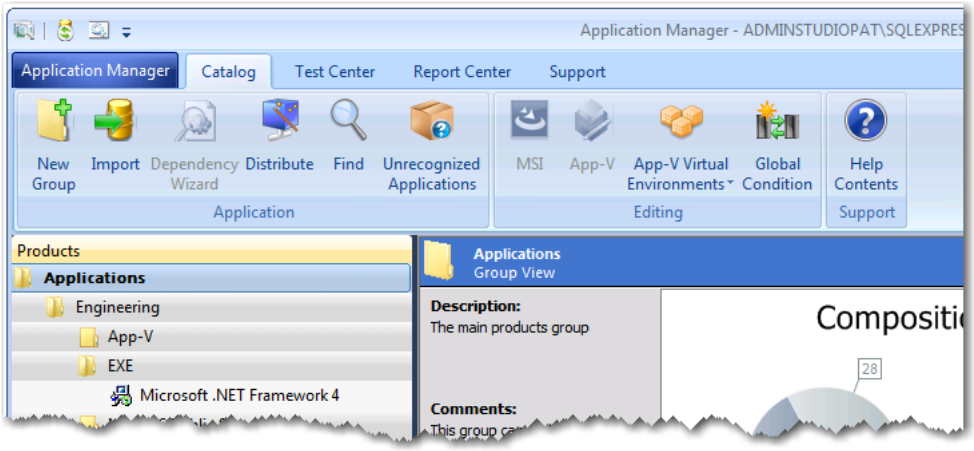


Figure 7-4: Application Manager's Ribbon Interface

The ribbon interface includes the **Application Manager** tab menu, along with buttons that are grouped in four additional tabs: **Catalog**, **Test Center**, **Report Center**, and **Support**.

- Application Manager Tab Menu
- Catalog Tab
- Test Center Tab
- Report Center Tab
- Support Tab

Note • *The Application Manager ribbon interface incorporates all of the functionality that, in previous releases, was available in the menus.*

Application Manager Tab Menu

The Application Manager tab menu is opened by clicking the **Application Manager** tab:

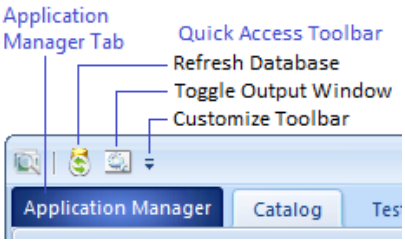

Figure 7-5: Application Manager Tab and Other Controls

The Application Manager tab menu includes database connection related tasks, as well as commands for setting Application Manager options, and for exiting from the application.

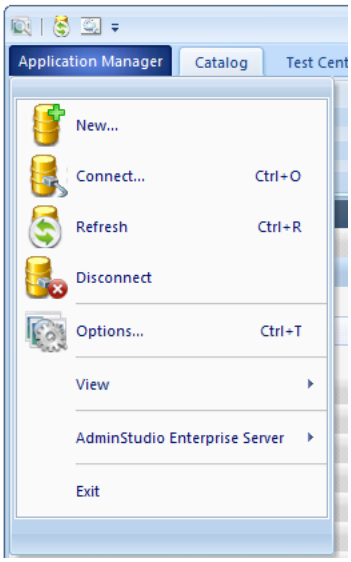

Figure 7-6: Application Manager Tab Menu

For detailed information on each of the items on this menu, see Application Manager Tab Menu.

Catalog Tab

The **Catalog** tab includes buttons to import packages into the Application Catalog, edit packages, use Software Repository commands, and distribute packages.

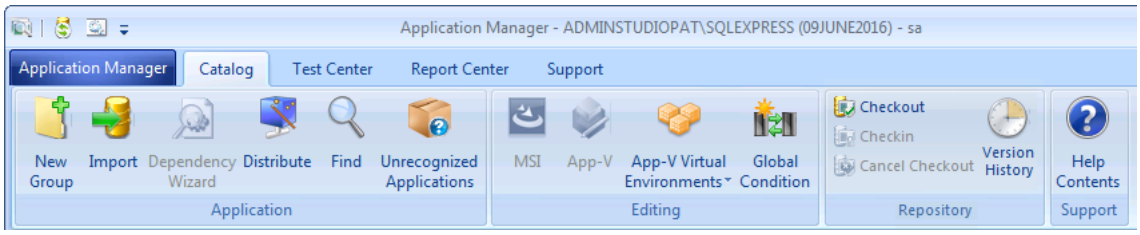

Figure 7-7: Catalog Tab of Application Manager Ribbon

For detailed information on each of the buttons on this tab, see Catalog Tab of Application Manager Ribbon.

Test Center Tab

The **Test Center** tab includes buttons to analyze a package's readiness for deployment and to detect and resolve package conflicts.

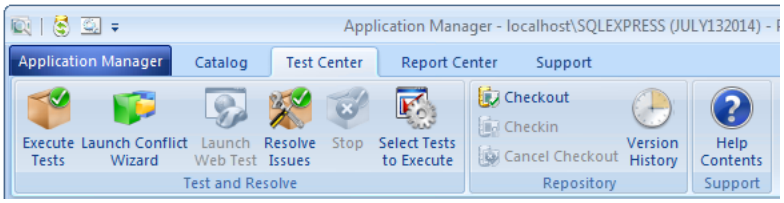

Figure 7-8: Test Center Tab of Application Manager Ribbon

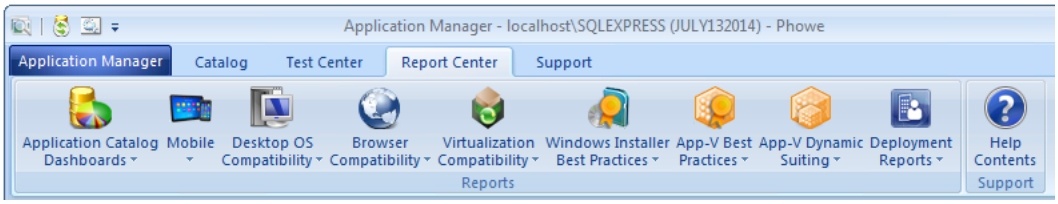
For detailed information on each of the buttons on this tab, see Test Center Tab of Application Manager Ribbon.

Report Center Tab

When you select the **Report Center** tab of the Application Manager ribbon, you can view detailed reports on the test results and overall status of the applications and packages in the Application Catalog. For more information, see Report Center Tab of Application Manager Ribbon.



Support Tab

The **Support** tab includes buttons to give you quick access to the AdminStudio help library and information specific to the current release of AdminStudio.

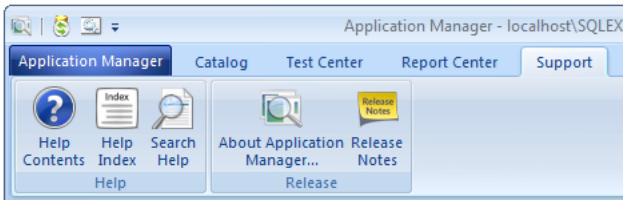


Figure 7-9: Support Tab of Application Manager Ribbon

For detailed information on each of the buttons on this tab, see Support Tab of Application Manager Ribbon.

Connecting to an Application Catalog for the First Time

When you initially open AdminStudio, because a default Application Catalog has not yet been set, the **Default Application Catalog** dialog box opens, prompting you to either create a new Application Catalog to connect to an existing Application Catalog.

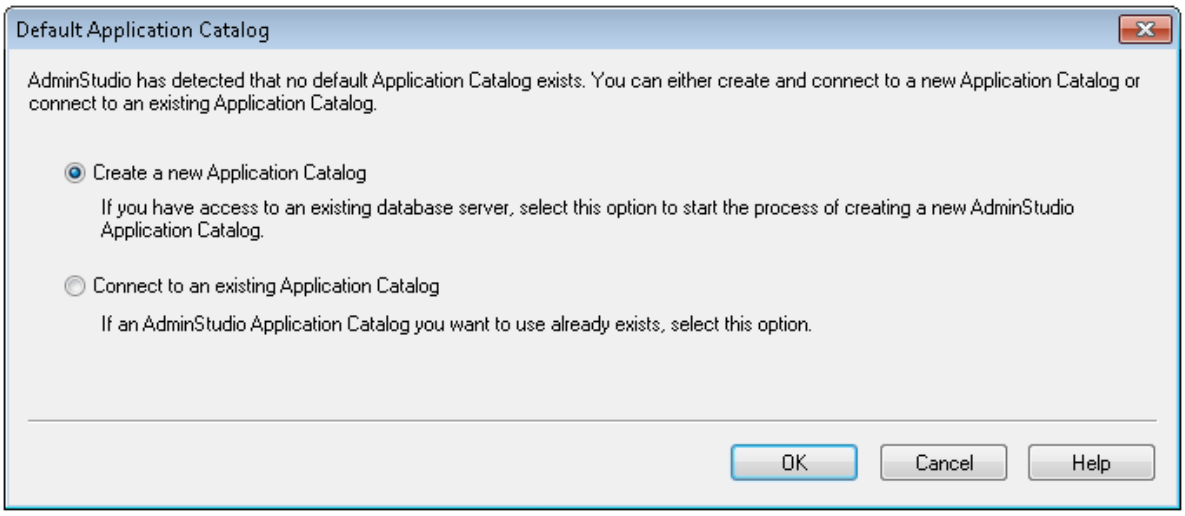

Figure 7-10: Default Application Catalog Dialog Box

To get started using AdminStudio, select one of the following options:

- **Create a new Application Catalog**—Choose this option to create a new Application Catalog database on the SQL Server database server that you specify. The **Application Catalog Wizard** opens.
- **Connect to an existing Application Catalog**—Choose this option to connect to an existing AdminStudio Application Catalog database. The **Connect Application Catalog** dialog box opens.

Note *• In previous releases of AdminStudio, you could choose the* ***Quick Start*** *option on this dialog box to instruct AdminStudio to automatically install Microsoft SQL Server 2005 Express on your machine and create a new Application Catalog. Starting with AdminStudio 11.5, the* ***Quick Start*** *option is no longer included on this dialog box. However, if you do not have access to a Microsoft SQL Server database, you can download and install the current version of Microsoft SQL Server Express from the Microsoft website. For more information, see the SQL Server Express Edition page of the Microsoft website.*

Connecting to an Existing Application Catalog

Edition *• AdminStudio Enterprise Server Tools are included with AdminStudio Enterprise Edition.*

From Application Manager, you usually connect to an Application Catalog by selecting **Connect** on the Application Manager tab menu. From AdminStudio, you select **Connect** on the **Catalog** menu. AdminStudio supports SQL Server databases.

You can choose to connect to a standalone Application Catalog database or the AdminStudio Enterprise Server Application Catalog database.

- Connecting AdminStudio Client Tools to a Standalone Application Catalog
- Connecting AdminStudio Client Tools to the AdminStudio Enterprise Server Application Catalog

***Note** • See Standalone Application Catalog vs. the AdminStudio Enterprise Server Application Catalog for more information.*

***Note** • AdminStudio Enterprise Tools are always connected to the AdminStudio Enterprise Server database.*

Connecting AdminStudio Client Tools to a Standalone Application Catalog

To connect to an existing Standalone Application Catalog from Application Manager, perform the following steps.

Task ***To connect to an existing Standalone Application Catalog from the AdminStudio client tools:***

1. Perform one of the following:
   - **AdminStudio**—On the **Catalog** menu, click **Connect**.
   - **Application Manager**—On the Application Manager tab menu, click **Connect**.

   The **Connect Application Catalog** dialog box opens, displaying three tabs: **Enterprise Server**, **Standalone**, and **Recent**.
2. Click the **Standalone** tab. The Standalone tab opens, prompting you to enter database connection information.
3. If you want this Application Catalog to be the default shared Application Catalog used in your organization, select the corresponding option at the bottom of the dialog box.
4. Select the **Server** where the Application Catalog is stored.
5. Specify how the database server should verify the authenticity of the login—either using **Windows Authentication** or **Server Authentication**. If you selected **Server Authentication**, enter the appropriate **Login ID** and **Password**.
6. In the **Catalog** box, enter the name of the Application Catalog you want to open.
7. Click **Test** to test the connection to the database.
8. Click **OK**.

Connecting AdminStudio Client Tools to the AdminStudio Enterprise Server Application Catalog

The AdminStudio Enterprise tools—Report Center, Security Console, and (optionally) Workflow Manager—are configured during installation to connect to an Application Catalog, which is referred to as the Enterprise Server Application Catalog.

You can also connect the AdminStudio *client* tools to the Enterprise Server Application Catalog. This allows you to have all of the client and enterprise tools reference the same database.

To connect to the AdminStudio Enterprise Server application catalog from an AdminStudio client tool, perform the following steps.

Task ***To connect to the AdminStudio Enterprise Server Application Catalog:***

1. Perform one of the following:
   - **AdminStudio**—On the **Catalog** menu, click **Connect**.
   - **Application Manager**—On the Application Manager tab menu, click **Connect**.

   The **Connect Application Catalog** dialog box opens, displaying three tabs: **Enterprise Server**, **Standalone**, and **Recent**.
2. Open the **Enterprise Server** tab.
3. The URL to the AdminStudio Enterprise Server is listed above the **Authentication** field. If the AdminStudio Enterprise Server has not yet been configured with the AdminStudio client tools (such as when it is set to its default value of **http://localhost**), click the URL link to open the **Select AdminStudio Enterprise Server URL** dialog box, and enter the URL for location of the AdminStudio Enterprise Server associated with this installation of AdminStudio.
4. From the **Authentication** list, select either **AdminStudio Enterprise Server User** or **Windows Authentication**.

   Important • *When using **AdminStudio Enterprise Server User** authentication, if Anonymous authentication is turned off in IIS, both the user's machine and the AdminStudio Enterprise Server need to be on the same domain in order for login to succeed.*
5. If you selected **AdminStudio Enterprise Server User**, enter your AdminStudio Enterprise Server **User Name** and **Password** (provided by your System Administrator).
6. Click **Login**. After a successful login, the **Provider**, **Server**, and **Catalog** name of the Enterprise Server database is listed.
7. Click **OK**.

Login Troubleshooting: Error 0x800A1518

If you are using a Workflow Manager Web Portal website with custom security zone settings and your AdminStudio Enterprise Server URL is using an IP address, you may receive Error 0x800A1518 when you attempt to connect to the AdminStudio Enterprise Server database from Application Manager or the AdminStudio interface.

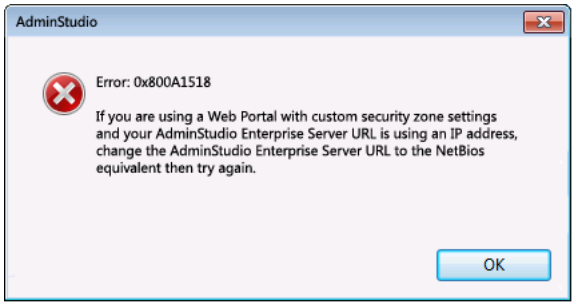

Figure 7-11: Error 0x800A1518

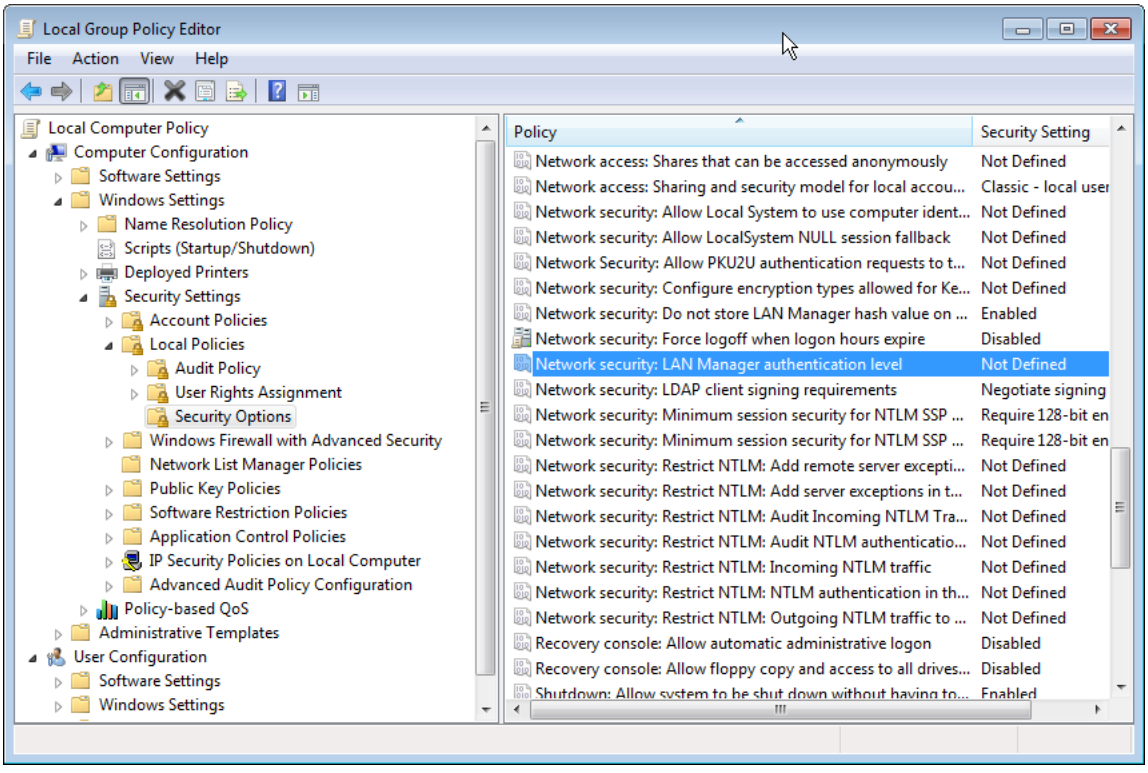
Windows has a policy setting that is not set by default: **Network security: LAN Manager authentication level**. If both the client workstation and the web server do not have this policy configured, they will sometimes not communicate properly, and this prevents AdminStudio from being able to connect to the catalog database. This can be an intermittent problem.

If you receive this error, first change the AdminStudio Enterprise Server URL to the NetBios equivalent and then try again. For example, if you are connecting to **http://120.12.1.15**, the NetBios equivalent would be **http://wfmportal**.

Also, if you are using Kerberos and different levels of authentication on your network, be sure that the workstations and servers all use the same settings. In particular, the **Network security: LAN Manager authentication level** must be set to the same value throughout the network, otherwise it may not be possible to log into a Workflow Manager Portal website that uses Windows Authentication. To set the LAN Manager authentication level, perform the following steps:

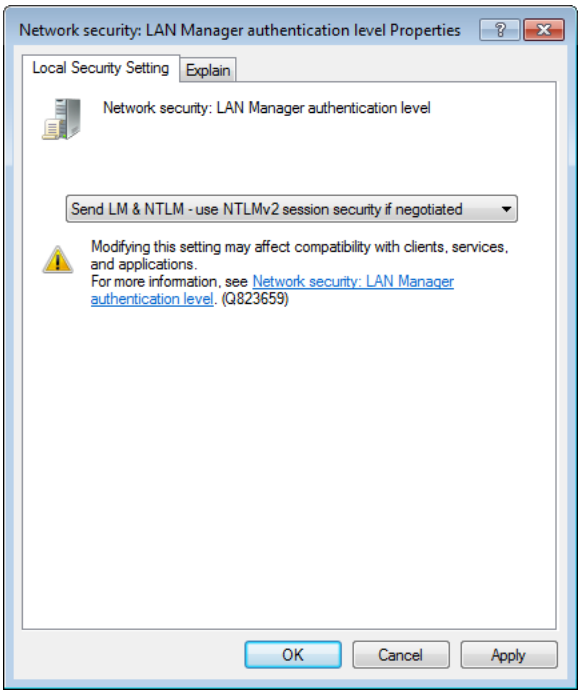
Task ***To set the Network security: LAN Manager authentication level:***

1. On the client machine, run `gpedit.msc` to open the Windows **Local Group Policy Editor**.
2. In the **Local Computer Policy** tree, select **Computer Configuration > Windows Settings > Security Settings > Local Policies > Security Options**. The **Security Options** view opens.
3. Locate the **Network security: LAN Manager authentication level** policy.



***Note** • If the **Network Security: LAN Manager authentication level** is set to **Not Defined** on both a Windows 7 client and a Windows Server 2012 server, AdminStudio cannot connect to the Windows Server 2012 and the 0x800A1518 error could be generated.*

4. Double-click on **Network Security: LAN Manager authentication level** to open its **Properties** dialog box.



5. Select **Send LM & NTLM - use NTLMv2 session security if negotiated** from the list and click **OK**.
6. Repeat the above procedure to modify the **Network Security: LAN Manager authentication level** setting on the server machine.

Creating New Application Catalogs

You can create new Application Catalogs using the AdminStudio interface, or using scripts. This section includes the following topics:

- Creating New Application Catalogs Using the AdminStudio Interface
- Creating New Application Catalogs Using Scripts

Creating New Application Catalogs Using the AdminStudio Interface

To create a new SQL Server application catalog database, perform the following steps.

Task ***To create a new standalone Application Catalog:***

1. Click **New** on the Application Manager tab menu (or click **Create** on the AdminStudio **Catalog** menu). The **Welcome** panel of the **Application Catalog Wizard** opens.
2. Click **Next**. The **Specify Database Information** panel opens.
3. Enter or select the name of the **Server** where this Application Catalog will be stored.
4. Specify how the database server should verify the authenticity of the login—either using **Windows Authentication** or **Server Authentication**. If you selected **Server Authentication**, enter the appropriate **Login ID** and **Password**.
5. In the **Catalog** box, enter the name of the Application Catalog you are creating.
6. Click **Test** to test the connection to the database.
7. Click Next. The **Select Software Repository Location** panel opens, prompting you to select the location where the Software Repository will store imported packages and their associated files. For more information, see Using the Software Repository.
8. If you want to store data associated with this Application Catalog's packages in the Software Repository, choose the **Enable the Software Repository** option, select a **Software Repository Location**, and enter a **Login ID** and **Password** of the **Proxy Account** that must be used to access this Repository.

   Note *• The Proxy Account needs full control on the* ***Software Repository Location*** *folder at the directory level as well as at the sharing level. Only such accounts can be used as a Proxy Account to access the Software Repository.*
9. Click **Next**. The **Creating Application Catalog** panel opens and reports on the creation progress. When the Application Catalog has been created, a message appears stating that the creation was successful.
10. Click **Finish**. The new Application Catalog now opens in AdminStudio.

Tip *• The first time AdminStudio is run, anyone can create an SQL Server database (providing they have access to an SQL Server and database creation rights). However, once an AdminStudio Application Catalog has been created, the database creator becomes the Application Catalog administrator, and security rights are in place in AdminStudio.*

Creating New Application Catalogs Using Scripts

Typically, users with administrative privileges in AdminStudio use **New** on the Application Manager Tab Menu to create a new Application Catalog.

However, because of security concerns, some database administrators may be hesitant to grant the database creation rights that are necessary to create an Application Catalog database using SQL Server to AdminStudio users. Consequently, the database administrator must manually create the database using scripts and provide the necessary read and write access for users to that database. AdminStudio is shipped with database creation SQL scripts to make it easy for database administrators to manually create new Application Catalogs.

- Scripts to Run

- Creating an Application Catalog Using Scripts

Scripts to Run

When creating an Application Catalog database using scripts, you need to execute both standard scripts and scripts for AdminStudio plug-ins:

- Standard Scripts
- Plug-In Scripts

Standard Scripts

AdminStudio is shipped with the following database creation SQL scripts:

```
AMS_System_Schema.sql
WFM_System_Data.sql
AMSCreateIndex.sql
WFM_SampleTemplates.sql
AS_System_Schema.sql
AS_ApplicationModel.sql
OsSecurityPatch.sql
MergeModule.sql
PredeploymentTest.sql
SystemManagementServer.sql
WFM_JobManager.sql
AS_TestCenter_Schema.sql
Seed_Data.sql
AS_ApplicationModelSeedData.sql
AS_TestCenter_SeedData.sql
CustomReportWizard.sql
AS_StoredProcedures.sql
VirtualizationReadiness.sql
AS_UI_Support.sql
GroupPackageTree.sql
AS_TestCenter_StoredProcedures.sql
Reporting.StoredProcedures.sql
ApplicationExtendedAttributes.sql
MobileTables.sql
MobileProgrammability.sql
MobileSeedData.sql
DAR_Schema.sql
AS_ShimDB_Schema.sql
AS_ShimDB_SeedData.sql
```

These SQL scripts are located in the following directory:

[AdminStudioInstallDirectory]\Support\SQL_Scripts

Note • *You can also find the list of the standard scripts that you are required to run to create a new database in the following nodes of the* ***upgrade.xml*** *file (in the AdminStudio* ***Support*** *folder):*

//AdminStudioUpgrade/WorkflowManager/Create/SQLServer
//AdminStudioUpgrade/AdminStudio/Create/SQLServer

Plug-In Scripts

In addition to the scripts located in the **Support\SQL_Scripts** directory, you also need to run any SQL script files that are found in the **Common\Plugins** directory. Because AdminStudio provides extensible plug-in functionality, the list of SQL scripts in this directory is not fixed. However, the following table lists the plug-in scripts that are shipped with the product:

```
AirWatch.sql
Altiris.sql
ApkDeepLink.sql
AppV.sql
AppV5Conversion.sql
AppvServer.sql
AutomatedApplicationConverter.sql
Casper.sql
IpaDeepLink.sql
Msi.sql
WebDeploy.sql
XenApp.sql
Xpf.sql
```

Important • *The order in which these scripts are run is not important; however, they must be run after the set of scripts listed in Standard Scripts.*

Creating an Application Catalog Using Scripts

To create an Application Catalog database on SQL Server, perform the following steps:

Task ***To use scripts to create an AdminStudio Application Catalog on SQL Server:***

1. Log on to your SQL Server.
2. Launch the Enterprise Manager and Query Analyzer.
3. In Query Analyzer, execute a `CREATE DATABASE` command to create and identify the new Application Catalog database.
4. Select the newly created database in Query Analyzer.
5. Execute the following scripts **in this order**:

   ```
   AMS_System_Schema.sql
   WFM_System_Data.sql
   AMSCreateIndex.sql
   WFM_SampleTemplates.sql
   AS_System_Schema.sql
   AS_ApplicationModel.sql
   OsSecurityPatch.sql
   MergeModule.sql
   PredeploymentTest.sql
   SystemManagementServer.sql
   WFM_JobManager.sql
   AS_TestCenter_Schema.sql
   Seed_Data.sql
   AS_ApplicationModelSeedData.sql
   ```

```
AS_TestCenter_SeedData.sql
CustomReportWizard.sql
AS_StoredProcedures.sql
VirtualizationReadiness.sql
AS_UI_Support.sql
GroupPackageTree.sql
AS_TestCenter_StoredProcedures.sql
Reporting.StoredProcedures.sql
ApplicationExtendedAttributes.sql
MobileTables.sql
MobileProgrammability.sql
MobileSeedData.sql
DAR_Schema.sql
AS_ShimDB_Schema.sql
AS_ShimDB_SeedData.sql
```

6. Execute all of the SQL scripts found in the **Common\Plugins** directory. By default, the following scripts are found in the **Plugins** directory:

```
AirWatch.sql
Altiris.sql
ApkDeepLink.sql
AppV.sql
AppV5Conversion.sql
AppvServer.sql
AutomatedApplicationConverter.sql
Casper.sql
IpaDeepLink.sql
Msi.sql
WebDeploy.sql
XenApp.sql
Xpf.sql
```

Upgrading an Existing Application Catalog

When you attempt to open an AdminStudio 5.x to 2013 R2 Application Catalog in AdminStudio 2016, you are prompted to upgrade it to use the AdminStudio 2016 schema.

Log files for the upgrade are created in the following directory:

*AdminStudio Shared Directory***ConflictSolver\Logs**

Note • *Note the following regarding upgrading an existing Application Catalog:*

- *The upgrade of AdminStudio 3.0, 3.01, and 3.5 databases is not supported by AdminStudio 7.0 or later.*
- *Starting with AdminStudio 8.0, Microsoft Access databases are not supported.*
- *Starting with AdminStudio 9.01, Oracle databases are not supported.*
- *When an SQL Server Application Catalog database is upgraded, the old tables are not dropped from the Application Catalog.*

Important • *Specific permissions are required to upgrade an Application Catalog. See* *Required Permissions on Application Catalog Databases*.

Upgrading Pre-AdminStudio 5.0 Application Catalogs

Pre-AdminStudio 5.0 Application Catalogs cannot be upgraded automatically by AdminStudio 7.0 or later. However, you can upgrade them using the Legacy Upgrade Wizard, a standalone utility that was included with AdminStudio 7.0 and 7.5. The Legacy Upgrade Wizard utility is installed in the following directory:

C:\Program Files\InstallShield\AdminStudio\7.x\Common\LegacyUpgradeWizard.exe

If you do not have a copy of AdminStudio 7.0 or 7.5 available to you, contact Technical Support.

Upgrading an Application Catalog Using Scripts

To see a list of the scripts that you are required to run to upgrade an existing Application Catalog database, view the following nodes of the **upgrade.xml** file (in the AdminStudio **Support** folder):

//AdminStudioUpgrade/WorkflowManager/Upgrades/Upgrade/SQLServer
//AdminStudioUpgrade/AdminStudio/Upgrades/Upgrade/SQLServer

For detailed information on upgrading an Application Catalog using scripts, see the *AdminStudio Client Tools Installation Guide*.

Specifying a Default AdminStudio Application Catalog

You can specify a default Application Catalog so that each time you open AdminStudio, you will be prompted to login to the same Application Catalog database.

You can also configure your enterprise so that *all of the users at your enterprise* will be prompted to login to the same Application Catalog each time they open AdminStudio.

Setting a Default Application Catalog for Yourself

Whenever you connect to an Application Catalog, you can designate it as the default Application Catalog by selecting the **Make this the shared default Application Catalog** option on the **Connect Application Catalog** dialog box.

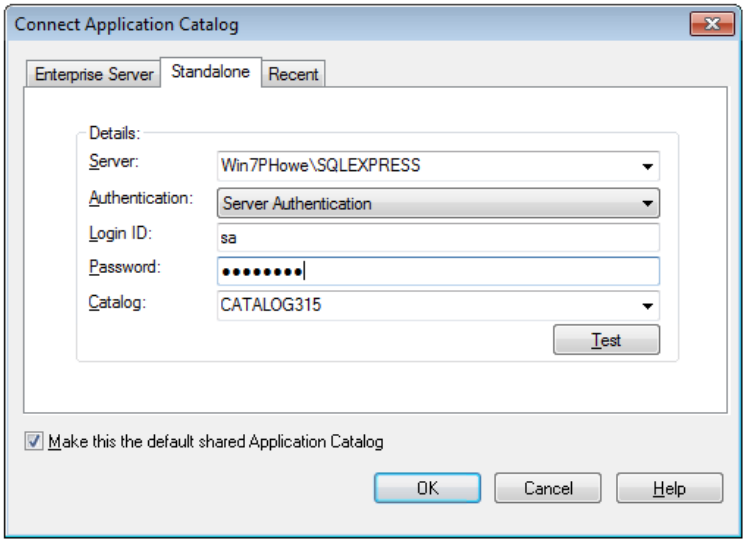


Figure 7-12: Default Shared Application Catalog Option on the Connect Application Catalog Dialog Box

Setting the Default Application Catalog for Your Enterprise

To configure your enterprise so that *all of the users at your enterprise* will be prompted to login to the same Application Catalog each time they open AdminStudio, all users need to be connected to the same **AdminStudio Shared.ini** file that is stored in a shared network location that is available to all users. To set a default Application Catalog for all AdminStudio users at your enterprise, you need to edit the **Shared AdminStudio.ini** file.

Task ***To set the Default Application Catalog for your enterprise:***

1. First, the AdminStudio System Administrator needs to perform the following steps to set the default Application Catalog for the enterprise:
   a. Locate and copy the following file on the machine where you installed AdminStudio:

      C:\Program Files (x86)\AdminStudio Shared\Shared AdminStudio.ini

   b. Copy this file to a shared network location that is accessible to all of the users in your enterprise.

   c. Open the **Shared AdminStudio.ini** file that you just copied to a shared network location.

2. Insert the following in the `[Database Settings]` section of the **Shared AdminStudio.ini** file:

   ```
   [Database Settings]
   DefaultDatabase=Provider=SQLOLEDB.1;User ID=userid; PWD=password;Initial
   Catalog=nameofdatabase;Data Source=nameofsqlserver;
   ```

3. Next, each AdminStudio user in the enterprise needs to perform the following steps to set the location of *their* **AdminStudio Shared Location** directory to the same shared network directory that the System Administrator configured.
   a. Launch AdminStudio.

   b. On the **Tools** menu, click **Options**. The AdminStudio **Options** dialog box opens.

   c. Open the **Locations** tab.

   d. Set the **AdminStudio Shared Location** to the shared network location provided by your System Administrator.

Caution *• If a user is not assigned to a Role that has the* ***Modify AdminStudio Tools Options Dialog*** *permission, they cannot change the* ***AdminStudio Shared Location*** *setting on the* ***Options*** *dialog. In this situation, the location of the AdminStudio Shared Location would be set during installation.*

Note *• The Roles assigned to a user determine that user's permissions:*

- *The* ***Create*** *and* ***Connect*** *options on the* ***Catalog*** *menu on the AdminStudio interface (and the* ***New*** *and* ***Connect*** *options on the Application Manager tab menu) are disabled for users that are not assigned to a Role that has permission to perform those actions.*
- *Users that are assigned to Roles that have the* ***Modify AdminStudio Tools Options Dialog*** *permission can change the location of the* ***AdminStudio Shared Location*** *setting on the* ***Options*** *dialog (accessed by selecting* ***Options*** *on the* ***Tools*** *menu from the AdminStudio Interface). For those users who do not have that permission,*

Options *on the* ***Tools*** *menu is disabled, so they are unable to change the location of the AdminStudio Shared location.*

Creating Multiple Named Connections to Distribution Systems

You can define multiple named connections to System Center Configuration Manager, Citrix XenApp Server, Symantec Altiris Server, Microsoft App-V Server, Casper Suite Server, and AirWatch Server distribution systems. This enables you to both have multiple connections easily available during import and distribution, and to refer to those connection settings by name in Platform API commands.

Important • *In order to distribute packages to an App-V Server, the WinRM service must be running, and the App-V Server must be in the list of trusted hosts. For more information, see Microsoft App-V Server Distribution Requirements.*

You need to specify named connections to distribution systems in order to enable Application Manager to perform the following tasks:

Table 7-3 • Application Manager Integration with Distribution Systems

Category	System Center Configuration Manager		Citrix XenApp Server	Symantec Altiris Server	Microsoft App-V Server	AirWatch Server	Casper Server
	2012	2007					
Import packages from	✓	✓					
Distribute applications to	✓		✓	✓	✓	✓	✓
Supported deployment types:	Windows Installer App-V 4.x, 5.0 Apple iOS (local file and public store link) Google Android (local file and public store link) Windows Store (local file and public store link) Legacy installer	Windows Installer App-V 4.x Legacy installer	Citrix XenApp App-V 4.x	Windows Installer Symantec Workspace VMware ThinApp Legacy installer	App-V 5.0	Apple iOS (local file and public store link) Google Android (local file and public store link)	Mac OS X (local file and public store link)
Distribute packages to		✓					

Table 7-3 • Application Manager Integration with Distribution Systems

Category	System Center Configuration Manager		Citrix XenApp Server	Symantec Altiris Server	Microsoft App-V Server	AirWatch Server	Casper Server
	2012	2007					
View application deployment status	✓						
View and edit package deployment data	✓	✓	✓	✓	✓	✓	✓

You specify distribution system connection settings on the **Distribution System** tab of the Application Manager **Options** dialog box.

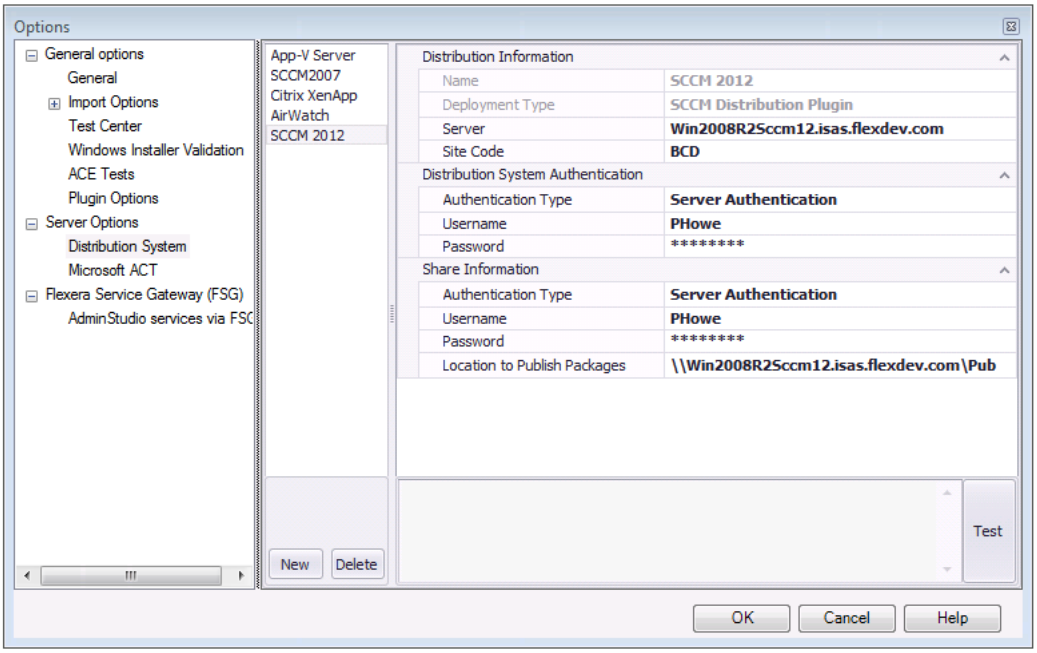

Figure 7-13: Distribution System Tab of Options Dialog Box

After you enter these connection settings, those distribution systems will be available to you when importing and distributing applications and packages. Also, information from those distribution systems will be displayed:

- **System Center Configuration Manager**—The **Deployment Data** tab of the **Catalog Deployment Type View** lists deployment data that will be used by System Center Configuration Manager when deploying the selected package.
- **Citrix XenApp**—For App-V 4.x and Citrix XenApp packages, the **XenApp Deployment Data** tab of the **Catalog Deployment Type View** will be displayed, listing deployment data that will be used by Citrix XenApp Server when deploying the selected package.

- **Altiris**—For Windows Installer, VMware ThinApp, and Symantec Workspace packages, the **Altiris Deployment Data** tab of the **Catalog Deployment Type View** will be displayed, listing deployment data that will be used by Symantec Altiris Server when deploying the selected package.
- **Casper**—For Mac OS X packages, the **Casper Deployment Data** tab of the **Catalog Deployment Type View** will be displayed, listing deployment data that will be used by Casper when deploying the selected package.
- **App-V Server**—For App-V 5.0 packages, the **App-V Deployment Data** tab of the **Catalog Deployment Type View** will be displayed, listing deployment data that will be used by the App-V Server when deploying the selected package.
- **AirWatch**—For iOS enterprise applications, the **AirWatch Deployment Data** tab of the **Catalog Deployment Type View** will be displayed, listing deployment data that will be used by AirWatch Server when deploying the selected package.

For instructions on setting up a named connection to a distribution system, see:

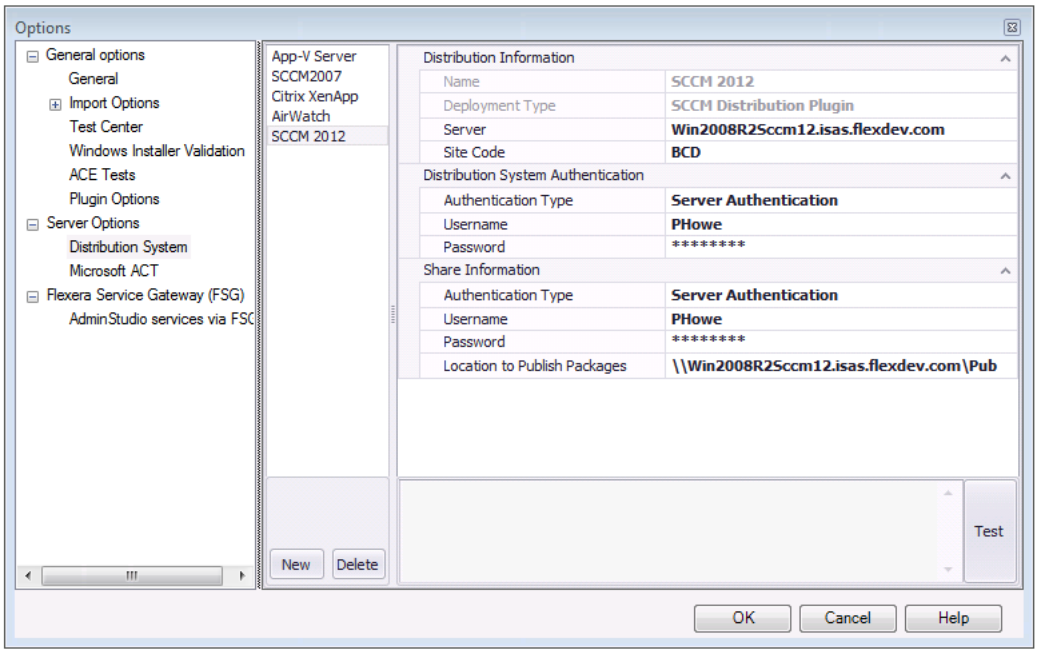
- Creating a New Distribution System Connection Setting
- Editing an Existing Distribution System Connection Setting

Creating a New Distribution System Connection Setting

To create a new named connection to a distribution system, perform the following steps:

Task ***To create a new named connection to a distribution system:***

1. On the Application Manager tab menu, select **Options**. The **Options** dialog box opens.
2. Under **Servers Options**, select **Distribution System**. The **Distribution System** tab opens, and lists all defined connections.



3. Click **New**. A new set of empty connection setting fields is displayed.
4. In the **Name** field, enter a name to identify this new named connection to a distribution system.
5. From the **Deployment Type** list, select one of the following to identify the distribution system technology of this new named connection:
   - **AirWatch Distribution Plugin**
   - **Altiris Distribution Plugin**
   - **App-V Server Distribution Plugin**
   - **Casper Distribution Plugin**
   - **SCCM Deployment Plugin**
   - **XenApp Distribution Plugin**
6. In the **Server** field, enter the name of your distribution system server.
7. In the **Site Code** field, enter the code that identifies your distribution system site.

   ***Note** • If you are creating a named connection to a XenApp, Altiris, or App-V server, leave the **Site Code** field blank. If you are creating a named connection to Casper, this field will not be displayed.*
8. Under **Distribution System Authentication**, set the **Authentication Type** field to either **Windows Authentication** or **Server Authentication** to identify the authentication type you are going to use to access the specified distribution system.

   If you selected **Server Authentication**, you need to also enter a **Username** and **Password**.
9. Under **Share Information**, set the **Authentication Type** field to either **Windows Authentication** or **Server Authentication** to identify the authentication type you are going to use to access the shared location where you will be publishing packages during distribution.

   If you selected **Server Authentication**, you need to also enter a **Username** and **Password**.
10. (Casper only) In the **Distribution Point** field, enter the Casper distribution point you want to distribute packages to.

    ***Note** • Casper supports multiple server infrastructures, but AdminStudio only supports the File Share Distribution Points infrastructure, and copies packages to a UNC File Share Distribution Point in Casper. AdminStudio currently does not support copying packages to JDS Instances, Cloud Distribution Points, Software Update Servers, or NetBoot Servers.*
11. In the **Location to Publish Package** field, enter or browse to the shared location where you will be publishing packages during distribution.

    ***Note** • The fields in the **Share Information** section are not required when setting up a connection to AirWatch Server. Applications are published directly to the AirWatch Server, not to a shared location.*
12. If you want to add another named connection, click **New** and repeat the above process.

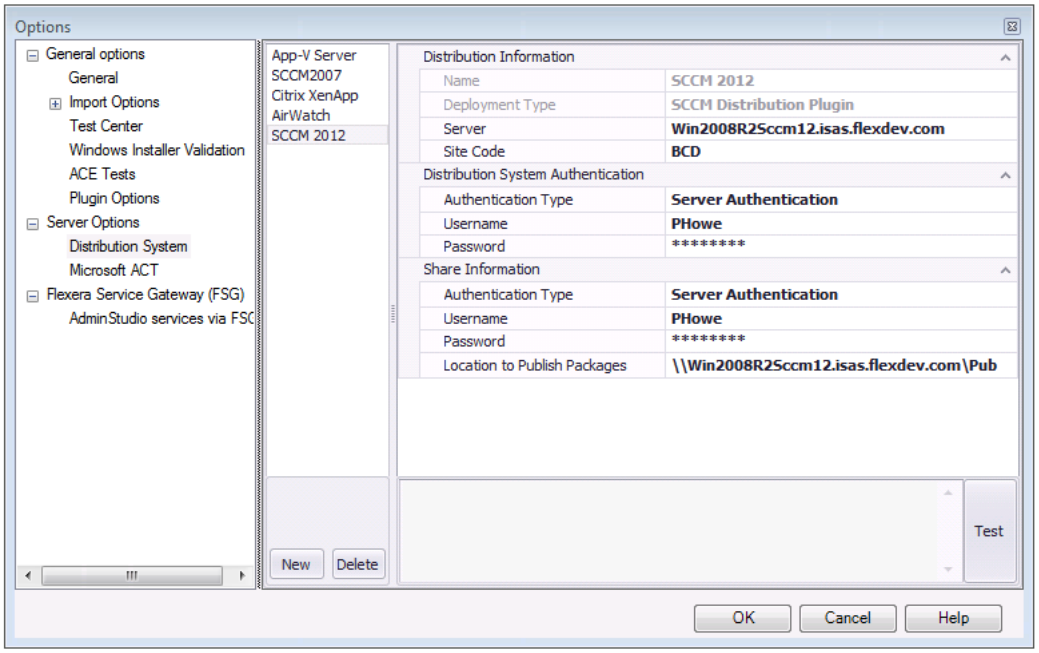
13. Click **OK** to close the dialog box.

Editing an Existing Distribution System Connection Setting

To edit the settings of an existing connection to a distribution system, perform the following steps.

Task ***To edit an existing named connection to a distribution system:***

1. On the Application Manager tab menu, select **Options**. The **Options** dialog box opens.
2. Under **Servers Options**, select **Distribution System**. The **Distribution System** tab opens, and lists all defined connections.



3. In the left pane of the **Distribution System** tab, select the name of the connection that you want to edit. The selected connection's settings are displayed.
4. Make any desired edits, as described in Creating a New Distribution System Connection Setting.

Note • *You cannot edit the* ***Name*** *and* ***Deployment Type*** *fields. If you want to change those fields, you would have to delete the connection and recreate it.*

5. Click **OK**. Your edits will be saved.

Note • *If you want to delete a connection, select its name and then click* ***Delete****.*

Integrating with Other Flexera Software Applications via the Flexera Service Gateway

AdminStudio can communicate with App Portal, FlexNet Manager Suite, and Workflow Manager via the Flexera Service Gateway.

Overview of Unified Application Management Workflow

Because AdminStudio can communicate with App Portal, FlexNet Manager Suite, and Workflow Manager via the Flexera Service Gateway, you can implement a unified application management workflow.

In this integrated solution, a Flexera Identifier—a unique identifier assigned to applications by the FlexNet Manager Suite and stored in its Application Recognition Library (ARL)—is used to maintain application identity across products.

***Note** • The ARL uniquely identifies over 110,000 applications (including multiple versions and editions) from over 14,000 publishers.*

Because AdminStudio, App Portal, and FlexNet Manager Suite use the same ID to identify an application, you can implement a unified application management workflow, which enables you to automatically and efficiently manage your application licenses:

- **AdminStudio obtains the Flexera Identifier from FlexNet Manager Suite**—When an application is imported into the Application Catalog, AdminStudio automatically queries the FlexNet Manager Suite ARL and obtains the application's Flexera Identifier.
- **AdminStudio creates catalog item in App Portal**—When you publish an application from AdminStudio to System Center 2012 Configuration Manager, Symantec Altiris Server, or Casper Suite Server, you can choose to have a catalog item for that application automatically created in App Portal, identified by the same Flexera Identifier (assuming that App Portal is also connected to that distribution system).
- **App Portal and FlexNet Manager Suite share license information**—Because an application's identity is maintained between App Portal and FlexNet Manager Suite, automatic license management can be performed.

The following diagram gives you an overview of how the integrated Flexera Software applications communicate—via the Flexera Service Gateway—when performing the tasks involved in a single application's life cycle.

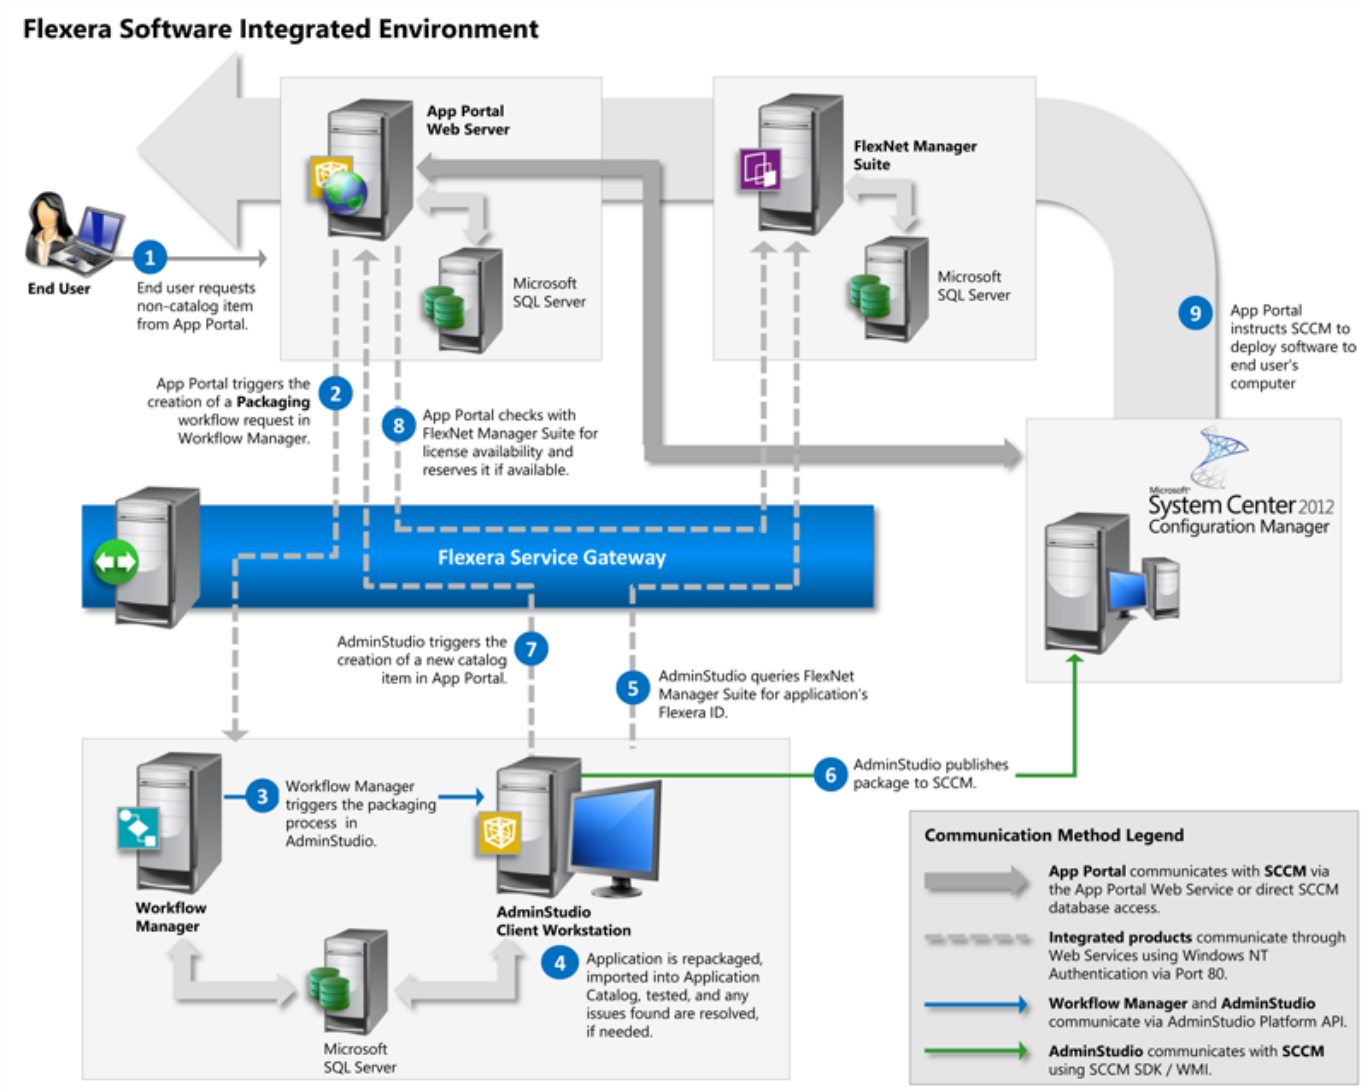


Figure 7-14: Flexera Software Integrated Environment

This application life cycle workflow includes the following steps:

Table 7-4 • Flexera Software Integrated Environment Workflow

#	Step	Description
1.	**End user requests non-catalog item from App Portal.**	Using the App Portal website, an end user submits a request for a software item that is not currently in the App Portal catalog.
2.	**App Portal triggers the creation of a Packaging workflow request in Workflow Manager.**	After the end user's request for new software is approved, App Portal triggers the creation of a **Packaging** workflow request in Workflow Manager.

Table 7-4 • Flexera Software Integrated Environment Workflow

#	Step	Description
3.	**Workflow Manager triggers the packaging process in AdminStudio.**	Workflow Manager can be configured to trigger AdminStudio tasks such as repackaging, importing a package into the Application Catalog, performing tests, and resolving issues that are found, if needed.
4.	**Application is repackaged, imported into Application Catalog, tested, and any issues found are resolved, if needed.**	The package is ready for deployment.
5.	**AdminStudio queries FlexNet Manager Suite for application's Flexera Identifier.**	When the package is imported into the Application Catalog, AdminStudio automatically queries the FlexNet Manager Suite ARL and obtains the application's Flexera Identifier.
6.	**AdminStudio publishes package to supported distribution system.**	After the software has been repackaged and tested, AdminStudio publishes the application to System Center 2012 Configuration Manager, Symantec Altiris Server, or Casper Suite Server.
7.	**AdminStudio triggers the creation of a new catalog item in App Portal.**	When AdminStudio publishes the application, a catalog item for that application is automatically created in App Portal, identified by the same Flexera Identifier. End user can now request this software in App Portal.
8.	**App Portal checks with FlexNet Manager Suite for license availability and reserves it if available.**	App Portal queries FlexNet Manager Suite to obtain entitlement and usage data from FlexNet Manager Suite for that application including available license count and the number of licenses used. If a license is available, App Portal will automatically reserve it for the end user.
9.	**App Portal instructs distribution system to deploy software to end user's computer.**	App Portal instructs System Center 2012 Configuration Manager, Symantec Altiris Server, or Casper Suite Server to deploy the software to the end user's computer.

Enabling Communication Between Products

You enter the login credentials for your Flexera Service Gateway server on the **Flexera Service Gateway (FSG)** tab of the Application Manager **Options** dialog box.

To enable AdminStudio to communicate with additional Flexera Software applications via the Flexera Service Gateway, perform the following steps:

Task ***To enter Flexera Service Gateway connection settings:***

1. On the Application Manager tab menu, select **Options**. The **Options** dialog box opens.
2. Under select **Flexera Service Gateway (FSG)**. The **Flexera Service Gateway (FSG)** tab opens.

3. Enter the following information:

Property	Description
Gateway Host Name	Enter the name or URL of your Flexera Service Gateway server. If your System Administrator has installed Flexera Service Gateway using a different port than the default port, enter the appropriate port number at the end of the URL, preceded by a colon, such as: `172.300.40.501`**:8484** ***Note*** *• The Flexera Service Gateway installer is downloaded from the Flexera Software Product & License Center.*
Access Token	If you are connecting to an installation of FlexNet Manager Suite Cloud, enter the access token that was provided by your system administrator. If you are connecting to an installation of FlexNet Manager Suite On Premises, leave this field blank.
Advanced	Click to open the **Credentials** dialog box, where you can enter the Flexera Service Gateway login credentials: • **User Name**—Unless your System Administrator has provided you with a specific **User Name** to use, enter the default value of **admin**. • **Password**—Unless your System Administrator has provided you with a specific **Password** to use, enter the default value of **admin**. ***Note*** *• By default, the default credentials are already entered. Unless your system administrator has informed you that these credentials have been changed, you do not need to open the* ***Credentials*** *dialog box.*

4. Click **Test** to validate the Flexera Service Gateway connection information.
5. Click **OK** to exit the dialog box.

Setting Up AdminStudio Accounts

The Flexera Software Integrated Solution includes AdminStudio, App Portal, FlexNet Manager Suite, the Flexera Service Gateway, Workflow Manager, and Microsoft System Center Configuration Manager (SCCM). All of these products communicate over a company network to provide a complete packaging and deployment solution that tracks usage and reports licensing.

When setting up these integrated Flexera Software products, you need to give certain accounts enhanced permissions to other products. The following table lists the required permissions for AdminStudio accounts:

Table 7-5 • AdminStudio Accounts and Privileges in the Integrated Solution

AdminStudio Account	Product/Machine Account Needs Access To	Required Privileges
AdminStudio user accounts	**Local workstation**	Require administrator privileges on the workstation where they are running AdminStudio.
	System Center 2012 Configuration Manager	Require the Application Administrator role on System Center 2012 Configuration Manager.
	FlexNet Manager Suite	See the Accounts for Integration of AdminStudio and AppPortal with FlexNet Manager Suite help topic on the Enterprise Product Integration HelpNet Site: http://helpnet.flexerasoftware.com/epi
	App Portal	Need to make sure that AdminStudio users have access to the App Portal Web Site using Windows Authentication.
	SQL Server	In order to connect to an AdminStudio Application Catalog database, users require `db_datareader`, `db_datawriter`, `execute`, and `alter` permissions on the AdminStudio database. For detailed instructions on assigning these permissions, see Required Permissions on Application Catalog Databases. ***Tip*** • *The AdminStudio user account does not require these permissions if connecting to SQL Server using an SQL Server user account (which already has the appropriate permissions).*

Synchronizing Applications with App Portal and FlexNet Manager Suite

After you have entered Flexera Service Gateway credentials on the **Flexera Service Gateway (FSG)** tab of the **Options** dialog box, as described in Enabling Communication Between Products, you can then synchronize the applications in the Application Catalog with App Portal and FlexNet Manager Suite.

Task ***To synchronize applications:***

1. On the Application Manager tab menu, select **Options**. The **Options** dialog box opens.
2. Under **Server Options**, select **Flexera Service Gateway (FSG)**. The **Flexera Service Gateway (FSG)** tab opens.

3. Under **Synchronize Flexera Products**, click the **FlexNet Manager Platform** button to search the FlexNet Manager Suite Application Recognition Library (ARL) to locate and obtain the **Flexera Identifier** for the Application Catalog's existing applications.

   ***Note** • After valid Flexera Service Gateway connection information is entered, each time you import an application into the Application Catalog, the **Flexera Identifier** for that application will be automatically obtained from FlexNet Manager Suite.*

4. Click the **App Portal** button to create a catalog item in App Portal for all of the applications in the Application Catalog that were published to a distribution system that App Portal is also connected to before the Flexera Service Gateway connection information was entered.

   ***Note** • After valid Flexera Service Gateway connection information is entered, each time you publish a supported application to a distribution system that App Portal is also connected to, a catalog item for that application will automatically be created in App Portal.*

5. Click **OK** to exit the dialog box.

Flexera Service Gateway Messages

When AdminStudio is connected to the Flexera Service Gateway, additional output messages appear on the **Summary** panel of the Import Wizard each time you import an application into the Application Catalog or publish an application to System Center 2012 Configuration Manager:

- **Importing a package**—When you import a package into the Application Catalog, the following messages are listed:

  ```
  Extracting Flexera Identifier from FlexNet Manager Platform...
      Done with extracting Flexera Identifier from FlexNet Manager Platform
  ```

- **Publishing an application**—When you publish an application to System Center 2012 Configuration Manager, the following messages are listed:

  ```
  Sending publish notification to Flexera Gateway Service.
  Publish for Group/Application {0} has successfully notified AppPortal.
  ```

App Portal Only Integration

If you have purchased App Portal but have not purchased FlexNet Manager Suite, you can still benefit from just integrating AdminStudio with App Portal.

When both AdminStudio and App Portal are connected to the Flexera Service Gateway, whenever you publish a supported application from AdminStudio to a distribution system that App Portal is also connected to (System Center 2012 Configuration Manager, Symantec Altiris, or Casper Suite), a new catalog item will automatically be created in App Portal (in the category or categories specified on the **App Portal Information** tab of the Application View), making the application available for purchase in the App Portal storefront.

***Note** • Both AdminStudio and App Portal use the same SCCM ID for the application.*

***Note** • The Flexera Identifier is not used in this scenario.*

Managing an Application's Flexera Identifier

A Flexera Identifier—a unique identifier that is assigned to applications by FlexNet Manager Suite and is stored in its Application Recognition Library (ARL)—is used to maintain application identity across Flexera Software products.

***Note** • The ARL uniquely identifies over 110,000 applications (including multiple versions and editions) from over 14,000 publishers.*

A Flexera Identifier is used to link application information from Application Manager with application information in AdminStudio Inventory and Rationalization, FlexNet Manager Suite, and App Portal. An application's Flexera Identifier is listed on the **General Information** tab of an application's **Application View**.

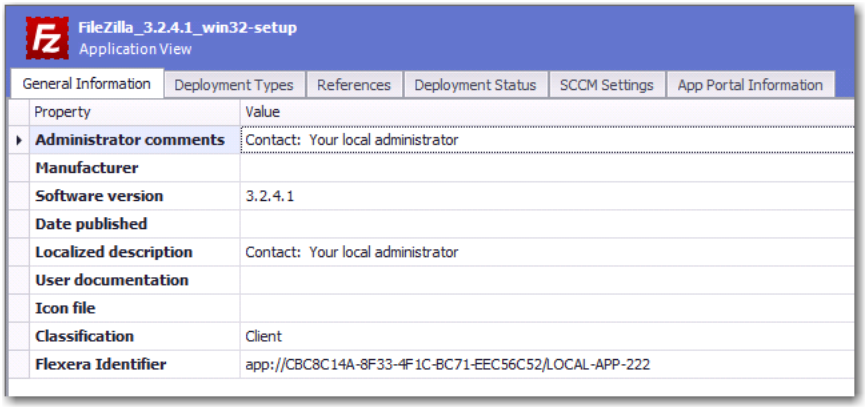

Figure 7-15: Flexera Identifier Field on the General Information Tab of Application View

When an application is imported into the Application Catalog, AdminStudio automatically queries the FlexNet Manager Suite ARL and attempts to obtain the application's Flexera Identifier. For applications that were already imported into the Application Catalog prior to connecting to the Flexera Service Gateway, you can sync applications with the Application Recognition Library, as described in Synchronizing Applications with App Portal and FlexNet Manager Suite.

However, sometimes a Flexera Identifier is not found, and you are required to either perform a manual search for an existing Flexera Identifier or create a new local entry.

- Searching an Application Catalog for Unrecognized Applications
- Performing a Manual Search for a Flexera Identifier
- Creating Local Flexera Identifier Entries for Internal or Repackaged Applications

Searching an Application Catalog for Unrecognized Applications

If both Application Manager and FlexNet Manager Suite are connected to the same Flexera Service Gateway, each time you import an application into the Application Catalog, a search for the application's Flexera Identifier is performed, and if it is found, it is listed on the **General Information** tab of the **Application View**. If the application was imported into the Application Catalog prior to connecting to the Flexera Service Gateway, you can attempt to identify its Flexera Identifier by syncing all imported applications with the Application Recognition Library, as described in Synchronizing Applications with App Portal and FlexNet Manager Suite

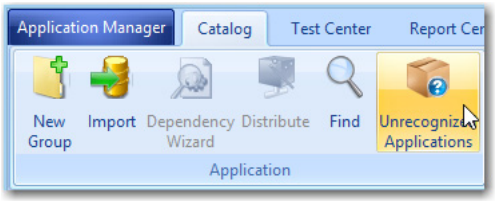
However, sometimes an application's Flexera Identifier is not found, such as when:

- **Incorrect information**—The value of the information in the application's Product Name, Version, Edition, or Publisher fields is either incorrect or too specific.
- **Internally developed applications**—The application has been developed internally.
- **Repackaged applications**—The application has been repackaged.

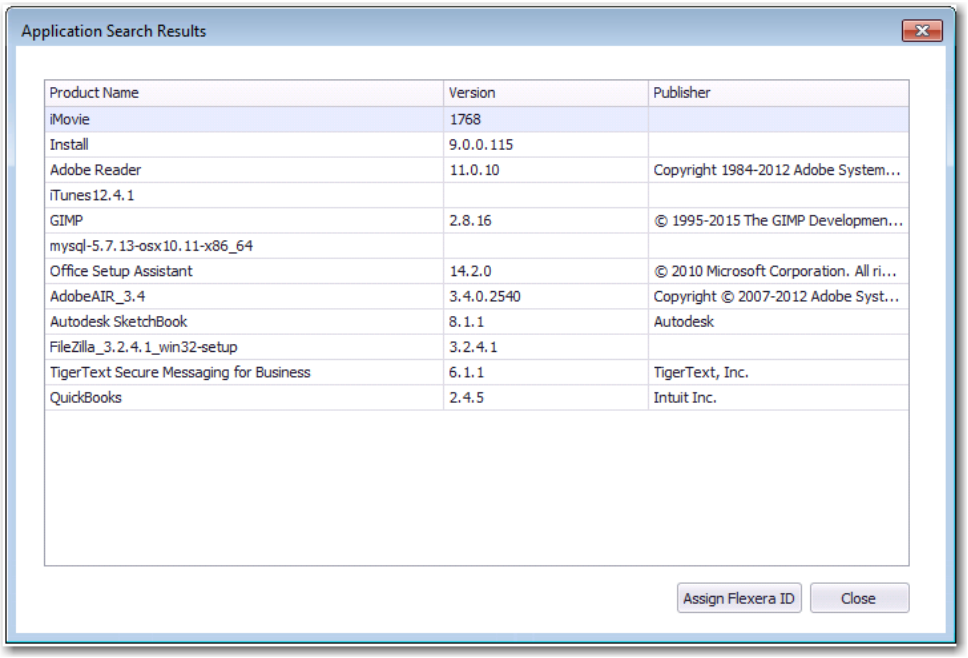
You can quickly identify all of the applications in your Application Catalog that do not have an assigned Flexera Identifier by clicking the **Unrecognized Applications** button in the toolbar of the Application Manager **Catalog** tab. From this **Application Search Results** list, you can search for and assign an existing Flexera Identifier to the application or create a new local Flexera Identifier.

Task ***To search Application Catalog for unrecognized applications:***

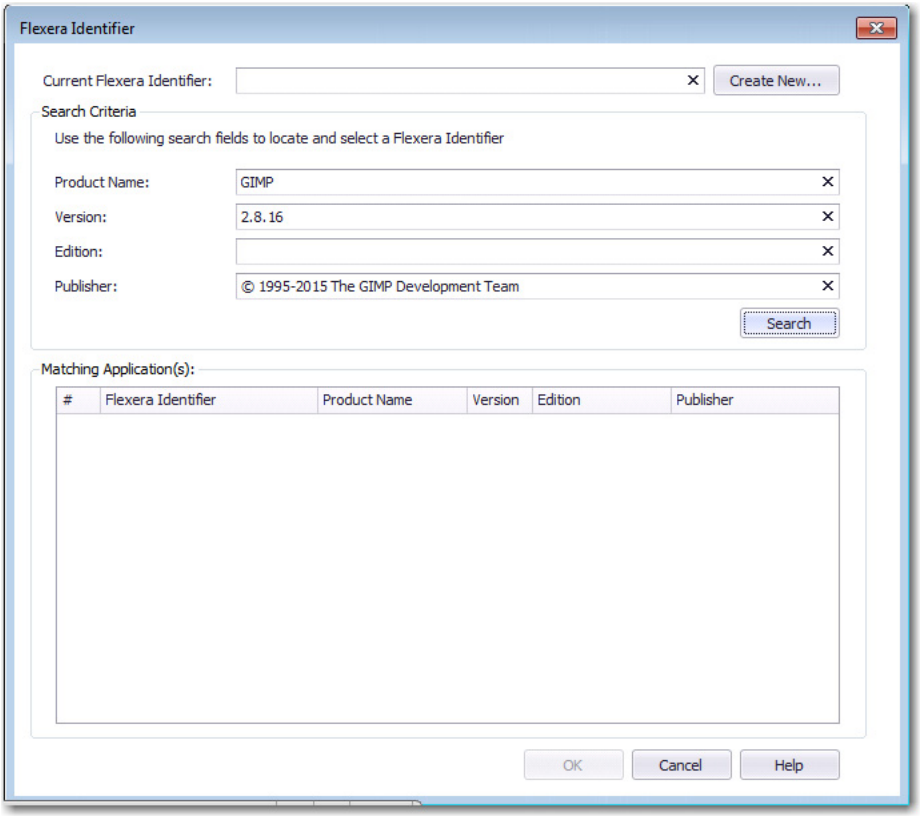
1. Click **Unrecognized Applications** in the toolbar of the Application Manager **Catalog** tab.



The **Application Search Results** dialog box opens, listing all applications in the Application Catalog that do not have an associated Flexera Identifier.



2. Select an application in the list and click **Assign Flexera ID**. The **Flexera Identifier** dialog box opens.



3. Proceed with the steps in Performing a Manual Search for a Flexera Identifier, and if a Flexera Identifier is not found, proceed with the steps in Creating Local Flexera Identifier Entries for Internal or Repackaged Applications.

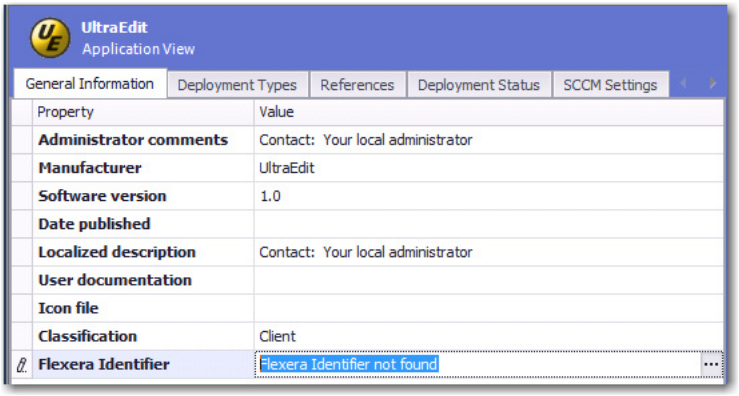
Performing a Manual Search for a Flexera Identifier

When an application is imported into the Application Catalog, AdminStudio automatically queries the FlexNet Manager Suite ARL and attempts to obtain the application's Flexera Identifier. If the application was imported into the Application Catalog prior to connecting to the Flexera Service Gateway, you can attempt to identify its Flexera Identifier by syncing all imported applications with the Application Recognition Library, as described in Synchronizing Applications with App Portal and FlexNet Manager Suite.

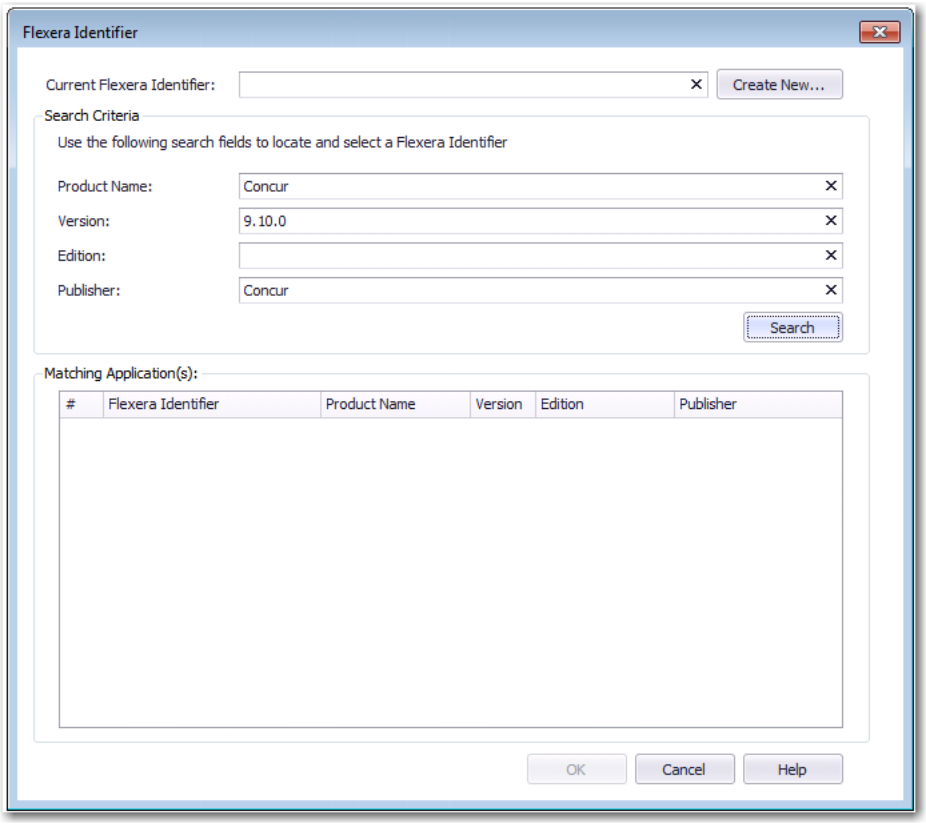
However, if an application still does not have an assigned Flexera Identifier, you can perform a manual search of the FlexNet Manager Suite Application Recognition Library.

Task ***To perform a manual search for a Flexera Identifier:***

1. Open the application's **General Information** tab of the **Application View**. The **Flexera Identifie**r field will be set to `Flexera Identifier not found`.
2. Click the browse button in the **Flexera Identifier** field.



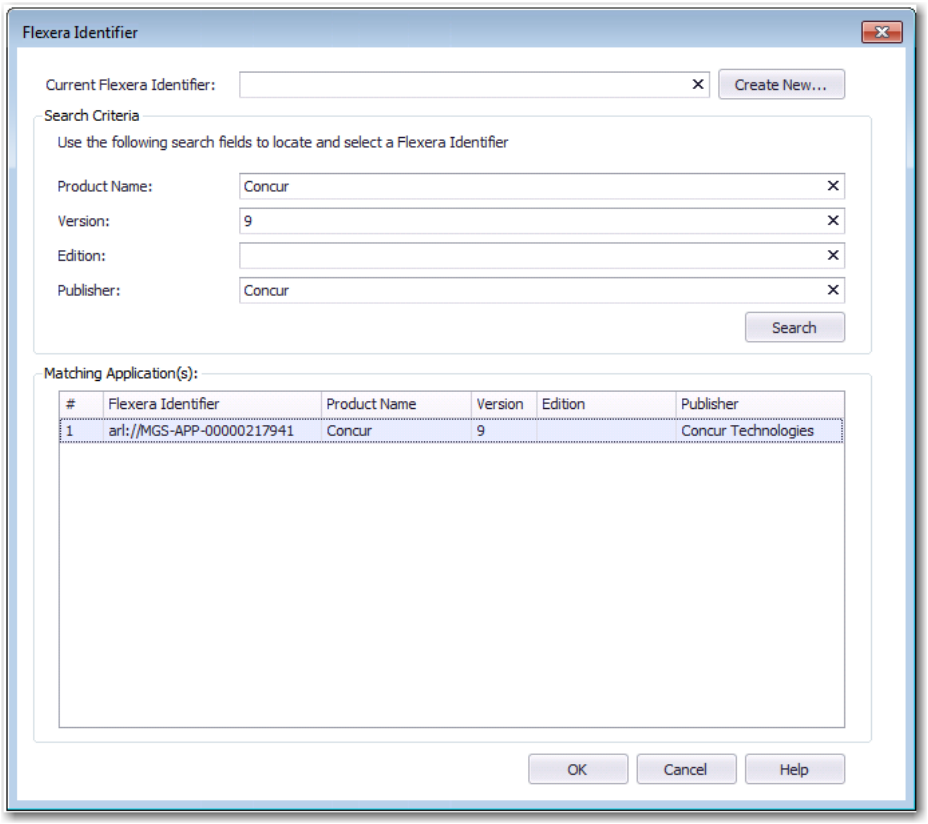
The **Flexera Identifier** dialog box opens.



3. Edit the text in the **Search Criteria** fields to either correct the information or make it less specific, and then click **Search**. A list of possible matching applications will be generated and will be listed in the **Matching Application(s)** list.

4. Do one of the following:

   - **Matching application found**—If the correct matching application is listed, select it from the list and click **OK** and then confirm that you want to associate the application with the selected Flexera Identifier. The Flexera Identifier will be saved in the Application Catalog and will be listed on the **General Information** tab of the **Application View** for that application.



- **Matching application not found**—If a matching application is not listed, continue with the steps in Creating Local Flexera Identifier Entries for Internal or Repackaged Applications to create a new local Flexera Identifier.

Creating Local Flexera Identifier Entries for Internal or Repackaged Applications

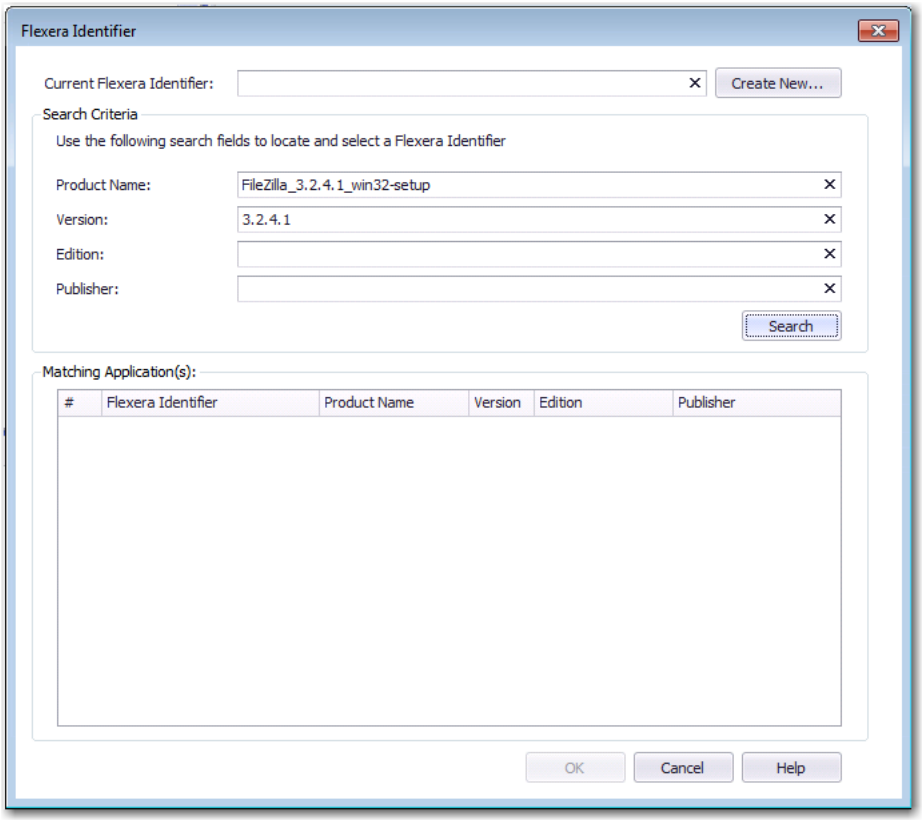
When an application is imported into the Application Catalog, AdminStudio automatically queries the FlexNet Manager Suite ARL and attempts to obtain the application's Flexera Identifier. If the application was imported into the Application Catalog prior to connecting to the Flexera Service Gateway, you can attempt to identify its Flexera Identifier by syncing all imported applications with the Application Recognition Library, as described in Synchronizing Applications with App Portal and FlexNet Manager Suite.

If an application still does not have an assigned Flexera Identifier, you can perform a manual search of the FlexNet Manager Suite Application Recognition Library, as described in Performing a Manual Search for a Flexera Identifier to attempt to identify an existing entry.

However, if you cannot locate an existing entry, you can create a new local Flexera Identifier entry for the FlexNet Manager Suite Application Recognition Library. These may be required for internally developed applications, repackaged applications, and other applications that are not recognized by FlexNet Manager Suite.

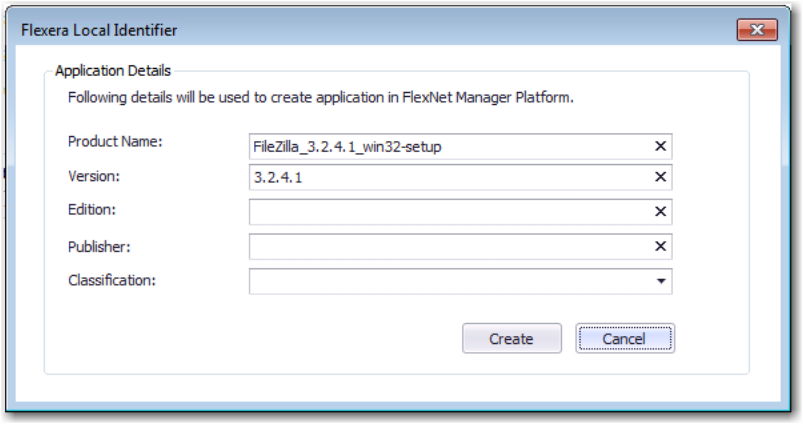
Task ***To search Application Catalog for unrecognized applications:***

1. Open the **Application View** of the unrecognized application and click the browse button in the empty **Flexera Identifier** field. The **Flexera Identifier** dialog box opens.



2. Use the search fields to locate and select a Flexera Identifier, as described in Performing a Manual Search for a Flexera Identifier.

3. If no Flexera Identifier is found, click **Create New**. The **Flexera Local Identifier** dialog box opens.

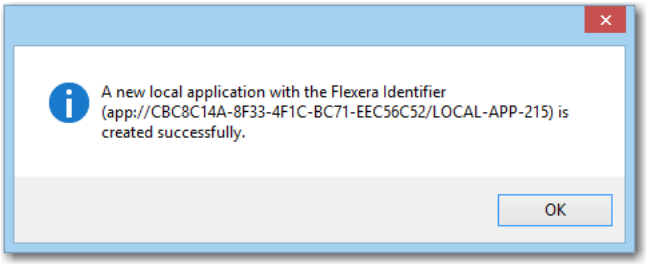


4. Enter the following information:

Property	Description
Product Name	The basic name of the application, excluding references to versions or editions, and without mentioning the publisher.
Version	The release number (or release identifier) of an application.
Edition	Enter the edition of this application.
Publisher	The name of the publisher of this software, responsible for its development and distribution.

Property	Description
Classification	To indicate how this application is classified, select one of the following options: • **Beta**—A pre-release application (covers such items as beta releases, alpha releases, or release candidates) that you have under some special arrangement. • **Commercial**—The application requires a license to be purchased for use in a commercial setting. • **Freeware**—Licensed for use in a commercial environment free-of-charge. • **Malware**—A potentially harmful application (a virus, Trojan, and the like), and should be treated as malware. If installations of this application are identified, you need to address the corresponding incidents or security issues. • **Shareware**—The application is available for downloading from web sites, and typically uses a "try-before-you-buy" licensing model that might include reminder messages, functional limitations, or other restrictions until a full license is purchased. • **X Rated**—The application contains potentially objectionable or sexually explicit material. You might want to consider whether corporate policies require any action. • **Update**—The application represents an update, for example, a service pack, to another application, and is issued for free to all customers regardless of purchasing agreements or support contracts (a "minor" update).

5. Click **Create**. A confirmation message appears stating that a new local Flexera Identifier has been created.



Entering Microsoft ACT Database Connection Settings

To enable AdminStudio to display data from your Microsoft ACT (Application Compatibility Toolkit) database in Test Center views and reports, you need to enter connection information for your Microsoft ACT database. You specify these settings on the **Server Options / Microsoft ACT** tab of the Application Manager **Options** dialog box.

To enable AdminStudio to communicate with your ACT database, perform the following steps.

Task ***To enter ACT database connection settings:***

1. On the Application Manager tab menu, select **Options**. The **Options** dialog box opens.
2. Under **Servers Options**, select **Microsoft ACT**. The **Microsoft ACT** tab opens.

3. Enter the following information:

Property	Description
Server	Enter the name of the server that contains your ACT database.
Database	Enter the name of your ACT database.
Authentication	Choose one of the following options: • **Server Authentication**—Choose this option if you want to use database server login identification to log into this server. Then enter the appropriate **User Name** and **Password**. • **Windows Authentication**—Choose this option if you want to use Windows network authentication (your network login ID) to log into this database server.

Searching an Application Catalog

You can search for data in Application Catalog tables by using **Find** on the **Catalog** tab of the Application Manager ribbon. You can search all tables in all packages in a group, or just search one column in one table of one package.

Note • *This search is limited to string type columns.*

The tables that are searched depend upon what is selected when the **Find** dialog box is opened:

Table 7-6 • Application Catalog Search Options

If you select...	and specify these options...	this will be searched
Application Catalog	**All Tables** and **All Columns**	All tables and all columns in all of the packages in the Application Catalog.
Group	**All Tables** and **All Columns**	All tables and all columns in all of the packages in the selected group.
Package	**All Tables** and **All Columns**	All tables and all columns in the selected package.
Package	A table and **All Columns**	All columns of a specific table in the selected package.
Package	A table and a column	A specific column in a specific table in the selected package.

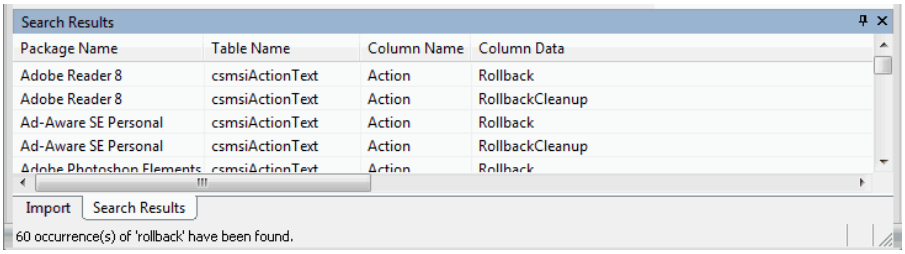
Task ***To search the Application Catalog:***

1. Open Application Manager and connect to an Application Catalog.
2. Select the node in the tree (Application Catalog, Groups, a specific group, a specific package, an OS snapshot, etc.) that you want to search.
3. On the **Catalog** tab of the ribbon, click **Find**. The **Find** dialog box opens.

   You could also use Ctrl + F or choose **Find** from the selected package or group's shortcut menu.
4. In the **Find What** text box, enter the text that you want to search for.

   Note • *This search is limited to string type columns.*
5. On the **Look In Table** list, select the table that you would like to search, or select **<All Tables>**. When you select a table from this list, the **Look In Columns** list is populated with all of the columns in that table.
6. If you selected a table from the **Look in Table** list, all of the columns in that table are listed. Select the column that you would like to search, or select **<All Columns>**.
7. If you want to search for a partial match rather than an exact match, select the **Partial Match** option.
   - **If this option is not selected**, Application Manager will search for an exact match of the text you entered in the **Find What** text box. The search will be case sensitive.
   - **If this option is selected**, then Application Manager will use appropriate wild card characters so that a partial data match is performed. The search will be case insensitive
8. Click **Find** to initiate the search.

   The **Find** dialog box will close, and the data that is found is displayed in the **Search Results** tab of the Output Window, in the following format:



Disconnecting from an Application Catalog

To disconnect from the currently open Application Catalog, select **Disconnect** from Application Manager tab menu (or from the AdminStudio **Catalog** menu).

When you have disconnected from an Application Catalog, a message appears instructing you to connect to a Microsoft SQL Server Application Catalog database.

Organizing Your Application Catalog Using Groups

Within Application Manager, you can create groups to organize your applications, patches, and OS Snapshot images in the Application Catalog. This is especially useful for organizing your Application Catalog in ways consistent with how your company is organized.

For example, you could create a group representing a certain department's base image including the proper operating system and necessary applications. When you perform conflict analysis on new packages you are integrating into your environment, you can run only the relevant comparisons—saving you the time it would take to run the analysis against all packages in the Application Catalog, or the effort of manually determining the set of packages against which you want to run the analysis each time.

Tasks relating to groups include:

- Adding Groups
- Organizing Applications in Application Manager
- Deleting Application Manager Groups
- Editing Group Properties
- Copying and Sharing Packages in the Application Catalog
- Moving Applications, OS Snapshots, and Groups

Adding Groups

To add additional groups or subgroups to an Application Catalog, perform the following steps.

Task ***To add a group to Application Manager:***

1. Open the **Catalog** tab of Application Manager.
2. In the tree, right-click on the group to which the new group should belong and select **New Group**.
3. Provide a name for the new group.
4. Press **Enter**.

Organizing Applications in Application Manager

To move applications or groups into different groups, perform the following steps:

Task ***To organize individual packages and groups of packages in Application Manager:***

1. Open the **Catalog** tab of Application Manager.
2. In the tree, select the application or group that you want to move.
3. Drag the application or group onto a new group.

***Note** • The following rules apply to drag and drop operations in the Application Manager:*

- *You cannot drop a node on itself.*
- *You cannot drop a node on its parent. It is already a child of the parent.*
- *You cannot drop a group on its child groups.*

Deleting Application Manager Groups

To delete a group from an Application Catalog, perform the following steps:

Task ***To delete a Application Manager group:***

1. Open the **Catalog** tab of Application Manager.
2. Right-click on the group you want to delete in the tree and select **Delete** from the shortcut menu.
3. From the resulting message box, confirm the deletion.

***Caution** • When you delete a group, all subgroups and applications within that group are also removed from the Application Manager.*

Editing Group Properties

For each group, you can modify its name, and add a description or other comments. To edit this information, perform the following steps.

Task ***To edit group properties:***

1. Open the **Catalog** tab of Application Manager.
2. Right-click on the group in the tree and select **Properties** from the shortcut menu. The **Group Properties** dialog box opens, displaying the group **Name**, **Description**, and **Comments**.
3. Make any desired edits.
4. Click **OK**.

Copying and Sharing Packages in the Application Catalog

You can choose to import multiple copies of a package into the Application Catalog or share a single package between multiple groups.

Having Multiple Copies of a Package in the Application Catalog

More than one copy of the same package can exist in an Application Catalog. To accomplish this, you can use the Import Wizard to import the same package into multiple groups. Each time you import the package, Application Manager will create a new application node in that group (if one does not already exist) to store that package, and a new entry will be made for that package in the database. When testing is performed, the package will be tested multiple times.

Sharing a Package in the Application Catalog

You can share the same package between multiple groups in the Application Catalog. An application node for that package will exist in multiple groups, but all will point to the same package; the package itself is not copied and a new entry is not made in the database. Also, when testing is performed, the package will only be tested one time.

To share a package, perform the following steps:

Task ***To share a package between groups in the Application Catalog:***

1. Open the **Catalog** tab of Application Manager.
2. In the first group, right-click the application node containing the package that you want to share and select **Copy** from the shortcut menu (or press Ctrl + C).
3. Right-click on a different group and select **Paste** from the shortcut menu (or press Ctrl + V). A new application node is created in the selected group for the package.

Note • *You cannot use the* ***Copy*** *function to copy a package into the same group.*

Moving Applications, OS Snapshots, and Groups

You can move OS Snapshots, applications, or groups into other groups.

Task ***To move an application, OS Snapshot, or group:***

1. Open the **Catalog** tab of Application Manager.
2. Select the application or group you want to move in the tree.
3. Drag the item into a new group.

Deleting Packages and Applications

You can delete both packages (deployment types) and applications from the Application Manager tree.

Deleting Packages

You can delete packages that have been imported into the Application Catalog.

Task ***To delete a package from the Application Catalog:***

1. Open the **Catalog** tab of Application Manager.
2. Right-click on the package in the tree, point to **Delete** on the shortcut menu, and click **Package** to delete the package from the selected application.
3. Confirm the deletion.

Note • *If you delete a package from an application that only has one deployment type, the application is also deleted. However, if the application has other associated deployment types, it is not deleted.*

Deleting Applications

If you delete an application from the Application Manager tree, you are also deleting all of that application's deployment types.

Task ***To delete an application from the Application Catalog:***

1. Open the **Catalog** tab of Application Manager.
2. Right-click on an application in the tree, and select **Delete** from the shortcut menu.
3. Confirm the deletion.

Note • *If you delete an application, all of that application's deployment types (packages) are also deleted.*

Browsing to Package Location from Application Manager Tree

You can quickly browse to the directory location of your source package files by right-clicking on the package in the Application Manager tree and then selecting **Open File Location** from the shortcut menu. This new option is available on both the **Catalog** and the **Test Center** tabs of Application Manager.

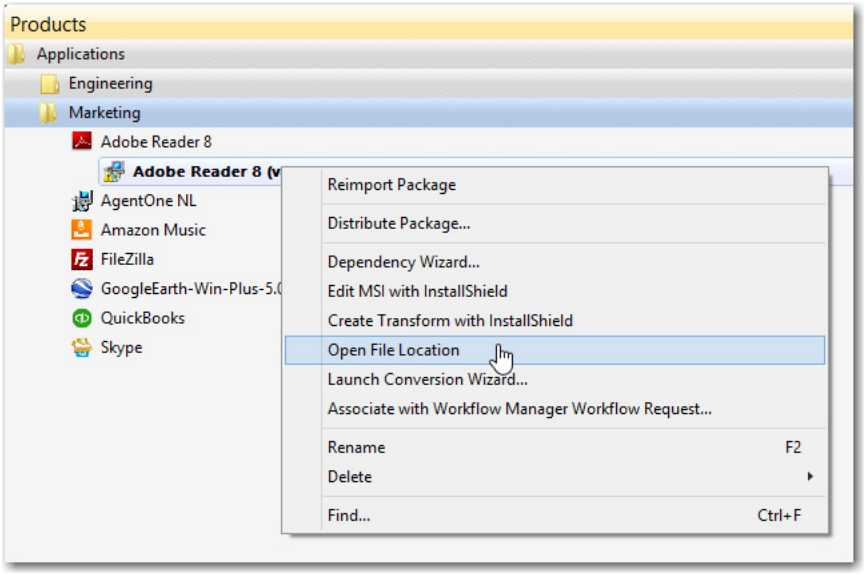


Figure 8: New "Open File Location" Command on Shortcut Menu

A new File Explorer window opens, listing the package's source files.

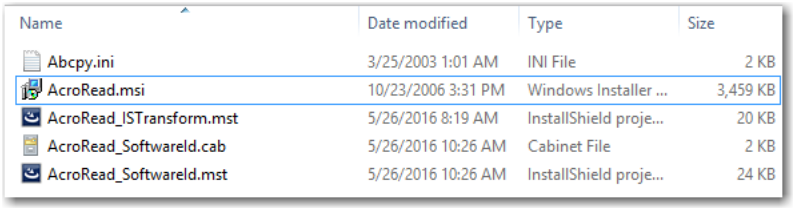

Figure 9: File Location of Imported Package's Source Files

Importing

You can use the Import Wizard to import multiple application deployment types either one at a time, all of the packages in a directory, or one or multiple packages directly from a deployment system. You can also import web applications, web deploy packages, and links to mobile apps in a public store.

- Package Types Supported By the Import Wizard
- Package Sources Supported by the Import Wizard
- Importing a Single Package File
- Importing Links to Public Store Applications

- Importing a Folder of Multiple Applications
- Importing From Microsoft System Center Configuration Manager
- Importing Web Applications
- Importing Merge Modules
- Importing OS Snapshots
- Importing Packages Using Command Line Bulk Import
- Using Duplicate Package Identifiers
- Generating Software ID Tag Files During Package Import
- Viewing Bundled Packages of Complex Installer Executables

Package Types Supported By the Import Wizard

You can use the Import Wizard to import the following package types into the Application Catalog:

Table 7-7 • Data Types Supported By the Import Wizard

Data Type	Description
Windows Installer Packages, Transforms, and Patches	You can import Windows Installer packages (**.msi**) with any associated transforms (**.mst**) and patches (**.msp**) into the Application Catalog. You have several available options when importing Windows Installer packages: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager
Virtual Packages: Microsoft App-V, Citrix XenApp, VMware ThinApp, Symantec Workspace	You can import virtual packages in Microsoft App-V (4.x and 5.0), Citrix XenApp, VMware ThinApp (4.x and 5.0), and Symantec Workspace formats. You have several available options when importing virtual packages: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager Virtual packages are associated with their source Windows Installer package by matching Package Codes. Virtual packages that were created by AdminStudio include a **metadata.ami** file that identifies the Package Code of the virtual package's source Windows Installer package. To manually associate a virtual package with its source Windows Installer package, you can use the **Associate Package** function, as described in Associating a Virtual Package with its Source Windows Installer Package.

Table 7-7 • Data Types Supported By the Import Wizard (cont.)

Data Type	Description
Mac OS X Desktop Applications	You can import the following Mac OS X desktop applications into the Application Catalog, which will enable you prepare those applications for deployment, and then deploy them to JAMF Casper Suite. • **Local file**—The following types of Mac OS X desktop applications can be imported: ◦ **Apple disk image package (.dmg)**—When you double-click a **.dmg** file, an Apple disk image is "mounted" as a volume within the Finder. To install the application, you usually drag the application icon from the disk image into the Applications folder. ◦ **Apple installer package (.pkg)**—Double-clicking a **.pkg** file launches the Apple installer application, where the package is installed by proceeding through an installation wizard. • **Public store link**—Link to Mac OS X desktop application in the Apple Mac App Store. For more information, see: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing Links to Public Store Applications
Legacy Applications	You can import non-MSI legacy setup types (such as InstallShield Professional or ISMP installations) into the Application Catalog using any of the following methods: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager When you import a legacy installer (**.exe**), you are prompted to select a setup configuration file (**.ini**) to include with the imported package. For more information, see About Legacy Installer Packages.

Table 7-7 • Data Types Supported By the Import Wizard (cont.)

Data Type	Description
Complex Installer Executables	You can import complex installer executable files (.exe) that contain bundled Windows Installer packages, including: • InstallShield InstallScript **.exe** files • InstallShield Basic MSI installers that are compressed into a **setup.exe** file • InstallShield Suite Installer **.exe** files • Wise Package Studio **.exe** files • Other executable file types that can be uncompressed by 7-ZIP You can import these executables using any of the following methods: • Importing a Single Package File • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager When you import one of the complex installer executables, you can view the names of bundled Windows Installer packages and perform operating system compatibility, application virtualization compatibility, and best practices testing on those bundled packages. For more information see: • Viewing Bundled Packages of Complex Installer Executables • Viewing Combined Test Results of Child Windows Installer Packages of Complex Installer Executables

Table 7-7 • Data Types Supported By the Import Wizard (cont.)

Data Type	Description
Mobile Apps	You can import the following mobile apps into the Application Catalog, which will enable you prepare those applications for deployment, and then deploy them to System Center 2012 Configuration Manager or AirWatch. • **Apple iOS mobile app** ◦ **Local file**—Mobile app file (**.ipa**). ◦ **Public store link**—Link to mobile app in the Apple App Store. • **Google Android mobile app** ◦ **Local file**—Mobile app file (**.apk**). ◦ **Public store link**—Link to mobile app in the Google Play Store. • **Microsoft Windows Store mobile app** ◦ **Local file**—Mobile app file (**.appx**). ◦ **Public store link**—Link to mobile app in the Microsoft Windows Store. You have several available options when importing mobile apps: • Importing a Single Package File • Importing Links to Public Store Applications • Importing a Folder of Multiple Applications • Importing From Microsoft System Center Configuration Manager  ***Edition*** • *Support for mobile apps is included when you purchase AdminStudio Professional or Enterprise Edition with Mobile.*  ***Note*** • *To import a link to a mobile app in a public store, see Importing Links to Public Store Applications.*
Web Applications	You can import a local web application or a deployed web application by specifying a URL. See Importing Web Applications.
Web Deploy Packages	You can use the web deploy package format to streamline the deployment of web applications to Microsoft IIS web servers or to Microsoft Azure websites. In a web deploy package, the content, configuration, databases and other artifacts of a web application are packaged in a .zip file. You can import web deploy packages (.zip) into the AdminStudio Application Catalog so that you can test them for compatibility with the Windows Server 2012 R2 operating system and the Microsoft Azure remote application publishing platform, as well as test them for best practices and browser compatibility. See Importing a Web Deploy Package.

Table 7-7 • Data Types Supported By the Import Wizard (cont.)

Data Type	Description
Merge Modules	A merge module (**.msm**) is a package containing all of the logic and files needed to install distinct pieces of application functionality such as run-time **.dll** files and virtual machines. For optimal performance, Merge modules should be imported into an Application Catalog database prior to importing Windows Installer packages. This ensures that conflicts resulting from not using available merge modules are correctly identified. For more information, see Importing Merge Modules.
OS Snapshots	You can import OS Snapshot (**.osc**) files into the Application Catalog to use to determine conflicts between an operating system and a package. See Importing OS Snapshots and About Legacy Installer Packages.

Note • *In previous releases, if you were connected to a Software Repository-enabled Application Catalog, it was possible to use the Import Wizard to perform an ad-hoc import of a transform or patch file (importing a transform or patch file after their associated Windows Installer package had already been imported). Beginning with AdminStudio 11.5, this option is no longer available. Transform and patch files always have to be imported along with their associated Windows Installer package.*

Package Sources Supported by the Import Wizard

You can import packages or a directory of packages from your local network. You can also import packages from System Center 2012 Configuration Manager or System Center 2007 Configuration Manager. In addition, you can "import" a deployed web application by entering its URL; this enables you to perform browser compatibility testing.

Note • *You can also set up automatic package import from a specified network directory, as described in Automatically Importing Packages from a Network Directory.*

Note • *You can also import a local web application, as described in Importing a Local Web Application from a Virtual Directory.*

You specify the source of the package(s) that you want to import by making a selection on the **Source** panel of the Import Wizard:

Table 7-8 • Package Sources Supported by the Import Wizard

Source	Description
Single application	Select to import a single application into the Application Catalog. See Importing a Single Package File.

Table 7-8 • Package Sources Supported by the Import Wizard

Source	Description
Folder of multiple applications	Select to import a directory of packages (containing multiple deployment types, if desired) into the Application Catalog. See Importing a Folder of Multiple Applications.
Link to a public store app	Select to import a link to an Apple iOS mobile app in the Apple App Store, a Google Android mobile app in the Google Play Store, or a Windows Store mobile app in the Windows Store. See Importing Links to Public Store Applications.
Applications from a deployment system	Select this option to import applications or packages from a Microsoft System Center Configuration Manager server. See Importing From Microsoft System Center Configuration Manager.
Website from URL	Select this option to import a deployed web application for testing, as described in Importing a Deployed Web Application.  ***Note*** • *You can also import a local web application, as described in Importing a Local Web Application from a Virtual Directory.*

Importing a Single Package File

Edition • *Support for virtual packages is included when you purchase AdminStudio Professional or Enterprise Edition with Application Virtualization.*

You can import the following types of package files:

- **Windows Installer package**—You can import a Windows Installer package with all of its associated transform files and patches into the Application Catalog at the same time.
- **Virtual package**—You can import a single virtual package in Microsoft App-V, Citrix XenApp, VMware ThinApp, or Symantec Workspace format.

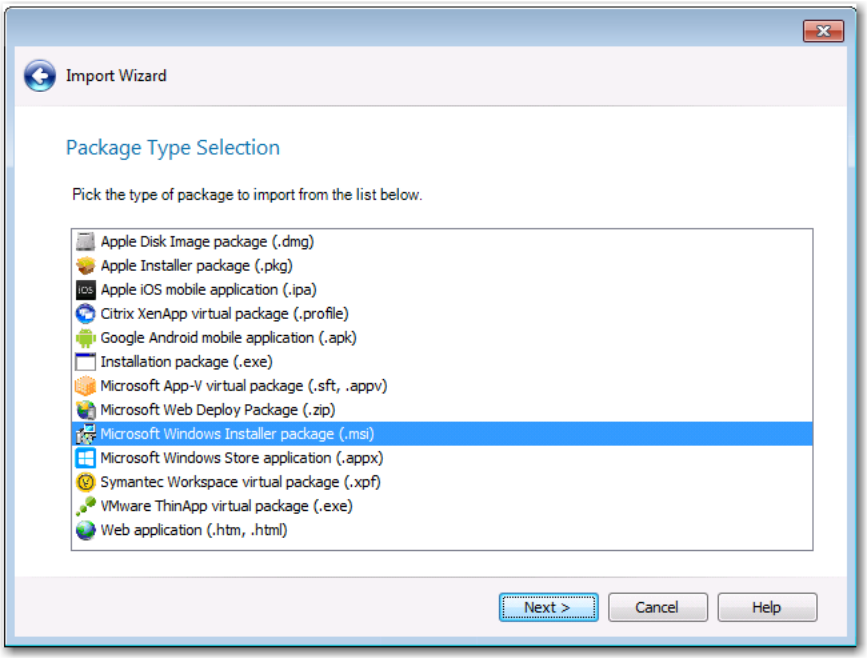
  Note • *AdminStudio supports the import of App-V 4.x packages (.sft files) as well as App-V 5.0 packages (.appv files).*
- **Mac OS X App**—You can import a single Mac OS X desktop application in **.pkg** or **.dmg** format.
- **Mobile app**—You can import a single mobile app in Apple iOS, Google Android, or Windows Store format.

Note • *For information on importing web applications, see Importing Web Applications. For information on importing a Microsoft Web Deploy Package (.zip), see Importing a Web Deploy Package.*

To import a single Windows Installer package, virtual package, or mobile app, perform the following steps:

Task ***To import a single package into an Application Catalog:***

1. On the **Catalog** tab of the Application Manager ribbon, click the **Import** button. The **Source** panel opens.
2. Select **Single application** and click **Next**. The **Package Type Selection** panel opens.



3. Select the package type of the package that you want to import, and click **Next**. The **Package File Selection** panel opens.
4. Click **Browse** and select the package that you want to import.

5. Click **Next**. For some package types, the **Package Support Files** panel opens, where you may optionally select any additional files to be imported along with the package, such as:

Package Type	Support File	Description
Windows Installer (.msi)	Transform files (.mst)	All of the **.mst** files that are in the same directory as the Windows Installer file you are importing are automatically listed, but only those **.mst** files that AdminStudio determines are probably applicable to this Windows Installer package are selected to be included in the import. If you do not want to import a selected **.mst** file, clear the selection. ***Note*** • *You an add additional transform files and specify the order that they will be applied, as described in Adding Additional Package Support Files and Ordering List.*
	Patch files (.msp)	If a patch file is in the same directory as the Windows Installer file you are importing, that patch file will automatically be listed. If you do not want to import it, clear the selection. ***Note*** • *You an add additional patch files and specify the order that they will be applied, as described in Adding Additional Package Support Files and Ordering List.* ***Note*** • *If you specify an update.exe patch file that was created by Developer/DevStudio/InstallShield Editor, Application Manager will extract the .msp file in the Temp folder and then perform the import.* ***Note*** • *See About the Administrative Installation of Patches.*
Legacy packages (.exe)	Setup configuration files (.ini)	Contains setup and configuration information for a legacy installation package.

6. If the **Package Support Files** panel opens, do the following to add and select this package's support files, and to modify the order in which they are applied:

   - **Selecting a support file**—If a support file is already listed, select it to include it in the import.
   - **Adding support file**—To add an additional support file, click the **Add** button and browse to the location of the support file. If the package requires multiple support files, you can repeat the procedure as necessary. T

- **Reordering support files**—The order in which the support files are applied may be important, and can be changed by selecting a support file in the list and clicking the **Up** and **Down** buttons.

Note • *More than one **Package Support Files** panels may open. For Windows Installer packages, you first see a **Package Support Files** panel prompting the import of transform files, and next a **Package Support Files** panel that prompts the import of patch files opens.*

Note • *If you specify an **update.exe** patch file that was created by Developer/DevStudio/InstallShield Editor, Application Manager will extract the **.msp** file in the **Temp** folder and then perform the import.*

7. When you have finished adding files to the **Package Support Files** panel, click **Next**. The **Destination Group** panel opens.
8. Select a destination group into which your package will be imported.

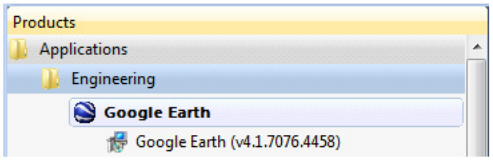
Note • *If you launched the Import Wizard by selecting a group in the tree and then clicking **Import**, that group will be selected by default on the **Destination Group** panel.*

Note • *If you want to import the package into a new group, click the **New Group** button to create a new group.*

9. Click **Next**. The **Summary** panel opens.
10. Review the information in the **Summary** panel. If you are satisfied with the import options, click **Next** to start the import.

    Progress messages are displayed. Depending on whether options have been set on the **Import Options / General** tab of the Application Manager **Options** dialog box (available from the Application Manager tab menu), testing may be performed during import.

    The package will then appear under an **Application** node in the Application Manager tree:



Creation of Application Nodes During Package Single Package Import

Application nodes are created in the Application Manager tree using the package's associated Package Code. If multiple packages of different deployment types (such as Windows Installer, App-V, and ThinApp, and Symantec Workspace) of the same software product are all imported into the same Group and all have the same Package Code, all of the deployment types will be automatically listed under the same application node.

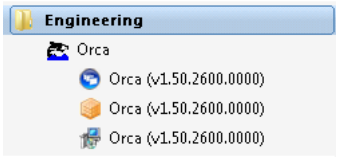


Figure 7-1: Three Deployment Types Under One Application Node

However, if multiple packages of different deployment types of the same software product have different Package Codes, and are all imported into the same Group, an additional node for that application will be created for each Package Code, incremented by a number, such as: **ABC Application** and `ABC Application [1]`.

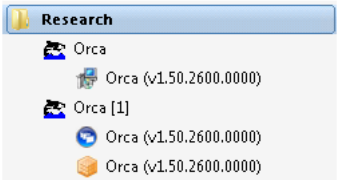

Figure 7-2: Three Deployment Types Under Two Different Application Nodes

Note • *Virtual packages that were created by AdminStudio include a* ***metadata.ami*** *file that identifies the Package Code of the virtual package's source Windows Installer package.*

Forcing Packages With Different Package Codes Under Same Application Node

You also have the option of forcing packages with different Package Codes to be listed under the same application node. To do this, import the package that has the different Package Code using the **Single application** option of the Import Wizard, and select the application node that you would like it to appear under on the **Destination Group** panel.

Associating a Virtual Package with its Source Windows Installer Package

You can import Microsoft App-V, VMware ThinApp, Citrix XenApp, and Symantec Workspace virtual packages into the Application Catalog and associate them with their source Windows Installer package.

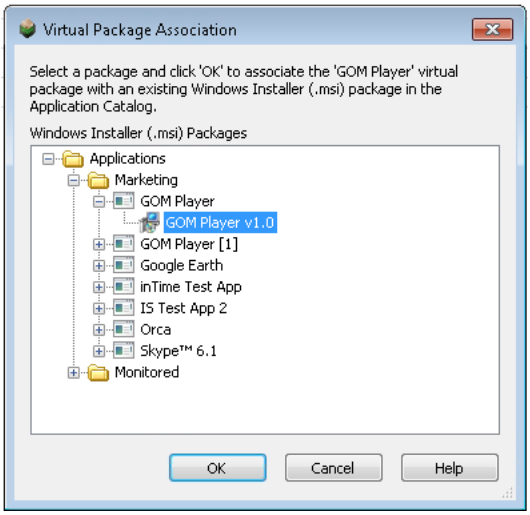
Virtual packages are self-contained entities which ordinarily cannot be modified after they are created. By associating a virtual package with the Windows Installer package which originated it, you have the convenience of being able to easily locate the virtual package's originating Windows Installer package, modify the original Windows Installer package, and then regenerate the virtual package.

Application Manager uses a package's Package Code to associate packages and to automatically group them under an application node (if they are imported into the same group).

If a Windows Installer package and a virtual package that AdminStudio created by converting that Windows Installer package are imported into the same Group, the virtual package will be associated with its source Windows Installer package. However, if you want to manually associate a virtual package to its source Windows Installer package, perform the following steps:

Task ***To manually associate a virtual package with a Windows Installer package:***

1. Open the **Catalog** tab of Application Manager
2. Right-click on the virtual package you want to make an association for, and select **Associate Package** from the shortcut menu. The **Virtual Package Association** dialog box opens, listing Windows Installer packages in the Application Catalog.



3. Select the virtual package's source Windows Installer package and click **OK**. The virtual package is now associated with the selected Windows Installer package.

Caution • *After you have imported a virtual package into the Application Catalog, you are permitted to use the* ***Associate Package*** *function to associate it with any Windows Installer package in the Application Catalog, even one that is not its source package. Therefore, use this feature with caution.*

Deleting a Virtual Package Association

You can delete a virtual package's association with a Windows Installer package by performing the following steps:

Task ***To delete a virtual package association:***

1. Open Application Manager.
2. Right-click on a virtual package, point to **Delete** and click **Package Association** on the shortcut menu. The **Delete Virtual Package Association** dialog box opens, prompting you to confirm the deletion.
3. Select the association that you want to delete and click **OK**. The association is deleted.

About Windows Installer Packages (.msi)

Application Manager supports the import of Windows Installer packages **(.msi)**. A Windows Installer package contains all of the information that the Windows Installer requires to install or uninstall an application or product and to run the setup user interface. The **.msi** file can also contain one or more transform files (**.mst**) and one or more patches (**.msp**).

A Windows Installer package is organized around the concepts of components and features:

- A feature is a part of the application's total functionality that a user may decide to install independently.
- A component is a piece of the application or product to be installed.

The Windows Installer always installs or removes a component from a user's computer as a coherent piece. Components are usually hidden from the user. When a user selects a feature for installation, the installer determines which components must be installed to provide that feature.

About Transforms (.mst)

Application Manager supports the import of Windows Installer packages (**.msi**) with associated transforms (**.mst**). A transform is a collection of changes applied to an installation. By applying a transform to a base installation package, the installer can add or replace data in the installation database. The installer can only apply transforms during an installation.

The installer registers a list of transforms required by the product during the installation. The installer must apply these transforms to the product's installation package when configuring or installing the product.

A transform can modify information that is in any persistent table in the installer database. A transform can also add or remove persistent tables in the installer database. Transforms cannot modify any part of an installation package that is not in a database table, such as information in the summary information stream, information in substorages, information in nested installations, or files in embedded cabinets.

About Patches (.msp)

AdminStudio supports the import of Windows Installer packages (**.msi**) with associated patches (**.msp**). A Windows Installer patch (**.msp** file) is a file used to deliver updates to Windows Installer applications. A patch is a self-contained package that contains all the information required to update an application.

A patch package contains the actual updates to the application and describes which versions of the application can receive the patch. A patch package does not include a database like a regular installation package (**.msi** file). Patches contain at minimum two database transforms. One transform updates the information in the installation database of the application. The other transform adds information that the installer uses for patching files.

About the Administrative Installation of Patches

For patches to be applied to a Windows Installer package, it is necessary to perform an administrative install of the Windows Installer package and then perform an administrative install of each patch package one by one. This way, the content of each patch package is appended to the Windows Installer package at the administrative install location.

In previous releases, when you imported a patch into the Application Catalog, you were prompted to specify a location for an administrative install. However, starting with AdminStudio 2013, you no longer have to specify a location for an administrative install if your Windows Installer package includes patches. Instead, the administrative install operation is automatically performed in a TEMP folder.

About Legacy Installer Packages

Application Manager supports the import of non-MSI legacy setup types (such as InstallShield Professional or ISMP installations) into the Application Catalog. By importing these legacy setup formats, you allow AdminStudio to manage these setups in a manner consistent with other MSI based packages.

When you import a legacy installer (**.exe**), you are prompted to select a setup configuration file (**.ini**) to include with the imported package.

***Note** • Testing using Test Center is not supported by the **Legacy installer package (.exe)** package type.*

Importing Links to Public Store Applications

You can import links to public store apps in the Apple iOS App Store, Apple Mac App Store, Google Play Store, or Windows Store into the Application Catalog. This enables you to prepare and manage them in conformance with your standard application readiness processes. The following features are supported for public store apps:

Table 7-9 • Support for Public Store Apps

Feature	Description
Obtain and view metadata	When a public store app is imported, metadata is automatically extracted from the application's property files and its public store, and that data can be viewed in Application Manager, both on the **General Information** tab of the **Application View** and on the **Tables** view. See Managing Mobile App Metadata.
Perform testing	After you import a public store app, you can perform OS compatibility and risk assessment testing to determine whether deployment of these public store apps will be successful. Test results are displayed in Test Center. See Performing Compatibility, Best Practices, and Risk Assessment Testing. ***Note** • Operating system compatibility testing is only available for Apple iOS, Mac OS X, and Google Android public store apps.*
Detailed reporting	In Report Center, you can view device compatibility, OS compatibility, and feature use reports for iOS, Mac OS X, Android, and Windows Store apps (local and public store). See Viewing Application Testing and Analysis Reports on the Report Center Tab.
Policy compatibility reporting	If you import iOS Enterprise Policy Configuration files (**.mobileconfig** or **.plist)**, you can view policy compatibility reports in Report Center for both iOS local and public store mobile apps. See Importing Enterprise Policy Configuration Files.

Table 7-9 • Support for Public Store Apps

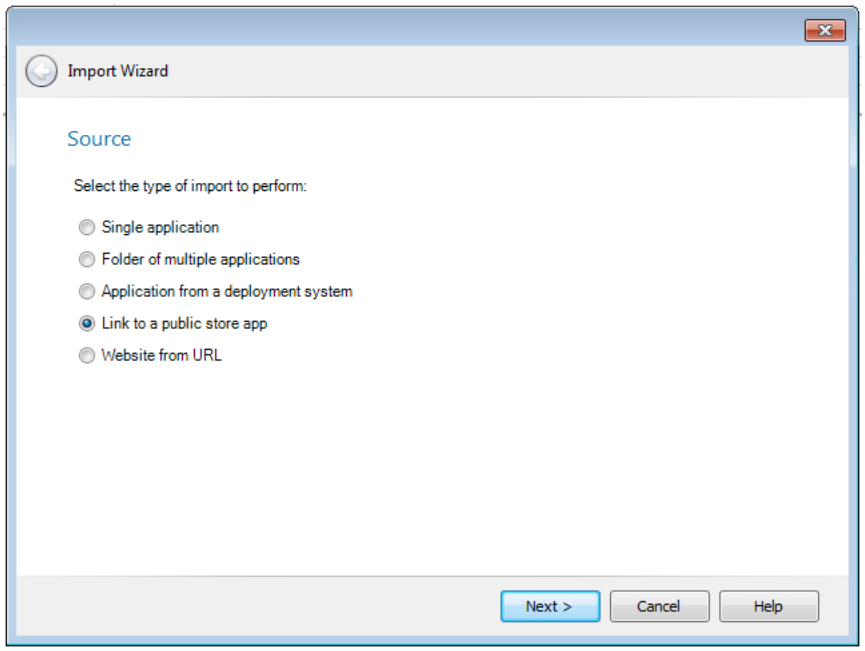
Feature	Description
Distribution	You can use the Distribution Wizard to deploy iOS, Mac OS X, Android, and Windows Store mobile apps (both local and public store) to Microsoft System Center 2012 Configuration Manager, Casper Server, and AirWatch Server. See Distributing Applications Using the Distribution Wizard.

Note • *For information on importing local mobile apps, see Importing a Single Package File or Importing a Folder of Multiple Applications.*

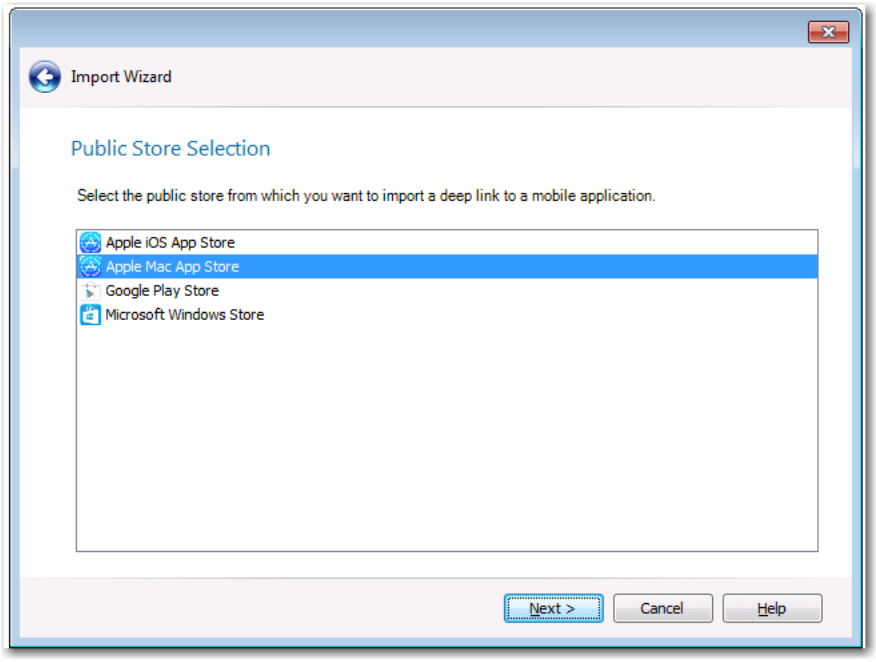
To import a link to public store application, perform the following steps:

Task ***To import a link to a public store mobile app into the Application Catalog:***

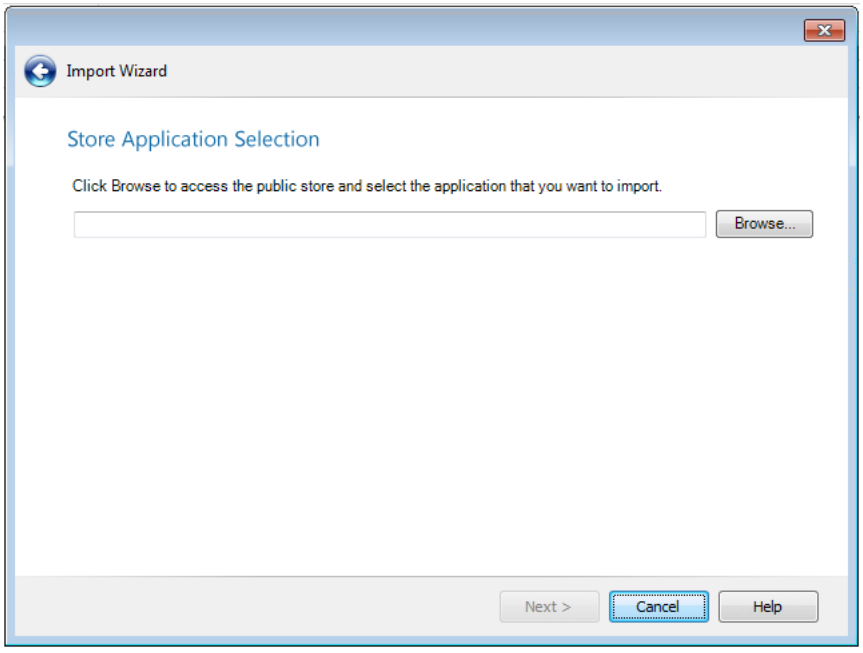
1. On the **Catalog** tab of the Application Manager ribbon, click the **Import** button. The **Source** panel opens.



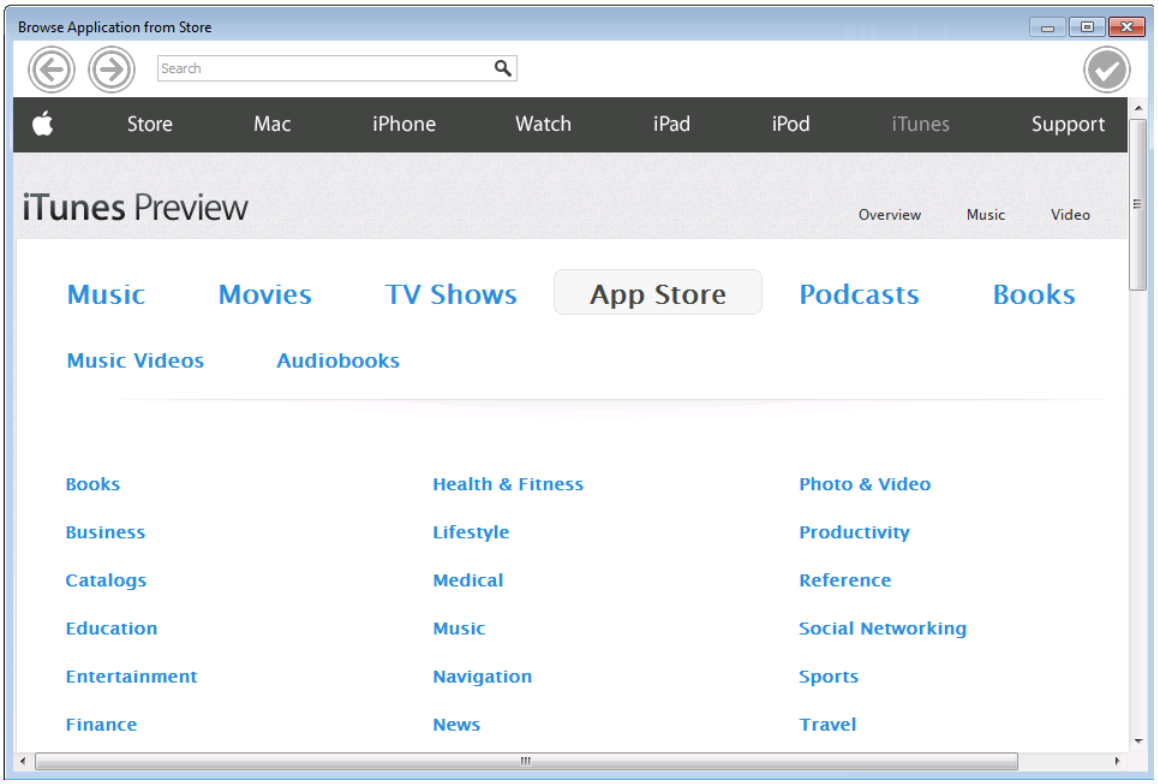
2. Select **Link to a public store app** and click **Next**. The **Public Store Selection** panel opens.



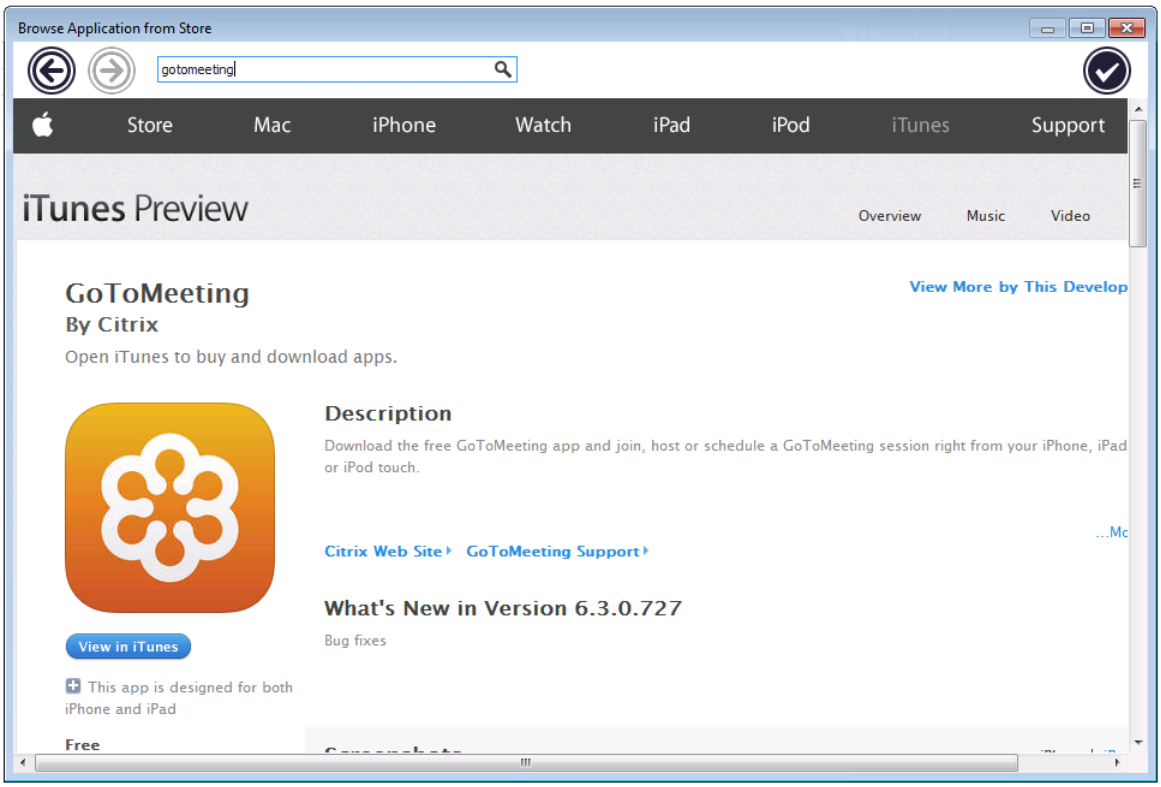
3. Select one of the following public stores:
   - **Apple iOS App Store**
   - **Apple Mac App Store**
   - **Google Play Store**
   - **Microsoft Windows Store**
4. Click **Next**. The **Store Application Selection** panel opens.



5. Click **Browse**. The **Browse Application from Store** dialog box opens which displays the browser window of the selected public store.



6. Use the links in the browser window and the search functionality to locate the desired mobile app and open its informational page.



Note • *You can also use the arrow keys at the top left of the dialog box to navigate through the public store.*

7. When you have opened the informational page of the public store app that you would like to import, click the checkmark button at the top right of the dialog box.

Tip • *When importing Microsoft Windows Store mobile apps, It is possible that the Windows Store app may open and obscure this checkmark button. If this happens, minimize the Windows Store app, and then return to the browser window and click the checkmark button.*

The link to the selected public store app is now listed on the **Store Application Selection** panel, such as:

```
https://itunes.apple.com/us/app/gotomeeting/id424104128?mt=8
```

8. Click **Next**. The **Destination Group** panel opens.
9. Select a destination group into which your public store app will be imported.

Note • *If you launched the Import Wizard by selecting a group in the tree and then clicking* ***Import****, that group will be selected by default on the* ***Destination Group*** *panel.*

Note • *If you want to import the package into a new group, click the* ***New Group*** *button to create a new group.*

10. Click **Next**. The **Summary** panel opens.
11. Review the information in the **Summary** panel. If you are satisfied with the import options, click **Next** to start the import. Progress messages are displayed on the **Running the Import** dialog box.
12. When the import is complete, click **Finish** to close the wizard.

    The mobile app is now listed in the Application Manager tree using one of the following icons:

Public Store App Type	Icon	URL
Apple iOS App Store **Apple Mac App Store**		`https://itunes.apple.com/us/app`
Google Play Store		`https://play.google.com/store/apps`
Microsoft Windows Store		`http://windows.microsoft.com/en-us/windows/search#q=productivity+buisness &s=Store`

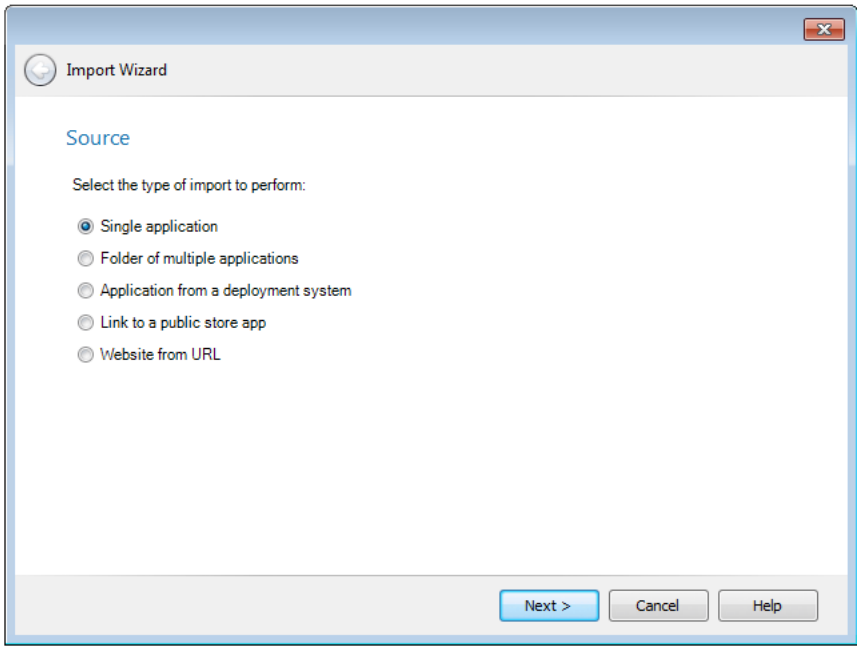
Importing a Folder of Multiple Applications

You can import multiple packages (of selected package types) from a directory of packages into the Application Catalog using the **Folder of multiple applications** option of the Import Wizard. You can use this method to import all of the package types described in Package Types Supported By the Import Wizard.

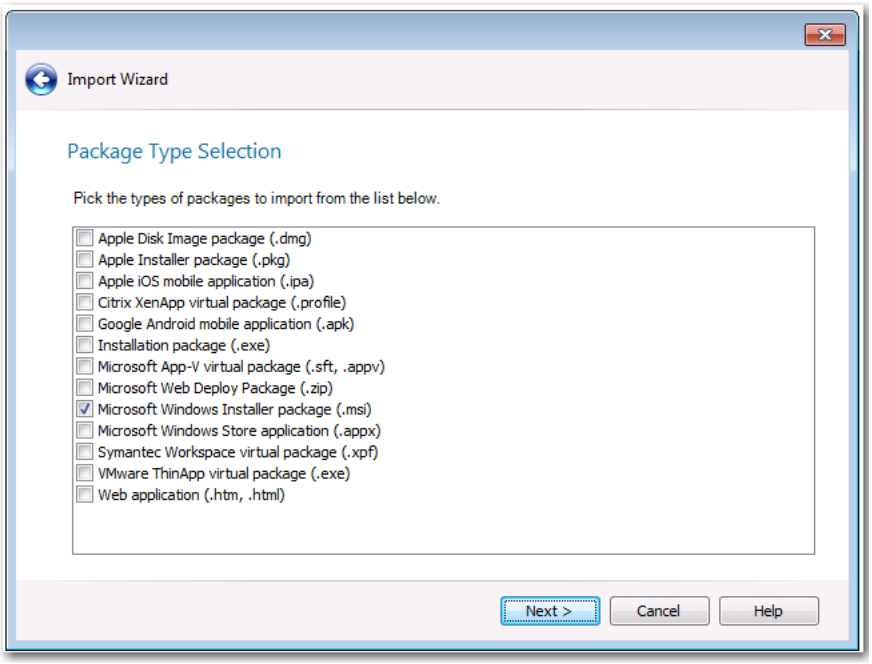
To import a directory of packages, perform the following steps.

Task ***To import a directory of packages:***

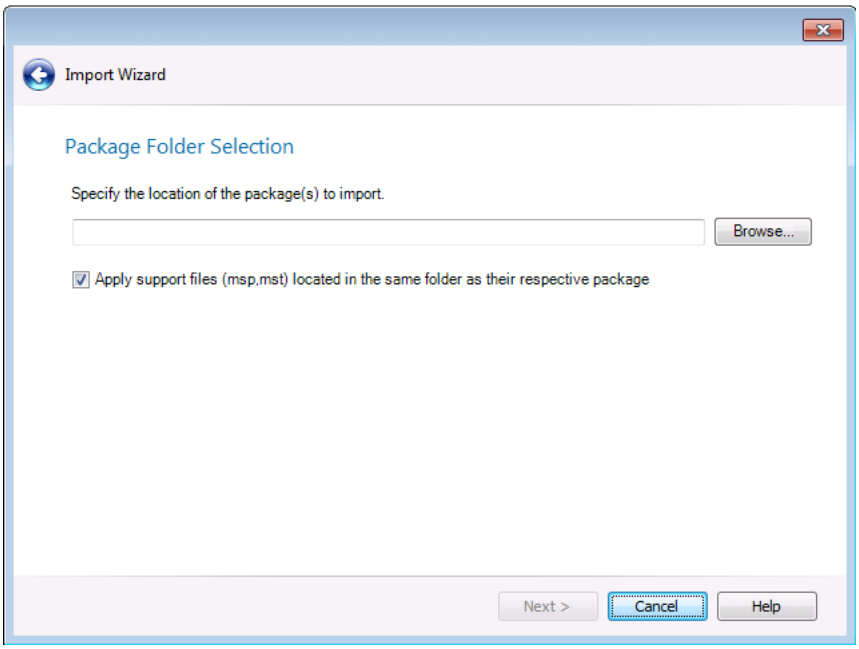
1. Open **Application Manager**.
2. On the **Catalog** tab of the Application Manager ribbon, click **Import**. The **Source** panel of the Import Wizard opens.



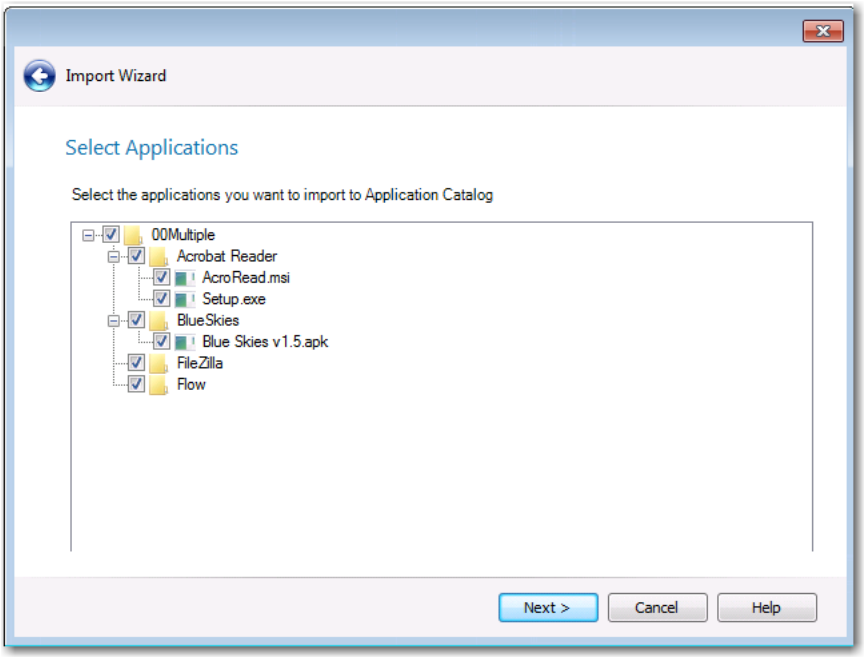
3. Select **Folder of multiple applications** and click **Next**. The **Package Type Selection** panel opens, prompting you to select the package deployment types that you want to import.



4. Select the package types that you want to import and click **Next**. The **Package Folder Selection** panel opens, prompting you to select the directory containing the packages you want to import.



5. Click **Browse** and select the directory containing the packages that you want to import.
6. Optionally, if you also want to import package support files (such as transforms or patch files), select the **Apply support files (.msp, .mst) located the same folder as their respective package** option.
7. Click **Next**. The **Select Applications** panel opens.



8. By default, all applications containing the selected package type are selected. You can clear the selection of any packages you do not want to import.
9. Click **Next**. The **Destination Group** panel opens.

10. Select the destination group into which the packages will be imported.

***Note** • If you launched the Import Wizard by selecting a group in the tree and then clicking **Import**, that group will be selected by default on the **Destination Group** panel.*

***Note** • If you want to import the packages into a new group, click the **New Group** button to create a new group.*

11. Set the **Create subgroups based on source folder structure** option to determine the location of the imported packages in the Application Manager tree:
    - **Selected**—Subgroups of the selected group will be created in the Application Manager tree that mimic the directory structure of the selected directory, and the packages will be imported into those subgroups.
    - **Not selected**—All of the packages in the selected directory (and its subdirectories) will be imported into the root of the selected group.
12. Click **Next**. The **Summary** panel opens.
13. Review the information in the **Summary** panel. If you are satisfied with the import options, click **Next** to start the import. Progress messages are listed on the **Running the Import** panel.
14. When import is complete, click **Finish** to close the wizard. The packages will then be listed in the Application Manager tree.

***Note** • Depending on whether options have been set on the **Import Options / General** tab of the Application Manager **Options** dialog box (available from the Application Manager tab menu), testing may be performed after import.*

***Note** • For information on how the Import Wizard decides which packages to import, see Import Wizard's Selection Rules When Importing Packages from a Directory.*

Creation of Application Nodes During Folder of Multiple Applications Import

Application nodes are created in the Application Manager tree using the package's associated Package Code. If multiple packages of different deployment types (such as Windows Installer, App-V, and ThinApp) of the same software product all have the same Package Code and are all imported using the **Folder of Multiple Package Import** option (without the **Create subgroups based on source folder structure** option), all of the deployment types will be automatically listed under the same application node.

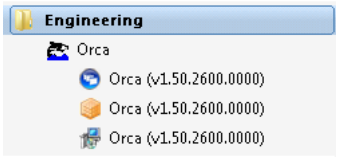


Figure 7-3: Three Deployment Types Under One Application Node

However, if multiple packages of different deployment types of the same software product have different Package Codes, and are all imported into the same Group, an additional node for that application will be created for each Package Code, incremented by a number, such as: **ABC Application** and `ABC Application [1]`.

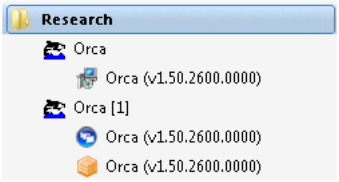

Figure 7-4: Three Deployment Types Under Two Different Application Nodes

Forcing Packages With Different Package Codes Under Same Application Node

You also have the option of forcing packages with different Package Codes to be listed under the same application node. To do this, import the package that has the different Package Code using the **Single application** option of the Import Wizard, and select the application node that you would like it to appear under on the **Destination Group** panel.

Importing From Microsoft System Center Configuration Manager

AdminStudio supports both Microsoft System Center 2012 Configuration Manager's application data model and the package model used in System Center 2007 Configuration Manager. Therefore, AdminStudio provides the following benefits related to migrating to Microsoft System Center 2012 Configuration Manager:

- **Eases your migration to Microsoft System Center 2012 Configuration Manager**—Because AdminStudio gives you the ability to choose the model which is best for your environment, it allows you to migrate to System Center 2012 Configuration Manager your own pace, minimizing possible disruptions to your functioning processes around packaging and repackaging during your migration. As you prepare your applications for migration to System Center 2012 Configuration Manager by importing them into the Application Catalog and collecting and reviewing metadata, you can continue to deploy packages from AdminStudio to System Center 2007 Configuration Manager.
- **Automates identification of System Center 2012 Configuration Manager metadata**—AdminStudio automates the identification of application metadata required for the population of System Center 2012 Configuration Manager's application model. Data is automatically collected during import into the Application Catalog—which is displayed in an organized, easy-to-navigate tabbed layout—and wizards are provided for you to quickly and easy add additional data. Using these features significantly reduces the time and cost to manually identify this metadata, and helps to speed the adoption of the user-centric deployment of applications using System Center 2012 Configuration Manager. For more information, see Managing System Center 2012 Configuration Manager Application Model Data and Managing System Center 2012 Configuration Manager Package Deployment Data.

You use the Import Wizard to perform a bulk import of Windows Installer, Microsoft App-V, Apple iOS, Google Android, and Windows Store packages from Microsoft System Center Configuration Manager server into the Application Catalog.

- Importing Applications, Mobile Apps, and Packages from System Center Configuration Manager
- Package Information Imported from System Center Configuration Manager

Importing Applications, Mobile Apps, and Packages from System Center Configuration Manager

You can import applications and mobile apps from System Center 2012 Configuration Manager or packages from System Center 2007 Configuration Manager into the Application Catalog.

You can import the following deployment types from System Center 2012 Configuration Manager:

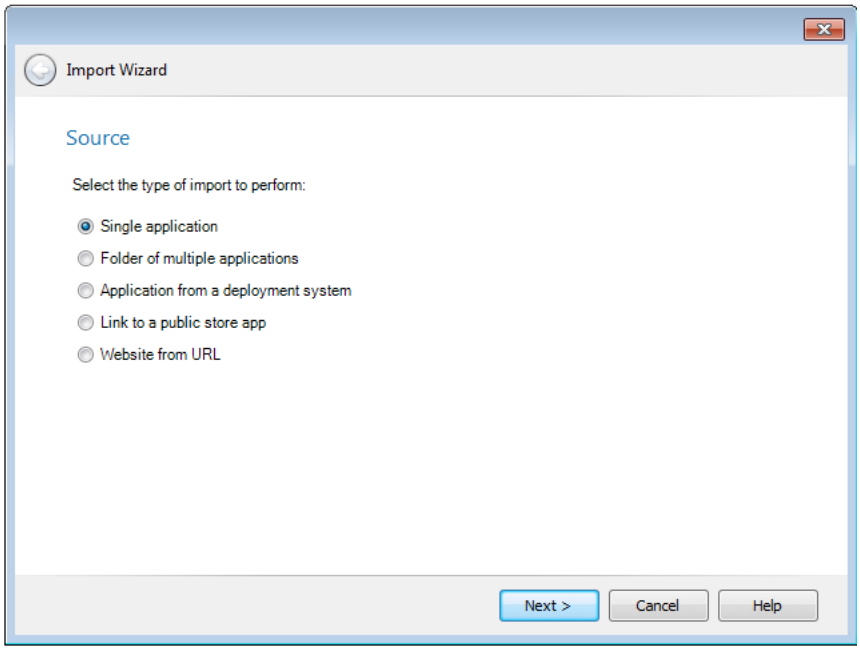
- Windows Installer
- Microsoft App-V 4.x and 5.0
- Apple iOS (local and public store link)
- Google Android (local and public store link)
- Windows Store (local only)

When you import packages from System Center Configuration Manager from versions prior to 2012, Application Manager also imports information that will assist you in migrating that package to System Center 2012 Configuration Manager's application model.

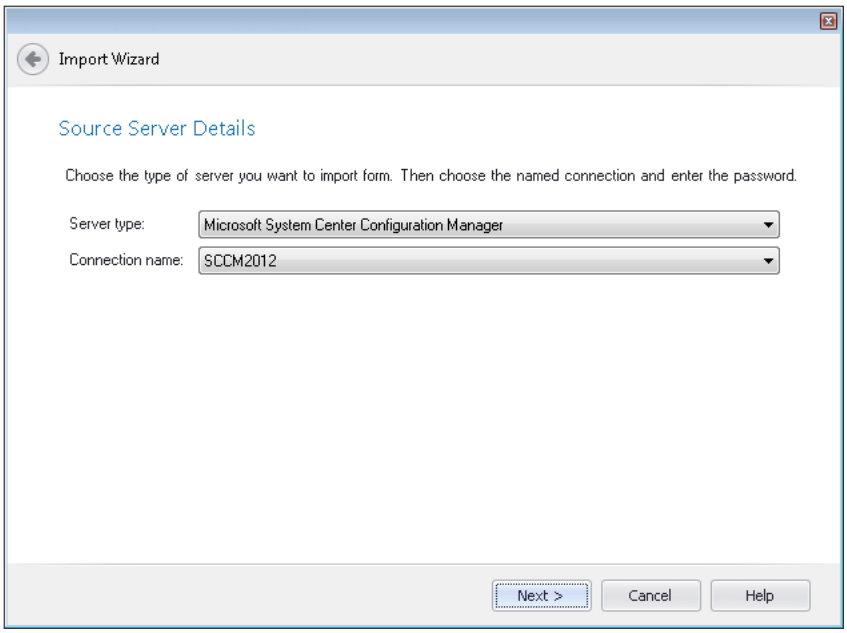
Note • *Before you can perform an import from System Center Configuration Manager, you need to define a named connection to a System Center Configuration Manager Server, as described in Creating a New Distribution System Connection Setting.*

Task ***To import applications and mobile apps from Microsoft System Center 2012 Configuration Manager:***

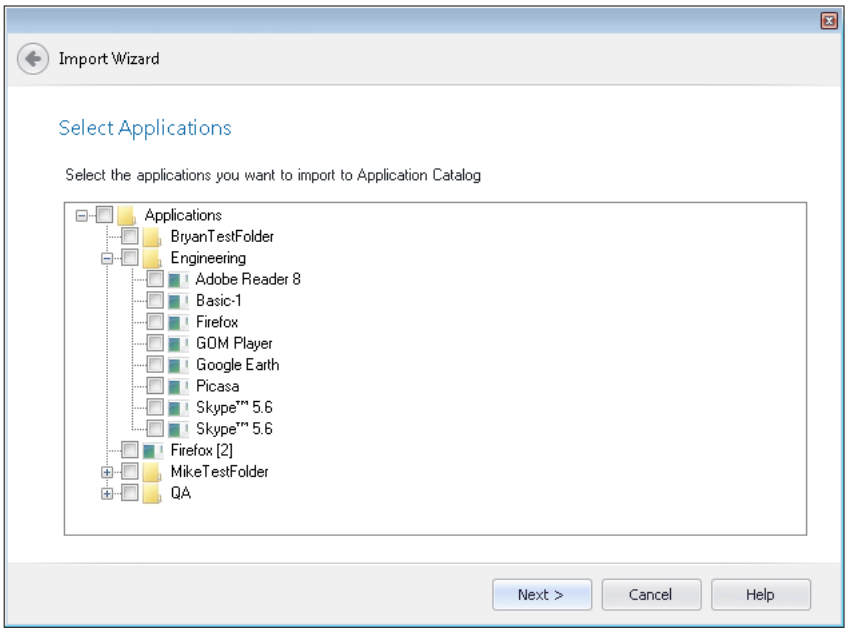
1. Open Application Manager and specify a named connection to a System Center Configuration Manager server, as described in Creating a New Distribution System Connection Setting.
2. On the **Catalog** tab of the ribbon, click the **Import** button. The **Source** panel of the **Import Wizard** opens.



3. Select **Packages from a deployment system** and click **Next**. The **Source Server Details** panel opens.



4. From the **Server type** list, select **Microsoft System Center Configuration Manager**.
5. From the **Connection name** list, select the named connection you created to your System Center Configuration Manager server.
6. Click **Next**. The **Select Applications** (for System Center 2012 Configuration Manager) or **Select Packages** for System Center 2007 Configuration Manager) panel opens, listing all of the applications or packages in the specified server.



7. Select the applications or packages that you want to import.
8. Click **Next**. The **Destination Group** panel opens.
9. On the **Destination Group** panel, select the group into which you want the selected applications to be imported.

***Note** • If you launched the Import Wizard by selecting a group in the tree and then clicking **Import**, that group will be selected by default on the **Destination Group** panel.*

***Note** • If you want to import the packages into a new group, click the **New Group** button to create a new group.*

10. Set the **Create subgroups based on source folder structure** option to determine the location of the imported packages in the Application Manager tree:
    - **Selected**—Subgroups of the selected group will be created in the Application Manager tree that mimic the directory structure of the selected System Center Configuration Manager directory, and the packages will be imported into those subgroups.
    - **Not selected**—All of the packages in the selected System Center Configuration Manager directory (and its subdirectories) will be imported into the root of the selected group.
11. Click **Next**. The **Summary** panel opens.
12. Review the information in the **Summary** panel. If you are satisfied with the import options, click **Next** to start the import.

    Progress messages are listed on the **Running the Import** panel.
13. When import is complete, click **Finish** to close the wizard. The applications imported from System Center Configuration Manager will then be listed in the Application Manager tree.

Note • *Depending on whether options have been set on the* ***Import Options / General*** *tab of the Application Manager* ***Options*** *dialog box (available from the Application Manager tab menu), testing may be performed after import.*

Package Information Imported from System Center Configuration Manager

When you import a package from System Center Configuration Manager, information from Configuration Manager is imported along with it and that information is displayed on the **Deployment Data** tab of the package's **Catalog Deployment Type View**.

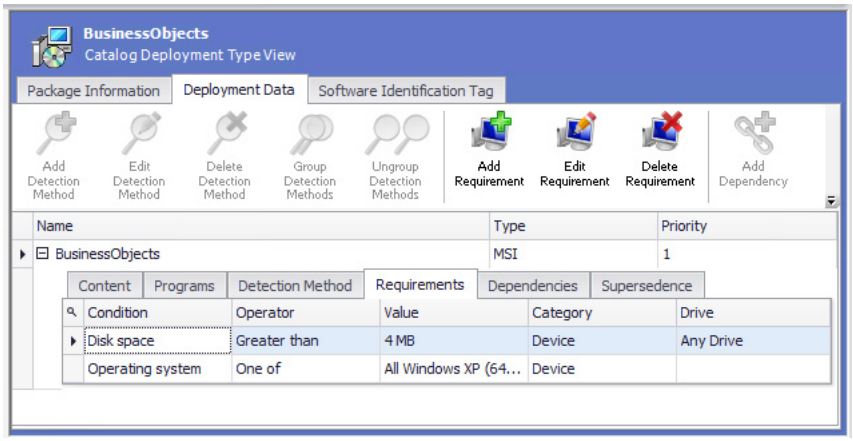


Figure 7-5: Deployment Data Tab of Catalog Deployment Type View

The following information is imported from System Center Configuration Manager:

Table 7-10 • Package Information Imported from System Center Configuration Manager

System Center 2007 Configuration Manager Program Property	Application Model Property on Deployment Data Tab	
Program > General > Command Line	**Programs** subtab	**Install Command Line**
Program > Requirements > Estimated Disk Space	**Requirements** subtab	**Disk Space** condition
Program > Requirements > Client Platforms	**Requirements** subtab	**Operating System** condition
Program > Advanced > Run Another Program First	**Dependencies** subtab	**Dependency**
Program Advertised to Collection	**Requirements** subtab	**Custom Requirement** (derived from collection queries of the advertised collection)

Importing Web Applications

Edition *• Support for importing web applications into the Application Catalog is available in AdminStudio Enterprise Edition with Application Compatibility.*

You can import web applications into Application Manager, which will enable you to perform browser compatibility testing and interactive web testing.

You can import a local web application by specifying its root page or its virtual directory, or a deployed web application by specifying its URL.

- Importing a Deployed Web Application
- Importing a Local Web Application from a Virtual Directory

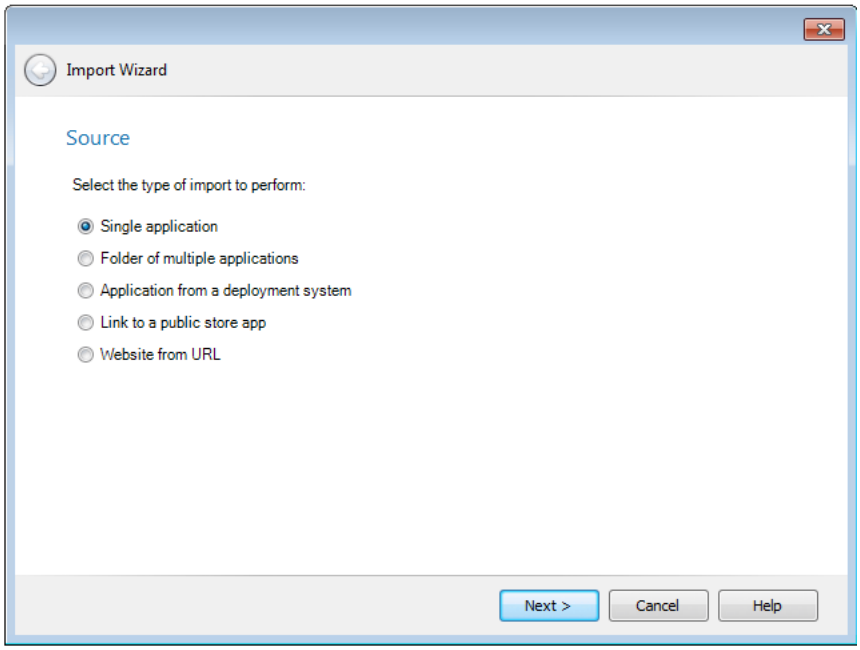
Note *• For information on testing web applications, see Performing Static Testing of Web Applications and Performing Dynamic Testing of Web Applications.*

Importing a Deployed Web Application

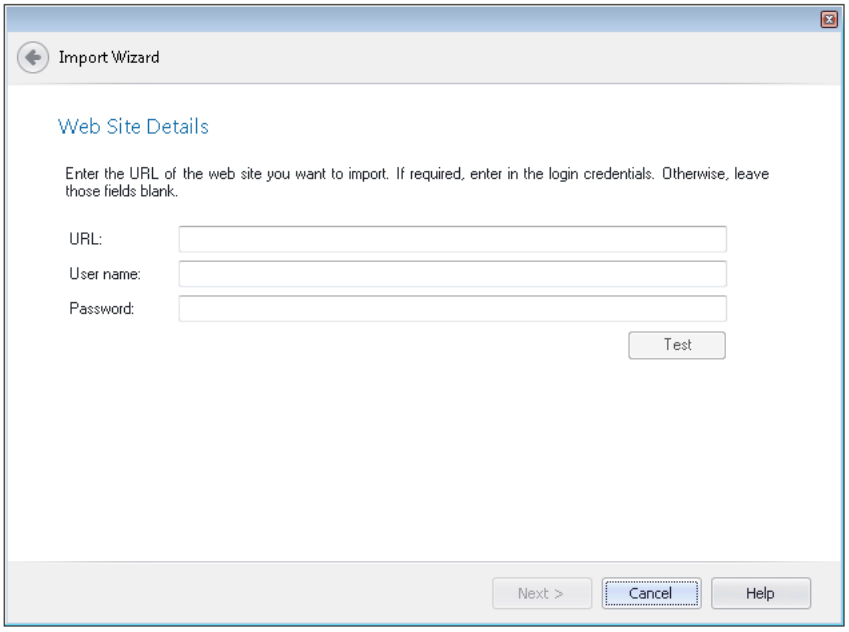
To import a deployed web application into the Application Catalog, which will enable you to perform browser compatibility testing and interactive web testing, perform the following tests.

Task ***To import a deployed web application:***

1. Open Application Manager.
2. On the **Catalog** tab of the ribbon, click the **Import** button. The **Source** panel of the **Import Wizard** opens.



3. Select **Website from URL** and click **Next**. The **Web Site Details** panel opens.



4. In the **URL** field, enter the URL to the web application you want to import, such as:

   http://www.corporatetravel.com

5. In the **User name** and **Password** fields, enter the login credentials for the specified web application.

   Important • *If you are not required to login to this web application, leave these fields blank.*

6. To test the entered credentials, click the **Test** button.

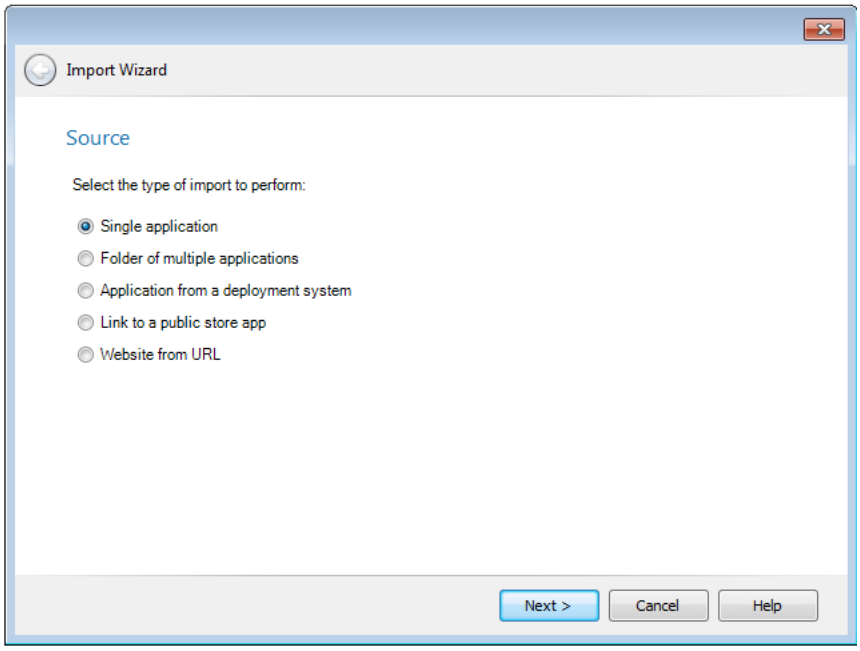
7. Click **Next**. The **Destination Group** panel opens.
8. Select the group into which you want to import this web application and then click **Next**. The **Summary** panel opens.
9. Review the information on the **Summary** panel, and then click **Next** to begin the import.
10. When the import is complete, click **Finish** to close the wizard. The web application is now listed in the Application Manager tree in the group that you specified.

Importing a Local Web Application from a Virtual Directory

To import a local web application into the Application Catalog, which will enable you to perform browser compatibility testing and interactive web testing, perform the following tests.

Task ***To import a local web application:***

1. Open Application Manager.
2. On the **Catalog** tab of the ribbon, click the **Import** button. The **Source** panel of the **Import Wizard** opens.



3. Select **Single application** and click **Next**. The **Package Type Selection** panel opens.
4. Select **Web application (.htm, .html)** and click **Next**. The **Package File Selection** panel opens.
5. Click **Browse** and select the home page (usually **index.html** or **index.htm**) of the web application that you want to import.
6. Click **Next**. The **Destination Group** panel opens.
7. Select the group into which you want to import this web application and then click **Next**. The **Summary** panel opens.

8. Review the information on the **Summary** panel, and then click **Next** to begin the import.
9. When the import is complete, click **Finish** to close the wizard. The web application is now listed in the Application Manager tree in the group that you specified.

Importing a Web Deploy Package

You can use the web deploy package format to streamline the deployment of web applications to Microsoft IIS web servers or to Microsoft Azure websites. In a web deploy package, the content, configuration, databases and other artifacts of a web application are packaged in a .zip file.

You can import web deploy packages (.zip) into the AdminStudio Application Catalog so that you can test them for:

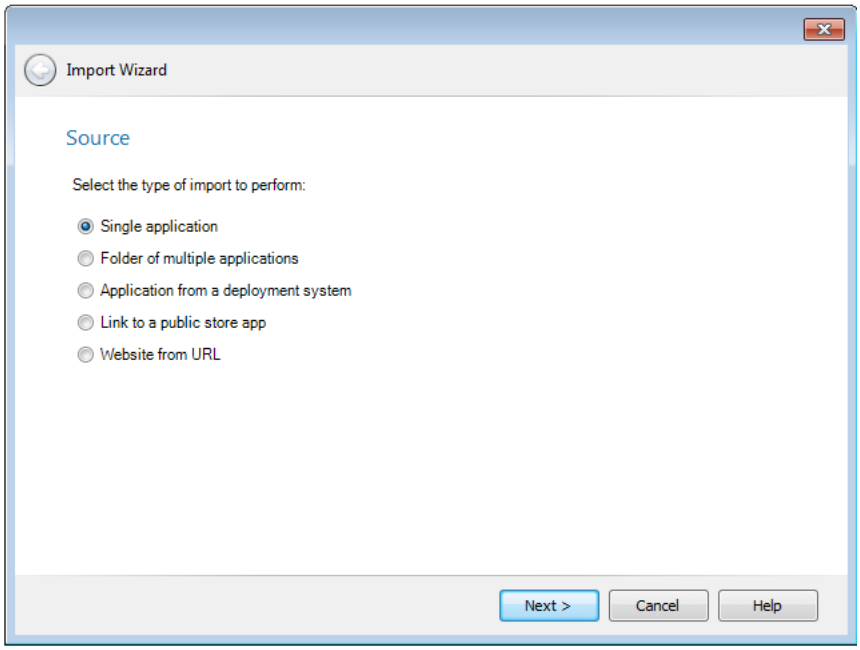
- **Microsoft Azure**—Remote application publishing compatibility with the Microsoft Azure platform. See Azure Application Services Tests.
- **Windows Server 2012 R2**—Operating system compatibility with Windows Server 2012 R2. See Windows Server 2012 Tests.

  Note • *A subset (21) of the Windows Server 2012 operating system compatibility tests apply to web deploy packages: 0501, 0508, 0510, 0515, 0516, 0517, 0519, 0520, 0521, 0522, 0523, 0529, 0530, 0533, 0535, 0537, 0538, 0540, 0541, 0542, and 0552.*
- **Browser compatibility**—Browser compatibility with Internet Explorer 9, 10, 11, and Microsoft Edge. See Browser Compatibility Tests.
- **Best practices**—Web deploy best practices. See Web Deploy Best Practices.

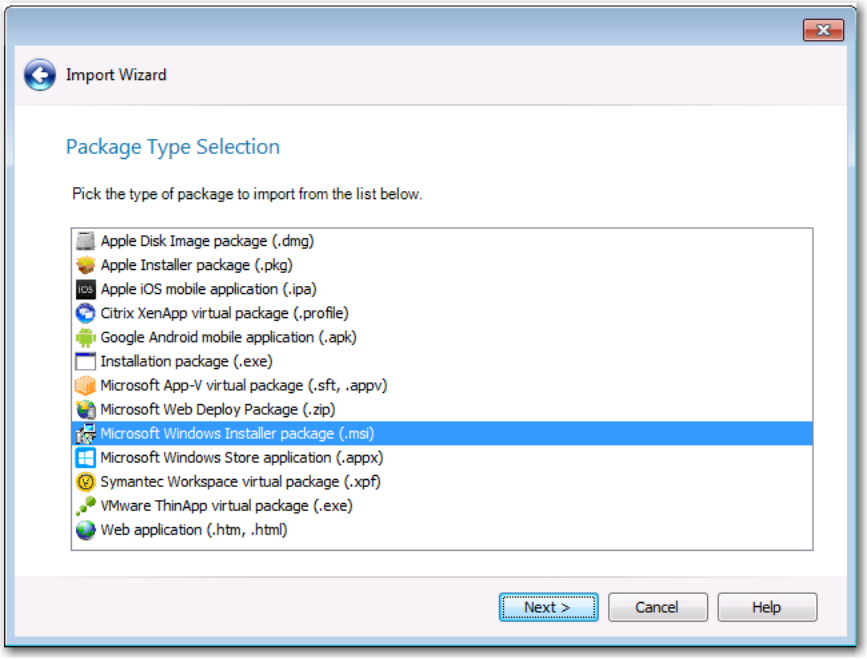
These tests help you to accelerate and simplify efforts to migrate web apps to either the latest release of Windows Server or to Windows Azure for cloud hosting by identifying which web applications are ready for migration and which ones require development.

Task ***To import a web deploy package:***

1. Open Application Manager.
2. On the **Catalog** tab of the ribbon, click the **Import** button. The **Source** panel of the **Import Wizard** opens.



3. Select **Single application** and click **Next**. The **Package Type Selection** panel opens.



4. Select **Microsoft Web Deploy Package (.zip)** and click **Next**. The **Package File Selection** panel opens.
5. Click **Browse** and select the package that you want to import.
6. Click **Next**. The **Destination Group** panel opens.
7. Select the group into which you want to import this web deploy package and then click **Next**. The **Summary** panel opens.
8. Review the information on the **Summary** panel, and then click **Next** to begin the import.

9. When the import is complete, click **Finish** to close the wizard. The web deploy package is now listed in the Application Manager tree in the group that you specified.

Importing Merge Modules

For optimal performance, Merge Modules should be imported into an Application Catalog database prior to importing Windows Installer packages. This ensures that conflicts resulting from not using available merge modules are correctly identified.

Task ***To import Merge Modules:***

1. Open **Application Manager**.
2. Open the **Merge Modules** tab.
3. Click the **Import** button in the ribbon. The **MSM Source Information** panel of the Merge Module Import Wizard opens.

   Note • *You can also open the Merge Module Import Wizard by right-clicking on the root Merge Module group or one of the imported Merge Modules in the tree and then selecting* ***Import Merge Module*** *from the shortcut menu.*
4. Click the Browse ( ) button in the **Merge Modules** area and select the merge module file that you want to import.
5. To import multiple merge modules, you can repeat the procedure as necessary.
6. The order in which merge modules are applied can be changed by selecting a merge module in the list and clicking the Move Up and Move Down arrows.
7. If you need to delete a merge module you have added, clear its check box.
8. Click **Next**. The **Summary** panel opens.
9. Click **Finish** to accept these options and begin the import.

   A report of the import process appears on the **Import** tab in the Output window.

About Merge Modules (.msm)

Application Manager supports the import of merge modules (.msm). Merge modules are essentially simplified Windows Installer **.msi** files.

A merge module cannot be installed alone because its lacks some vital database tables that are present in an installation database. Merge modules also contain additional tables that are unique to themselves. To install the information delivered by a merge module with an application, the module must first be merged into the application's .msi file.

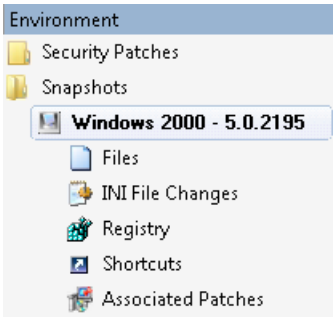
Importing OS Snapshots

You can import OS Snapshot (**.osc**) files into the Application Catalog to use to determine conflicts between an operating system and a package. OS Snapshot files are files representing a particular computer system's contents. To generate an OS snapshot file, use the OS Snapshot Wizard, as described in Capturing an OS Snapshot, to scan a computer's operating system and record the files, INI files, shortcuts, and registry entries present.

Caution *• The OS Snapshot Wizard saves OS Snapshot information in two files: an* ***.osc*** *file (a collection of file type information) and an associated* ***.nir*** *file (registry information). The* ***.nir*** *file must be present in the same directory as the* ***.osc*** *file in order for import to be successful.*

Task ***To import an OS Snapshot into an Application Catalog:***

1. Open Application Manager.
2. Click on the **Environment** tab. The tree lists the Security Patches, OS Snapshots, and Enterprise Policy Configuration files that have already been imported into the Application Catalog.



3. In the tree, right-click on the **Snapshots** group and select **Import Snapshot** from the shortcut menu. The **File Selection** panel opens.
4. Click **Browse** and select the OS Snapshot (**.osc**) file that you want to import.
5. Click **Next**. The **Summary** panel opens.
6. Click **Finish** to accept these options and begin the import.

   Progress messages are listed on the **Import** tab of the Output window.

About OS Snapshots (.osc)

Application Manager supports the import of OS Snapshot (**.osc**) files, which are files representing a particular computer system's contents. To generate an OS snapshot file, use the OS Snapshot Wizard to scan a computer's operating system and record the files, INI files, shortcuts, and registry entries present. The Wizard saves this information in an **.osc** file (a collection of file type information) and an associated **.nir** file (registry information).

When an OS Snapshot file is imported into Application Manager, it can be used as a reference point for conflict identification. See Taking OS Snapshots for more information.

To provide maximum flexibility during the OS Snapshot process, you can use the Exclusions Editor to create an exclusion list that identifies files, INI files, shortcuts, and registry entries that the OS Snapshot Wizard should disregard during the scan. Using this list, you can eliminate unnecessary files, shortcuts, or registry entries, and reduce the time it takes to perform the OS Snapshot. See Configuring Exclusions Using the Exclusions Editor for more information.

Caution • *OS Snapshots should only be used for comparison in Application Manager. You should never attempt to convert an OS Snapshot into an MSI package.*

Importing Packages Using Command Line Bulk Import

Application Manager supports a bulk import process, which allows you to import multiple installer packages (including Windows Installer and App-V packages) at once without any user intervention. You can set up these files and have them run overnight or on an unattended workstation. By doing this, you minimize the need for someone to monitor the import process, freeing that person up to perform other tasks.

Also, if you use bulk import to import packages before they have been conflict checked, Application Manager performance is improved because it is quicker to perform conflict detection between internal packages than between internal packages and an external package.

Task ***To perform a bulk import via command line:***

To perform a bulk import, use the following command line:

```
iscmide.exe -I -C"c:\mypackages\myconfig.ini"
```

If you are using a configuration file, the only necessary parameters to pass at the command line are `-I` and `-C"configuration_file_name.ini"`. You can include all other parameters inside the INI file. The following INI file is used to import packages into an SQL Server Application Catalog for a named user:

```
[General]
DatabaseType=SQL
LogFile=c:\temp\importlog.txt
PackageFile=4
MSMFile=1

[SQL]
Server=ConflictSolverSQL2K
UserID=Admin
Password=mypassword
Database=AdminStudio10

[PackageFile-1]
File=\\server\Data1.msi
Transform1=\\server\Data1a.mst
Transform2=\\server\Data1b.mst
Group=OfficeApps

[PackageFile-2]
File=\\server\ABCApplication.sft

[PackageFile-3]
```

```
File=\\server\Data2.msi
Group=OfficeApps\Secondary

[PackageFile-4]
File=\\server\Data3.msi

[MSMFile-1]
File=\\server\CrystalReports.msm
```

Important • *In previous releases, there was a* `[MSIFile-n]` *section in the* ***.ini*** *file. Starting in AdminStudio 10.0, this has been changed to* `[PackageFile-n]` *to support the bulk import of both Windows Installer (****.msi****) and Microsoft App-V (****.sft****) packages. When updating your scripts, you should convert* `[MSIFile-n]` *entries to* `[PackageFile-n]` *entries.*

For more information on command line options, see Application Manager Command-Line Functionality and Application Manager Configuration File.

Using Duplicate Package Identifiers

When you import a package into an Application Catalog database, Application Manager checks specific identifiers that are selected on the **Import Options / Duplicate Package** tab of the Application Manager **Options** dialog box to determine if that package has already been imported.

- **For Windows Installer files**, the following identifiers are listed on the **Duplicate Package** tab:
  - PackageCode
  - ProductCode
  - Product Language
  - ProductVersion
  - List of Transform Files

  If none of these identifiers are selected, Application Manager will use the Product Name identifier to perform a Duplicate Package check.
- **For App-V packages**, the following identifiers are listed on the **Duplicate Package** tab:
  - PackageGUID
  - VersionGUID

  If neither of these identifiers are selected, Application Manager will use the **Product Name** identifier to perform a Duplicate Package check.

If Application Manager determines that you are attempting to import a duplicate package (based upon the selected identifiers), the package is renamed using the syntax defined in the **Duplicate Package Naming Syntax** field.

Business Case for Importing a Package Multiple Times

You might encounter this situation if you are importing the same package into the same Application Catalog database multiple times, each time with a different set of transforms. One common reason why you might want to import the same package into your Application Catalog database more than once would be if you wanted to use InstallShield Editor to create custom installation SKUs of a common MSI package to distribute to different

departments in your organization, each installation including certain features that are appropriate for the department and excluding certain features that are not appropriate. For example, if you were distributing a copy of Microsoft Office, you could add transforms to the Microsoft Office MSI package so that:

- Accounting's installation would include only Word and Excel
- Marketing's installation would include only Word and PowerPoint, and
- Development's installation would include only Word and Access.

Therefore, you might want to import the same package into your database more than once, each time with a different set of transformations. What happens when you import the package the second time depends upon the identifiers you selected on the **Duplicate Package** tab. In this example:

- If you select the **List of Transform Files** and **ProductCode** identifiers on the **Duplicate Package** tab of the Application Manager **Options** dialog box, Application Manager will not identify these two packages as duplicate, even though they have the same **ProductCode**, because they have a different set of transformations. Therefore, the package will be imported with the same display name as the first package.
- If you only select the **ProductCode** identifier on the **Duplicate Package** tab of the Application Manager **Options** dialog box, Application Manager will identify the second package as a duplicate because the two packages have the same **ProductCode**.

Duplicate Product Name Conventions

When it identifies a duplicate package, by default Application Manager generates a new name for that package by pre-pending the Product Name with the Manufacturer's name and, if necessary, appending the Product Name with numbers:

- **1st Package**: PowerPoint
- **2nd Package**: Microsoft Corporation_PowerPoint

You can edit the **Duplicate Package Naming Syntax** on the **Import Options / Duplicate Package** tab of the **Options** dialog box.

When Duplicate Packages are Identified During Bulk Import

If Application Manager is performing a bulk import or reimport, it still identifies duplicate packages using the user-specified criterion and will rename duplicate packages using the syntax in the **Duplicate Package Naming Syntax** field.

Specifying Duplicate Package Identifiers

To specify duplicate package identifiers, perform the following steps.

Task ***To identify duplicate package identifiers:***

1. On the Application Manager tab menu, click **Options**. The Application Manager **Options** dialog box opens
2. Under **Import Options**, select **Duplicate Package**. The **Duplicate Package** tab opens.
3. Under **Duplicate Package Identification Options**, select the identifiers that you would like to use for Windows Installer package imports by selecting one or more of the following options:

- **PackageCode Property**— Identifier of the package the product was installed from. No two non-identical .msi files should ever have the same package code.
- **ProductCode Property**—Unique identifier for the particular product release, represented as a string GUID, for example:

  `{12345678-1234-1234-1234-123456789012}`

- **Product Language**—The language the installer should use for any strings in the user interface that are not authored into the database.
- **ProductVersion**—Version of the product in string format. The format of the string is: major.minor.build.
- **List of Transform Files**—A list of the transformations associated with this package.
- **[None Selected]**—If you do not select any of these five identifiers, Application Manager checks the Product Name identifier to determine if a package is a duplicate.

4. Under **Duplicate Virtual Package Identification Options**, select the identifiers that you would like to use for App-V package imports by selecting one or more of the following options:
   - **PackageGUID**—Unique identifier of App-V package.
   - **VersionGUID**—Unique identifier of App-V package version.
   - **[None Selected]**—If you do not select either of these identifiers, Application Manager checks the Product Name identifier to determine if a package is a duplicate.
5. Click **OK** to save your changes and exit the **Options** dialog box
6. Proceed with the package import, as described in .

***Note** • The options that you select on the **Import Options / Duplicate Package** tab of the Application Manager **Options** dialog box apply globally to all packages that you attempt to import; you cannot apply different identifiers to different packages. Also, since these options are saved in the AdminStudio Shared Directory, everyone using AdminStudio at your organization will share the same Duplicate Package options.*

Generating Software ID Tag Files During Package Import

AdminStudio includes ISO/IEC 19770-2 tagging as a standard capability, which simplifies the software asset management task by enabling the collection and analysis of the tags to provide an accurate application inventory.

ISO/IEC 19770-2 is an international standard for the creation of software identification tags. A software identification tag is a small, XML-based file that contains descriptive information about the software, such as the product name, product edition, product version, and publisher. Applications with tag files can be easily identified after installation. Software asset management tools collect the data in the tags to provide accurate application identification for software that is installed in an enterprise.

AdminStudio adds tag files—which contain both ISO 19770-2 compliant tag information and AdminStudio's extended tag information—to Windows Installer packages that it processes in two locations:

- **Packages built by Repackager**—By default, whenever Repackager builds a Windows Installer package (even when building one silently), a software ID tag file is created for that package. For more information, see Generating Software ID Tag Files During Repackaging.

- **Packages imported into the Application Catalog**—By default, tag files are created for each package that is imported into the Application Catalog. When Application Catalogs from versions of AdminStudio prior to 11.0 are upgraded, AdminStudio will, upon your approval, create tag files for all packages during upgrade.

In both of these cases, AdminStudio stores the ISO tag file in an external transform file.

Information about generating software ID tag files during package import is provided in the following topics:

- About Software ID Tag File Generation
- Viewing and Editing Package Tag Information in Application Manager

About Software ID Tag File Generation

AdminStudio includes ISO/IEC 19770-2 software tagging support. ISO/IEC 19770-2 is an international standard for the creation of software identification tags, which are small, XML-based files that contain descriptive information about a software package. This information is used by software asset management tools to identify the software that is installed in an enterprise.

AdminStudio adds software ID tag files to Windows Installer packages whenever Repackager builds a Windows Installer package or when packages are imported into the Application Catalog (or when an Application Catalog is upgraded).

Information about software ID tag files is presented in the following sections

- How Tag Files Are Named
- Output Files Created by Tag File Generation: .mst and .cab
- Sample Software ID Tag File
- Creation of Tag Files During Application Catalog Upgrade
- Support for Packages With Multiple Tag Files
- About Software Tagging RegIDs
- About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields

How Tag Files Are Named

AdminStudio uses the following format to name the software ID tag files that it creates:

```
SoftwareCreatorRegID.UniqueID.swidtag
```

The tag file's name is comprised of the following components:

- **SoftwareCreatorRegID**—By default, AdminStudio uses the value of the **Tag Creator RegID** field on the **Software Tagging** tab of the **General Options > Import Options > Software Tagging** tab of the Application Manager **Options** dialog box, which is:

  ```
  regid.2009-06.com.flexerasoftware,AdminStudio
  ```

  You may edit this value for a package that has been imported into the Application Catalog on the **Software Identification Tag** subtab of the Application Manager **Catalog Deployment Type View**. You can also edit this value for a Repackager project on the **Software Identification Tag** view in the Repackager interface.

- **UniqueID**—This portion of the tag file name uniquely identifies the package by using the product GUID, which is the ProductCode of the MSI package or the unique string used for the Add and Remove Programs uninstall key name.
- **.swidtag**—The **.swidtag** file extension is given to this XML file.

Here is an example of a software ID tag file name:

```
regid.2009-06.com.flexerasoftware,AdminStudio_6F7CB29F-1319-4816-B345-0856916EB801.swidtag
```

Output Files Created by Tag File Generation: .mst and .cab

When AdminStudio creates a tag file for a Windows Installer package, two files are created in the same directory as the **.msi** file:

- **Compressed (.cab) file**—A compressed **.cab** file is created to contain the tag file. The **.cab** file is named **PackageName_SoftwareID.cab**. It contains the **.swidtag** XML tag file.
- **Transform (.mst) file**—A transform **.mst** file is created to associate the tag file in the **.cab** file with the Windows Installer package. The transform file is named **PackageName_SoftwareID.mst**.

All three files are placed in the same directory:

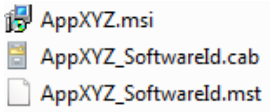


Figure 7-6: Software Tag Transform and CAB File

Sample Software ID Tag File

The following is a sample of a software ID tag file that is created by AdminStudio:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>

        <fs:adminstudio_app_catalog_db_name>jan18_1</fs:adminstudio_app_catalog_db_name>
        <fs:adminstudio_app_catalog_guid>9BC14888-65EA-8F03</fs:adminstudio_app_catalog_guid>
    </swid:extended_information>
</swid:software_identification_tag>
```

Extended “ARP” Information in Tag File

The fields in the `<swid:extended_information>` element contain the package’s original and current ARP (Add or Remove Programs) information. Having this ARP information in the tag file makes it easier to keep track of the original ARP entry information and to preserve it during repackaging. This extended information is added to all software ID tag files created by AdminStudio.

Application Catalog Reference Information in Tag File

Software tag files that are created by importing a package into the Application Manager Application Catalog will include an additional field in the `<swid:extended_information>` element to enable the package to be referenced in the Application Catalog:

```
< swid:extended_information>
    <fs:adminstudio_app_catalog_package_id>APP_ID_FROM_AS CATALOG
    </fs: adminstudio_app_catalog_package_id>
</ swid:extended_information>
```

Creation of Tag Files During Application Catalog Upgrade

The first time you open an Application Catalog database from a version of AdminStudio prior to 11.0, the following message appears to notify you that AdminStudio will reimport all of your Windows Installer packages so that software tag ID files can be created for them:

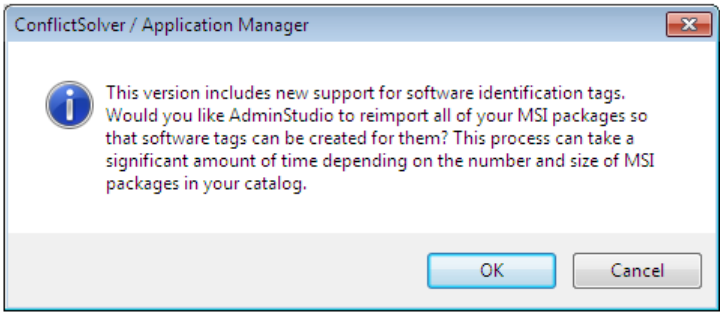

Figure 7-7: Creation of Software Tag File During Application Catalog Upgrade

If you click **Cancel**, software ID tag files will not be created.

Support for Packages With Multiple Tag Files

It is possible for a Windows Installer package to be associated with more than one tag file in Application Manager and in the Repackager interface.

If a Windows Installer package installs more than one product—which results in more than one entry in the list of installed products (Add or Remove Programs list)—it can have more than one associated software identification tag file. Both tag files will be stored in the same location in the **.cab** file.

If a Windows Installer package or a Repackager project includes more than one tag file, there will be two tabs (one for each tag file) displayed on the **Software Identification Tag** subtab of the **Catalog Deployment Type View** in Application Manager and on the Repackager **Software Identification Tag** view:

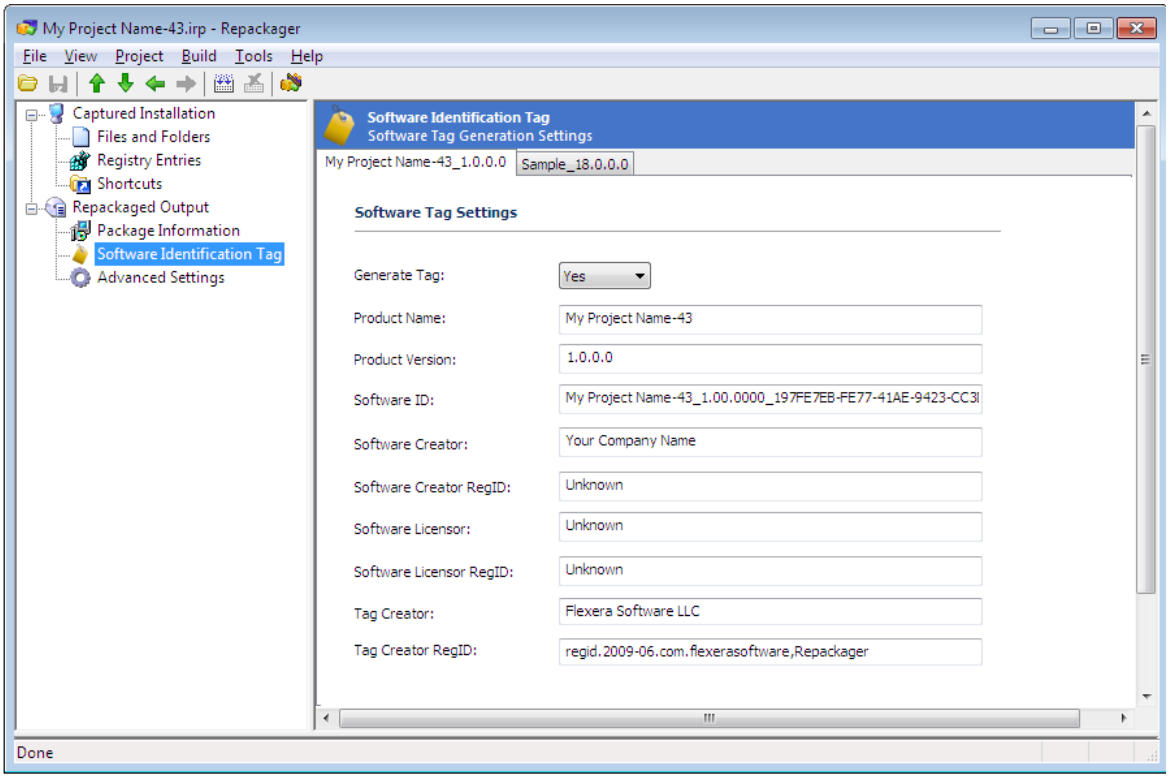

Figure 7-8: Repackager's Software Identification Tag View: Displaying Two Tag Files

If a Windows Installer package has multiple tag files, software asset management tools will treat each tag file as a separate product.

How Existing Tag Information is Incorporated Into the Software ID Tag File

If a Windows Installer project that you are either repackaging or importing into the Application Catalog already has an associated vendor tag file, AdminStudio will incorporate the existing tag information into the new tag file.

AdminStudio makes a copy of the original tag file and modifies it to add the AdminStudio extended information fields. This ensures that custom fields introduced by the vendor are not lost. Also, AdminStudio will not modify any of the standard software tag fields in existing tags. This ensures that any digital signing of these fields will remain valid.

Assuming that you have a Windows Installer package that creates an ARP entry and with an existing vendor tag file, the following scenarios could occur:

- **Repackaging**—Repackager will examine the information in the vendor tag file and determine whether it corresponds to the ARP entry in the Windows Installer package by matching one of the properties, such as Product Name. If there is a match, Repackager will copy the vendor tag information into a new tag file and then add the AdminStudio extended information nodes to that tag file to include information such as original product code, original product name, original product version, original publisher, current product code, current product name, current product version, and current publisher. The final Windows Installer package will have a transform file created along with the updated tag file. The original vendor tag file will not be present in the Windows Installer package.

- **Importing into Application Manager**—Application Manager will detect the existing vendor tag information and add the AdminStudio extended information nodes related to current product code, current publisher, current product name, current product version, AdminStudio application ID, AdminStudio catalog name, AdminStudio catalog ID, and AdminStudio server name. This updated version of the tag file will be added to the Windows Installer package using a transform file and the original vendor tag file in the original Windows Installer package will be removed by the same transform. If the Windows Installer package is imported into Application Manager after being repackaged by Repackager, there is no need for the transform to remove the original vendor tag file since it is not present.

About Software Tagging RegIDs

A software ID tag file can contain up to three different RegIDs: **Tag Creator RegID**, **Software Creator RegID**, and **Software Licensor RegID**. A `RegID` has the following format:

```
regid.YYYY-MM.ReversedDomainName,optional_division
```

For example:

```
regid.2009-06.com.yourcompany,GlobalProductDivision
regid.2001-09.com.ABCDcompany,AccountingSystems
regid.2005-11.com.WZYZcompany
regid.2010-02.net.1234company,WordProcessing
```

The following table describes the components of a RegID in more detail:

Table 7-11 • Components of a Software Tag File RegID

Component	Description
Type	A software tag ID begins with the string **regid**. This qualifies the element as a registration ID for software identification tags. The **regid** string is followed by a period.
Date	Enter a date code in `YYYY-MM` format which is the date during which the naming entity owned the domain, such as **2009-11**. • This date should be the first month in which the domain name was owned by this naming entity at 00:01 GMT of the first day of the month. • This date code uses the Gregorian calendar and must include all four digits of the year and both digits of the month (where January = 01 and December = 12). • The dash must be included. The date string is followed by a period.

Table 7-11 • Components of a Software Tag File RegID

Component	Description
Naming Authority	Enter the reversed domain name of the naming entity (person or organization) that is creating this software identification tag. For example, if your company's domain is `mycompany.com`, you would enter **com.mycompany** after the date code. Note the following regarding the naming authority domain name: • A RegID can be created by any individual or organization that owns or has owned the registration for a domain name. • The domain name does not need to be active, nor does it need to resolve to an address. • Domain names by themselves do not constitute a unique identifier because domains can expire and/or be acquired by other entities. This means that the RegID must also include a date indicating when the domain registration was owned by the entity.
Additional Subentity	(Optional) Enter a string that specifies any subentity that may have its own unique naming authority, such as **AccountingSystems** or **MarketingDepartment**. For example, AdminStudio's default RegID includes AdminStudio as a subentity of Flexera Software, which is the naming authority: `regid.2009-06.com.flexerasoftware,AdminStudio` Using this optional component enables individual business units of large software publishers to manage their own software identification tags independently. This string must be preceded by a comma.  ***Note*** • *With the exception of the comma prefix, the owner of the domain name can assign text following the reversed domain name as desired as long as all characters are valid for use in file names on any platform that the tag will be installed on. It is the responsibility of the naming entity to ensure that each subentity reference is unique within their organization.*

About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields

The **Tag Creator Name**, **Software Creator Name**, and **Software Licensor Name** fields could all refer to the same company, or could refer to different companies. It is entirely possible that one company could create the software (Software Creator Name), while a second company could license and distribute the software (Software Licensor Name), and yet another company could create the tag (Tag Creator Name). Any combination is possible.

When specifying these fields on the **Software Identification Tag** view, keep in mind the following:

- **Software Creator Name and Software Creator RegID**—Should be consistent across all software packages created by a company.
- **Software Licensor Name and Software Licensor RegID**—Should be consistent across all software packages licensed by a company.

- **Tag Creator Name and Tag Creator RegID**—Should be consistent across all software identification tags created by the company.

Note • *If the captured installation data for this application does not install any Add/Remove Programs entries (meaning that it will not be displayed on a machine's list of installed programs), the following message will be displayed on the* ***Software Identification Tag*** *view:*

```
No software ID tags will be created because no Add or Remove Program information was detected in the
    captured data.
```

However, if you build this project into a Windows Installer package and then import that package into Application Manager, a software tag file will be created.

Viewing and Editing Package Tag Information in Application Manager

You can view and edit the software ID tag information for an individual Windows Installer package on the **Software Identification Tag** subtab of the **Catalog Deployment Type View** in Application Manager.

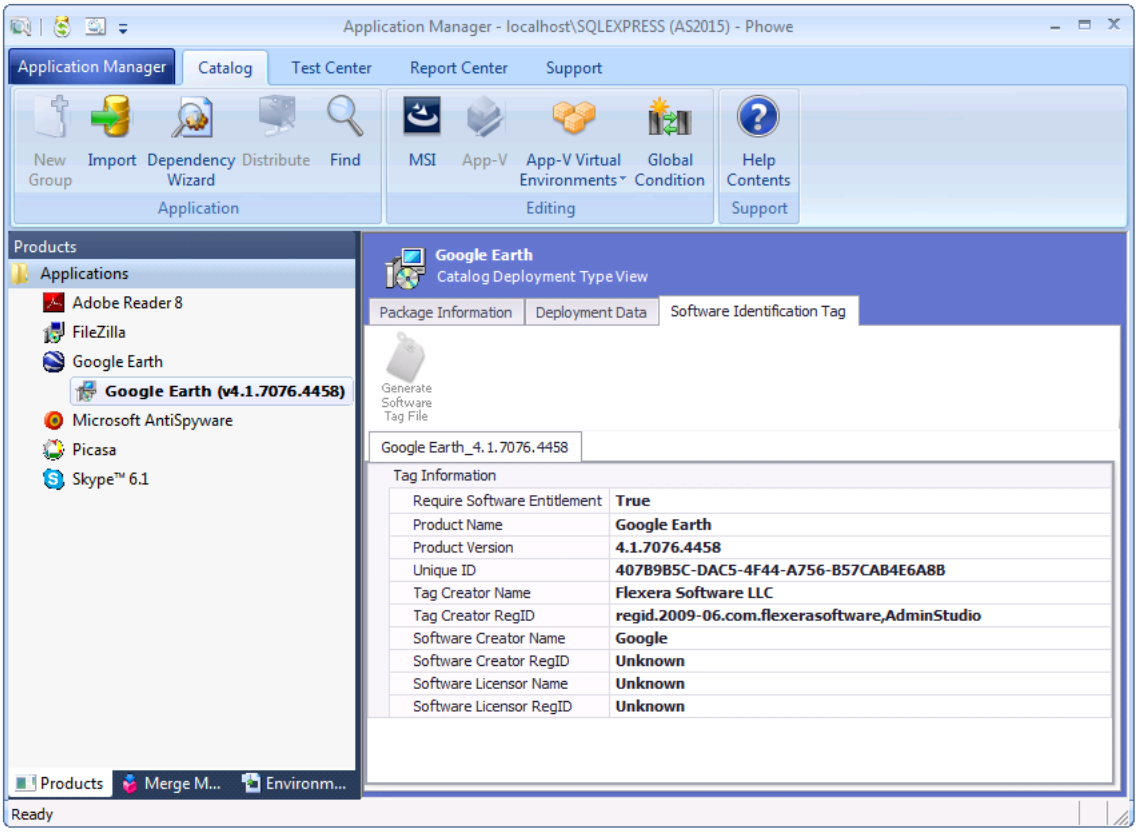

Figure 7-9: Software Identification Tag Subtab of Catalog Deployment Type View

Task ***To view and edit software ID tag file information for a Windows Installer package:***

1. Open Application Manager.
2. Select the **Catalog** tab in the ribbon.
3. In the Application Manager tree, select a Windows Installer package. The **Catalog Deployment Type View** opens.
4. Open the **Software Identification Tag** tab.
5. Review the properties, which are described in Software Identification Tag Tab, and make any desired edits.
6. To save your edits and generate an updated tag file, click the **Generate Software Tag File** button. When this button is clicked, Application Manager will generate a new transform file for this package that includes the newly modified tag file, and will then reimport the package into the Application Catalog along with its updated transform file.

Viewing Bundled Packages of Complex Installer Executables

You can import complex installer executable files (**.exe**) that contain bundled Windows Installer packages into the Application Catalog. There are multiple installation executable types that can contain embedded Windows Installer packages, including the following:

- InstallShield InstallScript **.exe** files
- InstallShield Basic MSI installers that are compressed into a **setup.exe** file
- InstallShield Suite Installer **.exe** files
- Wise Package Studio **.exe** files
- Other executable file types that can be uncompressed by 7-ZIP

After these complex installer executables have been imported, you can view a list of the child **.msi** packages bundled within them on the **Bundled Packages** tab of the **Catalog Deployment Type View**.

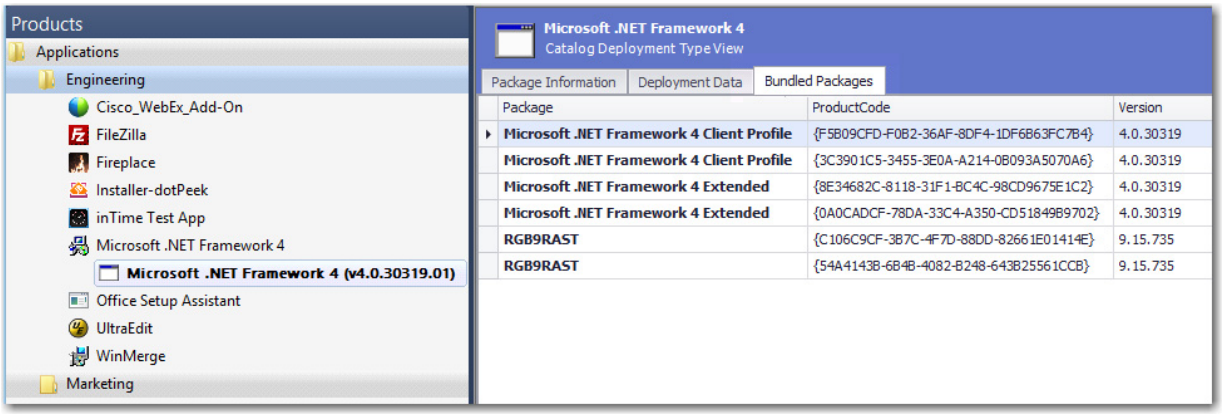

Figure 7-10: Bundled Packages Tab of Catalog Deployment Type View

When inspecting these child **.msi** packages, Application Manager extracts the information about each package, such as product name and version number. This makes it much more likely that Application Manager will be able to assign a Flexera Identifier to these applications.

You can perform operating system compatibility, application virtualization compatibility, and best practices testing on these bundled packages, and the test results will be combined. For more information, see Viewing Combined Test Results of Bundled Packages.

Note • *AdminStudio will only inspect complex installer .exe files one level deep. If a complex installer .exe file contains another complex installer .exe file bundled within it, that child .exe file will not be inspected.*

Automatically Importing Packages from a Network Directory

Note • *To use the Package Auto Import feature, you must have AdminStudio Administrator permission.*

For a large distributed enterprise, accurate and synchronized data is required for shared packages. If a corporate level team maintains a database of packages used throughout the corporation in New York, then all the regional offices should be able to obtain the corporate level packages and get the different pieces of data.

To address this issue, you may want to establish shared directories that contain the most recent version of shared packages, and then automatically sync the Application Catalogs in your enterprise to use the packages in these directories. You can do this using the **Package Auto Import** feature.

The **Package Auto Import** feature enables you to automatically import or re-import all selected package types in specified network directories into your Application Catalog.

- About Package Auto Import
- Setting Up Package Auto Import

About Package Auto Import

Note • *To use the Package Auto Import feature, you must have AdminStudio Administrator permission.*

The **Package Auto Import** feature enables you to automatically import or re-import all selected package types in specified network directories into your Application Catalog.

The Package Auto Import feature supports all package types, including:

- Apple disk image package (.dmg)
- Apple installer package (.pkg)
- Apple iOS mobile app (.ipa)
- Citrix XenApp virtual package (.profile)

- Google Android mobile app (.apk)
- Installer package (.exe)
- Microsoft App-V virtual package (.sft, .appv)
- Microsoft Web Deploy package (.zip)
- Microsoft Windows Installer package (.msi)
- Microsoft Windows Store mobile app (.appx)
- Symantec Workspace virtual package (.xpf)
- VMware ThinApp virtual package (.exe)
- Web application (.htm, .html)

In addition to being able to batch import these package types using the Package Auto Import feature, you can also use it to batch import the following additional types of files:

- Microsoft Windows Security Patch files (.msu)
- iOS Enterprise Policy Configuration files (.mobileconfig or .plist)

Note • *In versions of AdminStudio prior to 2016, you could only import Microsoft Security Patch files (.msu) and iOS Enterprise Policy Configuration Files (.mobileconfig or .plist) one at a time using the Import Wizard.*

After you have specified one or more shared directories to monitor using the Package Auto Import feature, and have selected the package types to import on the **Select Watcher Extensions** dialog box, the packages of the selected package types in those directories are automatically imported into Application Manager.

A group structure that mimics the directory structure of the selected network directory is created in the Application Manager tree:

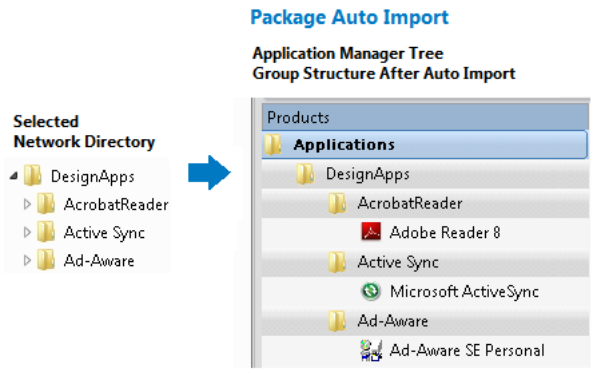

Figure 7-11: Group Structure Created by Package Auto Import

After the initial auto-import operation, packages will be imported or reimported into the Application Catalog whenever:

- A new package is added to the monitored directory.
- An existing package in the monitored directory is updated.

Distributed Import Using AdminStudio Host Process

The monitoring of the specified Package Auto Import directories is a task that can be distributed among the AdminStudio Host processes of all of the installations of AdminStudio in your network that have access to the specified shared directory.

After you have specified a directory on the **Package Auto Import** tab and have set the **Monitoring Status** field to **True**, the AdminStudio Host processes that are connected to the same Application Catalog will begin to monitor these directories.

Packages in the monitored directories will be imported as soon as one of the AdminStudio Host processes connected to the same Application Catalog is running but is not currently being used. This ensures that if someone is actively using one of AdminStudio's tools, the import (and subsequent testing) of packages by the Package Auto Import process will not slow down the performance of AdminStudio.

Tip *• To make sure that the batch import activities of the Package Auto Import process take place when AdminStudio tools are not in use, you can launch* ***AdminStudioHost.exe*** *as a scheduled task during off peak hours and it will perform the import of packages from the monitored directories at that time.*

Setting Up Package Auto Import

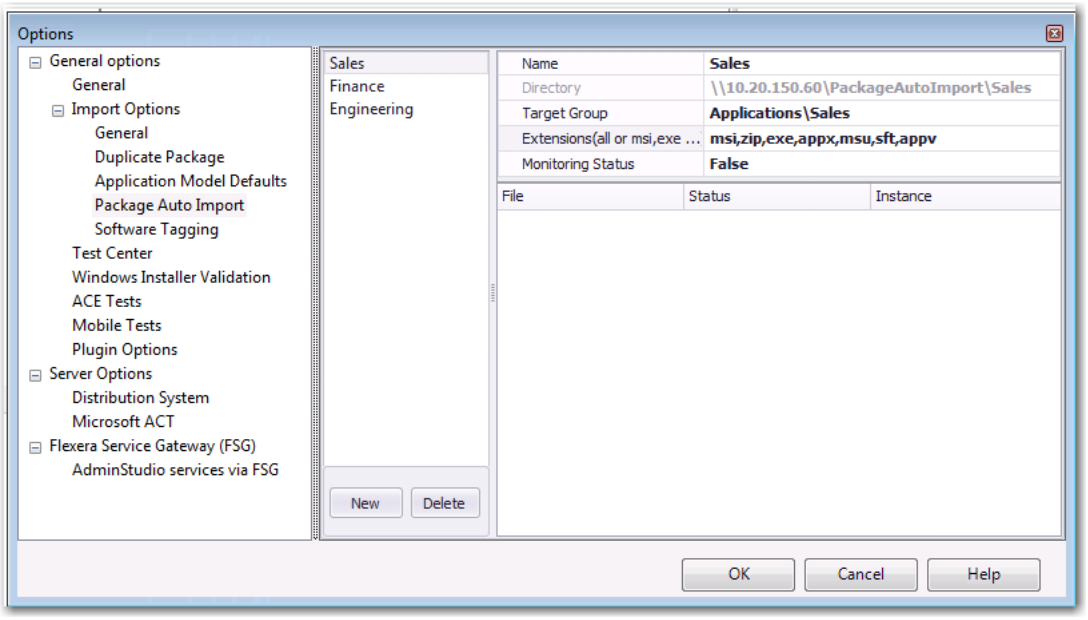
Note *• To use the Package Auto Import feature, you must have AdminStudio Administrator permission.*

The **Package Auto Import** feature enables you to automatically import or re-import all selected package types in specified network directories into your Application Catalog.

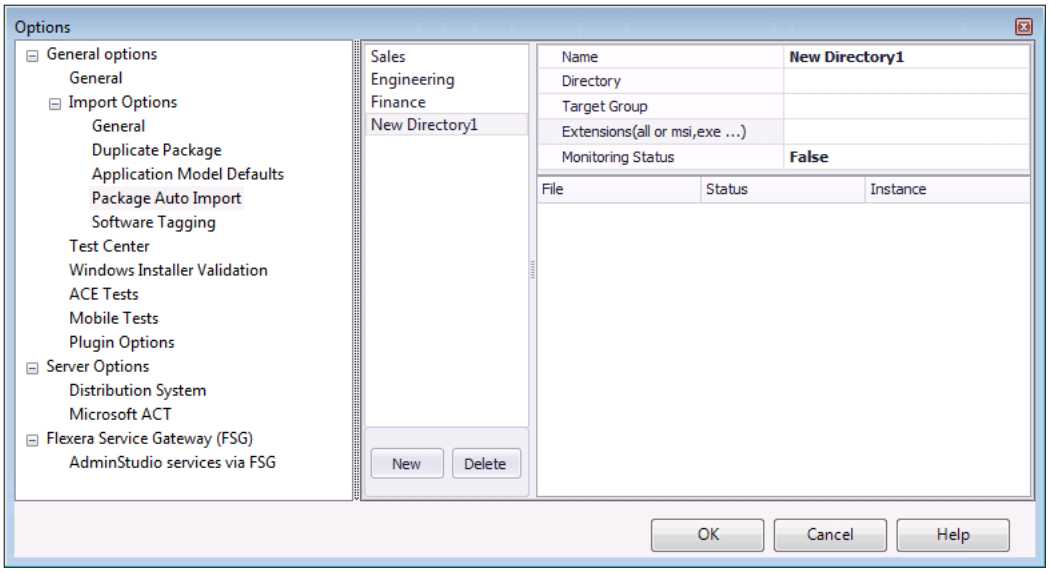
You initiate Package Auto Import by entering information on the **Import Options / Package Auto** Import tab of the Application Manager **Options** dialog box.

Task ***To initiate the automatic import of packages from a network directory:***

1. On the Application Manager tab menu, select **Options**. The **Options** dialog box opens.
2. Open the **Import Options / Package Auto Import** tab. The **Package Auto Import** tab opens.



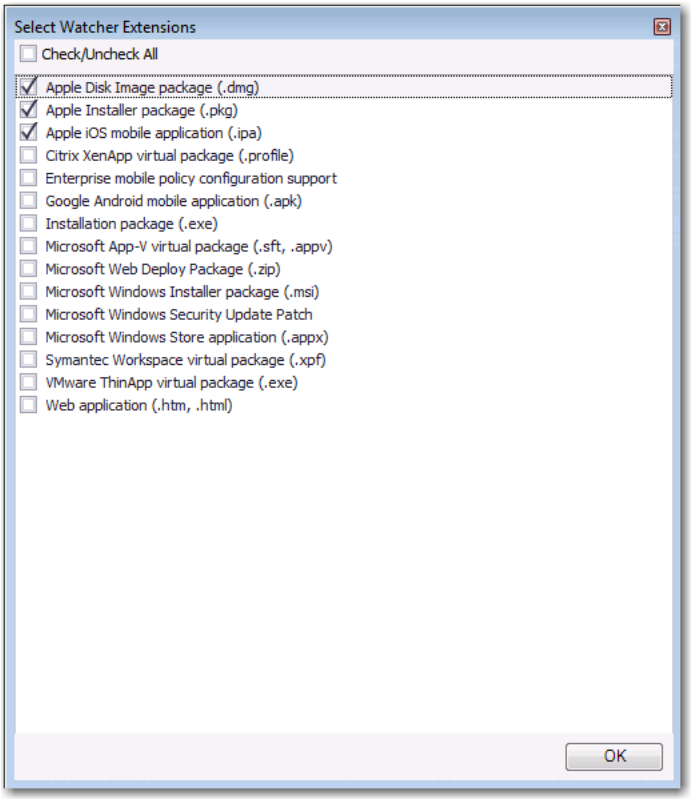
3. Click **New**. Fields to define a new directory are listed.



4. In the **Name** field, enter a name to define this new directory to monitor.
5. In the **Directory** field, you can either enter a directory path or click the browse button and select a directory.

Important • *The directory must be in UNC format and it must be a shared directory.*

6. In the **Target Group** field, specify the group in the Application Manager tree into which the packages will be imported.
7. In the **Extensions** field, click the browse button to open the **Select Watcher Extensions** dialog box.



8. Select the package types that you want to monitor and then click **OK** to close the dialog box.
9. To begin monitoring this directory for new and updated packages, set the **Monitoring Status** field to **True**.

Note • *To stop monitoring this directory, set the* ***Monitoring Status*** *field to* ***False****.*

10. Click **OK** to save these settings for the selected directory to monitor. After 30 minutes, the import of packages in the specified directories will begin.

Viewing the Status of a Monitored Directory

After a directory's **Monitoring Status** has been set to **True**, the packages (of the selected package type) in that directory are listed on the **Package Auto Import** tab.

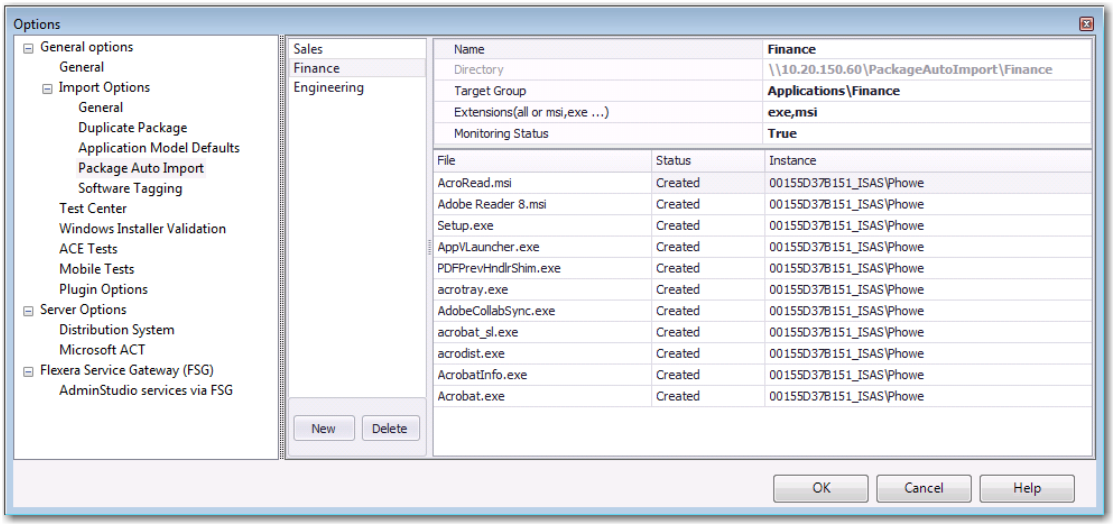


Figure 8: Monitoring the Import of Packages in a Directory on the Package Auto Import Tab

In the **Status** column, packages will have one of the following statuses:

- **Created**—Package will be imported as soon as one of the AdminStudio Host processes connected to this Application Catalog is running but is not currently being used.
- **Imported**—Package has been imported into the Application Catalog.
- **Canceled**—User canceled the import of the package into the Application Catalog.
- **Error**—There was an error during import of the package into the Application Catalog.
- **Fatal**—Something is wrong with the package and import failed.
- **FileNotExists**—File does not exist in the specified location.
- **AccessDenied**—Access to the file being imported was denied.

Package Auto Import and Duplicate Package Names

Note *• To use the Package Auto Import feature, you must have AdminStudio Administrator permission. For all other users, the Package Auto Import options will be disabled.*

If AdminStudio encounters a duplicate package name during auto import, the package you are importing will be automatically renamed by pre-pending the Product Name with the Manufacturer's name and, if necessary, appending the Product Name with numbers:

- **1st Package:** **Application 2004**
- **2nd Package:** **ABC Corporation_Application 2004**

The import is allowed to proceed without prompting the user.

You can edit the duplicate package identification options and the duplicate package naming syntax on the **Import Options / Duplicate Package** tab of the **Options** dialog box, as described in Using Duplicate Package Identifiers.

Viewing Application Testing and Analysis Reports on the Report Center Tab

Edition *• Application Manager's Report Center tab is included with AdminStudio Enterprise Edition.*

On the Application Manager **Report Center** tab, AdminStudio provides a wide array of reports containing Application Catalog summary information on the Windows Installer, App-V, and iOS and Android applications in your Application Catalog, giving you insight into the readiness of those packages for distribution.

These reports include test results from operating system compatibility, browser compatibility, virtualization compatibility, remote application publishing compatibility, best practices testing, and application conflict testing. For iOS and Android mobile apps, reports on feature use, risk assessment, device compatibility, and policy compatibility are available. Reports are also included on App-V packages in your Application Catalog, as well as Microsoft System Center Configuration Manager deployment information.

Because these reports are created using Microsoft SQL Reporting Services, you can create your own custom reports by adding client report definition (**.rdlc**) files to the AdminStudio installation directory.

To learn more about the **Report Center** tab, review the following topics:

- Available Reports
- Viewing a Report
- Exporting a Report in PDF, Excel, or Word Format
- Creating Custom Reports

Available Reports

Edition *• Application Manager's Report Center tab is included with AdminStudio Enterprise Edition.*

The available reports on the **Report Center** tab include test results from operating system compatibility, browser compatibility, virtualization compatibility, remote application publishing compatibility, best practices testing, and application conflict testing. For iOS and Android mobile apps, reports on feature use, risk assessment, device compatibility, and policy compatibility are available. Reports are also included on App-V packages in your Application Catalog, as well as Microsoft System Center Configuration Manager deployment information.

The **Report Center** tab includes the following reports:

Table 7-12 • Reports Available on Report Center Tab

Report Category	Reports
Application Catalog Dashboards	This category includes the following reports: • Application Readiness Dashboard • Operating System Application Compatibility Group Dashboard • Application Virtualization Compatibility Group Dashboard • Microsoft Application Compatibility Toolkit Assessment • Overall Testing Results for Windows Installer Packages
Mobile	This category includes the following reports: • iOS/Android/Windows Phone Mobile Dashboard • iOS/Android/Windows Phone App Details • iOS/Android/Windows Phone App Feature Use • iOS/Android/Windows Phone App - Device Compatibility • iOS/Android/Windows Phone App - OS Compatibility • iOS App - Policy Compatibility • iOS Best Practices and Risk Assessment
Desktop OS Compatibility	This category includes the following reports: • Desktop Operating System Application Compatibility Dashboard • Operating System Compatibility By Test Impact • Operating System Compatibility Test Suppression Report • Operating System Application Compatibility Snapshot Analysis
Browser Compatibility	This category includes the following reports: • Web Browser Application Compatibility Dashboard
Virtualization Compatibility	This category includes the following reports: • Application Virtualization Compatibility Dashboard
Windows Installer Best Practices	This category includes the following reports: • Windows Installer Best Practices • Windows Installer Conflicts • Shared Extensions Report • Error Category Breakdown

Table 7-12 • Reports Available on Report Center Tab

Report Category	Reports
App-V Best Practices	This category includes the following reports: • App-V Best Practices • App-V Conflicts • App-V 4 Dynamic Suiting ◦ App-V Dependencies ◦ App-V Dependents ◦ App-V Recommended Dependencies • App-V 5 Virtual Environments ◦ SCCM Server Environment ◦ App-V Server Environment
Deployment Reports	This category includes the following reports: • Microsoft Configuration Manager Deployments Report

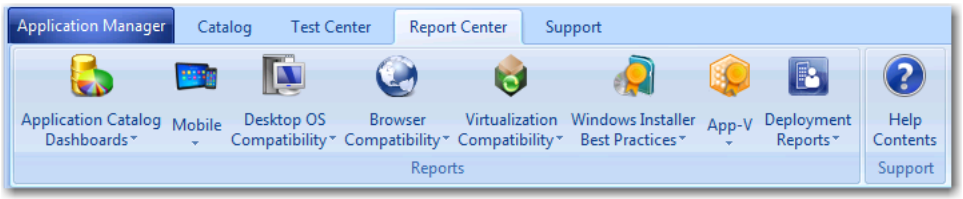
Viewing a Report

Edition • *Application Manager's Report Center tab is included with AdminStudio Enterprise Edition.*

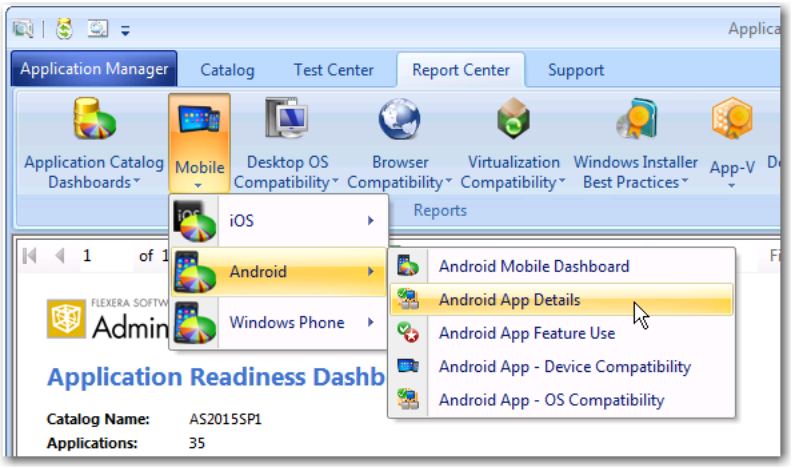
To view a report on the Report Center tab, perform the following steps.

Task ***To view a report on the Report Center tab:***

1. Open Application Manager and select the **Report Center** tab. The Report Center ribbon lists the available report groups:



2. Click on one of the report group icons and select a report from the drop-down list.



The report opens.

3. For most reports, detailed sub-reports are available by clicking on one of the categories of the pie bar chart, on one of the numbers in an issue count column, one of the icons, or on a package name. Click on the available hyperlinks until you have explored all of the levels of the report.

Note • *For more information, see Viewing Mobile App Reports.*

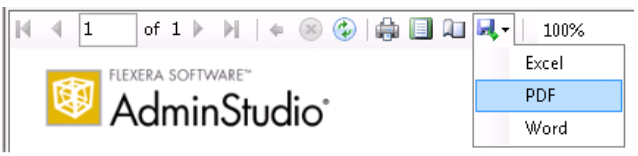
Exporting a Report in PDF, Excel, or Word Format

Edition • *Application Manager's Report Center tab is included with AdminStudio Enterprise Edition.*

You can save any of the Application Catalog summary reports or any of their drill-through reports in PDF, Microsoft Excel, or Microsoft Word format.

Task ***Saving a report:***

1. Open the report that you want to save.
2. In the toolbar, click the **Save** icon.



3. From the menu, select either **Excel**, **PDF**, or **Word**. The report is exported and you are prompted for a location to store the report.
4. Specify a location and click **Save**.

Note • *You can also print the currently viewed report by clicking the* ***Print*** *icon in the toolbar.*

Creating Custom Reports

Edition • *Application Manager's Report Center tab is included with AdminStudio Enterprise Edition.*

You can create your own custom reports that are generated using Microsoft SQL Reporting Services. Creating a custom report involves the following three steps:

- **Write a stored procedure** to obtain data from the AdminStudio Application Catalog database.
- **Create an .rdlc file** to format the display of the data in the desired manner. After you create an **.rdlc** file, using either Microsoft SQL Server Business Intelligence Development Studio or Visual Studio 2012, you need to copy that file to the AdminStudio installation directory.
- **Edit the AdminStudio.Reports.xml file** to add a reference to your custom report. The AdminStudio reporting framework uses the information in the **AdminStudio.Reports.xml** file to present the reporting view. This file includes the location, name, icons, and ribbon location of the report files. It also identifies the SQL queries or stored procedures that need to be run to populate the data for the report.

Report Center Tab Report Groups

When you add a reference to your report to the AdminStudio Report Definition file, you need to specify where you want the report to be displayed on the **Report Center** tab ribbon. By default, AdminStudio reports are grouped into eight groups, and each group has a drop-down list of reports:

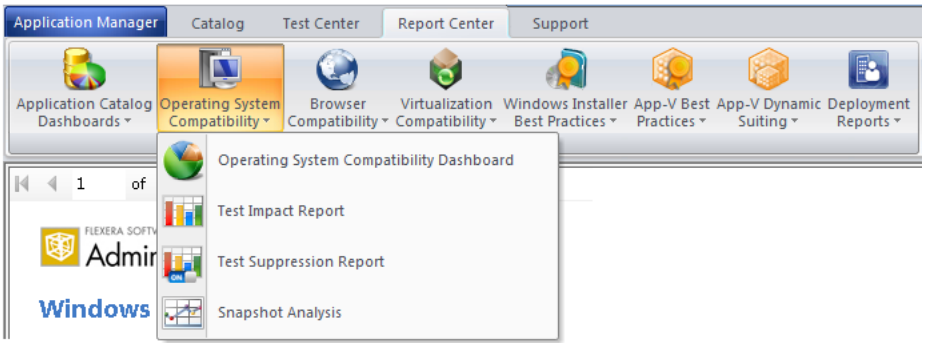


Figure 7-1: AdminStudio Report Groups

Before you begin to edit the AdminStudio Report Definition file, as described in Creating a Custom Report, you need to decide in which of these groups you want your new custom report to be listed. or whether you want your report to be listed in a new group. The parameters used to define a report's location in the ribbon are the `Group`, `GroupIndex`, and `OrderIndex` parameters of the `<Report>` element.

Creating a Custom Report

To create a custom AdminStudio report, perform the following steps:

Task ***To create a custom report and add it to the Report Center tab ribbon:***

1. Write an SQL stored procedure to obtain the data for the report from the AdminStudio Application Catalog database.

   For reference on writing stored procedures, you can open the following file and look at the stored procedures for the existing AdminStudio reports:

   `[AdminStudio_Installation_Directory]\Support\SQL_Scripts\Reporting.StoredProcedures.sql`

   For example, if you first find the name of an existing report in the **AdminStudio.Reports.xml** file (such as `Test Impact Report`), and then identify the stored procedure used to generate that report (such as `sp_asrpt_GetOsCompatTestImpactTopLevel`), you can then open the **Reporting.StoredProcedures.sql** file and look at that stored procedure.

2. Design a custom report in an **.rdlc** file using either Microsoft SQL Server Business Intelligence Development Studio or Visual Studio 2012, along with **.rdlc** files for each drill-through sub-report that you want to include.

   Tip • *An easy way to make sure that your custom report matches the layout of existing reports is to copy one of the* `.rdlc` *files in the* `[AdminStudioInstallDirectory]\Common\ReportDefinition\RDLC` *directory and use it as your starting point.*

3. Copy your new **.rdlc** file(s) to the following directory on the machine where AdminStudio is installed:

   `[AdminStudioInstallDirectory]\Common\ReportDefinition\RDLC`

4. Open the **AdminStudio.Reports.xml** file, found in the following location, in a text editor:

   `[AdminStudioInstallDirectory]\Common\ReportDefinition`

5. In the **AdminStudio.Reports.xml** file, locate and copy the code for an existing report that is listed in the group on the **Report Center** tab ribbon that you want your report to be listed in. You need to copy all of the code between the `<Report>` and `</Report>` elements, including the code for drill-through sub-reports.

   For example, if you wanted your report to appear in the **Windows Installer Best Practices** group, you could copy the code for the **Shared Extensions** report (and its drill-through report):

```
01  <Report Name="Shared Extensions" RdlcPathType="Relative"
          RdlcPath="RDLC\SharedExtensions.rdlc" Group="Windows Installer Best Practices"
          GroupIndex="5" OrderIndex="3" Icon="33120" GroupIcon="33138" >
02      <DataSources>
03          <DataSource DataSourceName="ds_asrpt_SharedExtensions"
                  SqlCommandType="StoredProcedure"
                  SqlCommandString="sp_asrpt_SharedExtensions">
04              <SqlParameters>
05                  <SqlParameter/>
06              </SqlParameters>
07          </DataSource>
08      </DataSources>
09      <Report Name="Shared Extensions By Product" RdlcPathType="Relative"
              RdlcPath="RDLC\SharedExtensionsByProduct.rdlc">
10          <DataSources>
11              <DataSource DataSourceName="ds_asrpt_SharedExtensionsByProduct"
                        SqlCommandType="StoredProcedure"
```

```
                    SqlCommandString="sp_asrpt_SharedExtensionsByProduct">
12                <SqlParameters>
13                    <SqlParameter DrillThroughParameterName="Extension"
                          SqlParameterName="@extension" SqlParameterValue=""/>
14                </SqlParameters>
15            </DataSource>
16        </DataSources>
17    </Report>
18 </Report>
```

Important • *Line numbers have been added to this example.*

6. Use the information on the following table to replace the highlighted text above with the correct information for your new custom report, including information for all of your custom report's drill through reports:

Line	Element/Parameter	Values
01	<Report	Opens the definition of the main report.
01	Name	Enter the name of the custom report. This name will be listed in the drop-down menu that opens when you click on the report group icon in the ribbon.
01	RdlcPathType	Valid values are Relative or Absolute.
01	RdlcPath	Enter the name of the custom report **.rdlc** file.
01	Group	Enter the name of the report group that this report will be listed in. In this example, the Group parameter is set to Windows Installer Best Practices. ***Note*** • *All of the reports in this group will have the same value for this parameter.* ***Note*** • *This parameter is not necessary for drill-through reports.*
01	GroupIndex	Set this parameter to a number to specify the order that this group will appear in the **Report Center** ribbon. In this example, the GroupIndex parameter is set to 5, meaning that it will be the fifth group listed in the Report Center ribbon, counting from left to right. ***Note*** • *All of the reports in this group will have the same value for this parameter.* ***Note*** • *Not necessary for drill-through reports.*

Line	Element/Parameter	Values
01	`OrderIndex`	Set this parameter to a number to specify the order that this report will appear in drop-down list that opens when you click on this report's group icon in the **Report Center** ribbon. In this example, the `OrderIndex` parameter is set to **3**, meaning that it will be the third report in the list.  ***Note*** • *Not necessary for drill-through reports.*
01	`Icon`	This icon specifies the icon that is displayed to the left of the report name in the drop-down list. For the reports shipped with AdminStudio, this parameter is set to a five-digit code to specify an image resource in the AdminStudio binary file. For your custom report, set this parameter to an absolute path to the icon that you want to use for this report.  ***Note*** • *All of the reports in this group will have the same value for this parameter.*  ***Note*** • *Not necessary for drill-through reports.*
01	`GroupIcon`	This icon specifies the icon that is displayed to the Report Center ribbon for this group. For the groups defined in the XML file shipped with AdminStudio, this parameter is set to a five-digit code to specify an image resource in the AdminStudio binary file. If you are creating a custom group, set this parameter to an absolute path to the icon that you want to use for this group.
02	`<DataSources>`	Element that opens the list of data sources for this report.
03	`<DataSource`	Element that opens a data source for this report.
03	`DataSourceName`	This name should match the data source specified in the RDLC file.
03	`SqlCommandType`	Valid values are `StoredProcedure` or `SQL`.
03	`SqlCommandString`	Enter the stored procedure name or an SQL string.
04	`<SqlParameters>`	Element that opens the list of SQL parameters.
05	`<SqlParameter>`	A parameter to pass to the stored procedure. This is usually used for drill-through reports to convey the context of what was clicked.

Line	Element/Parameter	Values
09	<Report	Because this element is nested within the first **<Report>** element, it defines a drill-through report for the first report. It will not be listed in the drop-down list; it is opened by clicking on a link in the original report. Define this report using the same parameters you used to define the parent report. However, it is not necessary to define the following parameters: Group, GroupIndex, GroupIcon, Icon, OrderIndex.

7. After you save this file, open the **Report Center** tab and this locate this report, which should be listed in the location you specified.

Managing System Center 2012 Configuration Manager Application Model Data

When the **Catalog** tab is selected in the Application Manager ribbon and an application is selected in the tree, the **Application View** opens, which provides summary information about the application, deployment data for each of its deployment types, dependencies/supersedences information, and Microsoft System Center Configuration Manager deployment status. Much of this information is used during deployment to Microsoft System Center Configuration Manager.

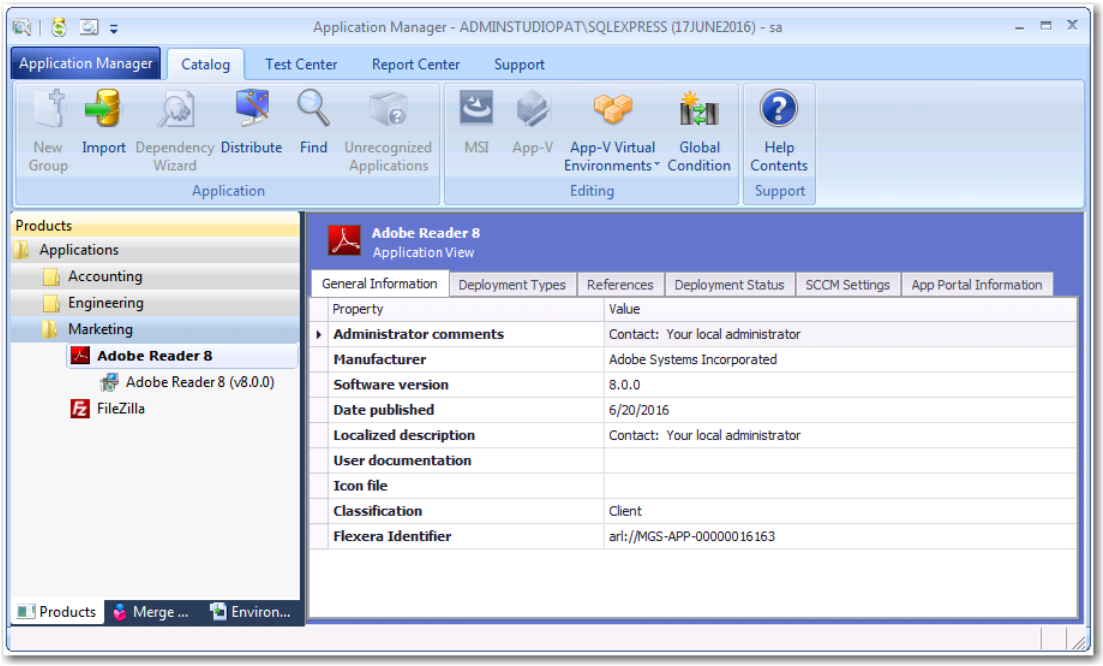
- Specifying General Application Information
- Specifying Deployment Data for an Application's Packages
- Viewing Reference Data: Dependencies and Supersedences
- Viewing Microsoft Configuration Manager Deployment Information
- Enabling Application Extended Attributes
- Retiring or Reinstating an Application in System Center 2012 Configuration Manager

Specifying General Application Information

You can view summary information about the application that AdminStudio gathered during package import on the **General Information** tab of the **Application View**.

Task ***To view general application information:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an application in the tree. The **Application View** opens.
3. Click the **General Information** tab. The **General Information** tab opens.



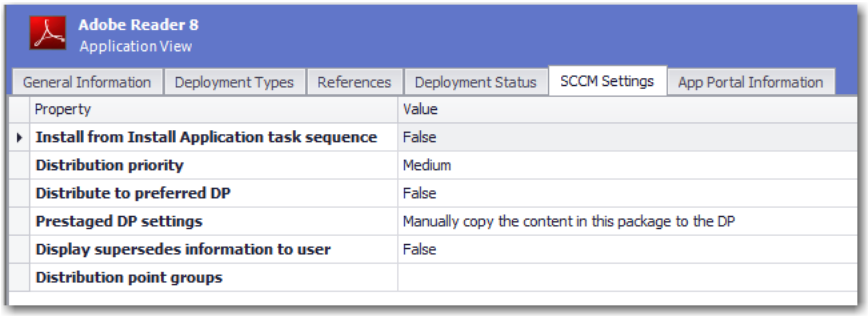
4. Review and edit the listed data, as described in General Information Tab.

Specifying System Center Configuration Manager Information

You can view summary information about the application that AdminStudio gathered during package import on the **SCCM Settings** tab of the **Application View**.

Task ***To view general application information:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an application in the tree. The **Application View** opens.
3. Click the **SCCM Settings** tab. The **SCCM Settings** tab opens.



4. Review and edit the listed data, as described in SCCM Settings Tab.

Specifying Deployment Data for an Application's Packages

The **Deployment Types** tab of the **Application View** lists data for all of the application's deployment types. It contains the same information that is displayed on the Deployment Data Tab for each of its associated deployment types (packages).

When you click the plus sign next to a package name on the **Deployment Types** tab, it expands to list the same deployment information that is displayed on the **Deployment Data** tab of the **Catalog Deployment Type View** for the selected package. Much of this information is used during deployment to Microsoft System Center Configuration Manager.

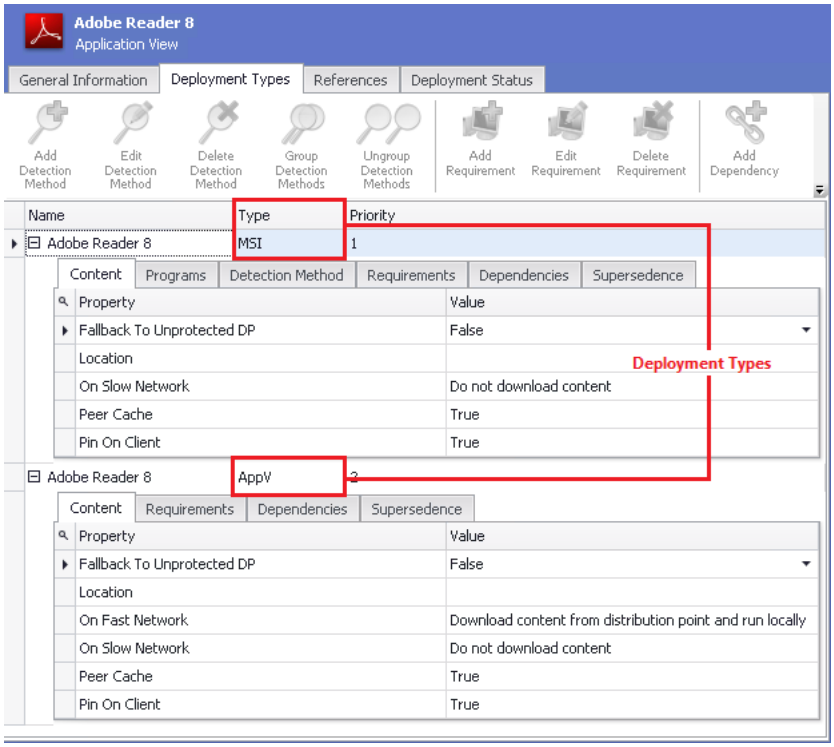


Figure 7-2: Application View / Deployment Types Tab (Expanded)

For information on the metadata displayed and defined on the subtabs of the **Deployment Types** tab, see the following sections:

- Specifying Package Content Deployment Data
- Specifying Package Programs Deployment Data
- Specifying Package User Experience Deployment Data
- Specifying Package Detection Methods Deployment Data
- Specifying Package Requirements Deployment Data
- Specifying Package Dependencies Deployment Data
- Specifying Package Supersedences Deployment Data
- Viewing and Editing Return Codes

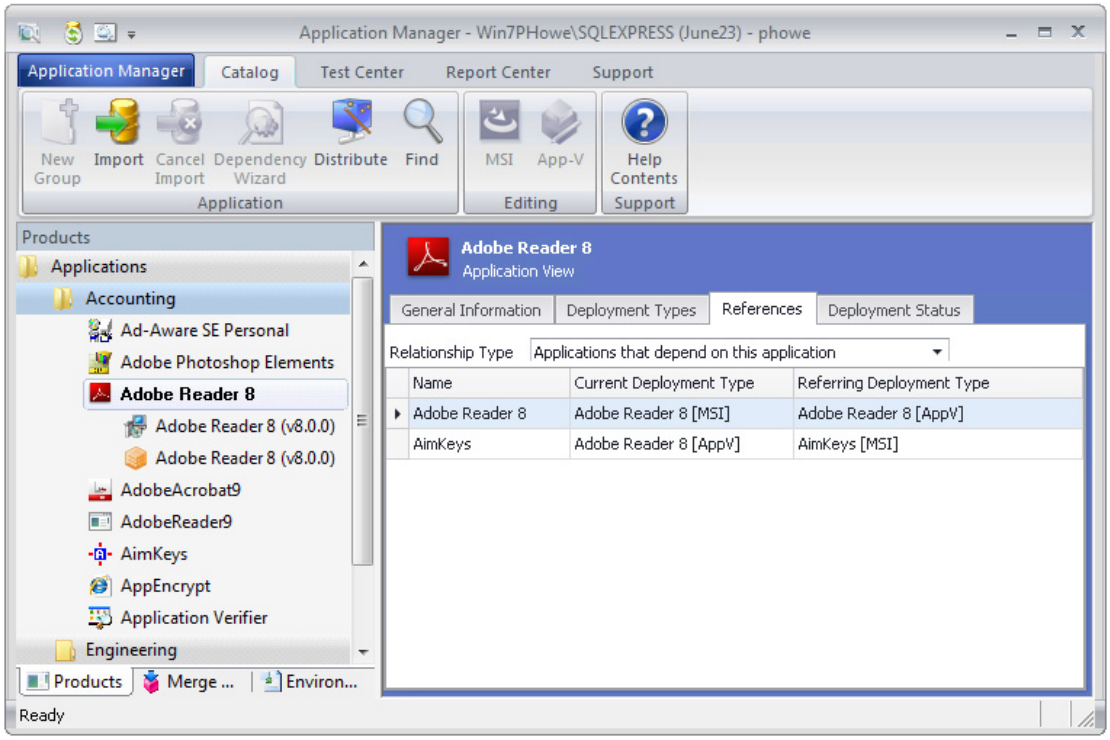
Viewing Reference Data: Dependencies and Supersedences

On the **References** tab of the **Application View**, you can view a list of packages that are dependent upon this application or that supersede this application. These dependencies are defined on the **Dependencies** and **Supersedence** subtabs of the **Deployment Data** tab of the **Catalog Deployment Type View** for a selected package. If another package has specified that it is dependent upon or supersedent to this package, that package will be listed here.

For more information, see Specifying Package Dependencies Deployment Data and Specifying Package Supersedences Deployment Data.

Task ***To view reference data:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an application in the tree. The **Application View** opens.
3. Click the **Reference** tab. The **References** tab opens.



4. Review and edit the listed data, as described in References Tab.

Viewing Microsoft Configuration Manager Deployment Information

If you have specified your Microsoft System Center Configuration Manager server connection information on the **Distribution System** tab of the Application Manager **Options** dialog box, Application Manager will display an application's Configuration Manager deployment status both on the **Deployment Status** tab of the **Application View** and on the **Microsoft Configuration Manager Deployments Report** on the **Report Center** tab.

- Viewing an Application's Configuration Manager Deployment Status
- Viewing the Microsoft Configuration Manager Deployments Report

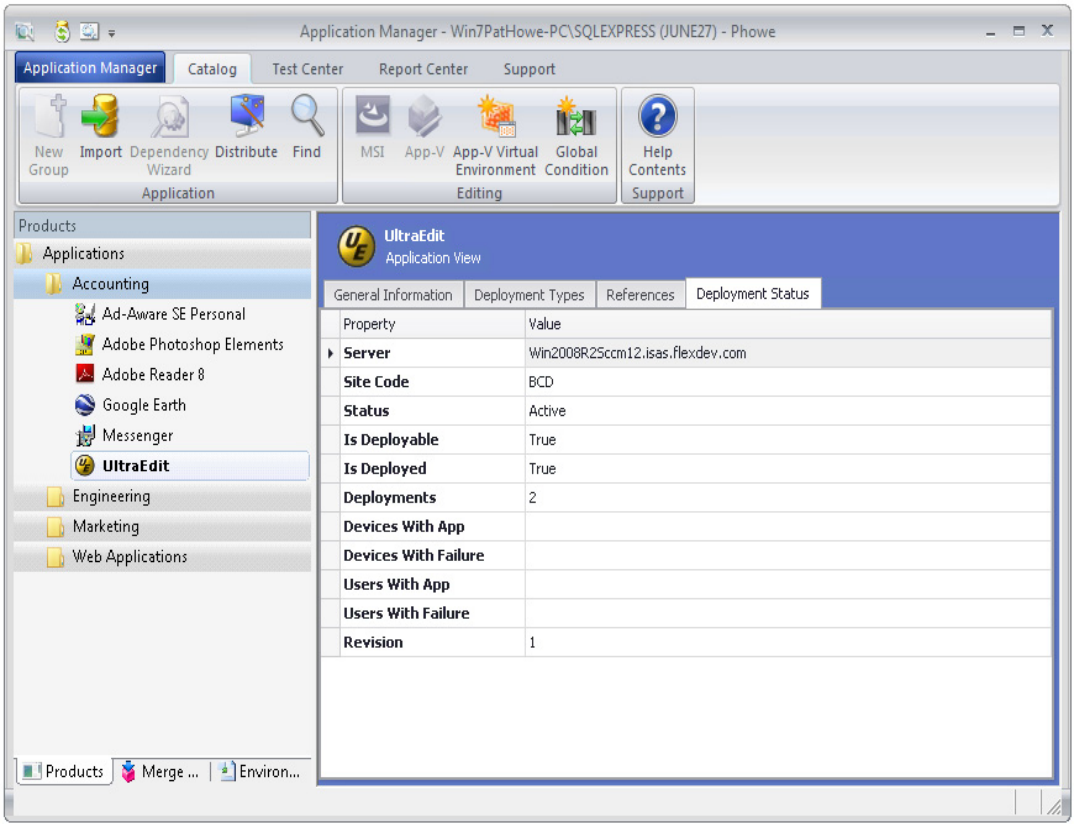
Viewing an Application's Configuration Manager Deployment Status

The **Deployment Status** tab of the **Application View** lists data from System Center Configuration Manager that is specific to this application, not to its deployment types. The data is read from the active System Center Configuration Manager server that has been specified on the **Server Options** > **Distribution System** tab of the Application Manager **Options** dialog box.

If Application Manager is unable to establish an active link to the System Center Configuration Manager server, then a message indicating that there is no active connection will be displayed.

Task ***To view reference data:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an application in the tree. The **Application View** opens.
3. Click the **Deployment Status** tab. The **Deployment Status** tab opens.



4. Review the listed data, as described in Deployment Status Tab.

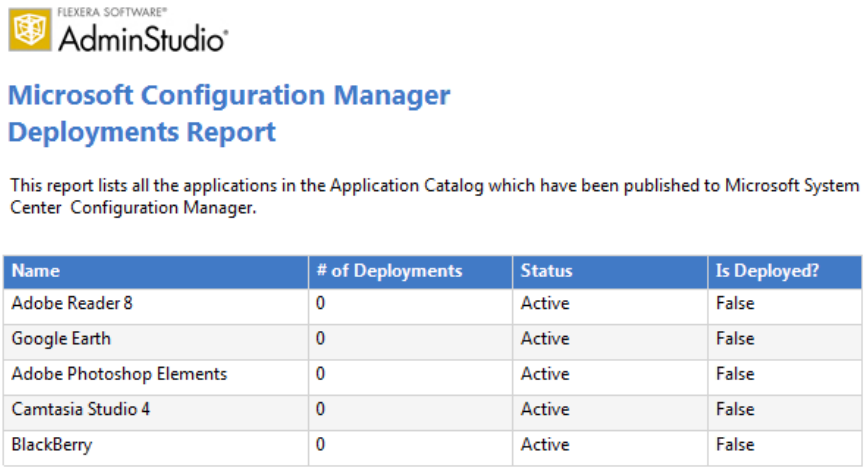
Viewing the Microsoft Configuration Manager Deployments Report

The **Microsoft Configuration Manager Deployments Report** on the **Report Center** tab lists the applications in the Application Catalog which have been published to Microsoft System Center Configuration Manager.

Note • *In order for this report to contain information, you need to have entered your System Center Configuration Manager server information on the* ***Distribution System*** *tab of the Application Manager* ***Options*** *dialog box, as described in Creating Multiple Named Connections to Distribution Systems.*

Task ***To view the Microsoft Configuration Manager Deployments Report:***

1. Open Application Manager and select the **Report Center** tab in the ribbon.
2. In the ribbon, click **Deployment Reports** and select **Configuration Manager Deployments**.



FLEXERA SOFTWARE®
AdminStudio®

Microsoft Configuration Manager Deployments Report

This report lists all the applications in the Application Catalog which have been published to Microsoft System Center Configuration Manager.

Name	# of Deployments	Status	Is Deployed?
Adobe Reader 8	0	Active	False
Google Earth	0	Active	False
Adobe Photoshop Elements	0	Active	False
Camtasia Studio 4	0	Active	False
BlackBerry	0	Active	False

The **Microsoft Configuration Manager Deployments Report** includes the following information:

- **Name**—Name of deployed application.
- **# of Deployments**—Number of machines this application has been deployed to by the connected Microsoft System Center Configuration Manager server.
- **Status**—Whether this application's status is **Active** (ready for deployment) or **Inactive** (not ready for deployment).
- **Is Deployed?**—Value is **True** if application has been deployed; set to **False** if the application has not been deployed.

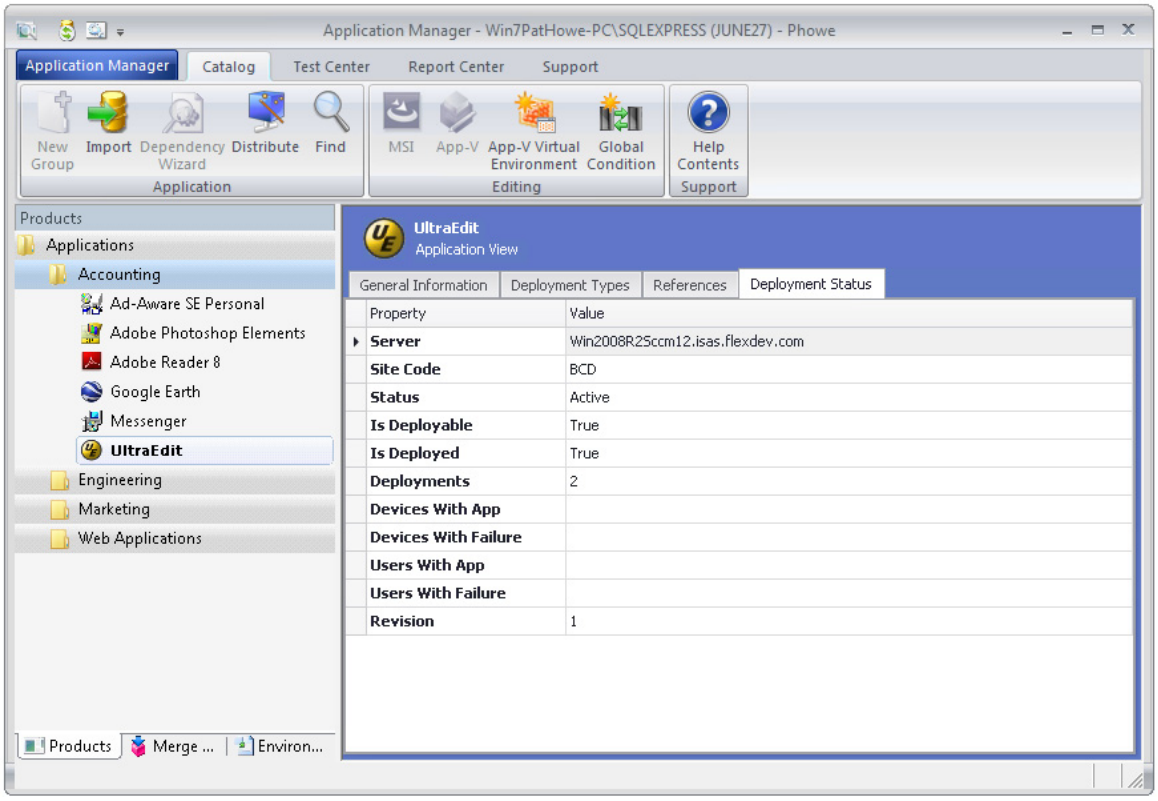
Retiring or Reinstating an Application in System Center 2012 Configuration Manager

You can retire or reinstate an application in System Center 2012 Configuration Manager by changing its **Status** property on the **Deployment Status** tab of the **Application View**, without even being required to republish the application.

When you *retire* an application, it is no longer available for deployment but the application and any deployments of the application are not deleted. Existing copies of this application that have been installed on client computers will not be removed. If an application that has no deployments is retired, it will be deleted from the Configuration Manager console after 60 days. However, any installed copies of the application are not removed.

Task ***To retire or reinstate an application in System Center 2012 Configuration Manager:***

1. Open the **Catalog** tab of Application Manager.
2. Select application node of an application that has been published to System Center 2012 Configuration Manager. The **General Information** tab of the **Application View** opens.
3. Open the **Deployment Status** tab.



4. Set the **Status** field to one of the following options:

   - **Retire**—Select this option to make this application unavailable for distribution by System Center 2012 Configuration Manager.
   - **Active**—Select this option to reinstate this application, making a formerly retired application once again available for distribution by System Center 2012 Configuration Manager.

Managing Mac OS X Desktop Application Metadata

To enable you to successfully manage Mac OS X desktop applications in your enterprise—both local package files and those from a public store—AdminStudio can extract and analyze metadata from those applications.

All of this metadata is needed for operating system compatibility and best practices testing.

Information about Mac OS X desktop application metadata is presented in the following sections:

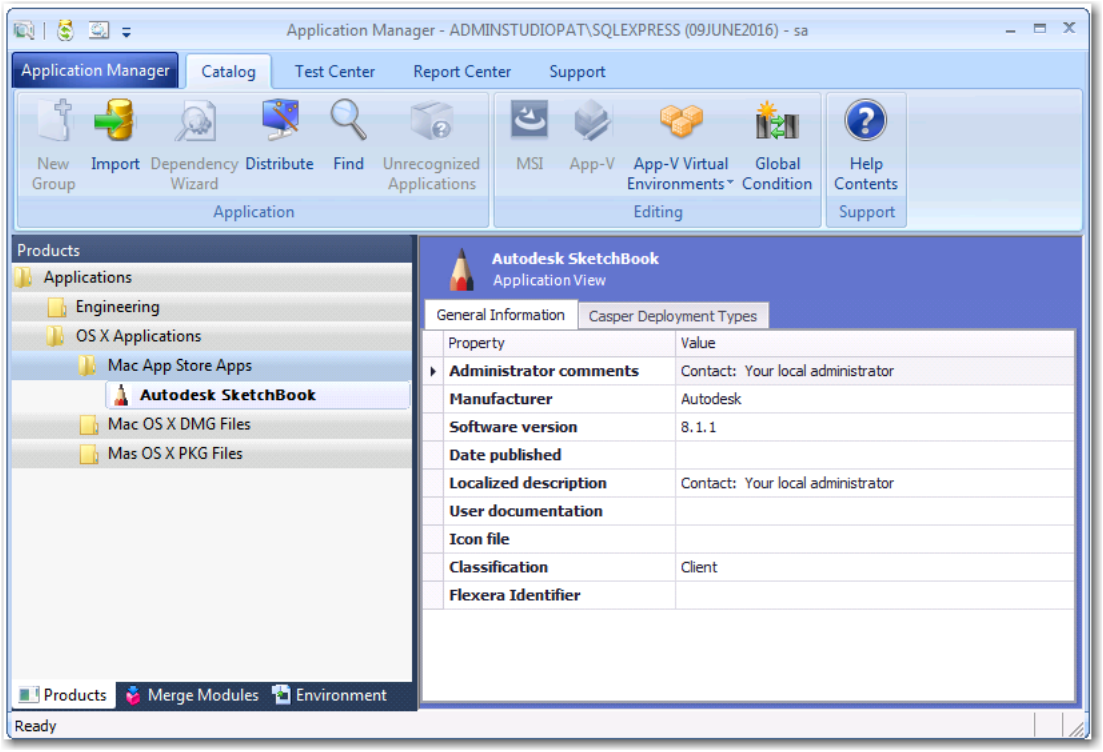
- Viewing Imported Mac OS X Desktop Application Metadata
- Customizing Apple Installer Package PKG Installer Settings
- Viewing Bundled Packages of Mac OS X PKG and DMG Files

Viewing Imported Mac OS X Desktop Application Metadata

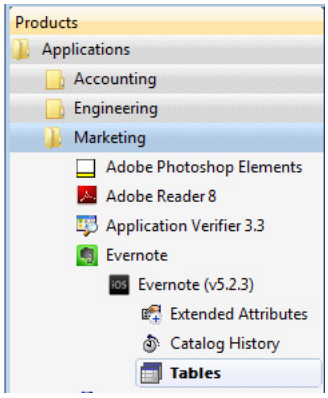
AdminStudio automatically extracts metadata when importing a Mac OS X desktop application (.pkg file, .dmg file, or link to Mac App Store app). To view the metadata of a Mac OS X desktop application, perform the following steps:

Task ***To view Mac OS X desktop application metadata:***

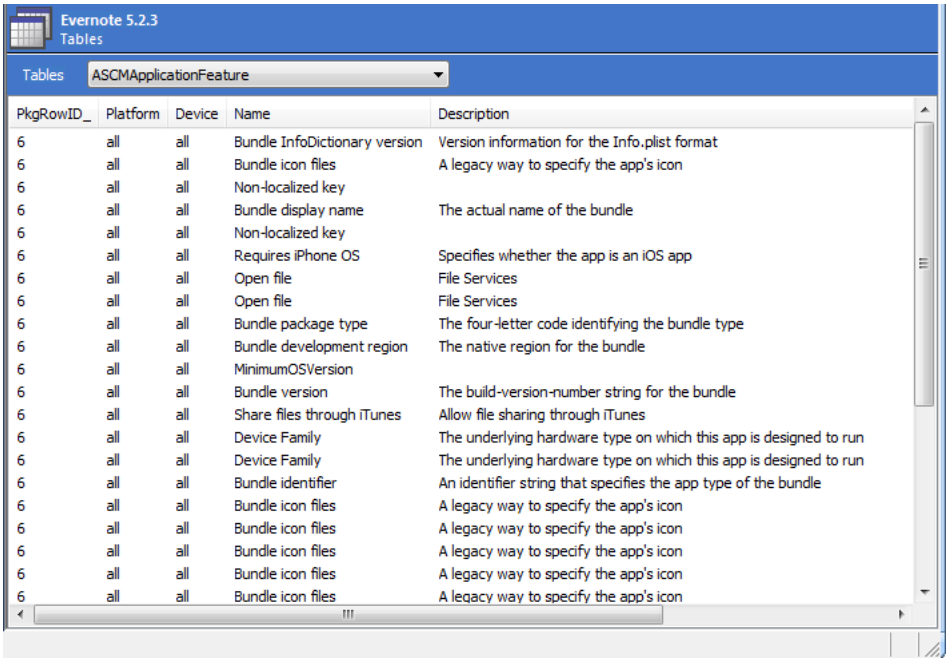
1. In Application Manager, open the **Catalog** tab.
2. In the tree, select the application node of a Mac OS X desktop application. The **General Information** tab of the **Application View** opens.



3. Review the properties, as described in General Information Tab.
4. In the tree, expand the mobile app's application node and its deployment type node to display the subnode icons, and select the **Tables** subnode.



The **Tables View** opens, listing metadata from the selected table.



5. From the **Tables** list in the toolbar, select one of the following tables:

Mac OS X Desktop Application Type	Table Name
All types	`cstblPackage`
Apple disk image package (.dmg)	`csDmgCustomTable` `cstblSetupFiles`
Apple installer package (.pkg)	`csPkgCustomTable` `cstblSetupFiles`
Apple Mac App Store application	`csAppDeepLinkExtraInfo` `ASCMApplicationFeature`

These tables list the properties and values that AdminStudio has extracted during import. This metadata is used when these applications are tested for OS compatibility and best practices.

6. To view the results of the testing of Mac OS X desktop applications, see Performing Compatibility, Best Practices, and Risk Assessment Testing and Viewing and Filtering Test Results.

7. This metadata along with test results are used to generate the reports displayed on the **Report Center** tab. For more information, see Viewing Application Testing and Analysis Reports on the Report Center Tab.

Customizing Apple Installer Package PKG Installer Settings

Just as a Windows Installer package can be customized by adding a transform file, an Apple installer package (**.pkg**) can be customized by editing an XML file that is embedded within it. In AdminStudio 2016, the settings defined in a **.pkg** file's embedded XML file are displayed on the new **PKG Installer Choices** tab of the package's **Catalog Deployment Type** view.

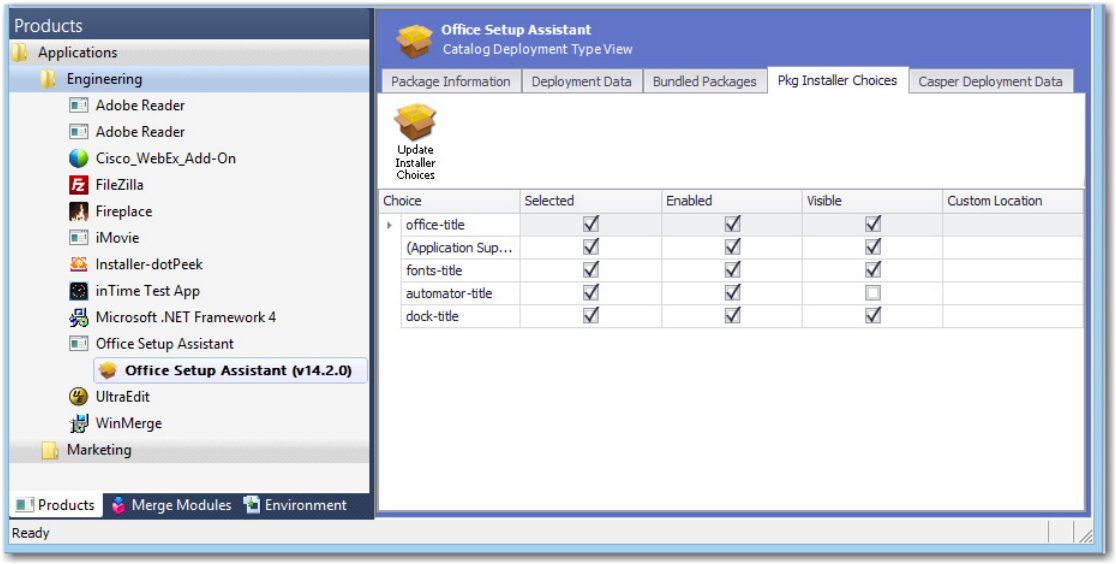


Figure 8: New PKG Installer Choices Tab of Catalog Deployment Type View for Mac PKG Installer

The **PKG Installer Choices** tab lists all settings that have been defined in that **.pkg** file's embedded XML settings file by the application manufacturer. To customize this installer (such as to prepare it for silent installation by Casper), you can make changes to the settings on this tab and then click **Update Installer Choices**. AdminStudio will then save your changes in the package's embedded settings file.

For each installer **Choice** listed on the **PKG Installer Choices** tab, the following options are available:

Option	Description
Visible	This option can be either selected or not selected: • **Selected**—This choice setting will be displayed in the installer. • **Not selected**—This choice setting will not be displayed in the installer.

Option	Description
Selected	This option can be either selected or not selected: • **Selected**—If this choice setting is displayed in the installer, its check box will be checked. • **Not selected**—If this choice setting is displayed in the installer, its check box will not be checked.
Enabled	This option can be either selected or not selected: • **Selected**—If this choice setting is displayed in the installer, it will be enabled. • **Not selected**—If this choice setting is displayed in the installer, it will be disabled.
Custom Location	If this choice setting explicitly permits the user to specify a user-defined installation path, the path entered in this field would populate the user-defined installation path when it is displayed in the installer.

Note • *Modifying the installer choices of an Apple installer package does not affect the digital signature of the package.*

Viewing Bundled Packages of Mac OS X PKG and DMG Files

If an Apple installer package (**.pkg**) or disk image (**.dmg**) contains child packages bundled within it, those child packages will be listed on the **Bundled Packages** tab of the **Catalog Deployment Type** view.

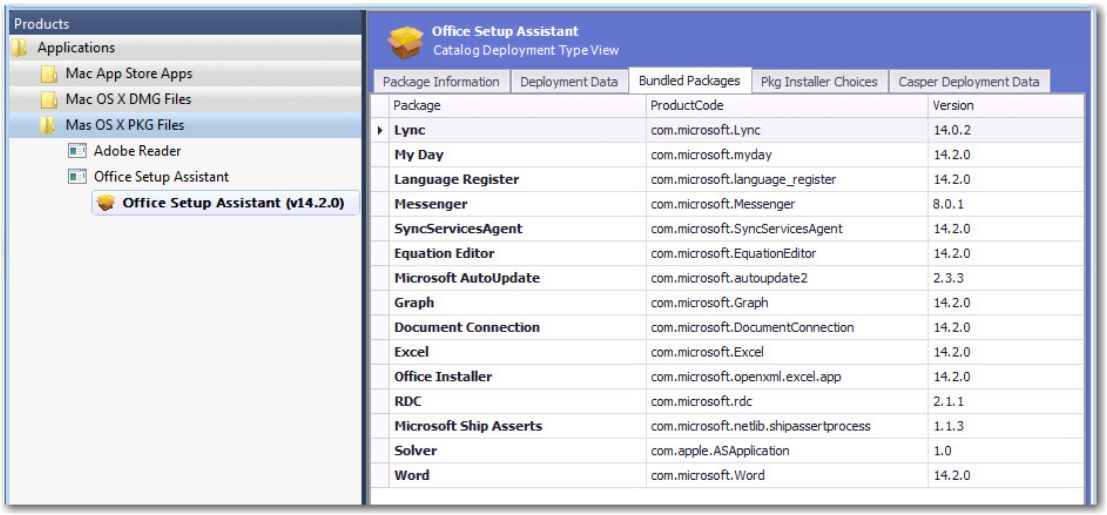

Figure 9: Bundled Packages Tab of Catalog Deployment Type View for Apple Installer Package (.pkg)

When the imported **.dmg** or **.pkg** file is tested, each of these child packages is also tested, and the combined test results are listed in Test Center, as described in Viewing Combined Test Results of Child Applications of PKG and DMG Installers.

***Note** • AdminStudio will only inspect Mac OS X package files one level deep. If a **.dmg** or **.pkg** package contains another **.dmg** or **.pkg** package bundled within it, that child package will not be inspected.*

Managing Mobile App Metadata

To enable you to successfully manage mobile apps in your enterprise—both local mobile apps and those from a public store—AdminStudio can extract and analyze metadata from those apps.

All of this metadata is needed for operating system compatibility, device compatibility, best practices, and risk and assessment testing, and for feature use reporting. By understanding a mobile app's configuration and property settings, AdminStudio can identify which apps might pose a security risk.

For Apple iOS mobile apps, you can import and view *Enterprise Policy Configuration* files so that you can determine the impact of enforcing those policies.

Information about mobile app metadata is presented in the following sections:

- About Mobile App Metadata
- Viewing Imported Mobile App Metadata
- Specifying the Path to Local iOS and Android Public Store Apps
- Managing iOS Enterprise Policy Configuration Files
- iOS Property Files (Info.plist) and iOS Enterprise Policy Files (*.plist)
- Viewing Mobile App Reports

About Mobile App Metadata

In enable you to successfully manage mobile apps in your enterprise—both local mobile apps and those from a public store—AdminStudio can extract and analyze metadata from those apps.

Some of this metadata is included in mobile app manifest files or within the application binaries and associated files. AdminStudio automatically extracts this information during mobile app import:

- **Apple iOS mobile apps (local)**—Many Apple iOS mobile apps have associated Info**.plist** (or property list) files which contain mobile app properties. AdminStudio captures the information in an iOS mobile app's associated **.plist** file.
- **Google Android mobile apps (local)**—Google Android apps include internal XML-based manifest files (**AndroidManifest.xml**) that contain additional mobile app metadata. AdminStudio captures this information during the import of an Android mobile app.
- **Binary scans**—AdminStudio scans the actual mobile app binary files during import to gather additional information.

- **Public store web sites**—For public store apps, AdminStudio captures all of the information that is displayed in the store about a mobile app.
- **Downloaded public store apps**—For iOS and Android public store mobile apps, you can choose to download the binaries of these apps to store locally (such as in a local iTunes Library or Google Android file share). This enables AdminStudio to scan those binary files, extract metadata, and store it in the Application Catalog along with the public store mobile app.

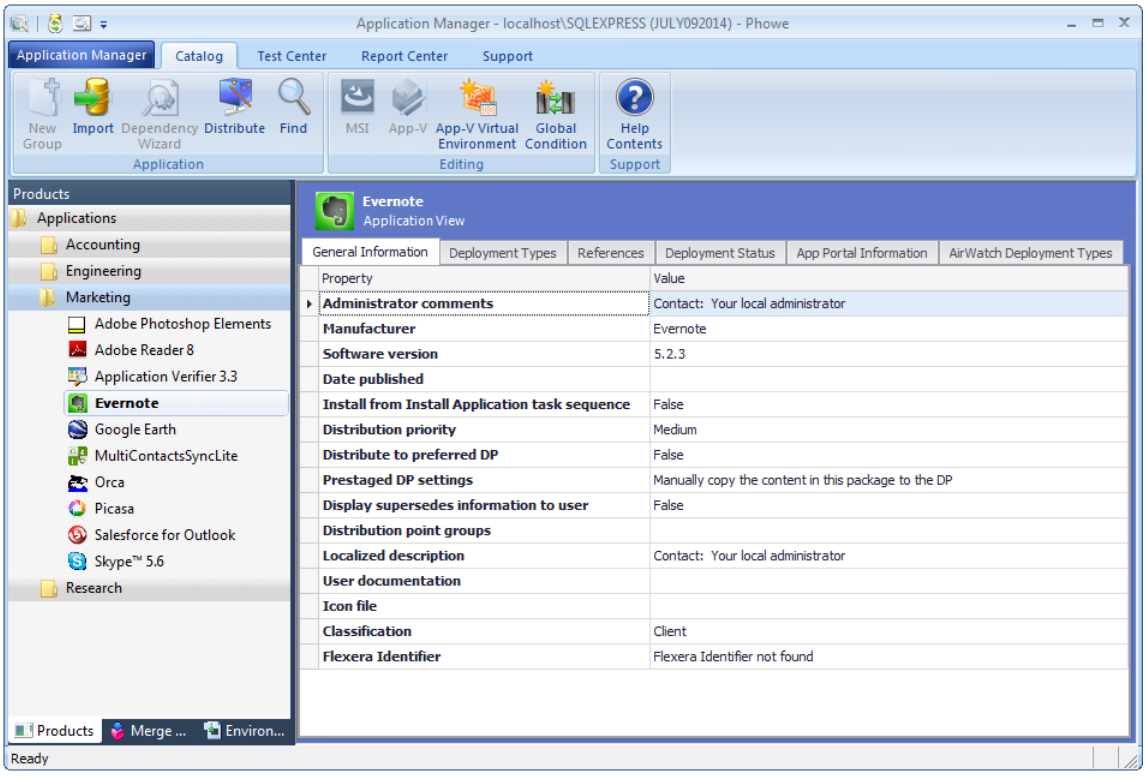
Viewing Imported Mobile App Metadata

AdminStudio automatically extracts mobile app metadata from multiple locations during mobile app import, as described in About Mobile App Metadata.

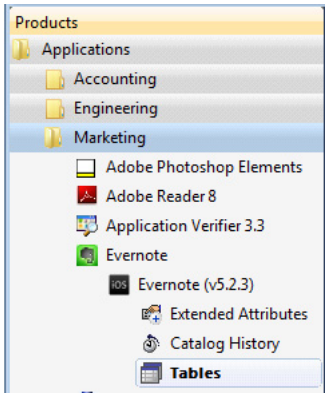
To view the metadata of a mobile app, perform the following steps:

Task ***To view mobile app metadata:***

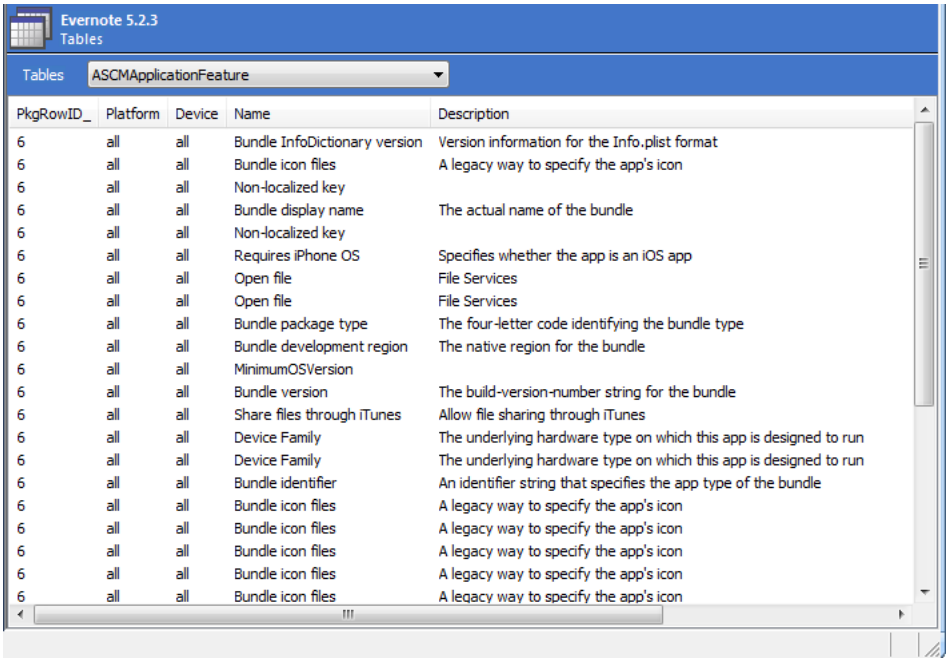
1. In Application Manager, open the **Catalog** tab.
2. In the tree, select the application node of a mobile app. The **General Information** tab of the **Application View** opens.



3. Review the properties, as described in General Information Tab.
4. In the tree, expand the mobile app's application node and its deployment type node to display the subnode icons, and select the **Tables** subnode.



The **Tables View** opens, listing metadata from the selected table.



5. From the Tables list in the toolbar, select one of the following tables:

Mobile App Type	Table Name
All types	`ASCMApplicationFeature`
Apple iOS (local)	`csIpaCustomTable`
Apple iOS (public store)	`csIpaDeepLinkExtraInfo`
Google Android (local)	`csApkCustomTable`
Google Android (public store)	`csApkDeepLinkExtraInfo`
Microsoft Windows Store (local)	`csAppxCustomTable`

Mobile App Type	Table Name
Microsoft Windows Store (public store)	`csAppxDeepLinkExtraInfo`

These tables list the properties and values that AdminStudio has extracted during mobile app import. This metadata is used when mobile apps are tested for OS compatibility, best practices, and risk assessment.

6. To view the results of mobile app testing, see Performing Compatibility, Best Practices, and Risk Assessment Testing and Viewing and Filtering Test Results.
7. This metadata along with test results are used to generate the reports displayed on the **Report Center** tab. For more information, see Viewing Mobile App Reports.

Specifying the Path to Local iOS and Android Public Store Apps

When you import a mobile app from a public store, AdminStudio extracts available metadata from the public store web site. However, to enable AdminStudio to examine the actual binary file of the mobile app so that it can extract even more metadata, you can specify the network directory where downloaded public store mobile app binary files are stored: a local iOS iTunes Library or Google Android file share.

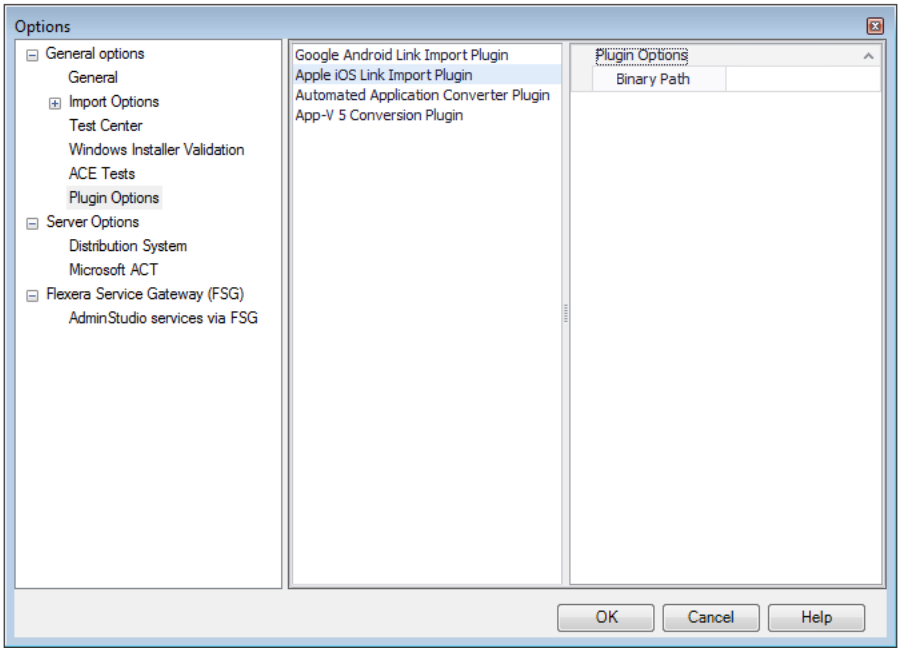
If you specify this location, and then you import a public store mobile app that has also already been downloaded locally, AdminStudio will analyze the downloaded binary's data to discover more details about the features used by the app, which will result in more detailed test results.

On the **Plugin Options** tab of the Application Manager **Options** dialog box, you can specify the location in your network of mobile apps that you have already downloaded from a public store:

- **iTunes Library**—Apple iOS apps downloaded from the Apple iTunes Store
- **Google Android file share**—Google Android apps downloaded from the Google Play Store

Task ***To specify the path to Local iOS and Android public store apps:***

1. On the Application Manager menu, click **Options**. The **Options** dialog box opens.
2. Open the **General options** > **Plugin Options** tab.
3. Select either **Apple iOS Link Import Plugin** or **Google Android Link Import Plugin**.



4. In the **Binary Path** field, enter the local path to the location of your iTunes Library or Google Android file share.
5. Click **OK**.

iOS Property Files (Info.plist) and iOS Enterprise Policy Files (*.plist)

There are two different types of files that can be associated with an iOS mobile app that have the **.plist** file extension:

- Information Property-List Files (Info.plist)
- Enterprise Policy Property List Files (*.plist or *.mobileconfig)

Information Property-List Files (Info.plist)

The **Info.plist** file contains critical information about the configuration of an iOS mobile app—such as iOS versions that are supported and device compatibility—which the operating system uses to interact with the app. This file is automatically created when the mobile app is compiled. This information is used by the App Store and by iOS to determine the app's capabilities and to locate key resources. Every app must include this file and it must be named **Info.plist**. AdminStudio uses the information in this file to perform testing. Also, this file is required by System Center Configuration Manager to deploy a mobile app.

Enterprise Policy Property List Files (*.plist or *.mobileconfig)

An enterprise policy file is a device-level configuration profile that defines policies that implement security standards for a specific device. Enterprise policy files contain the configurations for iPhones, iPads, and iPod Touch devices, and policy settings (or rules) that specify what features of a mobile app or device an enterprise user is

permitted to use. You can also enterprise policy files to distribute configuration information to a large number of devices throughout your enterprise, such as Wi-Fi or email settings. Enterprise policy files contain the following types of settings:

- Restrictions on device features, such as location services, GPS, or camera
- Wi-Fi settings
- VPN settings
- Email server settings
- Exchange settings
- LDAP directory service settings
- CalDAV calendar service settings
- Web clips
- Credentials and keys

For more information, see Managing iOS Enterprise Policy Configuration Files.

Managing iOS Enterprise Policy Configuration Files

Mobile apps are capable of accessing and exposing critical and sensitive corporate data, presenting challenges to enterprise security. To address this concern, AdminStudio is able to identify an organization's mobile apps that display behaviors that may introduce risk to corporate security and data privacy.

One method to implement these enterprise security standards for iOS mobile apps is through using Enterprise Policy Configuration files (**.mobileconfig** or **.plist**) By associating these policy files with iOS mobile devices, you are able to enforce and manage mobile policies.

AdminStudio enables you to import iOS policy configuration files, view their settings, and determine the policy compatibility of the iOS mobile apps in your Application Catalog.

- About Enterprise Policy Configuration Files
- Importing Enterprise Policy Configuration Files
- Viewing Enterprise Policy Configuration File Settings

About Enterprise Policy Configuration Files

Mobile apps are capable of accessing and exposing critical and sensitive corporate data, presenting challenges to enterprise security. One method of implementing enterprise security standards for iOS mobile apps is through using Enterprise Policy Configuration files (**.mobileconfig** or **.plist**). By associating these policy files with iOS mobile apps, you are able to enforce and manage mobile policies.

Settings in an Enterprise Policy Configuration File

Enterprise Policy Configuration files contain the configurations for iPhones, iPads, and iPod Touch devices and policy settings (or rules) that specify what features of a mobile app or device an enterprise user is permitted to use. Policy files contain the following types of settings:

- Device security policies and restrictions
- Wi-Fi settings
- VPN settings
- Email server settings
- Calendar settings
- Exchange settings
- LDAP directory service settings
- Credentials and certificates that permit iPhone and iPad devices to work with your enterprise systems

Types of Enterprise Policy Configuration Files

Enterprise Policy Configuration files are created using Apple utilities:

- **iPhone Configuration Utility**—Used for iOS Mountain Lion (10.8).
- **Apple Configurator**—Used for iOS Mavericks (10.9).

These XML-based policy files have the extension of **.mobileconfig** or **.plist**. If one of these policy files are downloaded to an iOS device, it would be listed on the device's **Settings > General** screen.

Tip *• Not all files associated with an iOS app that have a* ***.plist*** *extension are policy files. See iOS Property Files (Info.plist) and iOS Enterprise Policy Files (*.plist).*

Importing Enterprise Policy Configuration Files

Edition *• Support for mobile apps is included when you purchase AdminStudio Professional or Enterprise Edition with Mobile.*

You can import an iOS Enterprise Policy configuration file using the Import Wizard. An Enterprise Policy Configuration file (**.mobileconfig** or **.plist**) is used to manage the use of a mobile app in an enterprise. It contains information such as VPN configuration information, Wi-Fi settings, and email settings. It can also restrict the use of certain mobile app features that may introduce risk to corporate security and data privacy such camera use, location services, or GPS.

Tip *• You can also use the Package Auto Import feature to batch import multiple iOS Enterprise Policy configuration files from a monitored directory. For more information, see Automatically Importing Packages from a Network Directory.*

To import an iOS Enterprise Policy configuration file into the Application Catalog using the Import Wizard, perform the following steps:

Task ***To import an iOS Enterprise Policy configuration file:***

1. Open Application Manager.
2. Click on the **Environment** tab. The tree lists the Security Patches, OS Snapshots, and Enterprise Policy Configuration files that have already been imported into the Application Catalog.
3. In the tree, right-click on the **Enterprise Policy Configurations** group and click **Import** on the Application Manager ribbon. The **Enterprise Policy File Selection** panel opens.
4. Click **Browse** and select the Enterprise Policy Configuration file (**.mobileconfig** or **.plist**) that you want to import.
5. Click **Next**. The **Summary** panel opens.
6. Click **Next** to begin the import. The **Running the Import Panel** opens and progress messages are displayed.
7. When the import is complete, click **Finish** to close the wizard.

Viewing Enterprise Policy Configuration File Settings

Edition • *Support for mobile apps is included when you purchase AdminStudio Professional or Enterprise Edition with Mobile.*

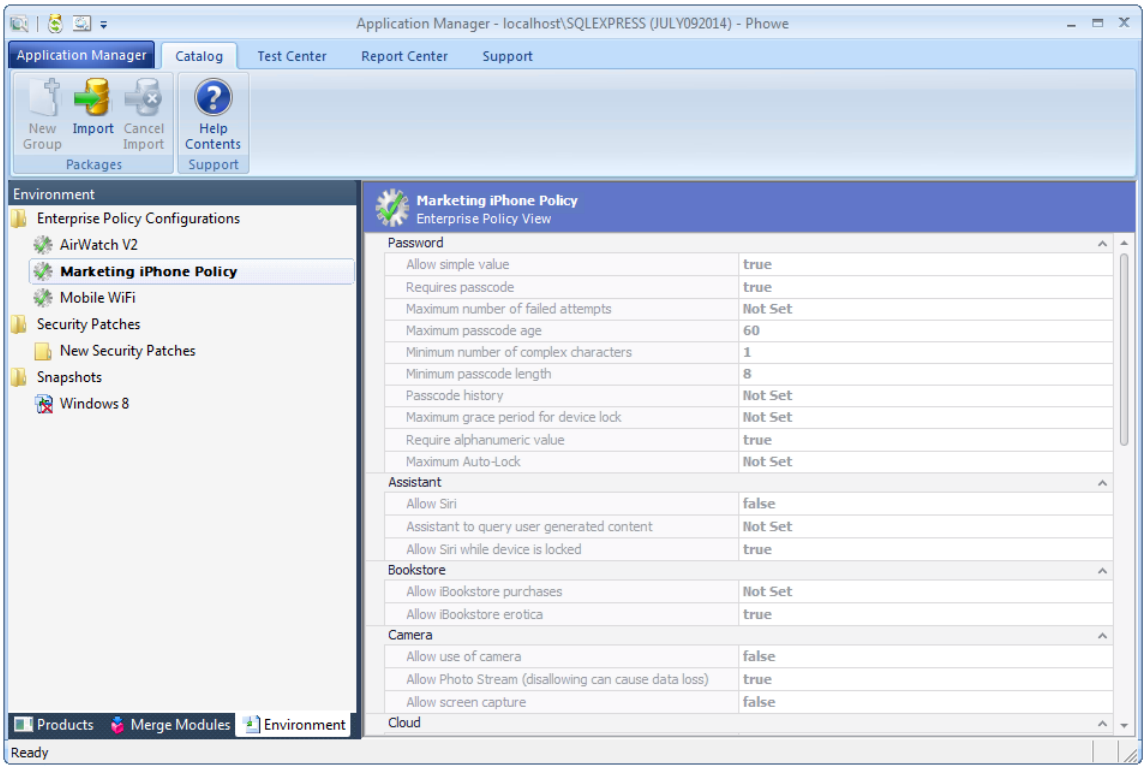
After you have imported an iOS Enterprise Policy Configuration file using the Import Wizard, you can view the settings in that configuration file on the **Enterprise Policy View** in Application Manager.

To view the settings of an iOS Enterprise Policy Configuration file, perform the following steps:

Task ***To view the settings of an iOS Enterprise Policy Configuration file:***

1. Open Application Manager.
2. Click on the **Environment** tab. The tree lists the Security Patches, OS Snapshots, and Enterprise Policy Configuration files that have already been imported into the Application Catalog.

3. In the tree, select an Enterprise Policy Configuration file. The **Enterprise Policy View** opens.



4. Scroll down the list to view all settings.

Viewing Mobile App Reports

AdminStudio offers extensive reporting on mobile apps. Using the metadata extracted during mobile app import, operating system compatibility, device compatibility, best practices, and risk and assessment testing is done, and the results of that testing can be viewed on the **Report Center** tab. In addition, reports on mobile app feature use and on the impact of enforcing enterprise policies can also be viewed.

- Viewing Mobile App Analysis and Test Result Reports
- Viewing iOS Enterprise Policy Compatibility Reports

Viewing Mobile App Analysis and Test Result Reports

When a mobile app is imported, AdminStudio captures metadata for each app, as described in About Mobile App Metadata. When mobile apps are tested for operating system compatibility, best practices, and risk assessment—as described in Performing Compatibility, Best Practices, and Risk Assessment Testing, additional metadata is generated. Reports displaying this metadata for Apple iOS and Google Android mobile apps can be viewed in on the **Report Center** tab.

On the **Report Center** tab, the following summary reports are available:

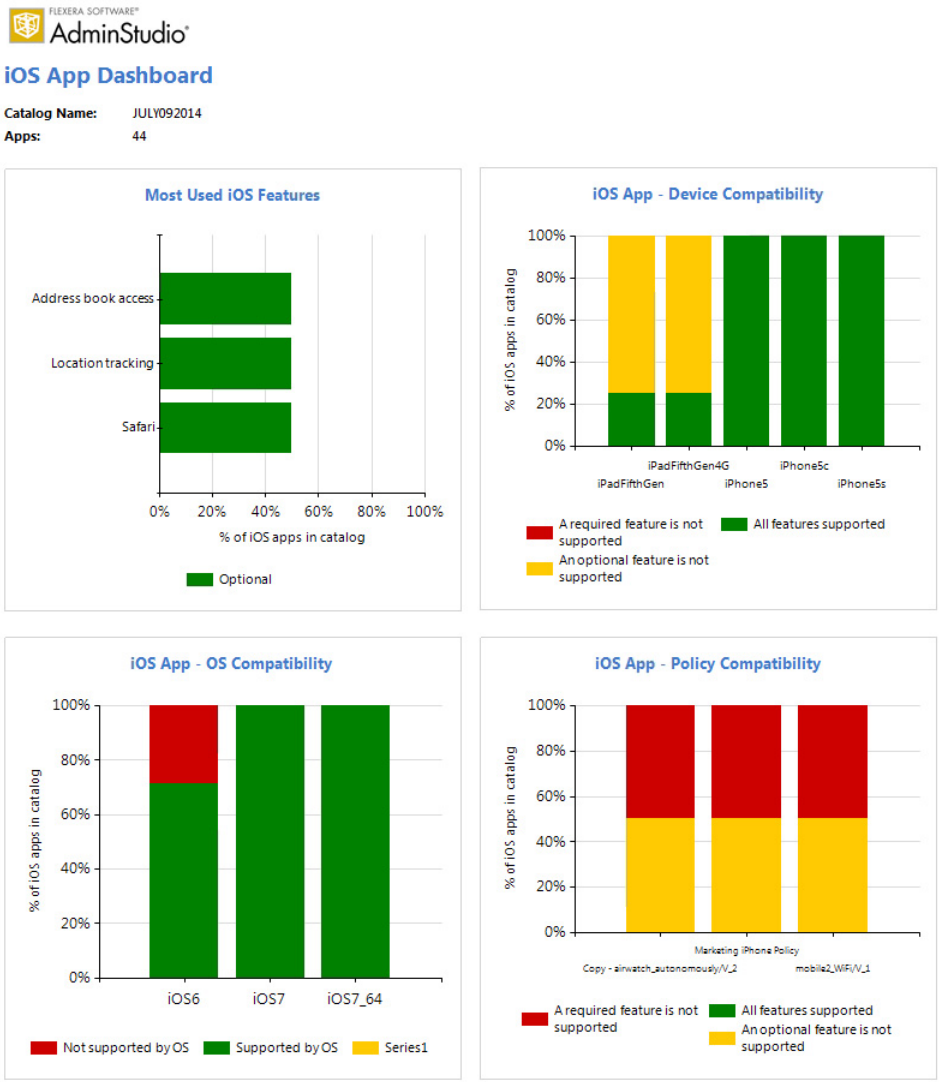
Table 7-13 • Mobile App Reports on the Report Center Tab

Report	Description
iOS/Android Mobile Dashboard	Provides summary charts of the major mobile app reports. Click to open more detailed reports.
iOS/Android App Details	Provides a combined view of the results of the analysis of feature use, feature compatibility with devices, and OS compatibility. Select the app to view by making a selection from the **Choose an app** list in the toolbar.
iOS/Android App Feature Use	The summary report lists the features that are being used by mobile apps in the Application Catalog and indicates the percentage of those apps that consider each feature to be either optional or required. Click on a bar segment to open more detailed reports. On **Feature Use** detail reports, you can select the feature that you want to view by clicking **Options** in the toolbar and making a selection from the list.
iOS/Android App - Device Compatibility	The summary report shows the compatibility of mobile apps on each of its operating system's devices. Each stacked bar indicates the percentage of mobile apps that fall into each of three categories: all features supported, an optional feature is not supported, or a required feature is not supported. Click on a bar segment to view **Device Compatibility** detail reports.
iOS/Android App - OS Compatibility	Shows the compatibility of mobile apps on each of its operating systems. Each stacked bar indicates the percentage of mobile apps that fall into one of two categories: supported by OS or not supported by OS. Click on a bar segment to view **OS Compatibility** detail reports.
iOS App - Policy Compatibility	The summary report shows the feature compatibility of iOS mobile apps on iOS devices for each Enterprise Policy in the Application Catalog. Each stacked bar indicates the percentage of iOS apps that fall into each of three categories: all features supported, an optional feature is not supported, or a required feature is not supported. Click on a bar segment to view **Policy Compatibility** detail reports. On the **Policy Compatibility** detail reports, you can choose to view additional policies by making a selection from the **Choose options** list in the toolbar.
iOS Best Practices and Risk Assessment	Summary reports shows the results of Apple iOS best practices and risk assessment testing to determine a mobile app's readiness for deployment. Mobile apps are assigned one of the following statuses: ready, warning, errors, not tested. Click on the pie chart segments to view detail reports.

To view mobile app analysis and test result reports, perform the following steps.

Task ***To view mobile app analysis and test results reports:***

1. Open the **Report Center** tab.
2. From the toolbar, select **Mobile > iOS or Android > iOS or Android Mobile Dashboard**. The iOS/Android App Dashboard report opens, listing the most used features, device compatibility, OS compatibility, and policy compatibility summaries.



3. Click on any of the bar segments to view more detailed reports. For example, below is the **iOS Compatibility** detail report for iOS 6.

FLEXERA SOFTWARE® AdminStudio®

iOS Apps - OS Compatibility

iOS6

This report shows the compatibility of iOS mobile apps on **iOS6**. To change the selected OS, or to select more than one OS, click **Options** in the toolbar.

Legend

Supported by OS
Not supported by OS

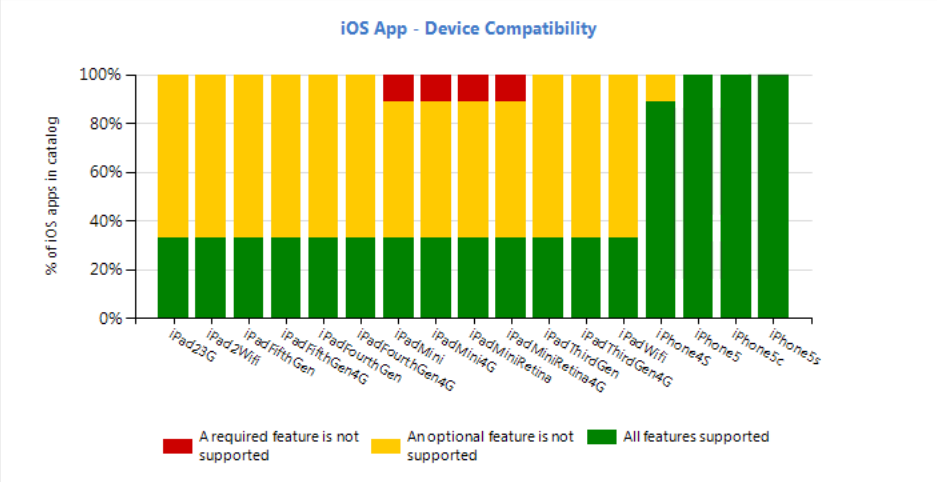
App	Minimum OS Version Required	iOS6
Cisco WebEx Meetings	6.0	✓
Evernote	5.0	✓
Facebook	6.0	✓
FindMyiPhone	5.0	✓
inTime Test App	5.0	✓
LinkedIn Connected	7.0	✗
MultiContactsSyncLite	5.0	✓

4. From the toolbar, select **Mobile > iOS or Android > iOS or Android Device Compatibility**. The iOS/Android **Device Compatibility** report opens, listing a summary of the compatibility of the mobile apps in the Application Catalog on each device.

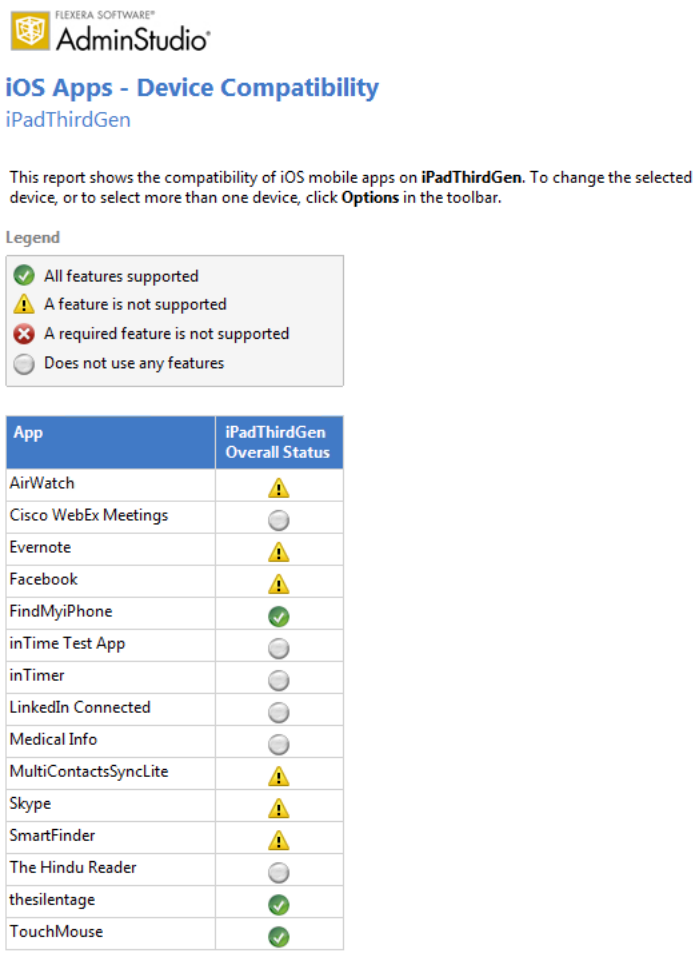
FLEXERA SOFTWARE® AdminStudio®

iOS Apps - Device Compatibility

This report shows the compatibility of iOS mobile apps on each iOS device. Each stacked bar indicates the percentage of iOS apps that fall into each of three categories: all features supported, an optional feature is not supported, or a required feature is not supported. Click a bar segment to view more detailed information.



5. Click on any of the bar segments to view a **Device Compatibility** detail report. For example, below is a **Device Compatibility** detail report for an iOS device (iPadThirdGen). It displays an icon to indicate the compatibility of each iOS mobile app on this device.



FLEXERA SOFTWARE®
AdminStudio

iOS Apps - Device Compatibility

iPadThirdGen

This report shows the compatibility of iOS mobile apps on **iPadThirdGen**. To change the selected device, or to select more than one device, click **Options** in the toolbar.

Managing App Portal Application Information

AdminStudio can communicate with App Portal and the FlexNet Manager Suite via the Flexera Service Gateway, as described in Integrating with Other Flexera Software Applications via the Flexera Service Gateway.

When AdminStudio is integrated with App Portal, when you publish a supported application from AdminStudio to System Center 2012 Configuration Manager, Symantec Altiris Server, or Casper Suite Server, you can choose to have a catalog item for that application automatically created in App Portal. And, if you are integrated with FlexNet Manager Suite, automatic license management can also be performed.

On the **App Portal Information** tab of the **Application View**, you need to specify the following:

- **Whether to create a catalog item**—Specify whether you want a new App Portal catalog item to be created when the supported application is published to System Center 2012 Configuration Manager, Symantec Altiris Server, or Casper Suite Server. To indicate that you want to create an App Portal catalog item upon publish, you need to:
  - **Select Notify option**—Click on the browse button in the **Categories** field to open the **Categories** dialog box, and select the **Notify Flexera Software App Portal on publish of current Application** option.

  - **Specify categories**—On the **Categories** dialog box, select an App Portal category or categories for this new catalog item.

- **Descriptions**—Enter the **Brief Description** and **Long Description** that will describe the new catalog item in App Portal.
- **Template**—Optionally, select an App Portal template that you want to base the new catalog item on.
- **Keywords**—Optionally, enter keywords that you wan the new catalog item to be searchable by in the App Portal **Browse Catalog** tab.

If AdminStudio is integrated with FlexNet Manager Suite, you should also open the **General Information** tab of the **Application View** and determine whether a Flexera Identifier is associated with this application. If not, you need to search for an application's Flexera Identifier, which is used when integrating with FlexNet Manager Suite to perform automatic license management. For more information, see Managing an Application's Flexera Identifier.

Instructions for performing these tasks are included in this section:

- Enabling Automatic Creation of App Portal Catalog Item
- Setting Brief Description and Long Description
- Specifying Catalog Item Categories
- Selecting an App Portal Template
- Specifying Catalog Item Keywords
- Troubleshooting: App Portal Catalog Item Not Created Upon AdminStudio Publication

Enabling Automatic Creation of App Portal Catalog Item

You can automatically create a new catalog item in App Portal each time either an application is published to System Center 2012 Configuration Manager, Symantec Altiris Management Suite, or Casper Suite Server, or when a package is published to System Center Configuration Manager. The instructions for enabling this feature vary depending upon whether you are publishing a package or an application.

- Catalog Item Creation When Publishing an Application
- Catalog Item Creation When Publishing a Package to System Center Configuration Manager

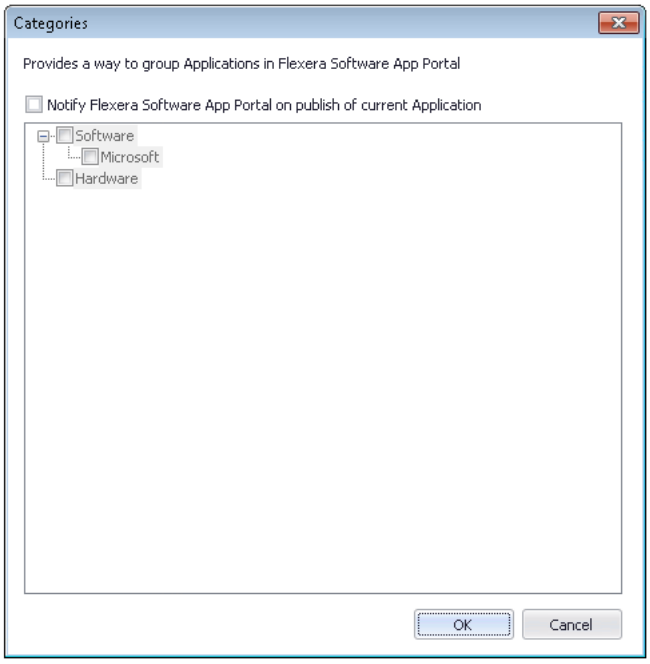
Catalog Item Creation When Publishing an Application

If you want a new catalog item to be created in App Portal when an application is published to System Center 2012 Configuration Manager, Symantec Altiris Management Suite, or Casper Suite Server, you need to select an option on the **Categories** dialog box, which is accessed from the **App Portal Information** tab of the **Application View**.

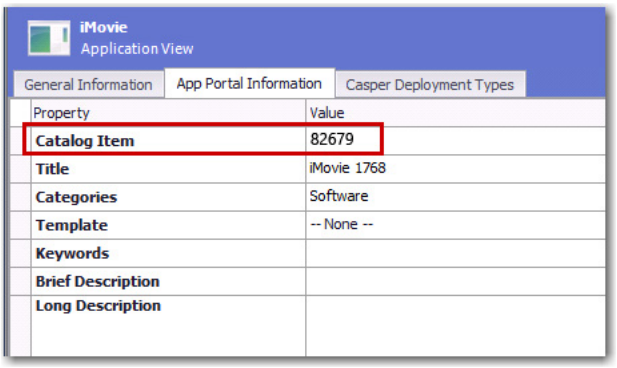
***Note** • App Portal does not support the creation of catalog items for Mac App Store apps.*

Task ***To enable automatic creation of App Portal Catalog item upon publication:***

1. Open the Application Manager **Catalog** tab.
2. Select an application in the tree. The **Application View** opens.
3. Select the **App Portal Information** tab. The **App Portal Information** tab opens.
4. Next to the **Categories** field, click the browse button. The **Categories** dialog box opens.



5. Select the **Notify Flexera Software App Portal on publish of current Application** option.
6. Select an App Portal category or categories, as described in Specifying Catalog Item Categories.
7. Click **OK**. When this application is published to System Center 2012 Configuration Manager, Symantec Altiris Management Suite, or Casper Suite Server, an App Portal catalog item will be automatically created, and the **Catalog Item** field on the **App Portal Information** view will display the App Portal Catalog ID for that catalog item:



Catalog Item Creation When Publishing a Package to System Center Configuration Manager

If both AdminStudio and App Portal are connected via the Flexera Service Gateway, when you publish a *package* from AdminStudio to System Center 2007 or 2012 Configuration Manager, a catalog item for that package should automatically be created in App Portal (in the default catalog category).

However, a catalog item will be created for this package in App Portal *only* if the **Default Category** field in App Portal is set to a valid category in App Portal. If the **Default Category** field on the App Portal **Settings > Web Site > General** tab is set to `-Select-` instead of to a valid category, an App Portal catalog item will not be created.

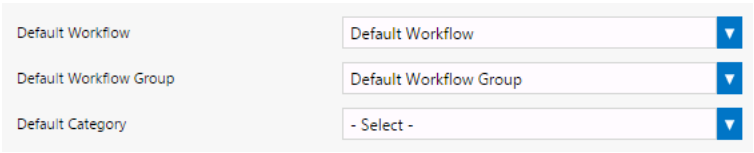


Figure 7-1: Default Category Field on Web Site > General Tab

If an App Portal catalog item fails to be created when you publish an AdminStudio package to System Center Configuration Manager, make sure that a category is selected in the **Default Category** list on the App Portal **Settings > Web Site > General** tab.

Setting Brief Description and Long Description

On the **App Portal Information** tab of the **Application View**, you can specify both a **Brief Description** and a **Long Description**, which will be used to describe the application on the App Portal's storefront.

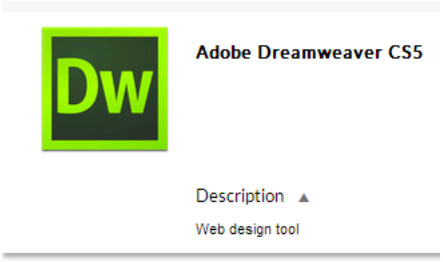

Figure 7-2: Catalog Item's Brief Description on the Browse Catalog tab

Figure 7-3: Catalog Item's Long Description Displayed in Detail View (Opened by Clicking on Catalog Item Name)

On the **App Portal Information** tab, you can also preview the **Title** that App Portal will assign to this application's catalog item.

Task ***To set the Brief Description and Long Description fields:***

1. Open the Application Manager **Catalog** tab.
2. Select an application in the tree. The **Application View** opens.
3. Select the **App Portal Information** tab. The **App Portal Information** tab opens.
4. Review the text in the read-only **Title** field. It is a concatenation of the text in the **Manufacturer** and **Version** fields on the **General Information** tab of the **Application View**, as well as the application name displayed in the Application Manager tree. This is a preview of the name that App Portal will assign to this catalog item.

   Note • *To edit this App Portal catalog item title, launch App Portal and edit the* ***Title*** *field on the* ***General > Title & Description*** *tab of the* ***Catalog Item Properties*** *dialog box for this catalog item.*

5. In the **Brief Description** field, enter the text that you want to display under this catalog item **Title** in the App Portal storefront. This text should briefly describe the purpose of the catalog item.
6. In the **Long Description** field, enter a more detailed description of this catalog item (optional).

   Note • *This field is referred to as the* ***Full Description*** *in App Portal.*

Specifying Catalog Item Categories

When an end user browses the App Portal catalog on the **Browse Catalog** tab, catalog items are organized into categories. In the image below, the **Software > Adobe** category contains two catalog items.

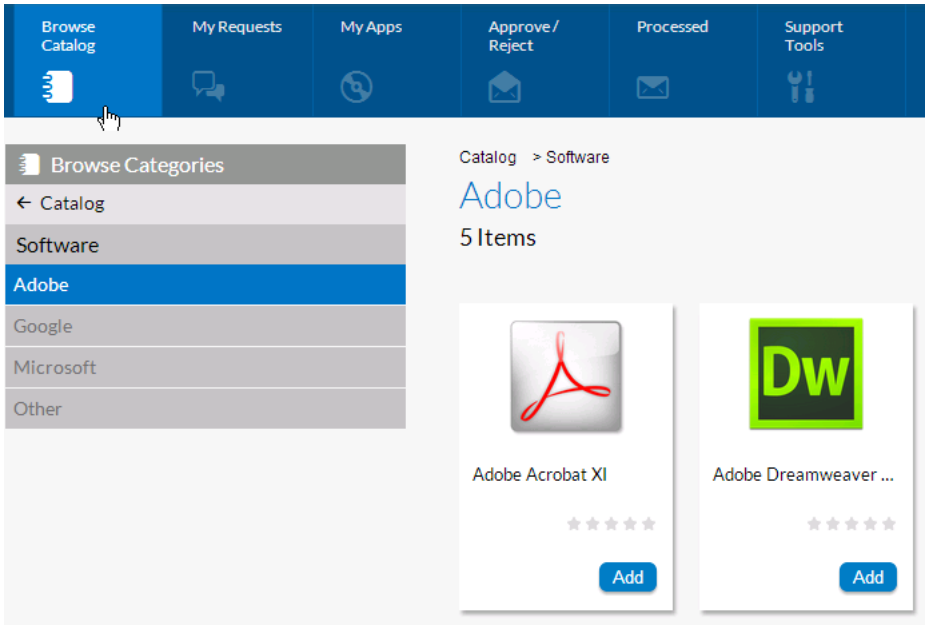

Figure 7-4: Categories Displayed on the App Portal Browse Catalog Tab

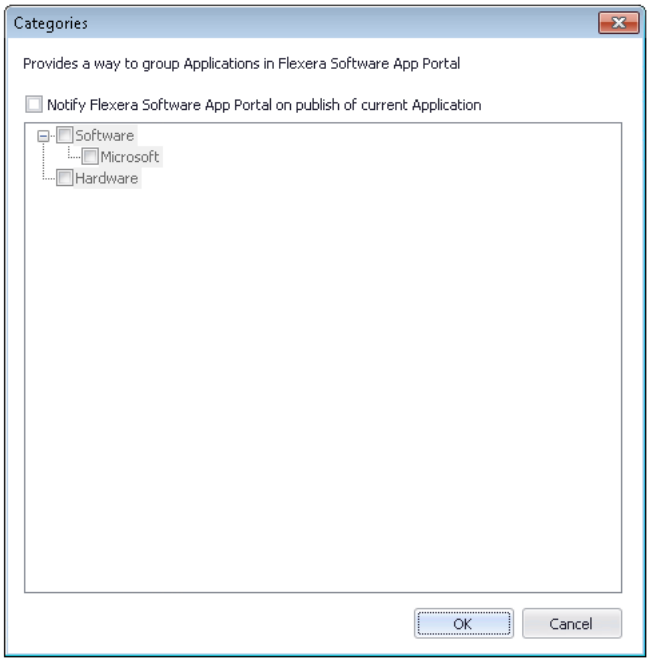
***Note** • Security permissions can be assigned to a category to control which users and groups are permitted to view and request the catalog items in that category. Also, category owners can be assigned to a category to give specific users permission to manipulate the catalog items in that category.*

When a catalog item is created in App Portal, a category must be specified. The catalog item that is created when you publish an application from AdminStudio to System Center 2012 Configuration Manager or Symantec Altiris Server will be placed in the category you selected.

You select a category or categories on the **Categories** dialog box, which is accessed from the **App Portal Information** tab of the **Application View**.

Task ***To select a catalog item's categories:***

1. Open the Application Manager **Catalog** tab.
2. Select an application in the tree. The **Application View** opens.
3. Select the **App Portal Information** tab. The **App Portal Information** tab opens.
4. Next to the **Categories** field, click the browse button. The **Categories** dialog box opens and displays a list of all of the categories that have been defined in App Portal.



5. Select the **Notify Flexera Software App Portal on publish of current Application** option (if it is not already selected). The categories are enabled.
6. Select one or more categories.
7. Click **OK**. When this application is published to System Center 2012 Configuration Manager or Symantec Altiris Server, an App Portal catalog item will be automatically created and will be placed in the category or categories you selected.

Selecting an App Portal Template

On the App Portal Catalog Item Properties dialog box, It is possible to set hundreds of different properties on a catalog item.

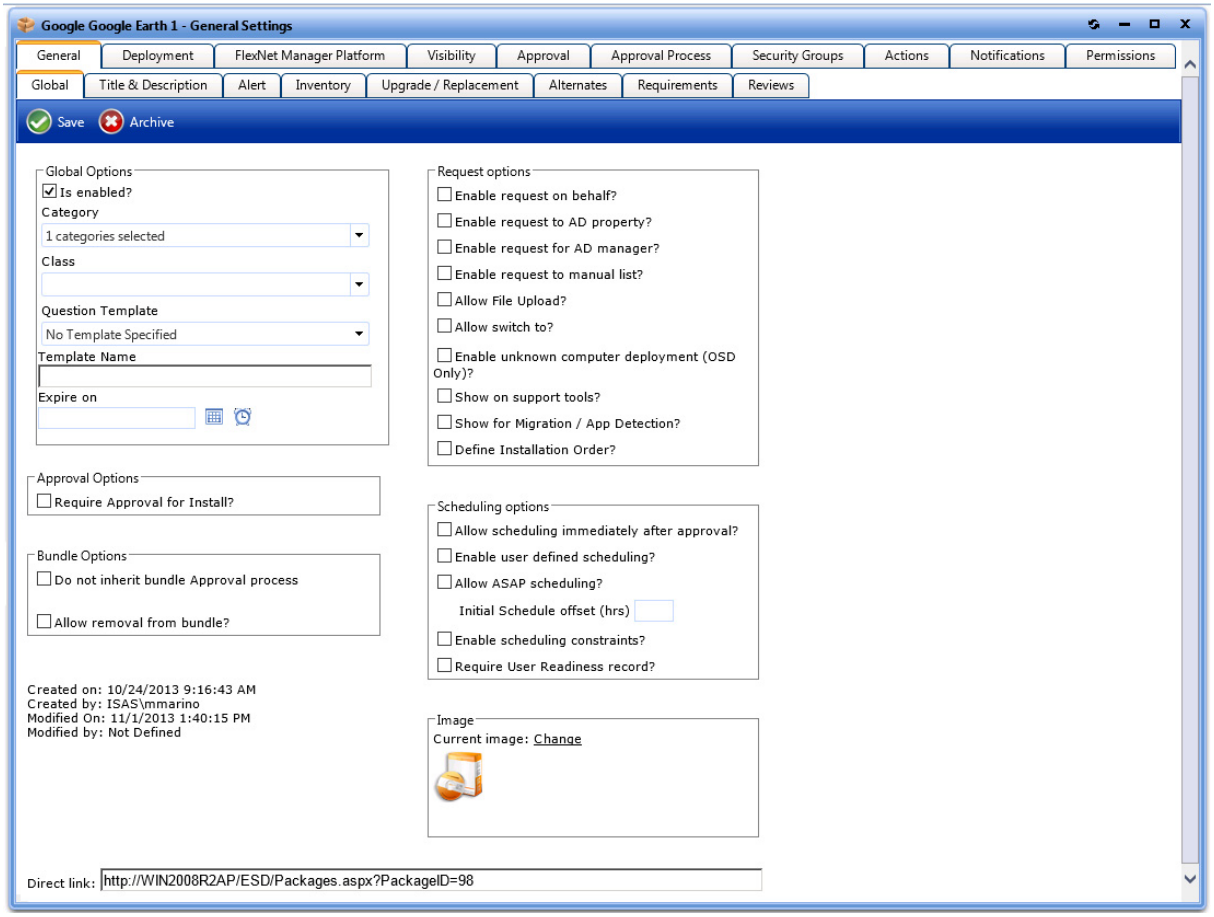


Figure 7-5: App Portal Catalog Item Properties Dialog Box

For catalog items that require a complex set of properties, it would be beneficial to create an App Portal template that contains all of those settings and properties. Then, whenever a new catalog item is created, properties and settings can be automatically loaded by selecting that template.

If templates have been created in App Portal, you can assign one of those templates to an application on the **App Portal Information** tab of the **Application View**.

Task ***To select an App Portal Template:***

1. Open the Application Manager **Catalog** tab.
2. Select an application in the tree. The **Application View** opens.
3. Select the **App Portal Information** tab. The **App Portal Information** tab opens.
4. Next to the **Template** field, select a template from the list.

5. Make sure that publishing to App Portal has been enabled, as described in Enabling Automatic Creation of App Portal Catalog Item, and that at least one category has been selected.
6. Click **OK**. When this application is published to System Center 2012 Configuration Manager or Symantec Altiris Server, an App Portal catalog item will be automatically created and all of the properties and settings defined in the selected template will be assigned.

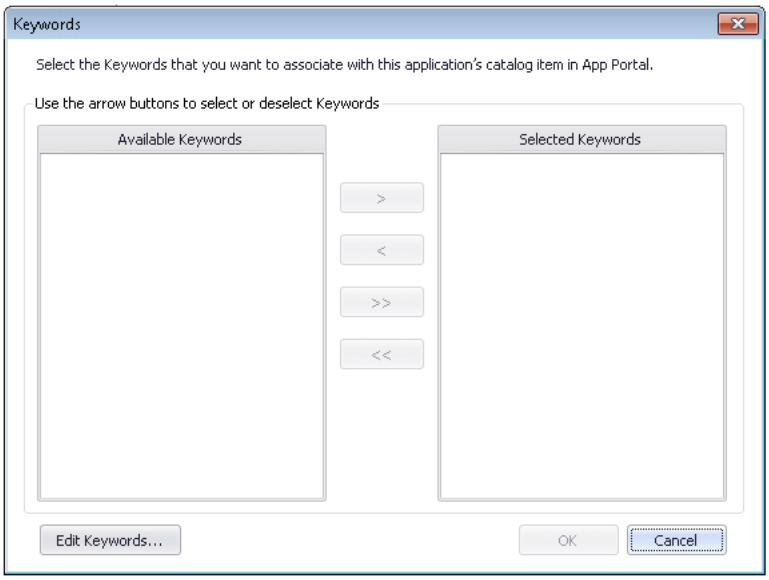
Specifying Catalog Item Keywords

When an App Portal end user performs a search on the **Browse Catalog** tab, App Portal performs a search on not only the **Title**, **Brief Description**, and **Full Description** fields, but also on any **Keywords** that have been specified for that catalog item.

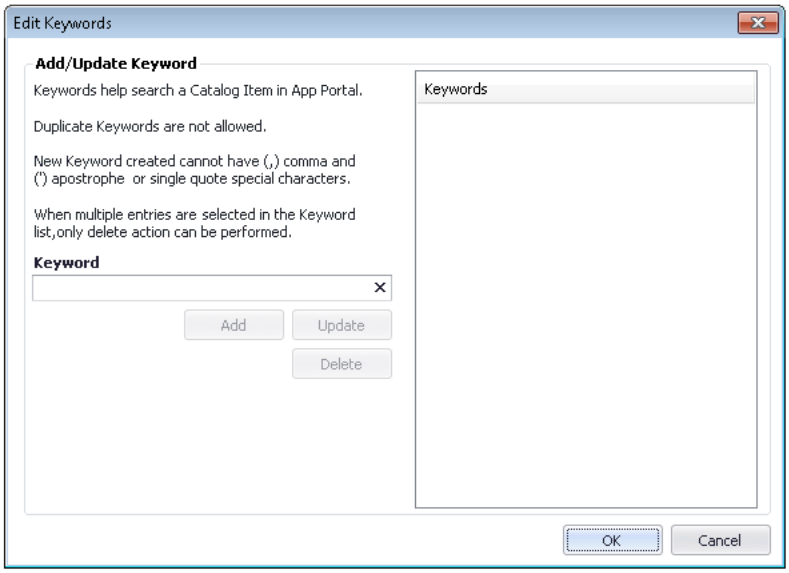
On the **App Portal Information** tab of the **Application View**, you can specify keywords for an application's App Portal catalog item.

Task ***To specify catalog item keywords:***

1. Open the Application Manager **Catalog** tab.
2. Select an application in the tree. The **Application View** opens.
3. Select the **App Portal Information** tab. The **App Portal Information** tab opens.
4. Next to the **Keywords** field, click the Browse button. The **Keywords** dialog box opens.



5. Click **Edit Keywords**. The **Edit Keywords** dialog box opens.



6. Enter a keyword in the **Keyword** box and click **Add**. The keyword is now listed in the **Keywords** list.

Important • *Keywords must be single words only. If you enter a multiple-word keyword, all words of the phrase will be ignored when a search is performed.*

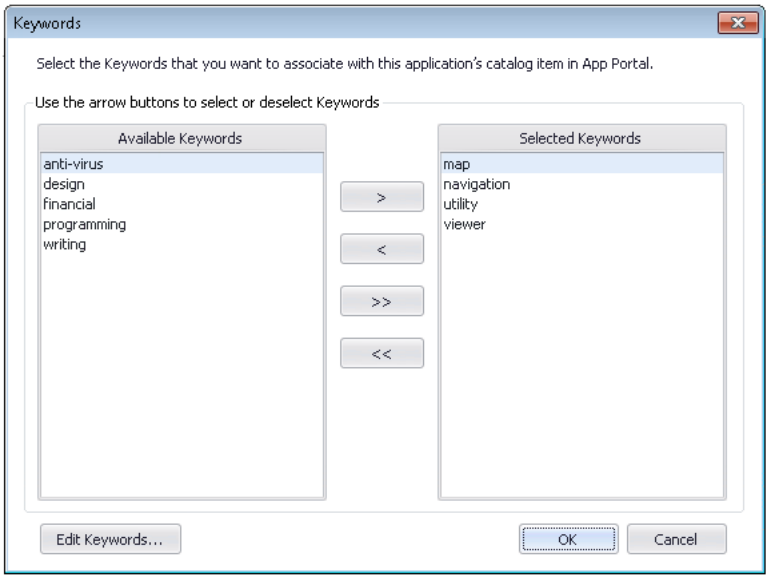
7. Repeat previous step until all desired keywords have been created.

Note • *To update an existing keyword, select it in the list, make edits in the **Keyword** box, and click **Update**.*

8. When you have finished adding keywords, click **OK**. The new keywords are now listed in the **Keywords** dialog box.

Note • *When you add a keyword on the **Edit Keywords** dialog box, it will be available to assign to any application in this Application Catalog.*

9. To add a keyword to an application, select the keyword in the **Available Keywords** list and then click the right arrow to move it to the **Selected Keywords** list.



10. When you have selected all of the desired keywords, click **OK**. The selected keywords are now listed in the **Keywords** field of the **App Portal Information** tab.

Troubleshooting: App Portal Catalog Item Not Created Upon AdminStudio Publication

There could be several reasons why an App Portal catalog item is not automatically created when AdminStudio publishes an application to System Center Configuration Manager or Symantec Altiris Management Suite. One of the reasons could be if the App Portal settings were not specified correctly. The App Portal settings changed between AdminStudio 2013 and AdminStudio 2013 R2. Therefore, troubleshooting steps for both versions are described in this section.

- AdminStudio 2013 R2 or 2014: App Portal Settings Not Specified
- AdminStudio 2013: App Portal Default Category Not Specified
- Symantec Endpoint Protection Blocking Notification of App Portal

AdminStudio 2013 R2 or 2014: App Portal Settings Not Specified

If you are using AdminStudio 2013 R2 or later, an App Portal catalog item is automatically created when AdminStudio publishes an application *only if* the following App Portal settings on the **App Portal Information** tab of the **Application View** in Application Manager have been set:

- The **Categories** property must be specified.
- The **Notify Flexera Software App Portal on publish of current Application** option on the **Categories** dialog box must be selected.

For more information, see Enabling Automatic Creation of App Portal Catalog Item.

AdminStudio 2013: App Portal Default Category Not Specified

Note • *This also applies when using AdminStudio 2014, 2015, or 2016 to publish a* ***package*** *to System Center 2007 or 2012 Configuration Manager.*

If both AdminStudio (11.5 SP2 or 2013) and App Portal are connected via the Flexera Service Gateway, when you publish an application from AdminStudio to System Center 2012 Configuration Manager, a catalog item for that application should automatically be created in App Portal (in the default catalog category). Both the App Portal catalog item and the AdminStudio application will be identified by the same Flexera Identifier.

If a catalog item fails to be created, it may be because App Portal no longer has a **Default Category** specified. This can occur if the existing default category is deleted in App Portal. If the existing default category is deleted, the **Default Category** field on the **Settings > Web Site > General** tab is set to `-Select-`:

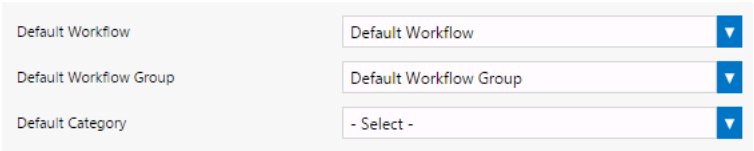


Figure 7-6: Default Category Field on Web Site > General Tab

In order for AdminStudio to automatically create an App Portal catalog item during publication, App Portal's default category must be set to a valid category. To attempt to resolve this issue, select an existing category from the **Default Category** list.

Note • *Starting with AdminStudio 2013 R2, you can choose whether or not to automatically create a catalog item for an application when you publish it to System Center 2012 Configuration Manager or Symantec Altiris Management Server. You can also specify the destination App Portal category for the new catalog item. These settings are made on the* ***App Portal Information*** *tab of the Application Manager* ***Application View****. For more information, see:*

- *Enabling Automatic Creation of App Portal Catalog Item*
- *Specifying Catalog Item Categories*

Symantec Endpoint Protection Blocking Notification of App Portal

In some instances, an App Portal catalog item is not created when AdminStudio publishes an application to System Center Configuration Manager.

Cause

This could be because Symantec Endpoint Protection blocked the notification of App Portal. If this is the case, the following error messages would be generated:

```
17:26:47 ERROR: AdminStudio.ESB.Integration.IntegrationService.LogException - NotifyAppPortalForGroup :
The ConnectionString property has not been initialized.

17:26:47 ERROR: AdminStudio.ESB.Integration.IntegrationService.LogException - NotifyAppPortalForGroup :
at System.Data.SqlClient.SqlConnection.PermissionDemand()

An anti-virus program (do not know which one yet) caused running tests in Test Center to fail. It
prevented extraction of CAB files from MSI files thus stopping the correct execution of tests
```

Resolution

To resolve this issue, try to disable SEP (Symantec Endpoint Protection).

Enabling Application Extended Attributes

If you want to record custom data for applications, you can edit and run a script that will define custom extended attributes and display those attributes on a new **Extended Attributes** tab of the **Application View**.

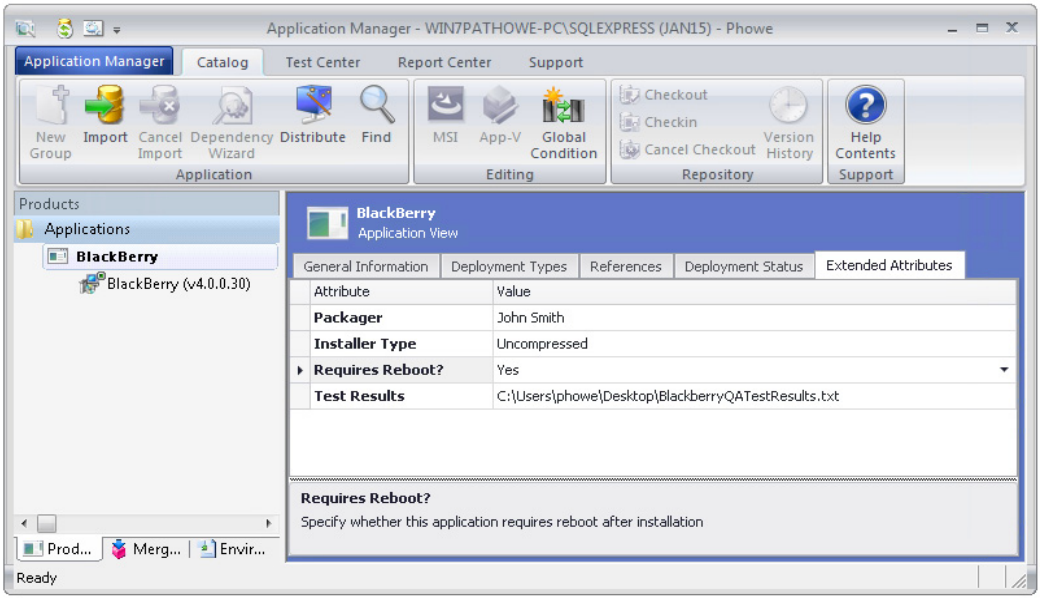

Figure 7-7: Extended Attributes Tab of the Application View

Information about enabling and viewing application extended attributes is provided in the following topics:

- Enabling the Extended Attributes Tab of the Application View
- Defining Application Extended Attributes
- Viewing and Editing Application Extended Attributes

Enabling the Extended Attributes Tab of the Application View

To enable the **Extended Attributes** tab of the **Application View**, you need to open a provided sample **ApplicationExtendedAttributes.SQL** script file, edit that script file to define your application attributes, and then run that SQL script on your Application Catalog.

After you edit and run the SQL script named **ApplicationExtendedAttributes.SQL** script, the extended attributes that you have defined are listed on the **Extended Attributes** tab of the **Application View**

Important • *The **Extended Attributes** tab will only be visible for applications imported into the Application Catalog after the **ApplicationExtendedAttributes.SQL** script is run.*

Task ***To enable the Extended Attributes tab of the Application View:***

1. Create a new Application Catalog.

   Important • *You can also run this script on an existing Application Catalog that already contains applications, but the **Extended Attributes** tab will not be visible for those existing applications; it will only be visible for applications imported after the script is run.*

2. Open Microsoft SQL Server Management Studio and connect to your database server.

3. Open the following file:

   ***AdminStudio_Installation_Directory*\Support\SQL_Scripts\ApplicationExtendedAttributes.SQL**

   You will see the following sample query (in comment form):

```
/* Below is the sample query to create extended attribute*/
--insert into ASCMExtendedAttribute
--([Name],[DisplayText],[HelpText],[Type],[Values],[DefaultFileExtension],[FileFilter],[DefaultValue],[OptimisticLockField],[GCRecord]) values
--('Name','DisplayText','HelpText','Text','Values','DefaultFileExtension','FileFilter','DefaultValue',0,NULL)

--GO
```

4. For each extended attribute that you want to define in the **ApplicationExtendedAttributes.SQL** script, copy the following three lines of code (without the leading hyphens):

```
insert into ASCMExtendedAttribute

([Name],[DisplayText],[HelpText],[Type],[Values],[DefaultFileExtension],[FileFilter],
    [DefaultValue],[OptimisticLockField],[GCRecord]) values

('Name','DisplayText','HelpText','Text','Values','DefaultFileExtension','FileFilter',
    'DefaultValue',0,NULL)
```

   Note the following regarding this code:

   - **Table name**—The first line of code (`insert into ASCMExtendedAttribute`) identifies the table in the Application Catalog that you are editing.

Important • *Do not edit this line of code.*

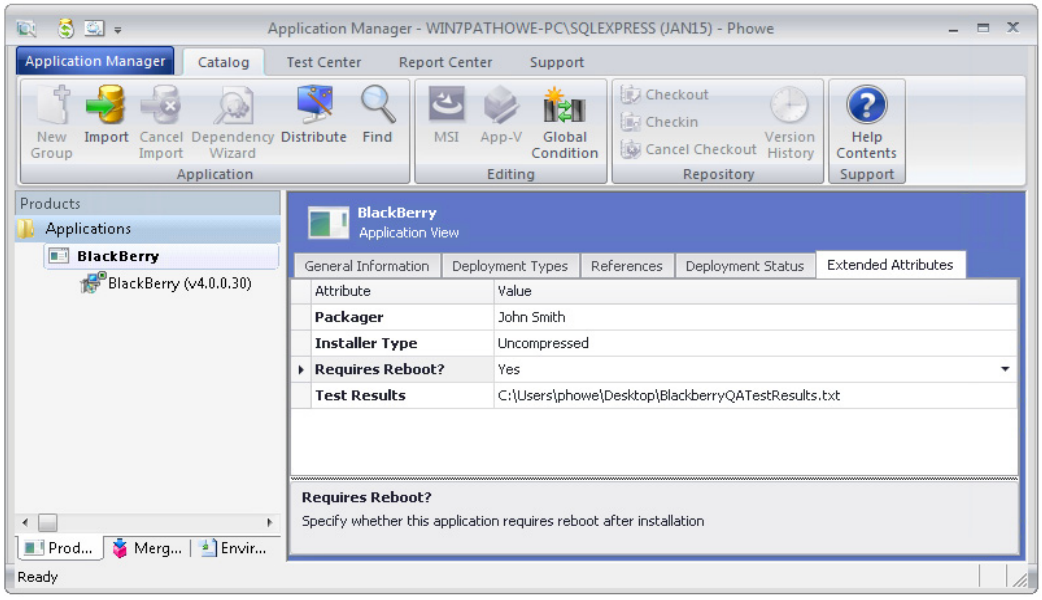
- **Column names**—The second line of code—which starts with `([Name],[DisplayText],` etc.—lists the columns in the table that need to be defined for each extended attribute.

Important • *Do not edit this line of code.*

- **Defining the attribute**—The third line of code—which starts with `('Name','DisplayText',` etc.—defines the extended attribute. You will need to replace each of the default values in this line of code with the value appropriate for the extended attribute you are defining. Each value is separated by a comma.

Important • *Do not delete any of the quote marks or commas from this line of code. If you do not want to define a value for a column, enter* ***NULL*** *or just leave a space between the quote marks.*

5. Define each attribute, as described in Defining Application Extended Attributes.
6. Under the list of attribute definitions, enter the command **GO**.
7. From the drop-down list in the toolbar, select the name of the Application Catalog you want to create these extended attributes in.
8. Click the **Execute** button in the toolbar.
9. In Application Manager, import an application and then open the **Application View**. A new **Extended Attributes** tab should now be displayed, listing the attributes you defined in the SQL file.



Defining Application Extended Attributes

For each extended attribute that you define, you have to edit the following line of code to replace the placeholder text with a value for each of the columns that were defined in the previous line of code:

```
('Name','DisplayText','HelpText','Text','Values','DefaultFileExtension','FileFilter',
    'DefaultValue',0,NULL)
```

Important • *Do not delete any of the quote marks or commas from this line of code. If you do not want to define a value for a column, enter* ***NULL*** *or just leave a space between the quote marks.*

The following table describes the possible values for each column:

Table 7-14 • ASCMExtendedAttribute Table Columns

Column	Possible Values
[Name]	Replace the default value of Name with a unique name to identify this Extended Attribute in the table.  ***Note*** • *Do not use spaces or special characters. Make sure that it is a unique name.*
[DisplayText]	Replace the default value of DisplayText with the name of this extended attribute. This value will be displayed in the **Attribute** column on the **Extended Attributes** tab of the **Application View**.
[HelpText]	Replace the default value of HelpText with text to describe the purpose of this extended attribute or any other information the end user will need to know when specifying a value for this attribute on the Extended Attributes tab. This text will be displayed at the bottom of the **Extended Attributes** tab when this attribute is selected. Therefore, do not leave the default value of HelpText. If you do not want to display any help text, enter **NULL** or leave this value empty.
[Type]	Replace the default value of Type with one of the following values: • **Text**—Enter this value to define a text field. • **Selection**—Enter this value to define a drop-down list. When defining a drop-down list, you will also need to define the values of the drop down list using the [Values] column. • **File**—Enter this value to prompt the end user to browse for a file. When defining file selection field, you will also need to define the default file extension, using the [DefaultFileExtension] column, and the available file filters, using the [FileFilter] column.
[Values]	If [Type] is set to **Selection**, use this column to define the selections in the drop-down list. Separate the values using a semicolon (;), such as: **Illinois;Michigan;Wisconsin**

Table 7-14 • ASCMExtendedAttribute Table Columns

Column	Possible Values
[DefaultFileExtension]	If [Type] is set to **File**, replace the default value of DefaultFileExtension with the extension that you want to be selected, by default, in the file type drop down list.  For example, if you wanted *.doc to be the default file type, enter the following: **'*.doc'**
[FileFilter]	If [Type] is set to **File**, replace the default value of FileFilter with code to identify the valid file types for this field.  You need to enter both the name of the file type—such as **Word Documents (*.doc)**—as well as the actual file type, such as ***.doc**. You separate these two values by a pipe **|** character, such as: **Word Documents (*.doc)|*.doc** You can specify two file types for the same entry by separating them by a semi-colon, such as: Word Documents (*.doc)|*.doc;*.docx To specify multiple entries, separate them by a pipe | character, such as: **Word Documents (*.doc)|*.doc;*.docx|** **HTML Documents (*.html)|*.html;*.htm|** **Text Documents (*.txt)|*.txt** In other words, enter these values in the following sequence: **Name_A|Extension1;Extension2|Name_B|Extension|Name_C|Extension**

Table 7-14 • ASCMExtendedAttribute Table Columns

Column	Possible Values
[DefaultValue]	Enter one of the following, depending upon the value specified for [Type]: • **Text**—If [Type] is set to **Text**, replace the default value of DefaultValue with text that you want to pre-populate this field. • **Selection**—If [Type] is set to **Selection**, replace the default value of DefaultValue with one of the values defined in the [Values] column to identify a default value. For example, if the [Values] column is set to **Illinois;Michigan;Wisconsin**, and if you want Michigan to be selected as the default selection in the drop-down list, then set the value of the [DefaultValue] column to **Michigan**. • **File**—If [Type] is set to **File**, replace the default value of DefaultValue with any file path. Make sure that the file type in this path matches one of the file filters listed in the [FileFilter] column definition. If you do not want to enter a default value, set [DefaultValue] to **NULL** or just leave a space.
[OptimisticLockField]	Always set this value set to **0**.
[GCRecord]	Always set this to NULL; if you do not, this record will be treated as deleted.

Sample Script and Extended Attributes Tab

If your **ApplicationExtendedAttributes.SQL** script included the following code:

```
insert into ASCMExtendedAttribute
([Name],[DisplayText],[HelpText],[Type],[Values],[DefaultFileExtension],[FileFilter],
    [DefaultValue],[OptimisticLockField],[GCRecord]) values
('Packager','Packager','Enter the name of the person who repackaged this application',
    'Text',' ',' ',' ',' ',0,NULL)

insert into ASCMExtendedAttribute
([Name],[DisplayText],[HelpText],[Type],[Values],[DefaultFileExtension],[FileFilter],
    [DefaultValue],[OptimisticLockField],[GCRecord]) values
('InstallerType','Installer Type','Specify whether this is a compressed or uncompressed setup',
    'Selection','Compressed;Uncompressed',' ',' ','Uncompressed',0,NULL)

insert into ASCMExtendedAttribute
([Name],[DisplayText],[HelpText],[Type],[Values],[DefaultFileExtension],[FileFilter],
    [DefaultValue],[OptimisticLockField],[GCRecord]) values
('RequiresReboot','Requires Reboot?','Specify whether this application requires reboot after
    installation','Selection','Yes;No;Unknown',' ',' ',' ',0,NULL)

insert into ASCMExtendedAttribute
([Name],[DisplayText],[HelpText],[Type],[Values],[DefaultFileExtension],[FileFilter],
    [DefaultValue],[OptimisticLockField],[GCRecord]) values
('TestResults','Test Results','Upload file containing QA test results','File',' ','*.doc',
    'Word Documents (*.doc)|*.doc|HTML Documents (*.html)|*.html;*.htm|
    Text Documents (*.txt)|*.txt',' ',0,NULL)

GO
```

... after it was run on an Application Catalog, the **Extended Attributes** tab of the **Application View** would list the following extended attributes:

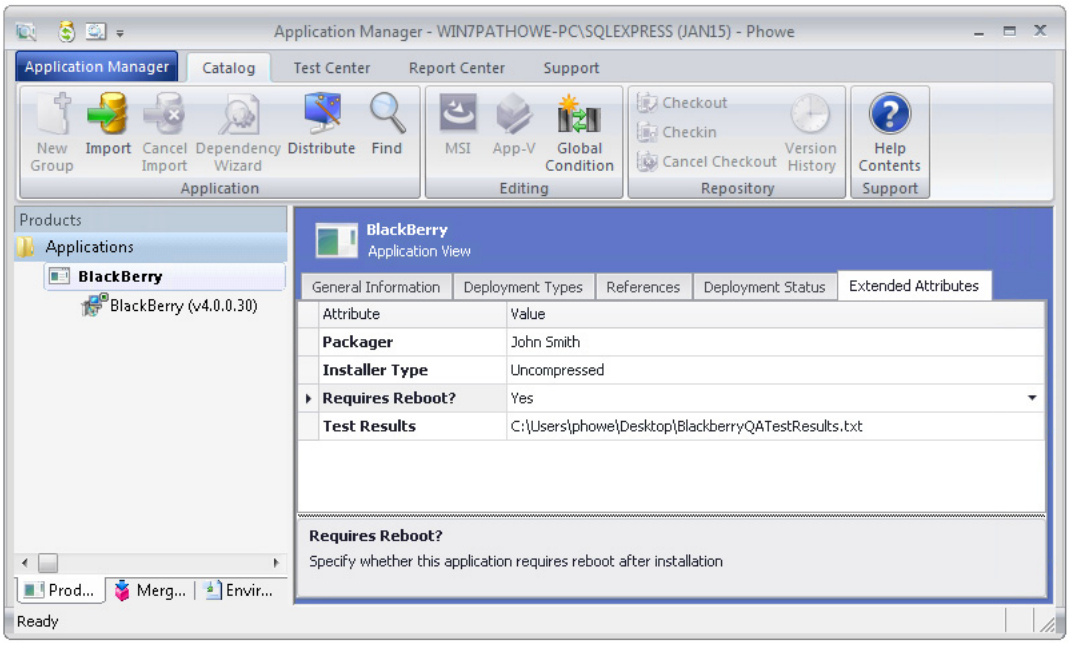


Figure 7-8: Extended Attributes Tab of the Application View

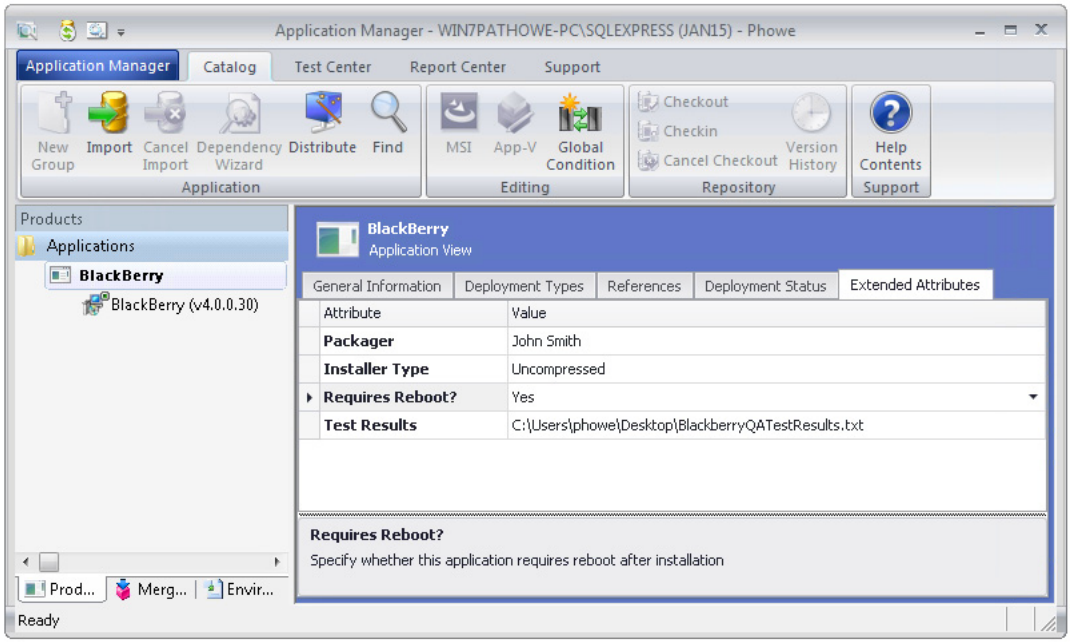
Viewing and Editing Application Extended Attributes

To view an application's extended attributes, perform the following steps:

Task ***To view an application's extended attributes:***

1. Make sure that the steps in Enabling the Extended Attributes Tab of the Application View have been performed.
2. Open Application Manager and select the **Catalog** tab of the ribbon.
3. Select an application node in the tree. The **Application View** opens.
4. Select the **Extended Attributes** tab. The custom extended attributes that have been defined are listed.



5. Edit the fields, if desired.

Managing System Center 2012 Configuration Manager Package Deployment Data

AdminStudio displays deployment data for all of an application's packages (deployment types) in a multi-tabbed, organized format that is easy to navigate through and to update.

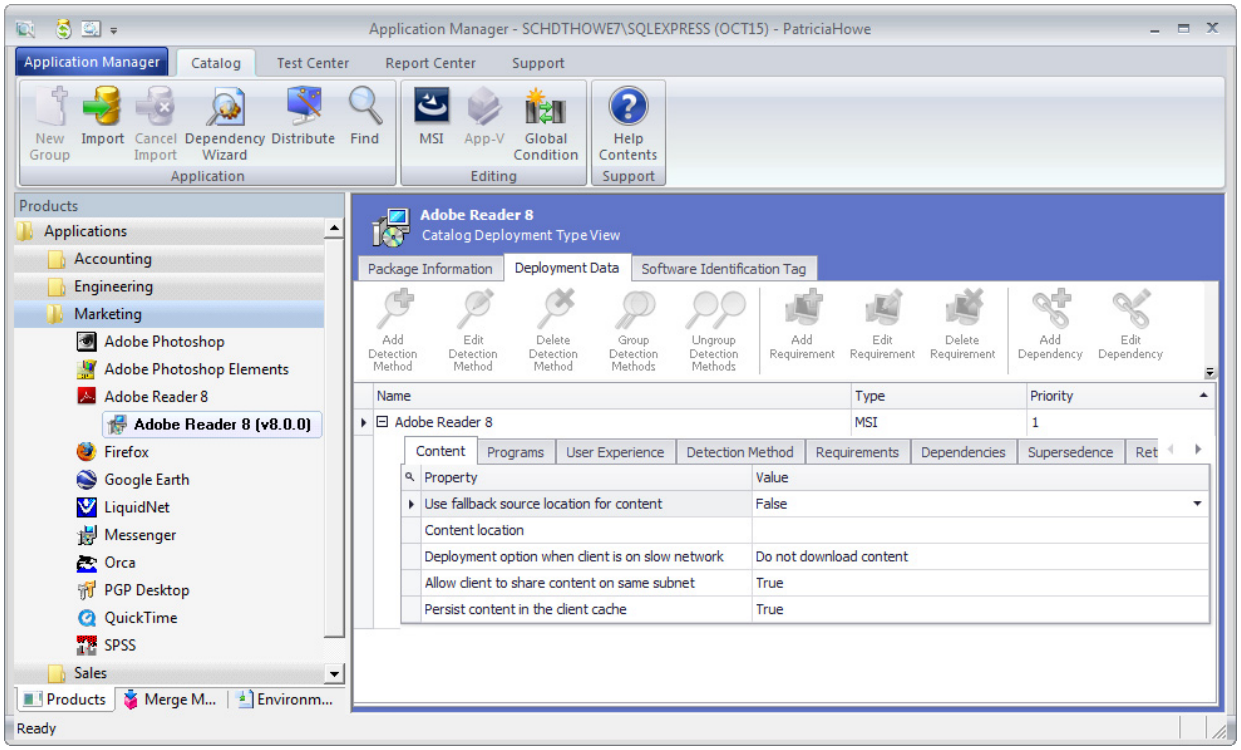


Figure 7-9: Catalog Deployment Type View / Deployment Data Tab

When a package is imported into the Application Catalog, Application Manager mines package elements for deployment data such as detection methods, dependencies, and requirements. You can view and modify this data and add new data by editing the properties on the subtabs of the **Deployment Data** tab and by using the easy-to-use wizards provided on the **Detection Methods**, **Requirements**, **Dependencies**, and **Supersedence** subtabs.

Using the subtabs of the **Deployment Data** tab of the **Catalog Deployment Type View**, you can perform the following tasks:

- Specifying Package Content Deployment Data
- Specifying Package Programs Deployment Data
- Specifying Package User Experience Deployment Data
- Specifying Package Detection Methods Deployment Data
- Viewing a Windows Store Application's Detection Methods
- Viewing a Windows Store Application's Framework Customizations
- Specifying Package Requirements Deployment Data
- Specifying Package Dependencies Deployment Data
- Specifying Package Supersedences Deployment Data
- Viewing and Editing Return Codes
- Changing the Priority of Deployment Types

Deployment Data and Microsoft System Center Configuration Manager

The data displayed on the **Deployment Data** tab of the **Catalog Deployment Type View** is used by Microsoft System Center Configuration Manager when deploying packages. This data corresponds to the application model data stored for applications and packages in Microsoft System Center 2012 Configuration Manager. When packages are published from the Application Catalog to Microsoft System Center Configuration Manager, this data is also published, which helps to ensure successful deployment.

- **Importing external packages**—When a package is imported into the Application Catalog, Application Manager mines package elements for this Microsoft System Center 2012 Configuration Manager application model deployment data.
- **Importing packages from Microsoft System Center 2007 Configuration Manager**—When a package is imported from System Center 2007 Configuration Manager into the Application Catalog, Application Manager also imports detailed deployment data from Configuration Manager. This data will be useful to have when migrating this package to a System Center 2012 Configuration Manager application.

You can view and modify this deployment data and add new data by editing the properties on the subtabs of the **Deployment Data** tab and by using the wizards provided on the **Detection Methods**, **Requirements**, **Dependencies**, and **Supersedence** subtabs.

Setting Application Model Properties

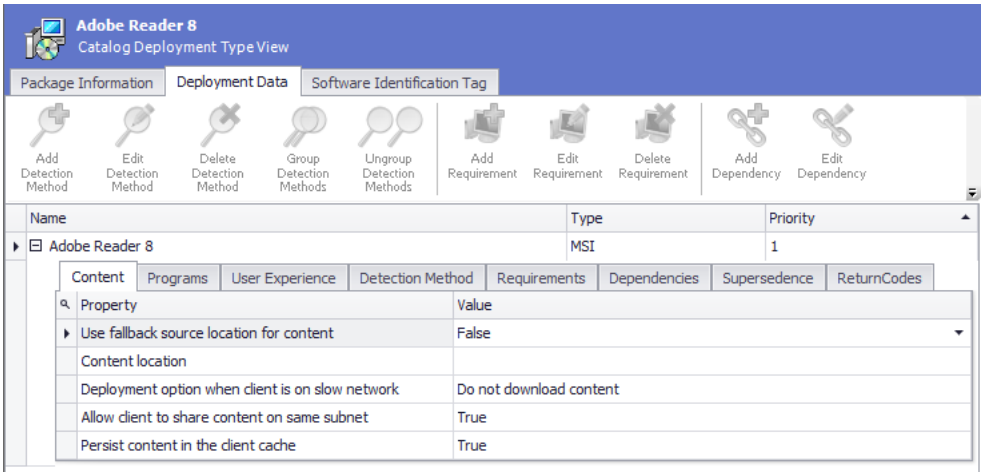
When a package is imported into the Application Catalog, AdminStudio inserts default values for various Microsoft System Center 2012 Configuration Manager application model properties which cannot be extracted from the imported package. There are several ways to set the default values for application model properties that are assigned during application import. You can also edit the application model properties for packages already in the Application Catalog. For more information, see Setting Application Model Properties.

Specifying Package Content Deployment Data

The **Content** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists general information about package contents.

Task ***To specify deployment information about package contents:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Contents** subtab.



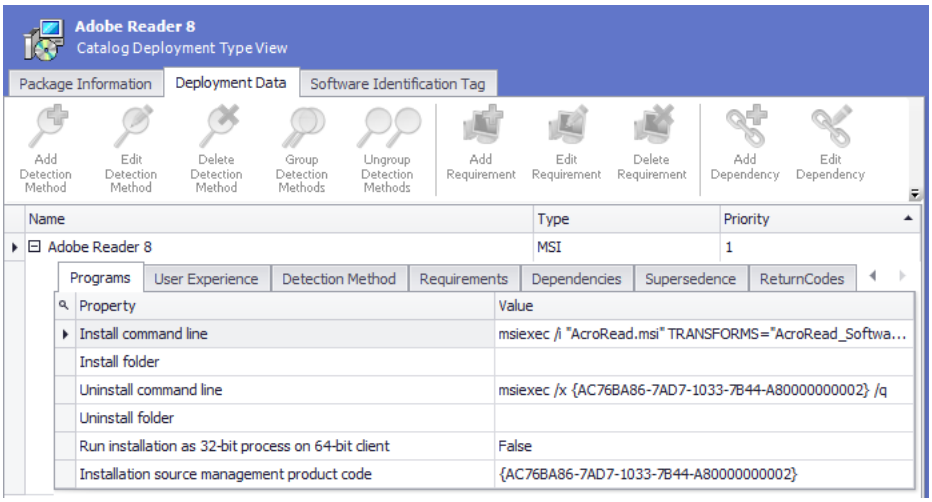
4. View and modify data, as described in Deployment Data Tab / Content Subtab.

Specifying Package Programs Deployment Data

The **Program** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists command line parameters for package installation and uninstallation.

Task ***To specify package program command line parameters:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Programs** subtab.



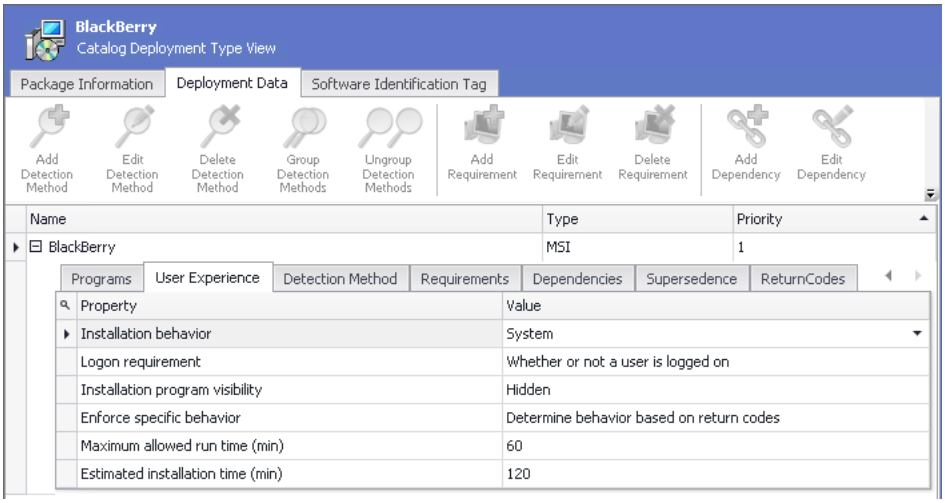
4. View and modify data, as described in Deployment Data Tab / Programs Subtab.

Specifying Package User Experience Deployment Data

The **User Experience** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists parameters relating to the user experience during installation.

Task ***To specify user experience parameters:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **User Experience** subtab.



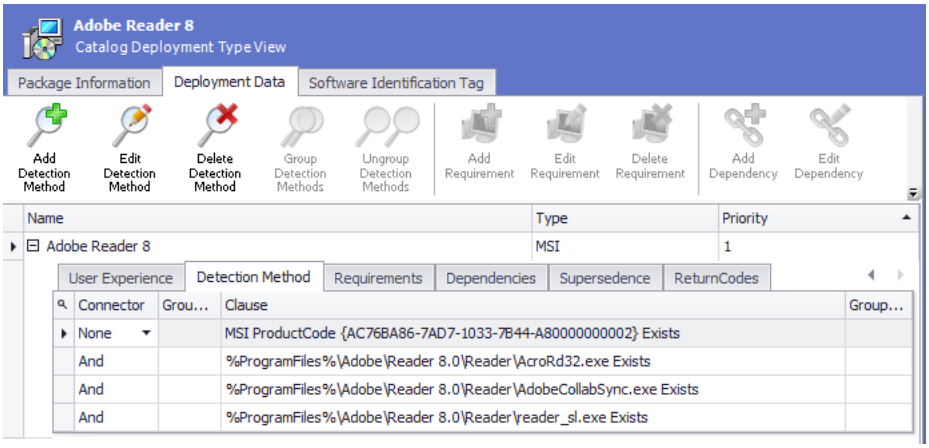
4. View and modify data, as described in Deployment Data Tab / User Experience Subtab.

Specifying Package Detection Methods Deployment Data

The **Detection Method** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists methods to detect whether this package is already installed on the target system.

Task ***To specify package detection methods:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Detection Method** subtab.



4. View existing detection methods, as described in Deployment Data Tab / Detection Method Subtab.
5. To add a detection method, click the **Add Detection Method** button in the ribbon toolbar to open the Detection Method Wizard.
6. To modify an existing detection method, select the detection method and click **Edit Detection Method**.

Note • *If you attempt to edit a Windows Installer Detection detection method, and you attempt to change the detection method property (from **Upgrade Code** to **Version** or vice versa), you may be required to required to browse to the Windows Installer file again to retrieve the new property value.*

7. To delete an existing detection method, click **Delete Detection Method**.

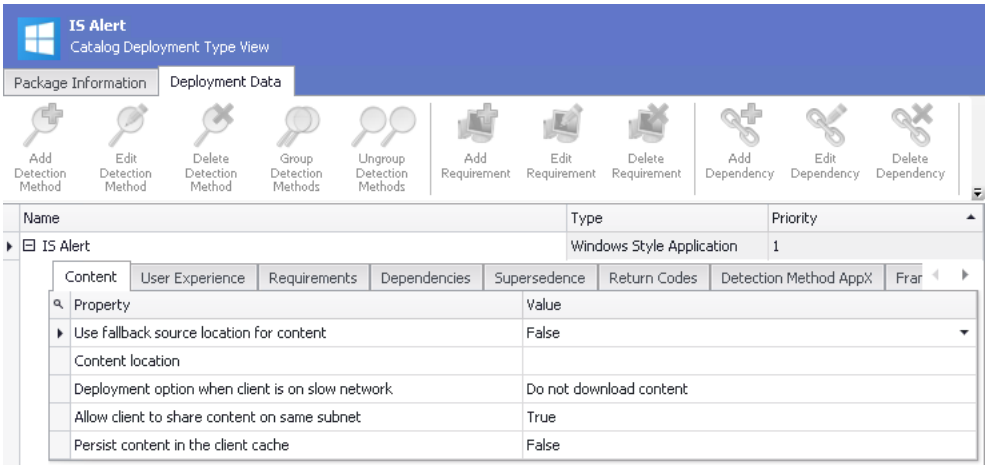
Viewing a Windows Store Application's Detection Methods

Edition • *Support for mobile apps is included when you purchase AdminStudio Professional or Enterprise Edition with Mobile.*

When you have a Windows Store mobile app deployment type selected in the Application Manager tree, the **Detection Method AppX** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** is displayed, which lists methods to detect whether this Windows Store mobile app is already installed on the target system.

Task ***To view a Windows Store mobile app's detection methods:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Store mobile app in the tree and select the Windows Store deployment type. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Detection Method AppX** subtab.



4. View existing detection methods, as described in Deployment Data Tab / Detection Method AppX Subtab.

Viewing a Windows Store Application's Framework Customizations

Edition • *Support for mobile apps is included when you purchase AdminStudio Professional or Enterprise Edition with Mobile.*

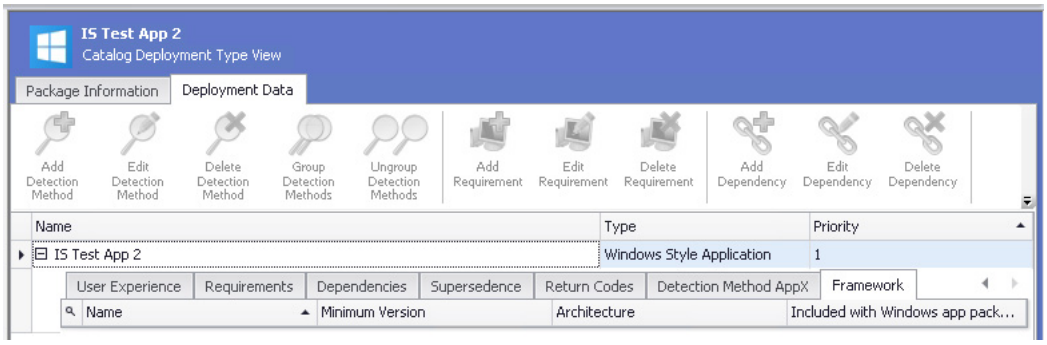
When you have a Windows Store mobile app deployment type selected in the Application Manager tree, the **Framework** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** is displayed, and displays any customizations that may have been added to this Windows Store mobile app.

Windows Store mobile app developers can use the application framework to customize a mobile app. With the framework, they can create a task or an extension to customize the application. They can extend existing functions within the application or embed new functionality with custom business logic.

If the selected Windows Store mobile app has any application framework customizations, they will be listed on the **Framework** subtab.

Task ***To view a Windows Store mobile app's application framework customizations:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Store mobile app in the tree and select the Windows Store deployment type. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Framework** subtab.



4. View existing application framework customizations, as described in Deployment Data Tab / Framework Subtab.

Specifying Package Requirements Deployment Data

You can use the **Requirements** subtab of the **Deployment Data** tab to add user, device, or custom requirements that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package.

- Creating Custom Requirements Containing Global Conditions
- Creating Device Requirements
- Creating User Requirements

Creating Custom Requirements Containing Global Conditions

You can use the **Requirements** subtab of the **Deployment Data** tab to add requirements that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package. You can set device requirements, custom device requirements, and user and group requirements.

When you open the **Requirement Wizard** and choose to create a custom requirement, you can create a requirement that contains global conditions by selecting **Expression** from the **Condition Type** list on the **Create Global Condition** dialog box. When you select **Expression** from this list, an expression builder interface is displayed. You have the option of using global conditions, containing expressions, to create complex custom requirements.

- Building Expressions When Creating Global Conditions
- Creating and Editing Global Conditions

Building Expressions When Creating Global Conditions

You can use the **Requirements Wizard** to create global conditions that use expressions (enabling you to connect clauses using AND and OR operators). Because many requirements may be common among applications, you could use this expression builder to add multiple custom requirements together as clauses in a global condition, and use this global condition in a custom requirement that you can assign to multiple deployment types, instead of creating a separate custom requirement for each.

When you open the Requirement Wizard and choose to create a custom requirement, there is an option in the **Condition Type** list on the **Create Global Condition** dialog box: **Expression**. When you select **Expression** from this list, an expression builder interface is displayed.

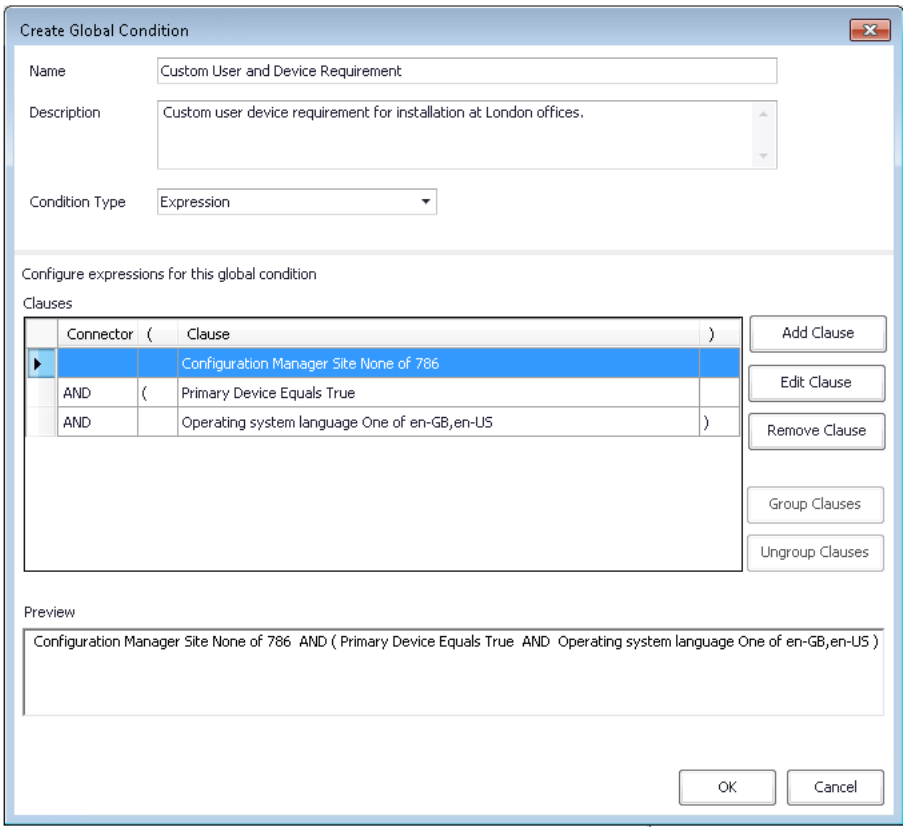


Figure 7-10: Building an Expression on the Create Global Condition Dialog Box

You can use the expression builder interface to form an expression using existing User/Device/Custom requirements. After you add multiple requirements, you can then connect them using **AND** or **OR** operators, and can group sets of clauses, which enables you to create complex requirements.

The expression building area of this dialog box includes the following options:

Table 7-15 • Create Global Condition Dialog Box

Option	Description
Add Clause	Click to open the Requirement Wizard, which you can use to add a User/Device/Custom requirement. When you click Finish on the wizard, the new requirement will be listed in the **Clauses** list. When you add the first requirement the **Connector** will be set to **None**. When adding subsequent requirements, the **Connector** will be set to **AND** by default.
Edit Clause	Click to edit the selected requirement using the Requirement Wizard.
Remove Clause	Click to delete the selected requirement.
Group Clauses	Click to group the selected requirements (if the grouping criteria matches). If grouping is successful, then the selected requirements will be marked as grouped and parentheses will be displayed the **(** and **)** columns.

Table 7-15 • Create Global Condition Dialog Box

Option	Description
Ungroup Clauses	Click to ungroup the selected requirements, if the ungroup criteria matches.
Preview	Lists the full expression.

Creating and Editing Global Conditions

In addition to using the **Requirements Wizard** to create global conditions, you can create new global conditions and edit existing global conditions on the **Global Conditions** dialog box, which can be opened by clicking the **Global Conditions** button on the **Catalog** tab of the Application Manager ribbon.

Task ***To edit global conditions:***

1. On the **Catalog** tab of the Application Manager ribbon, click the **Global Conditions** button. The **Global Conditions** dialog box opens, listing all of the global conditions present in the current Application Catalog.

   On the **Global Conditions** dialog box, the name, device type, condition type, and data type of each condition is listed, as well as whether the condition is in use or not.

2. On the **Global Conditions** dialog box, you can edit or delete an existing global condition or create a new global condition:

   - **Editing an existing global condition**—Right-click on the condition and then select **Edit Condition** from the shortcut menu. The **Create Global Condition** dialog box opens, where you can edit the condition.
   - **Deleting an existing global condition**—Right-click on the condition and then select **Delete Condition** from the shortcut menu.
   - **Adding a new global condition**—Right-click anywhere on the list of conditions and select **Create New Condition** from the shortcut menu. The **Create Global Condition** dialog box opens, where you can define a new condition.
   - **View references**—If a condition is in use, right-click on the condition and select **References** from the shortcut menu to open the **References** dialog box, which lists the referring applications and the referring global conditions of the selected global condition.

3. If you have a large list of global conditions and would like to perform a search, you can use the search box and **Find** button to filter the list.

Creating Device Requirements

You can use the **Requirements** subtab of the **Deployment Data** tab to add device requirements that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy a package. You can choose to add a custom device requirement or a device requirement from Configuration Manager.

- Creating a Custom Device Requirement
- Creating a Device Requirement from System Center Configuration Manager

Creating a Custom Device Requirement

To create a custom device requirement, perform the following steps:

Task ***To create a custom device requirement:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Requirements** subtab.
4. Click the **Add Requirement** button in the ribbon toolbar to open the Requirement Wizard.
5. On the **Welcome** panel, select **Device requirements** and click **Next**. The **Select the Device Requirements Type** panel opens.
6. Select **Custom Device requirement** and click **Next**. The **Create Device Requirements** panel opens.

7. Use the following fields to build a custom device requirement:

Property	Description
Condition	Select one of the following conditions: • **Active Directory Site** • **Configuration Manager Site** • **CPU Speed (MHz)** • **Disk space** • **Number of processors** • **Operating system** • **Operating system language** • **Organizational unit (OU)** • **Total physical memory (MB)** • **Windows Store inactive**
Rule Type	Select a rule type from the list. For custom device requirements, **Value** is the only type listed.
Operator	Select an operator from the list. Possible sets of operators are: • **One of** or **None of** • **Equals**, **Not equal to**, **Greater than**, **Less than**, **Between**, **Greater than or Equal to**, or **Less than or equal to**

Property	Description
[Additional Fields]	Additional fields are displayed depending upon the **Condition** selected. Use these fields to define the requirement for the selected **Condition**. • **Active Directory Site**—Click the **Add** button and add a site to the **Active Directory Sites** list. • **Configuration Manager Site**—Click the **Add** button and add a site to the **Configuration Manager Sites** list. • **CPU Speed (MHz)**—Enter a value, in MHz, in the **Value (MHz)** text field. • **Disk space**—Select a drive from the **Select logical drive** list and enter a value, in MBs, in the **Value (MB)** text box. • **Number of processors**—Enter a number in the **Value** text box. • **Operating system**—Select operating systems from the **Select Operating System** list. You can choose just a major category (such as **Windows 8** or **Windows Server 2012**) or you can identify a specific operating system / service pack / processor type combination, such as **All Windows 8 (32-bit)**. • **Operating system language**—Select languages from the **Select Operating System Language(s)** list. • **Organizational unit (OU)**—Click the **Add** button and add a OU to the list. • **Total physical memory (MB)**—Enter a value, in MBs in the **Value (MB)** text box. • **Windows Store inactive**—Enter a value in the **Value** text box.

8. Click **Next**. The **Summary** panel opens, listing the components of your custom device requirement.
9. Click **Finish** to close the wizard.

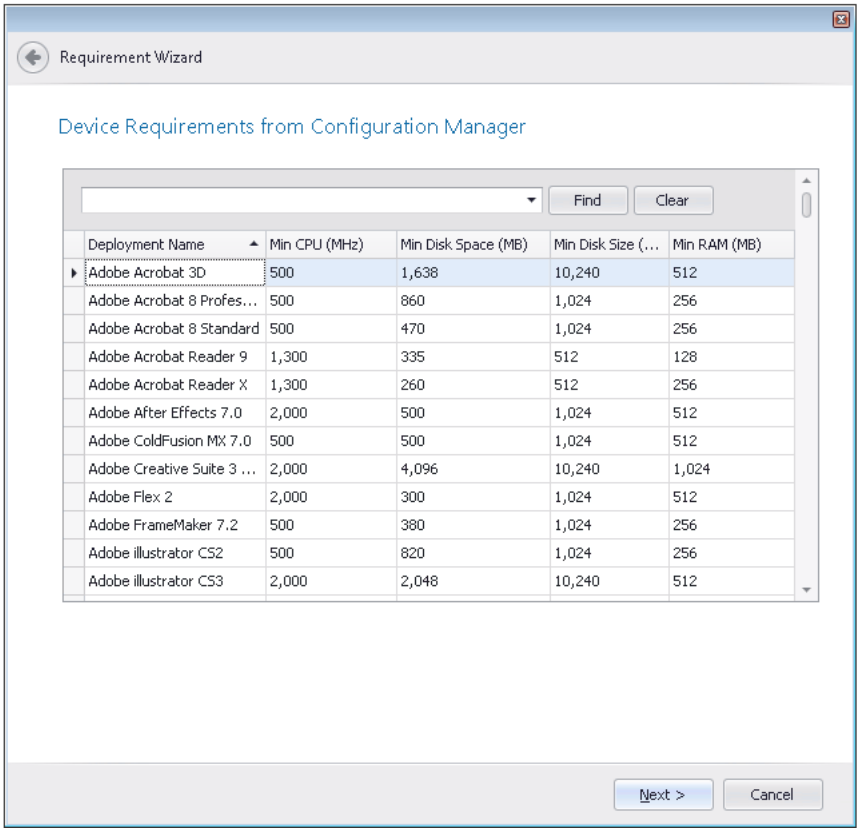
Creating a Device Requirement from System Center Configuration Manager

To create a device requirement from System Center Configuration Manager, perform the following steps:

Task ***To create a device requirement from System Center Configuration Manager:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Requirements** subtab.
4. Click the **Add Requirement** button in the ribbon toolbar to open the Requirement Wizard.
5. On the **Welcome** panel, select **Device requirements** and click **Next**. The **Select the Device Requirements Type** panel opens.
6. Select **Device requirement from Configuration Manager** and click **Next**. The **Configuration Manager Credentials** panel opens. The information from the System Center 2012 Configuration Manager named connection that you have set up on the **Distribution System** tab of the **Options** dialog box pre-populates the **Server**, **Site Code**, and **Username** fields.

7. Enter the required **Password** and click **Next**. The **Device Requirements from Configuration Manager** panel opens and lists those applications in the System Center 2012 Configuration Manager server that have defined device requirements.



8. Select the application in the list that matches the one that you are editing, and click **Next** to continue. The **Summary** panel opens, and lists the device requirement that you are adding.

Note • *For more information, see Device Requirements from Configuration Manager Panel.*

9. Click **Finish** to add the device requirement.

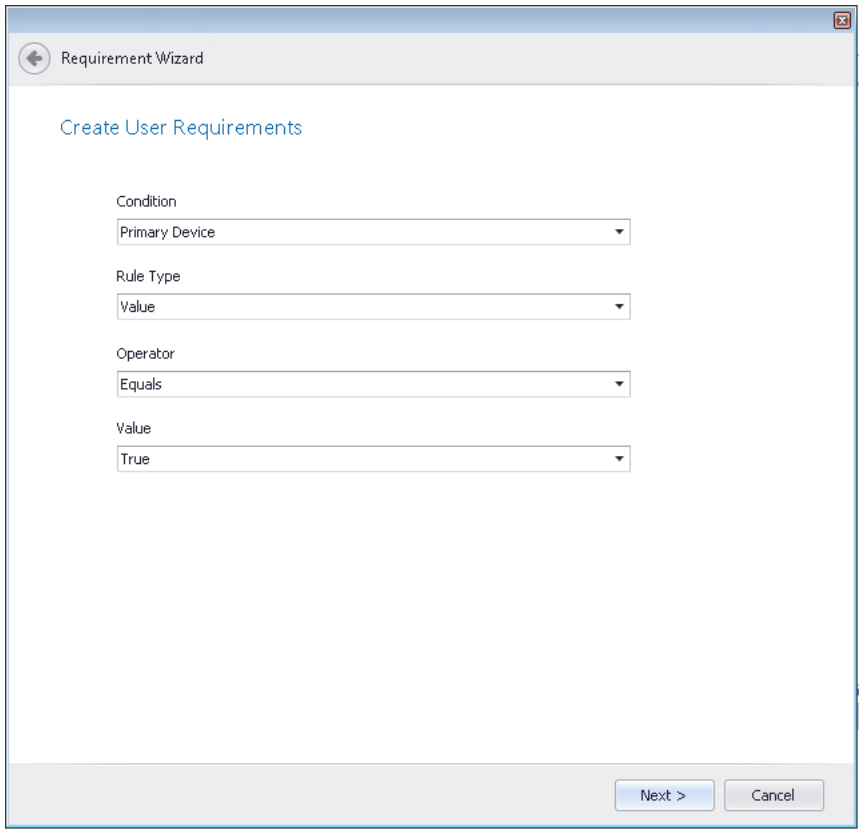
Creating User Requirements

You can use the **Requirements** subtab of the **Deployment Data** tab to add user requirements that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy a package.

To create a user requirement, perform the following steps:

Task ***To create a user requirement:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Requirements** subtab.
4. To add a requirement, click the **Add Requirement** button in the ribbon toolbar to open the Requirement Wizard.
5. On the **Welcome** panel, select **User requirements** and click **Next**. The **Create User Requirements** panel opens.



6. Use the following fields to build a user requirement:

Property	Description
Condition	Select a condition type from the list. For user requirements, **Primary Device** is the only condition type listed.
Rule Type	Select a rule type from the list. For custom device requirements, **Value** is the only type listed.
Operator	Select a rule type from the list. For user requirements, **Equals** is the only operator listed.

Property	Description
Value	Select either **True** or **False** to define this user requirement.

7. Click **Next**. The **Summary** panel opens, listing the components of your user requirement.
8. Click **Finish** to close the wizard.

Specifying Package Dependencies Deployment Data

You can use the **Dependencies** subtab to view or edit a list of other packages in the Application Catalog that must also be deployed with this package onto the target machine in order for this package to successfully operate.

You can use the Dependency Wizard to add new dependencies or to scan for dependencies.

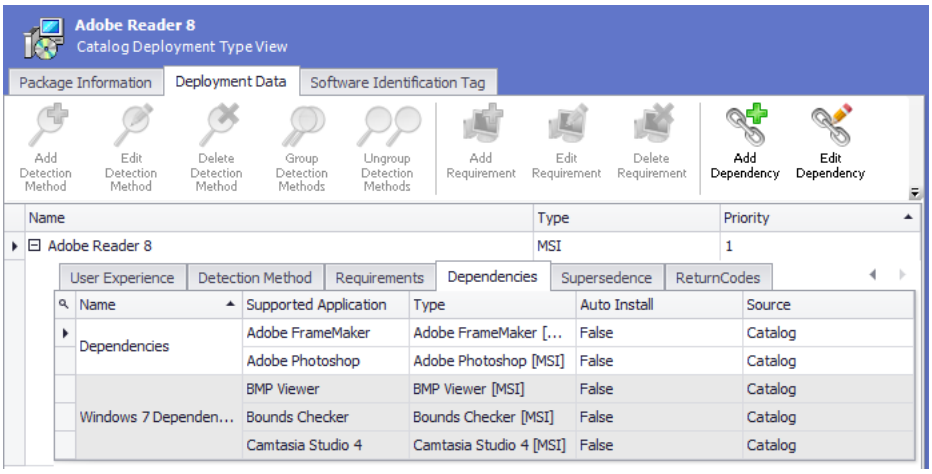
- Viewing and Editing Package Dependencies
- Adding a Dependency Using the Dependency Wizard
- Scanning for Dependencies

Viewing and Editing Package Dependencies

To view and edit package dependencies, perform the following steps:

Task ***To specify package dependencies:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Dependencies** subtab.



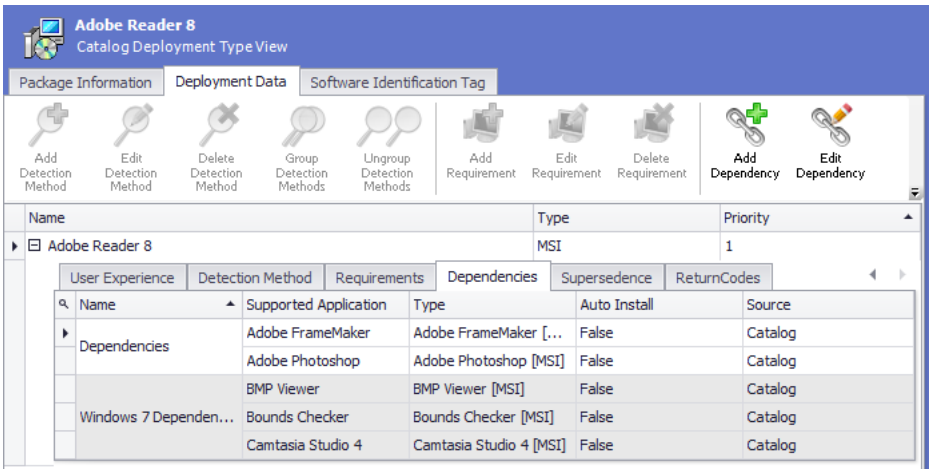
4. View existing dependencies, as described in Deployment Data Tab / Dependencies Subtab.
5. To modify an existing dependency, select the dependency and click **Edit Dependency**.
6. To delete an existing dependency, click **Delete Dependency**.

Adding a Dependency Using the Dependency Wizard

To add a dependency to a package using the **Dependency Wizard**, perform the following steps:

Task ***To add a package dependencies:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Dependencies** subtab.



4. To add a dependency, click the **Add Dependency** button in the ribbon toolbar. The **Welcome** panel of the Dependency Wizard opens.
5. Select one of the following options:
   - **Select dependencies from Application Catalog**
   - **Select dependencies from Configuration Manager**
6. Click **Next**. The **Deployment Types in Application Catalog** or **Deployment Types in Configuration Manager** panel opens.
7. From the **Specify or select a Group for dependencies** list, either select an existing group from the list or enter the name for a new group.
8. From the list of deployment types, select those that are dependent on the selected package.
9. Click **Next**. The **Summary** panel opens.
10. Click **Finish**. The wizard exits and the dependencies you selected are now listed on the **Dependencies** tab.

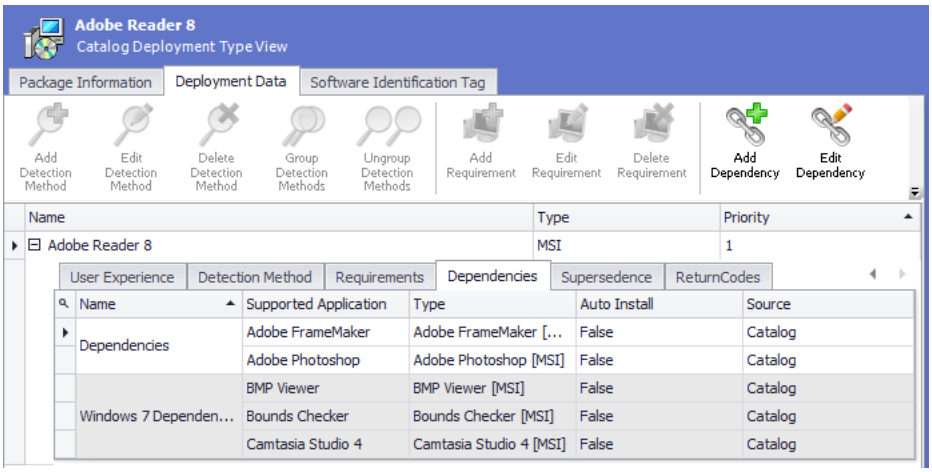
Scanning for Dependencies

To add dependencies to a package by performing a dependency scan using the **Dependency Wizard**, perform the following steps:

Note • *When you scan a Windows Installer package for dependencies, using the* ***Auto detect dependencies*** *option of the* ***Dependency Wizard****, you also populate the package's file level Dependencies View.*

Task ***To scan for dependencies:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Dependencies** subtab.



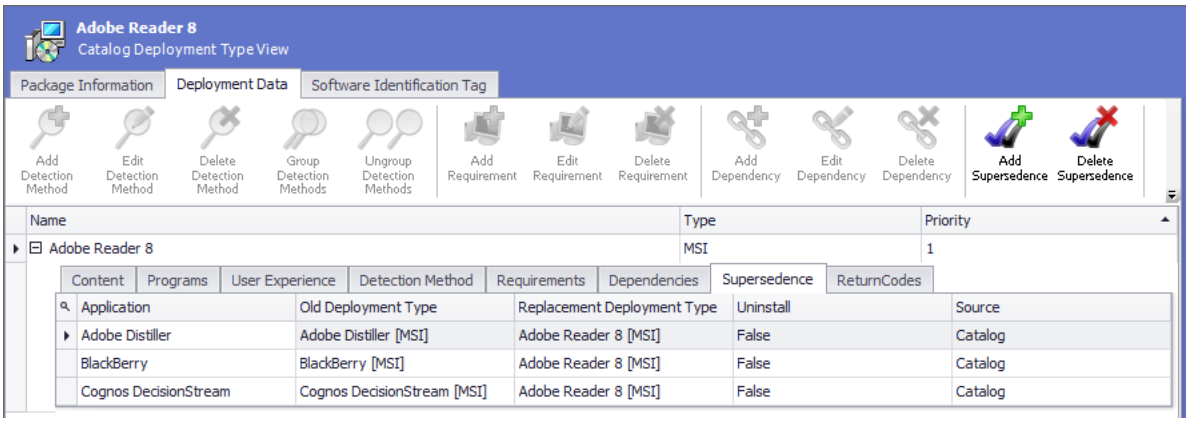
4. To scan for dependencies, click the **Add Dependency** button in the ribbon toolbar. The **Welcome** panel of the Dependency Wizard opens.
5. Select the **Auto detect dependencies** option and click **Next**. The **Auto Detect Dependencies** panel opens.
6. Click **Next** to begin scanning. The **Scanning Progress** panel opens showing the progress of the scan.
7. When scanning is complete, click **Next**. The **Auto Scan Results** panel opens.
   - **If dependencies were found**—The dependencies are listed. Select the dependencies that you want to add to the **Dependency** tab and specify a group name in the **Specify or select a Group for dependencies** list.
   - **If no dependencies were found**—Packages in the Application Catalog are listed. Select the packages that you want to specify as dependencies and specify a group name in the **Specify or select a Group for dependencies** list.
8. Click **Next**. The **System Requirements** panel opens and lists any system requirements that were detected for the selected package.
9. Click **Next**. The **Summary** panel opens, listing the selected dependencies.
10. Click **Finish** to close the wizard and add the dependencies to the list.

Specifying Package Supersedences Deployment Data

You can use the **Supersedence** subtab to view or edit a list of other packages that this package would supersede if installed on the same target machine (meaning that the package on the target system would need to be uninstalled prior to installing this package).

Task ***To specify package supersedences:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Deployment Data** tab and open the **Supersedence** subtab.



4. View existing supersedences, as described in Deployment Data Tab / Supersedence Subtab.
5. To add a supersedence, click the **Add Supersedence** button in the ribbon toolbar to open the Supersedence Wizard.
6. To modify an existing supersedence, select the supersedence and click **Edit Supersedence**. To delete an existing dependency, click **Delete Supersedence**.

Viewing and Editing Return Codes

You can edit a MSI and EXE package's return codes in the Application Manager interface. Return codes are used to indicate whether a restart is required, whether an installation is complete, and to customize the text shown to users when a specific code is returned.

You can view a package's return codes on the **Return Codes** subtab of the **Deployment Types** tab on the **Application View** or **Catalog Deployment Type View**.

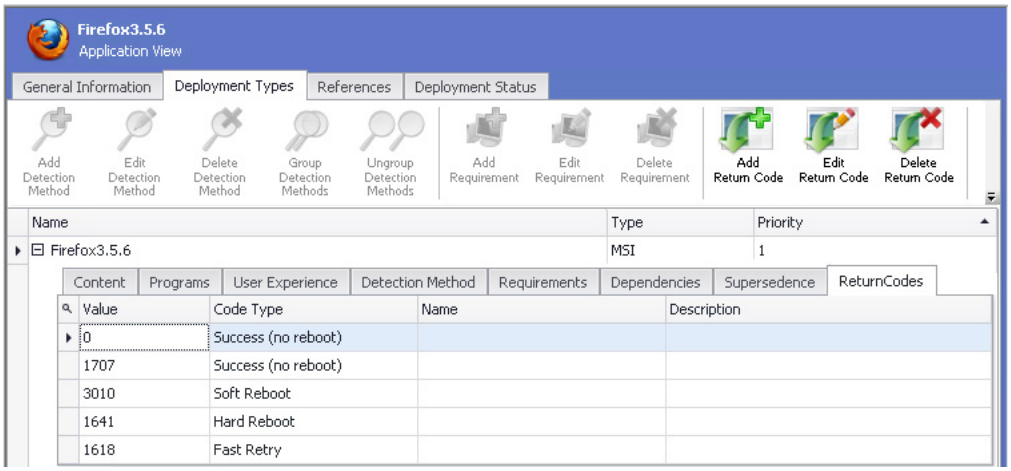


Figure 7-11: Return Codes Subtab of Deployment Types tab

The following return codes are populated by default during package import:

- **0**—Success (no reboot)
- **1707**—Success (no reboot)
- **3010**—Soft Reboot
- **1641**—Hard Reboot
- **1618**—Fast Retry

On the **Return Codes** tab, you can add, edit, and delete return codes.

- **Adding a return code**—Click **Add Return Code** in the ribbon and define a return code on the **Add Return Code** dialog box.

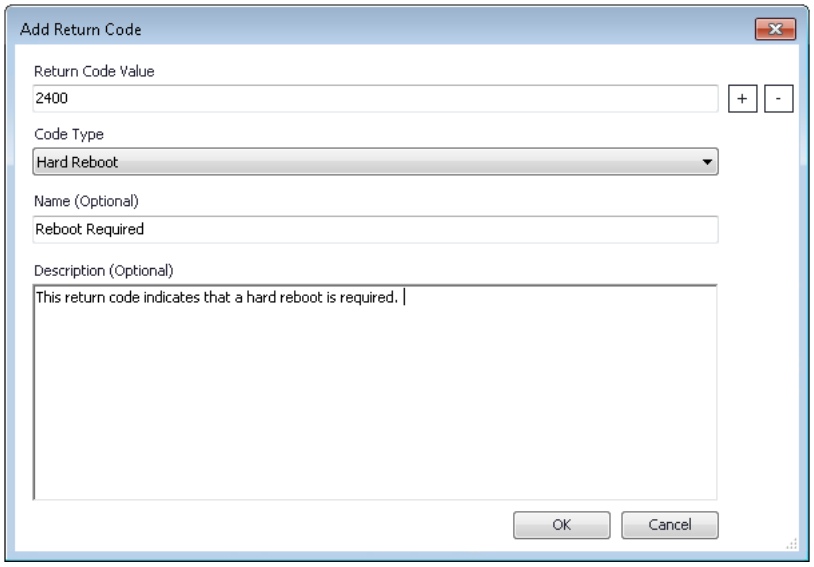

Figure 7-12: Add Return Code Dialog Box

When you create a new return code:

  - The **Return Code Value** should be unique.
  - The **Name** and **Description** fields are optional.

- **Editing a return code**—Select a return code, click **Edit Return Code** in the ribbon, and edit the details of the return code on the **Edit Return Code** dialog box. However, the **Return Code Value** field cannot be edited.
- **Deleting a return code**—Select a return code, click **Delete Return Code** in the ribbon, and confirm the deletion.

Changing the Priority of Deployment Types

When an application has multiple deployment types, the order in which they will be evaluated in System Center 2012 Configuration Manager depends upon the deployment type's assigned priority. When a deployment type meets the specified requirements, it will be run and then no further deployment types on the priority list will be evaluated. By default, Application Manager assigns a deployment type a priority based upon their import order.

You can modify the priority setting of an application's deployment types on the **Change Deployment Type Priority** dialog box, which is opened by clicking the **Change Priority** button in the **Deployment Types** tab ribbon.

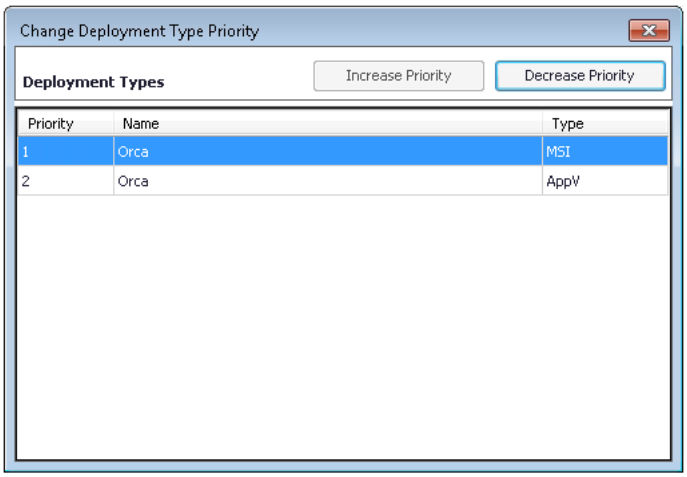

Figure 7-13: Change Deployment Type Priority Dialog Box

Just select the deployment type and click **Increase Priority** or **Decrease Priority** to move it up and down in the list.

Note *• You can only assign a priority to Windows Installer, App-V, and .exe packages. All other packages are assigned a priority of -1, which cannot be changed.*

Setting Application Model Properties

Application Manager stores Microsoft System Center 2012 Configuration Manager application model deployment data for each application in the Application Catalog. Much of this data is displayed on the **Deployment Data** tab of the **Catalog Deployment Type View**.

When a package is imported into the Application Catalog, AdminStudio inserts default values for various Microsoft System Center 2012 Configuration Manager application model properties which cannot be extracted from the imported package.

Setting Default Application Model Properties

There are several ways to set the default values for the application model properties that are assigned during application import:

- **Options dialog box**—You can set these defaults by editing the values on the **Import / Application Model Defaults** tab of the Application Manager **Options** dialog box. See Setting Default Application Model Properties on the Options Dialog Box.
- **SQL script**—You can also set these defaults by editing and running an SQL script and run this script against your Application Catalog. The defaults will be applied to all new packages imported into the Application Catalog. You can also choose to automatically run this script each time a new Application Catalog is created. See Setting Default Application Model Properties Using an SQL Script.

Setting the Application Model Properties of Existing Packages

You can also edit the application model properties for packages already in the Application Catalog in the Application Manager user interface, as described in Managing System Center 2012 Configuration Manager Package Deployment Data, or by using the AdminStudio Platform API, as described in Setting Application Model Properties Using the Platform API.

Setting Default Application Model Properties

When a package is imported into the Application Catalog, AdminStudio inserts default values for various Microsoft System Center 2012 Configuration Manager application model properties which cannot be extracted from the imported package.

You can set the defaults for these properties using the Application Manager user interface or by running an SQL script:

- Setting Default Application Model Properties on the Options Dialog Box
- Setting Default Application Model Properties Using an SQL Script

Setting Default Application Model Properties on the Options Dialog Box

You can specify the default values for the Microsoft System Center 2012 Configuration Manager application model properties that are assigned to a package when it is imported into the Application Catalog on the **Import Options / Application Model Defaults** tab of the Application Manager **Options** dialog box.

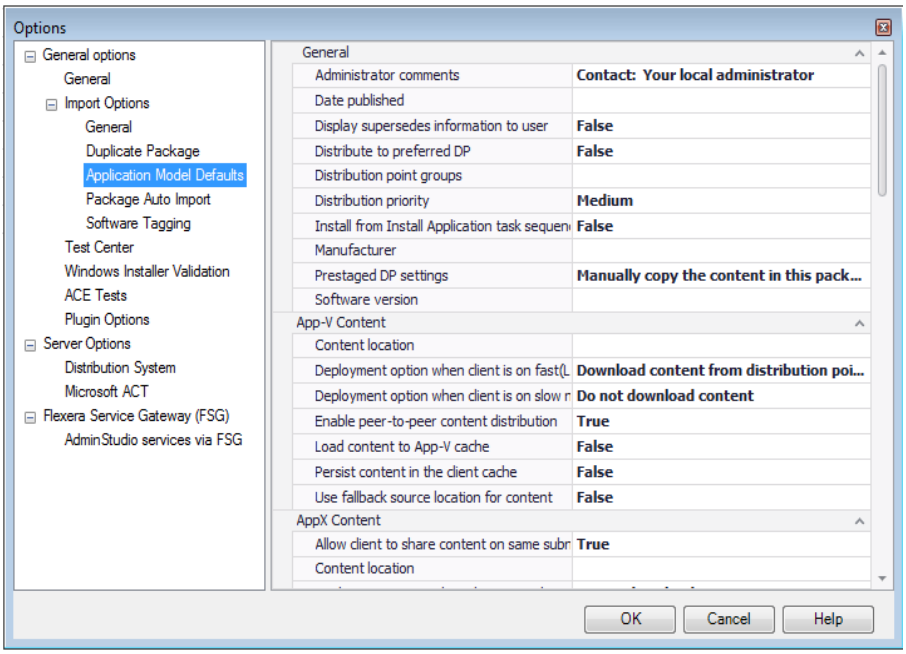

Figure 7-14: Options Dialog Box / Application Model Defaults Tab

For a detailed list of all of the properties that you can edit on the **Application Model Defaults** tab, see Import Options / Application Model Defaults Tab.

Setting Default Application Model Properties Using an SQL Script

When a package is imported into the Application Catalog, AdminStudio inserts default values for various Microsoft System Center 2012 Configuration Manager application model properties which cannot be extracted from the imported package.

You can use an SQL script to set these default values. To do this, you just need to update an existing SQL script file (**CustomDefaultValues.SQL**) and then run that SQL file to update your Application Catalog. The defaults will then be applied to all new packages imported into the Application Catalog.

You can also choose to run the script each time you create a new Application Catalog.

- Editing the CustomDefaultValues.SQL Script File
- Adding the CustomDefaultValues.SQL Script to the Scripts Run During Application Catalog Creation

Editing the CustomDefaultValues.SQL Script File

To specify default values for application model properties, you need to modify the **CustomDefaultValues.SQL** script file, which can be found in the following location:

C:\Program Files (x86)\AdminStudio\2016\Support\SQL_Scripts

Tip *• If you run this script, all of the properties in the script file will be updated. If you want to update just a few of the properties, you can create a script file that only contains a subset of the properties and then run that script.*

The following application model properties are defined in the **CustomDefaultValues.SQL** file:

Table 7-16 • Application Model Properties in the CustomDefaultValues.SQL File

Property	Values	SQl Statement to Set Default Value
AutoInstall	True False	UPDATE [ASCMProperty] SET [DefaultValue]='True' WHERE Name='AutoInstall'
Classification	Desktop Server	UPDATE [ASCMProperty] SET [DefaultValue]='Desktop' WHERE Name='Classification'
DisplaySupersedes	True False	UPDATE [ASCMProperty] SET [DefaultValue]='False' WHERE Name='DisplaySupersedes'
DistributionPriority	High Medium Low	UPDATE [ASCMProperty] SET [DefaultValue]='Medium' WHERE Name='DistributionPriority'
EnforceBehaviour	BasedOnExitCode NoAction ProgramReboot ForceReboot	UPDATE [ASCMProperty] SET [DefaultValue]='BasedOnExitCode' WHERE Name='EnforceBehaviour' AND [Class] = 'ASCMMsiUserExperience'
ExecuteTime	Any integer value	UPDATE [ASCMProperty] SET [DefaultValue]='120' WHERE Name='ExecuteTime' AND [Class] = 'ASCMMsiUserExperience'
FallbackToUnprotectedDP	True False	UPDATE [ASCMProperty] SET [DefaultValue]='False' WHERE Name='FallbackToUnprotectedDP' AND [Class] = 'ASCMMSIContent'
InstallBehaviour	User System Any	UPDATE [ASCMProperty] SET [DefaultValue]='System' WHERE Name='InstallBehaviour' AND [Class] = 'ASCMMsiUserExperience'
InstallFolder	Any string value	UPDATE [ASCMProperty] SET [DefaultValue]='' WHERE Name='InstallFolder' AND [Class] = 'ASCMMsiInstaller'
LogonRequirement	True Null False	UPDATE [ASCMProperty] SET [DefaultValue]='Null' WHERE Name='LogonRequirement' AND [Class] = 'ASCMMsiUserExperience'
MaxExecuteTime	Any integer value	UPDATE [ASCMProperty] SET [DefaultValue]='60' WHERE Name='MaxExecuteTime' AND [Class] = 'ASCMMsiUserExperience'
OnFastNetwork	Download DownloadContentForStreaming	UPDATE [ASCMProperty] SET [DefaultValue]='Download' WHERE Name='OnFastNetwork' AND [Class] = 'ASCMMSIContent'
OnSlowNetwork	DoNothing Download DownloadContentForStreaming	UPDATE [ASCMProperty] SET [DefaultValue]='DoNothing' WHERE Name='OnSlowNetwork' AND [Class] = 'ASCMMSIContent'

Table 7-16 • Application Model Properties in the CustomDefaultValues.SQL File (cont.)

Property	Values	SQl Statement to Set Default Value
PeerCache	True False	UPDATE [ASCMProperty] SET [DefaultValue]='True' WHERE Name='PeerCache' AND [Class] = 'ASCMMSIContent' ***Note*** • *To set the* ***Allow client to share content on the same subnet*** *property (for MSI or Script packages), pass* PeerCache *as a property name along with MSI/Script package ID.* *To set the* ***Enable peer-to-peer content distribution*** *property (for an App-V package), pass* PeerCache *as a property name along with the App-V package ID.*
PinOnClient	True False	UPDATE [ASCMProperty] SET [DefaultValue]='True' WHERE Name='PinOnClient' AND [Class] = 'ASCMMSIContent'
PreferredDistribute	True False	UPDATE [ASCMProperty] SET [DefaultValue]='False' WHERE Name='PreferredDistribute'
PrestagedDPSetting	Auto OnlyContentChange ManualCopy	UPDATE [ASCMProperty] SET [DefaultValue]='ManualCopy' WHERE Name='PrestagedDPSetting'
ProgramVisibility	Maximized Normal Minimized Hidden	UPDATE [ASCMProperty] SET [DefaultValue]='Hidden' WHERE Name='ProgramVisibility' AND [Class] = 'ASCMMsiUserExperience'
RequireLoad	True False	UPDATE [ASCMProperty] SET [DefaultValue]='False' WHERE Name='RequireLoad' AND [Class] = 'ASCMMSIContent'
RequiresUserInteraction	True False	UPDATE [ASCMProperty] SET [DefaultValue]='False' WHERE Name='RequiresUserInteraction'
RunAs32	True False	UPDATE [ASCMProperty] SET [DefaultValue]='False' WHERE Name='RunAs32' AND [Class] = 'ASCMMsiInstaller'
SourceUpdateProductCode	Any valid GUID	UPDATE [ASCMProperty] SET [DefaultValue]='' WHERE Name='SourceUpdateProductCode' AND [Class] = 'ASCMMsiInstaller'
UninstallCommandLine	Any string value	UPDATE [ASCMProperty] SET [DefaultValue]='' WHERE Name='InstallCommandLine' AND [Class] = 'ASCMMsiInstaller'

Table 7-16 • Application Model Properties in the CustomDefaultValues.SQL File (cont.)

Property	Values	SQl Statement to Set Default Value
UninstallCommandLine	Any string value	`UPDATE [ASCMProperty] SET [DefaultValue]='' WHERE Name='UninstallCommandLine' AND [Class] = 'ASCMMsiInstaller'`
UninstallFolder	Any string value	`UPDATE [ASCMProperty] SET [DefaultValue]='' WHERE Name='InstallFolder' AND [Class] = 'ASCMMsiInstaller'`

Adding the CustomDefaultValues.SQL Script to the Scripts Run During Application Catalog Creation

When you create a new Application Catalog, the scripts listed in the <Create> section under <AdminStudio> in the Upgrade.xml file are run. The Upgrade.xml file is found in the following location:

```
C:\Program Files (x86)\AdminStudio\2016\Support
```

If you want to use an SQL script to set the default Application Model properties for all applications that are imported into a new Application Catalog, you need to add the name of the **CustomDefaultValues.SQL** file to this script.

Task ***To add the CustomDefaultValues.SQL script to the Upgrade.xml file:***

1. Edit the **CustomDefaultValues.SQL** script file, as described in Editing the CustomDefaultValues.SQL Script File, and copy it to the following location:

   ```
   C:\Program Files (x86)\AdminStudio\2016\Support\SQL_Scripts
   ```

2. Open the following file in a text editor:

   ```
   C:\Program Files (x86)\AdminStudio\2016\Support\Upgrade.xml
   ```

3. Locate the <AdminStudio> element in the Upgrade.xml file.

4. Add the **CustomDefaultValues.SQL** file to the list of scripts in the <SQLServer> child element of the <Create> element, as highlighted below:

```
<AdminStudio>
  <Version version="12.01" target="13286599"/>
  <Create>
    <SQLServer>
      <Script internal="yes">AS_System_Schema.SQL</Script>
      <Script>Seed_Data.SQL</Script>
      <!-- <Script internal="no">AS_Schema.sql</Script> -->
      <!-- MUST RUN CustomReportWizard.SQL LAST-->
      <Script>CustomReportWizard.SQL</Script>
      <Script>AS_TestCenter.sql</Script>
      <Script>AS_TestEngine.sql</Script>
      <Script>Reporting.StoredProcedures.sql</Script>
      <Script>CustomDefaultValues.SQL</Script>
    </SQLServer>
    ...
  </Create>
```

5. Save the **Upgrade.xml** file. The next time you create a new Application Catalog, the **CustomDefaultValues.SQL** script will be run, setting the default application model properties that you have defined.

Setting Application Model Properties Using the Platform API

You can use the `Set-ASProperty` command of the AdminStudio Platform API to set application model properties for applications which have already been imported into the Application Catalog.

For detailed information and instructions, see the Set-ASProperty section of the AdminStudio Platform API.

Managing App-V Package Deployment Data

Note • *Because Microsoft App-V server only supports App-V 5.0 packages, the* ***App-V Deployment Data*** *subtab is only displayed for App-V 5.0 packages.*

When an App-V 5.0 package is imported into the Application Catalog, Application Manager mines package elements for App-V-specific deployment data. You can view and modify data for App-V 5.0 packages and add new data by editing the properties on the subtabs of the **App-V Deployment Data** tab. AdminStudio displays App-V deployment data in a multi-tabbed, organized format that is easy to navigate through and to update.

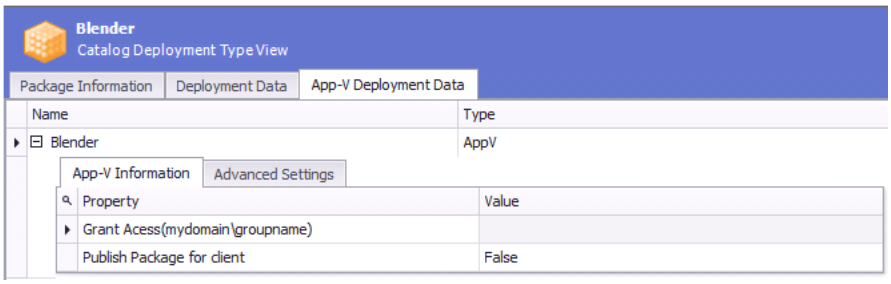

Figure 7-15: App-V Deployment Data

Using the subtabs of the **App-V Deployment Data** tab of the **Catalog Deployment Type View**, you can perform the following tasks:

- Specifying a Package's App-V Deployment Settings
- Specifying a Package's Advanced App-V Deployment Settings

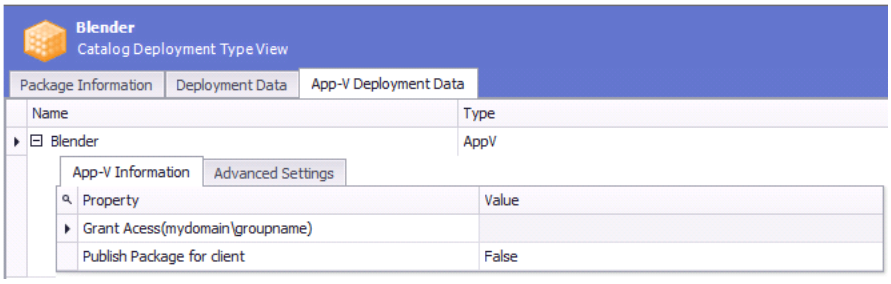
Specifying a Package's App-V Deployment Settings

Note • *Because Microsoft App-V server only supports App-V 5.0 packages, the* ***App-V Deployment Data*** *subtab is only displayed for App-V 5.0 packages.*

The **App-V Information** subtab of the **App-V Deployment Data** tab of the **Catalog Deployment Type View** lists parameters relating to package deployment on a Microsoft App-V Server.

Task ***To specify a package's App-V deployment settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an App-V 5.x package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **App-V Deployment Data** tab and open the **App-V Information** subtab.



4. View and modify any desired data, as described in App-V Deployment Data Tab.

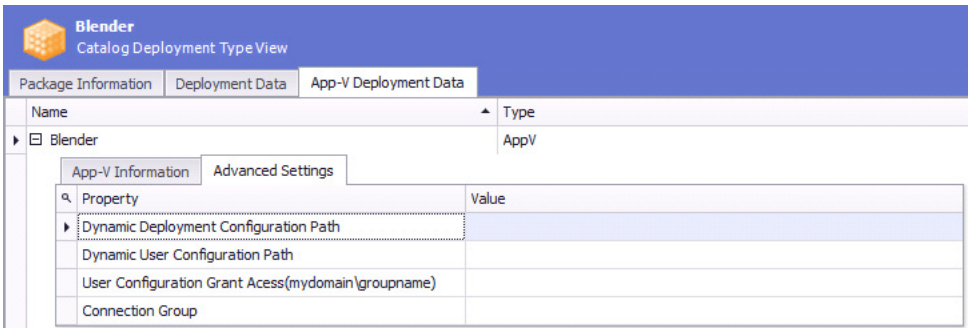
Specifying a Package's Advanced App-V Deployment Settings

Note • *Because Microsoft App-V server only supports App-V 5.0 packages, the* ***App-V Deployment Data*** *subtab is only displayed for App-V 5.0 packages.*

The **Advanced Settings** subtab of the **App-V Deployment Data** tab of the **Catalog Deployment Type View** lists advanced parameters relating to package deployment on a Microsoft App-V Server.

Task ***To specify a package's advanced App-V Server deployment settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an App-V 5.0 package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **App-V Deployment Data** tab and open the **Advanced Settings** subtab.



4. View and modify data, as described in App-V Deployment Data Tab.

Managing Casper Package Deployment Data

Note *• Because Casper only supports Mac OS X desktop packages, the* ***Casper Deployment Data*** *subtab is only displayed for* ***.pkg*** *files,* ***.dmg*** *files, and links to Apple Mac App Store apps.*

When a Mac OS X desktop package is imported into the Application Catalog, Application Manager mines package elements for Casper-specific deployment data. You can view and modify deployment data for Mac OS X desktop packages and add new data by editing the properties on the subtabs of the **Casper Deployment Data** tab. AdminStudio displays Casper deployment data in a multi-tabbed, organized format that is easy to navigate through and to update.

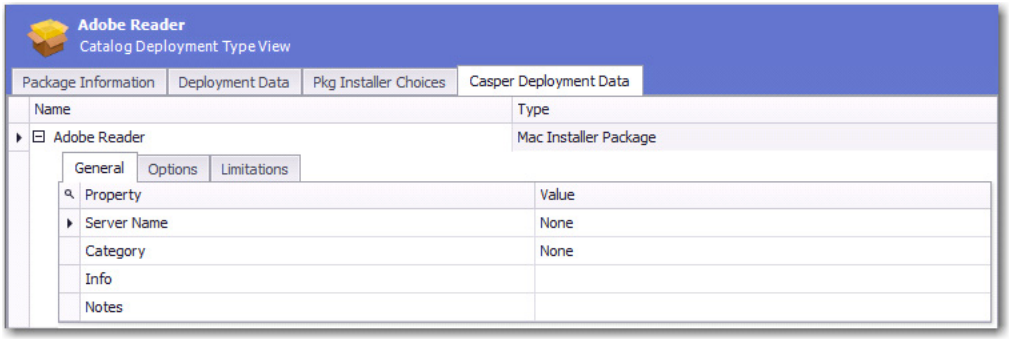


Figure 7-16: Casper Deployment Data

The **Casper Deployment Data** subtab of the **Catalog Deployment Type View** can include up to three subtabs that display Casper deployment data: **General**, **Options**, and **Limitations**. The **Options** and **Limitations** subtabs are not displayed for Mac App Store apps.

- General Tab
- Options Tab
- Limitations Tab

General Tab

The **General** tab of the **Casper Deployment Data** tab is displayed for all Mac OS X desktop applications.

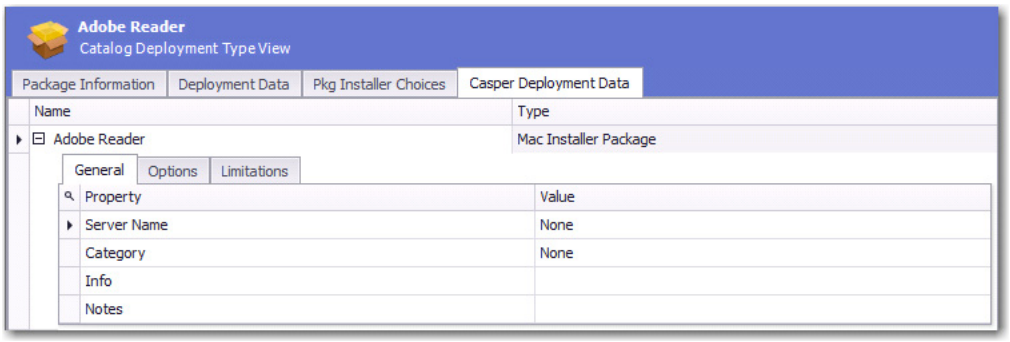

Figure 7-17: Casper Deployment Data / General Tab

The **General** subtab of the **Casper Deployment Data** tab includes the following properties.

Table 7-17 • Casper Deployment Data Tab / General Subtab

Property	Description
Server Name	Name of the Casper server.
Category	Category in Casper that the package will be added to. ***Note*** • *Casper lets you create custom categories. If AdminStudio has matched this application to an entry in the Application Recognition Library (ARL), AdminStudio will use the ARL category when publishing to Casper, creating it if necessary.*
Info	Information to display to the administrator when the package is deployed or uninstalled
Notes	Notes to display about the package (such as the name of the person who built it and when it was built). ***Note*** • *Not displayed for Mac App Store Apps.*
Free	Indicates whether or not the Mac App Store app is available for free (**True**) or whether it requires payment (**False**). ***Note*** • *Only displayed for Mac App Store Apps.*

Options Tab

The **Options** tab of the **Casper Deployment Data** tab is only displayed for PKG and DMG packages.

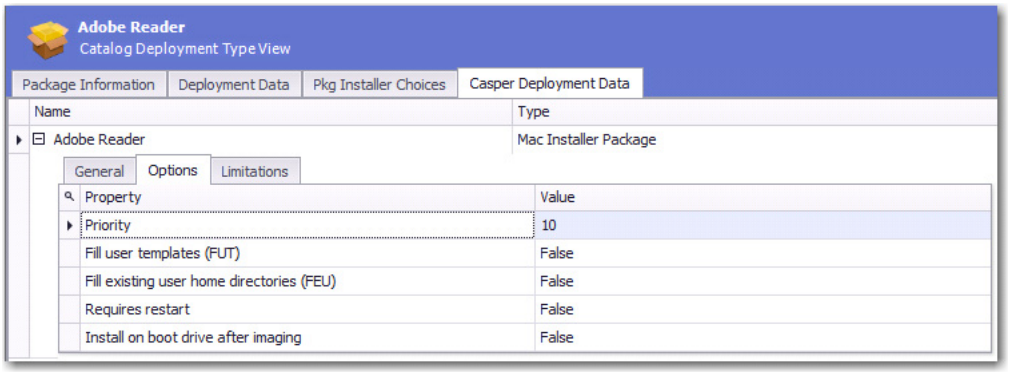

Figure 7-18: Casper Deployment Data / Options Tab

The **Options** subtab of the **Casper Deployment Data** tab includes the following properties.

Table 7-18 • Casper Deployment Data Tab / Options Subtab

Property	Description
Priority	Priority to use for deploying or uninstalling the package. For example, a package with a priority of **1** is deployed or uninstalled before other packages. When several applications are deployed together, the one with the highest priority is installed first. Therefore, if one application requires that another application be installed first before it can be successfully installed, you should assign the required application a higher priority (lower number) than the dependent application.
Fill user templates (FUT)	Set this property to **True** to fill new home directories with the contents of the home directory in the package's **Users** folder. This setting can be changed when deploying or uninstalling the package using a policy.l  ***Note*** • *Only applicable to DMG packages.*
Fill existing user home directories (FEU)	Set this property to **True** to fill existing home directories with the contents of the home directory in the package's **Users** folder. This setting can be changed when deploying or uninstalling the package using a policy  ***Note*** • *Only applicable to DMG packages.*
Requires restart	Set this property to **True** to require that computers must be restarted after installing the package.
Install on boot drive after imaging	Set this property to **True** to ensure that the package is installed on the boot drive after imaging.  ***Note*** • *This setting is only used when deploying a package with an OS image, like with an OSD. It does not affect day-to-day package delivery.*

Limitations Tab

The **Limitations** tab of the **Casper Deployment Data** tab is only displayed for PKG and DMG packages.

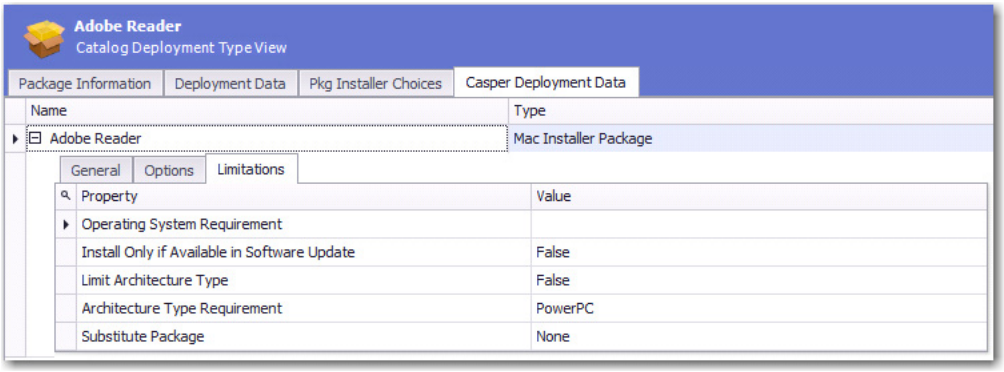

Figure 7-19: Casper Deployment Data / Limitations Tab

The **Limitations** subtab of the **Casper Deployment Data** tab includes the following properties.

Table 7-19 • Casper Deployment Data Tab / Limitations Subtab

Property	Description
Operating System Requirement	Enter operating system version numbers, separated by commas, to specify that the package only be permitted to be deployed to computers with these operating system versions. To restrict installation to OS X 10.6.8, 10.7.x, or 10.8, you would enter the following: `10.6.8, 10.7.x, 10.8`
Install Only if Available in Software Update	Set to **True** to require that this package only be installed if it is available in a software update.
Limit Architecture Type	Set to **True** to require that this package only be installed on machines matching the selected **Architecture Type Requirement**.
Architecture Type Requirement	If **Limit Architecture Type** is set to **True**, select the one of the following to specify the architecture type required to deploy the package: • PowerPC • Intel/X86
Substitute Package	If you want to specify a different package to deploy to computers that do not meet the architecture type requirement, click the Browse button in this field to open the Select Substitute Package Dialog Box, and select a substitute package from either Casper or the Application Catalog.

Select Substitute Package Dialog Box

The **Substitute Package** field on the **Casper Deployment Data > Limitations** tab specifies the package to deploy to computers that do not have the required architecture type.

If you click on the **Substitute Package** field (which, by default, is set to **None**), the **Select Substitute Package** dialog box opens, prompting you to select a substitute package from either the Casper Server or the Application Catalog.

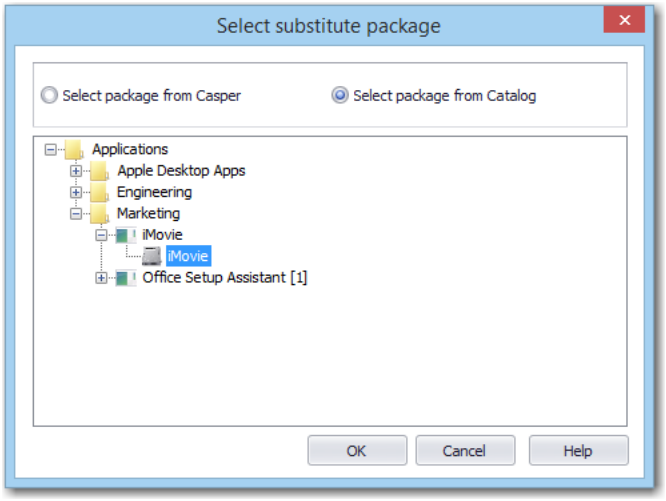

Figure 7-20: Select Substitute Package Dialog Box

Managing Citrix XenApp Package Deployment Data

Note • *Because Citrix XenApp server only supports App-V 4.x packages and Citrix XenApp profiles, the* ***XenApp Deployment Data*** *subtab is only displayed for App-V 4.x packages and Citrix XenApp profiles.*

When a XenApp profile or App-V 4.x package is imported into the Application Catalog, Application Manager mines package elements for Citrix XenApp-specific deployment data. You can view and modify data for Citrix XenApp profiles and App-V 4.x packages and add new data by editing the properties on the subtabs of the **XenApp Deployment Data** tab. AdminStudio displays XenApp deployment data in a multi-tabbed, organized format that is easy to navigate through and to update.

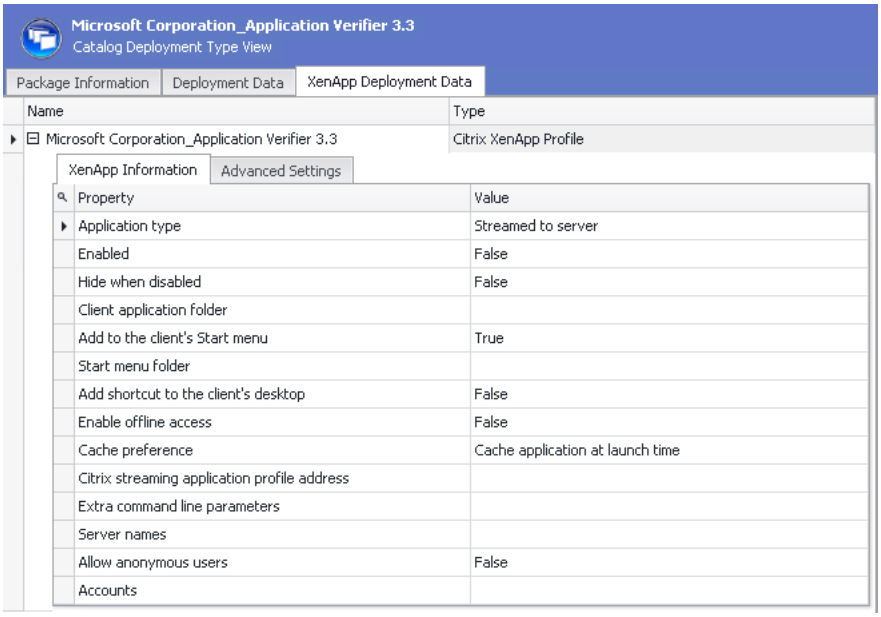

Figure 7-21: XenApp Deployment Data

Using the subtabs of the **XenApp Deployment Data** tab of the **Catalog Deployment Type View**, you can perform the following tasks:

- Specifying a Package's XenApp Deployment Settings
- Specifying a Package's Advanced XenApp Deployment Settings

Important • *In order to publish an application to a Citrix XenApp Server, there are several mandatory properties which must be set on the* ***XenApp Information*** *subtab of the* ***XenApp Deployment Data*** *tab. If these properties are not set, distribution will fail.*

Specifying a Package's XenApp Deployment Settings

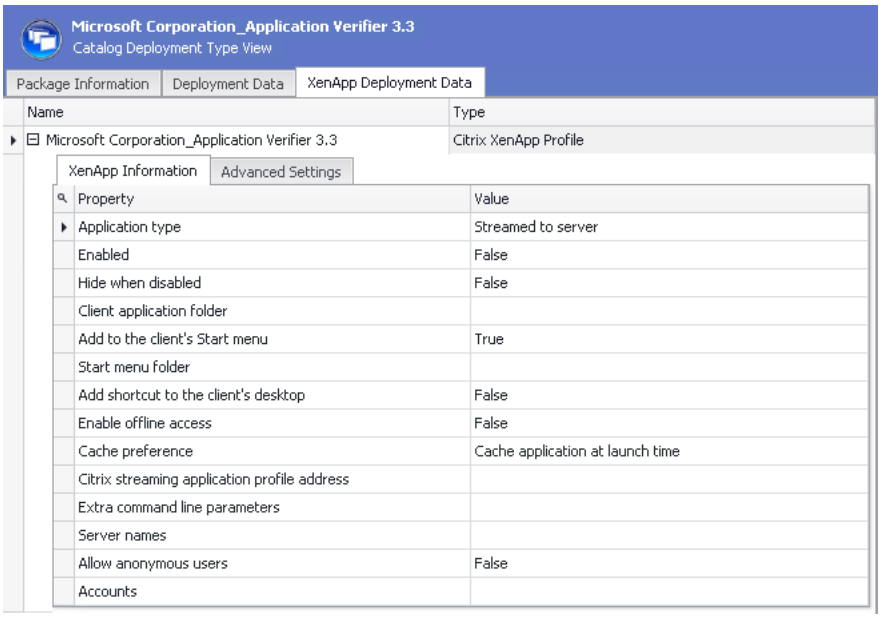
Important • *Citrix XenApp server only supports App-V 4.x packages and Citrix XenApp profiles. If you select another type of package in the tree, the* ***XenApp Deployment Data*** *tab of the* ***Catalog Deployment Type View*** *is not displayed.*

The **XenApp Information** subtab of the **XenApp Deployment Data** tab of the **Catalog Deployment Type View** lists parameters relating to package deployment on a Citrix XenApp Server.

Task ***To specify a package's XenApp deployment settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a Citrix XenApp or App-V 4.x package in the tree. The **Catalog Deployment Type View** opens.

3. Click the **XenApp Deployment Data** tab and open the **XenApp Information** subtab.



4. In the **Server names** field, you need to enter the Citrix XenApp server names where this application will be available. Click the browse button to open the **Servers** dialog box, where you can enter multiple server names or import a list of servers from an application server list file (***.asl**).

***Important** • This is a required field. If you only want to make this application available on the Citrix XenApp server that you are publishing to, enter that server name on the **Servers** dialog box. You can copy it from the **Distribution System** tab of the Application Manager **Options** dialog box.*

5. Set the **Allow anonymous users** field to one of the following values:

   - **False**—Do not grant access to anonymous users. (Default)
   - **True**—Grant access to anonymous users.

6. If the **Allow anonymous users** field is set to **False**, enter the accounts that you want to have access to this XenApp profile in the **Accounts** field. To do this, click the browse button to open the **Users** dialog box, where you can enter multiple user accounts or import a list of users from an application user list file (***.aul**).

***Note** • If **Allow anonymous users** is set to **True**, this field is not required. If **Allow anonymous users** is set to **False**, this is a mandatory field.*

7. If you are publishing an App-V package, enter the **Citrix streaming application profile address**, including the location of the manifest file (**.profile**). For example, enter the UNC path, such as:

   \\MyCitrixServer\Shared\App-V_IntegrationKit\AppStreamingToAppVConduit\AppStreamingToAppVConduit.profile

***Note** • If you are publishing an App-V package, this is a mandatory field.*

8. View and modify any other desired data, as described in XenApp Deployment Data Tab / XenApp Information Subtab.

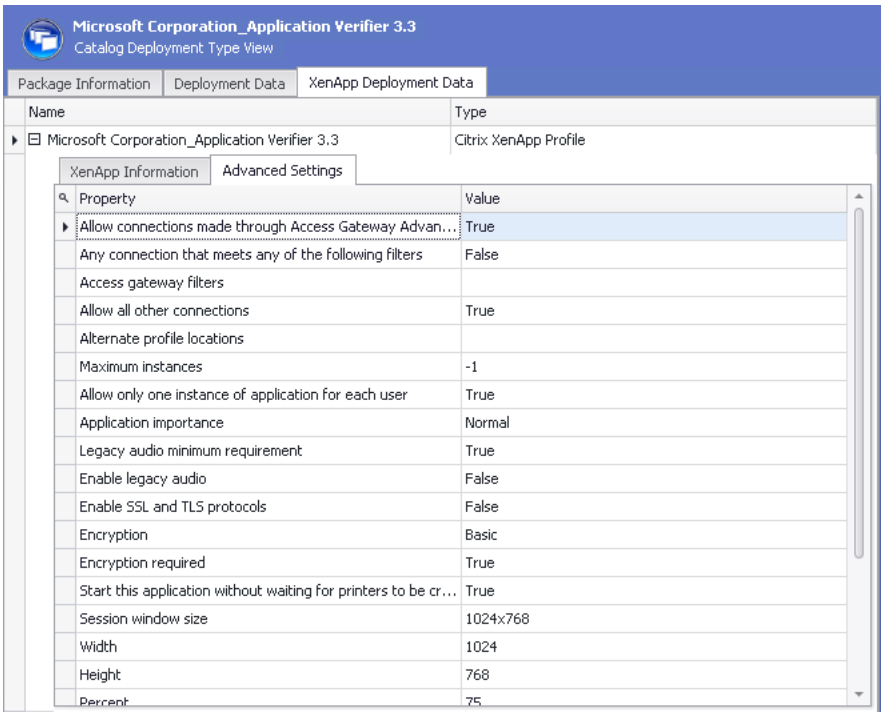
Specifying a Package's Advanced XenApp Deployment Settings

Important • *Citrix XenApp server only supports App-V 4.x packages and Citrix XenApp profiles. If you select another type of package in the tree, the* ***XenApp Deployment Data*** *tab of the* ***Catalog Deployment Type View*** *is not displayed.*

The **XenApp Information** subtab of the **XenApp Deployment Data** tab of the **Catalog Deployment Type View** lists parameters relating to package deployment on a Citrix XenApp Server.

Task ***To specify a package's advanced XenApp deployment settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a Citrix XenApp or App-V 4.x package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **XenApp Deployment Data** tab and open the **Advanced Settings** subtab.



4. View and modify data, as described in XenApp Deployment Data Tab / Advanced Settings Subtab.

Managing Altiris Package Deployment Data

Note *• Because Symantec Altiris server only supports Windows Installer, Symantec Workspace, VMware ThinApp, and legacy installer packages, the* ***Altiris Deployment Data*** *subtab is only displayed when a package of one of those deployment types is selected.*

When a Windows Installer, Symantec Workspace, VMware ThinApp, or legacy installer package is imported into the Application Catalog, Application Manager mines package elements for Altiris-specific deployment data. You can view and modify data for these packages and configure command line settings by editing the properties on the **Package Information** and **Command Lines** subtabs of the **Altiris Deployment Data** tab.

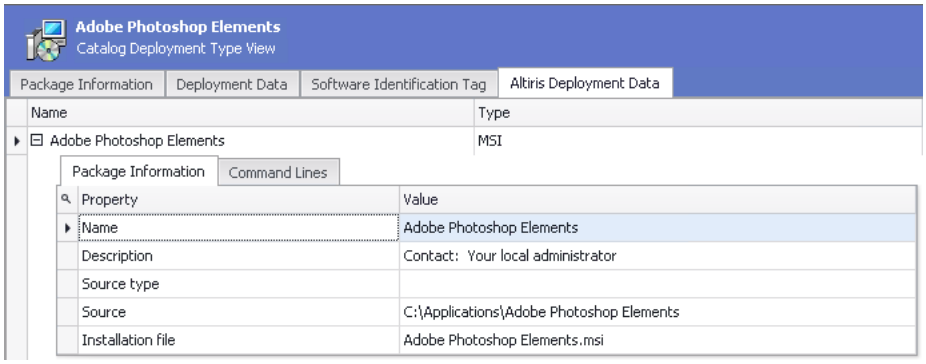


Figure 7-22: Altiris Deployment Data / Package Information Tab

Using the subtabs of the **Altiris Deployment Data** tab of the **Catalog Deployment Type View**, you can perform the following tasks:

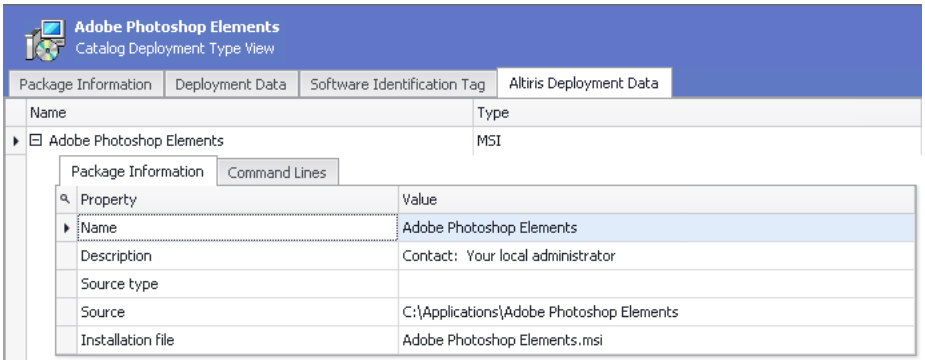
- Specifying a Package's Altiris Deployment Settings
- Specifying a Package's Altiris Deployment Command Line Settings

Specifying a Package's Altiris Deployment Settings

On the **Package Information** subtab of the **Altiris Deployment Data** tab, you can view and modify Altiris-specific data for packages.

Task ***To specify a package's Altiris deployment settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a Windows Installer, Symantec Workspace, VMware ThinApp, or legacy installer package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Altiris Deployment Data** tab and open the **Package Information** subtab.



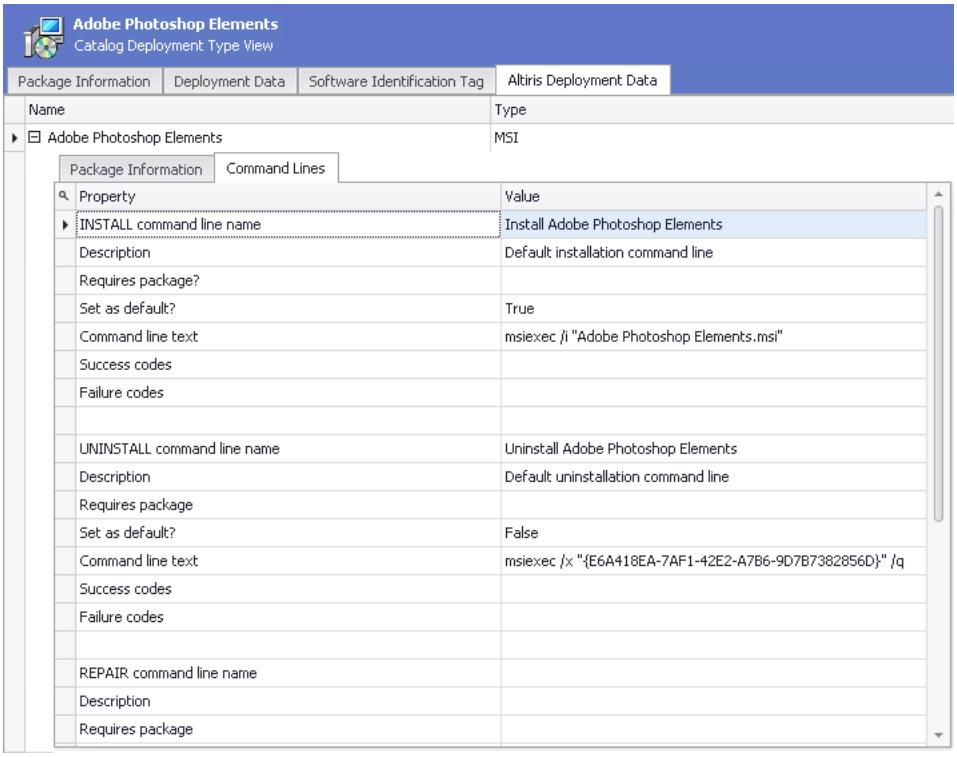
4. View and modify data, as described in Package Information Subtab in the Altiris Deployment Data Tab section.

Specifying a Package's Altiris Deployment Command Line Settings

On the **Command Lines** subtab of the **Altiris Deployment Data** tab, you can configure a package's Altiris-related command line settings.

Task ***To specify a package's Altiris command line settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select a Windows Installer, Symantec Workspace, VMware ThinApp, or legacy installer package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **Altiris Deployment Data** tab and open the **Command Lines** subtab.



4. View and modify data, as described in Command Lines Subtab in the Altiris Deployment Data Tab section.

Managing AirWatch Package Deployment Data

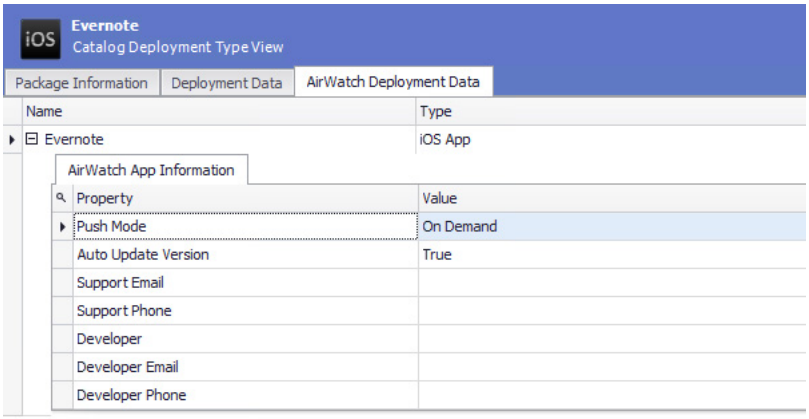
Edition • *Support for AirWatch integration is included in AdminStudio Enterprise Edition when you purchase Mobile.*

Note • *Because AirWatch server only supports Apple iOS and Google Android packages, the* ***AirWatch Deployment Data*** *subtab is only displayed when an iOS or Android package is selected.*

AirWatch is a leading global Mobile Device Management (MDM) provider. Using AdminStudio, you can manage and publish Apple iOS (local and public store) and Google Android (local and public store) mobile apps to AirWatch. You can view and modify data for these packages by editing the properties on the **AirWatch Deployment Data** tab.

Task ***To specify a package's AirWatch deployment settings:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an iOS or Android package in the tree. The **Catalog Deployment Type View** opens.
3. Click the **AirWatch Deployment Data** tab.



4. View and modify data, as described in AirWatch Deployment Data Tab.

Note • *If you are using an Application Catalog that has been upgraded from a release prior to AdminStudio 2013, and the iOS application was imported prior to the upgrade, you will need to reimport the iOS application before you will be able to successfully publish it to AirWatch Server.*

Managing App-V Virtual Environments

In Application Manager, you can create App-V virtual environments for App-V 5.0 packages for both Microsoft App-V Servers and Microsoft System Center 2012 Configuration Manager Servers.

App-V virtual environments enable deployed virtual applications to share the same file system and registry on client computers. This means that unlike standard virtual applications, these applications can share data with each other.

Tip • *Using virtual environments to group dependent packages together in App-V 5.0 is similar to the Dynamic Suite Composition feature used with App-V 4.x packages.*

Virtual environments are created or modified on client computers when the application is installed or when clients next evaluate their installed applications. You can order these applications so that when multiple applications attempt to modify the same file system or registry value on a client computer, the application with the highest order takes precedence.

For information on how to create App-V virtual environments, see the following topics:

- Creating an App-V Server Virtual Environment
- Creating a System Center Configuration Manager Server Virtual Environment

Creating an App-V Server Virtual Environment

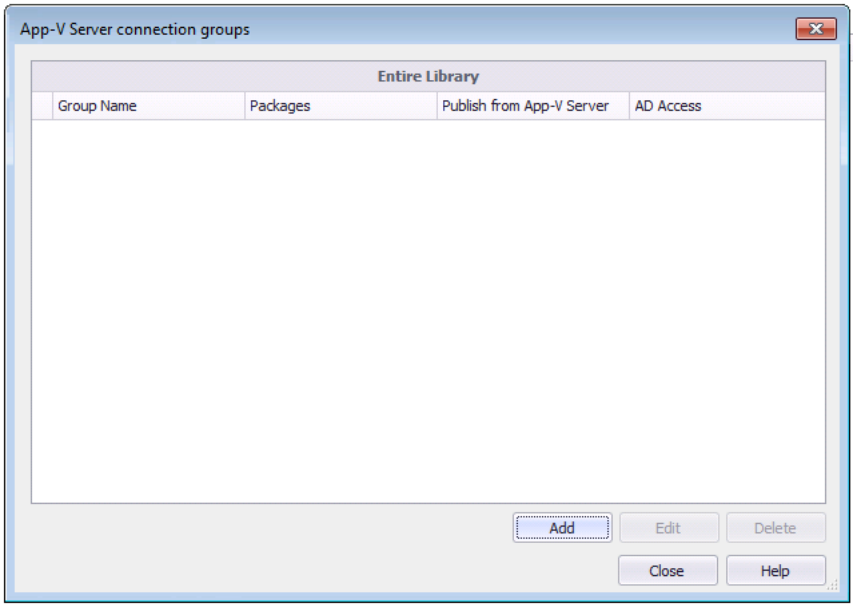
App-V Server virtual environments are called *connection groups*. Connection groups contain the name of groups that a package is associated with. You can create or edit a connection group using the **App-V Server Connection Groups** dialog box, which can be opened using either of these methods:

- **From the ribbon**—On the Application Manager **Catalog** tab, click **App-V Virtual Environments** > **App-V Server Environment** in the ribbon.
- **From the Catalog Deployment Type View**—With the Application Manager **Catalog** tab selected, select an App-V 5.0 package in the tree to open the **Catalog Deployment Type View**. Then open the **App-V Deployment Data** > **Advanced Settings** tab and click in the **Connection Group** field.

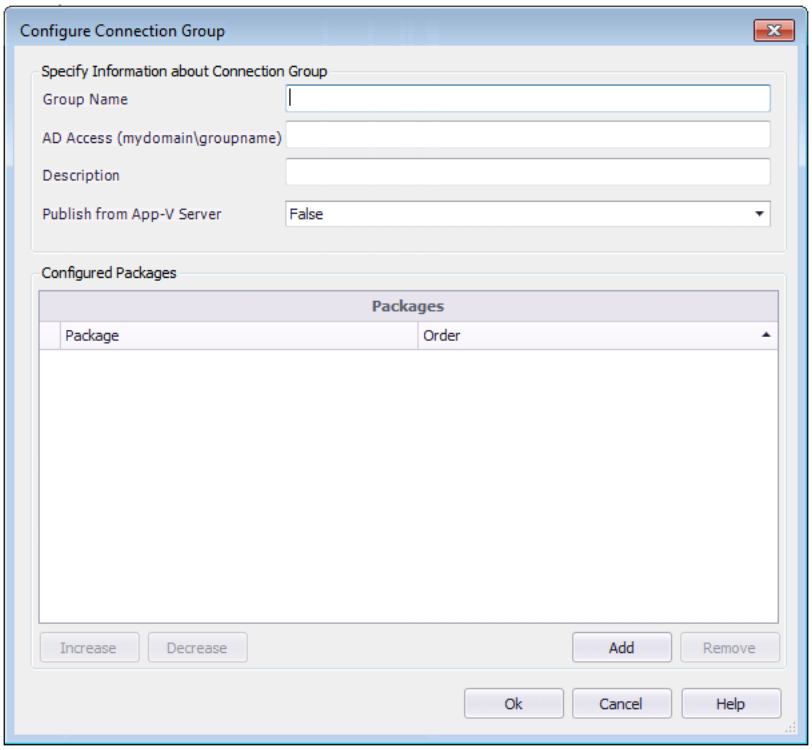
To create an App-V Server connection group for App-V 5.0 packages, perform the following steps:

Task ***To create an App-V Server connection group:***

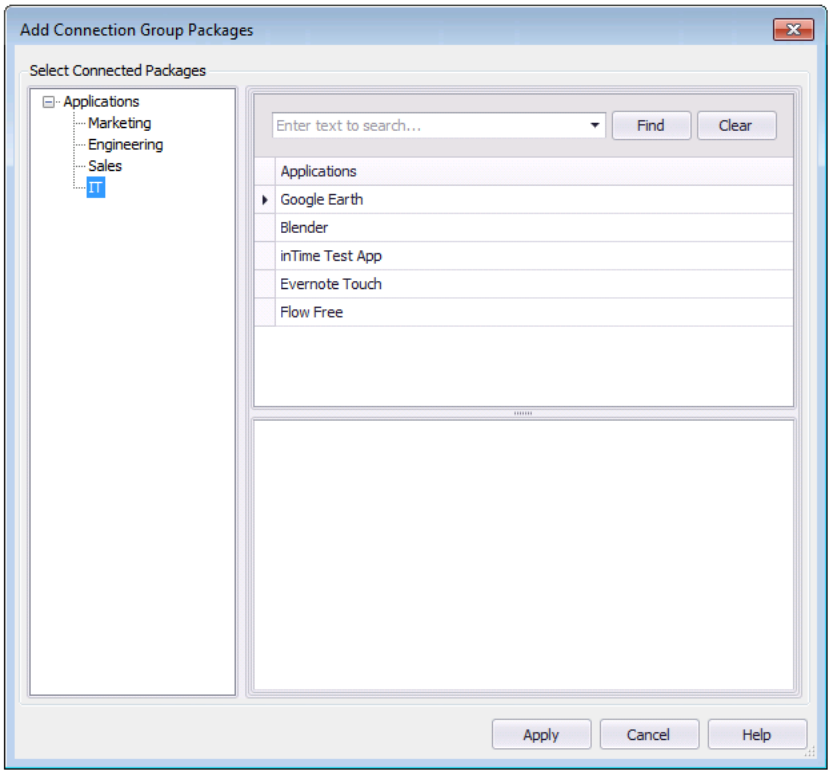
1. Open the **Catalog** tab of Application Manager.
2. In the ribbon, click **App-V Virtual Environments** > **App-V Server Environment**. The **App-V Server Connection Groups** dialog box opens.



3. Click **Add** to create a new connection group. The **Configure Connection Group** dialog box opens.



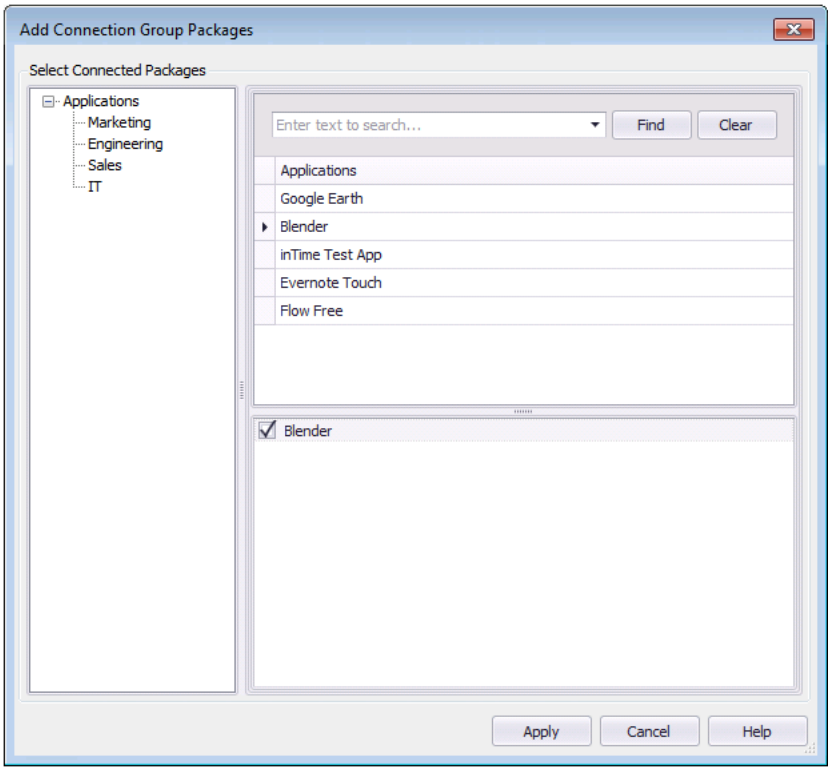
4. In the **Group Name** field, enter a name to identify this new connection group.
5. In the **AD Access** field, enter the name of the Active Directory group that will have permission to access this connection group.
6. In the **Description** field, enter a description of the purpose of this connection group.
7. From the **Publish from App-V Server** list, select one of the following options:
   - **False**—Do not publish from App-V server.
   - **True**—Publish from App-V server.
8. To add App-V packages to this connection group, click **Add**. The **Add Connection Group Packages** dialog box opens.
9. Under **Select Connected Packages**, select the group in the tree that contains the App-V package that you want to add to the connection group. The packages in that group are listed under **Applications**.



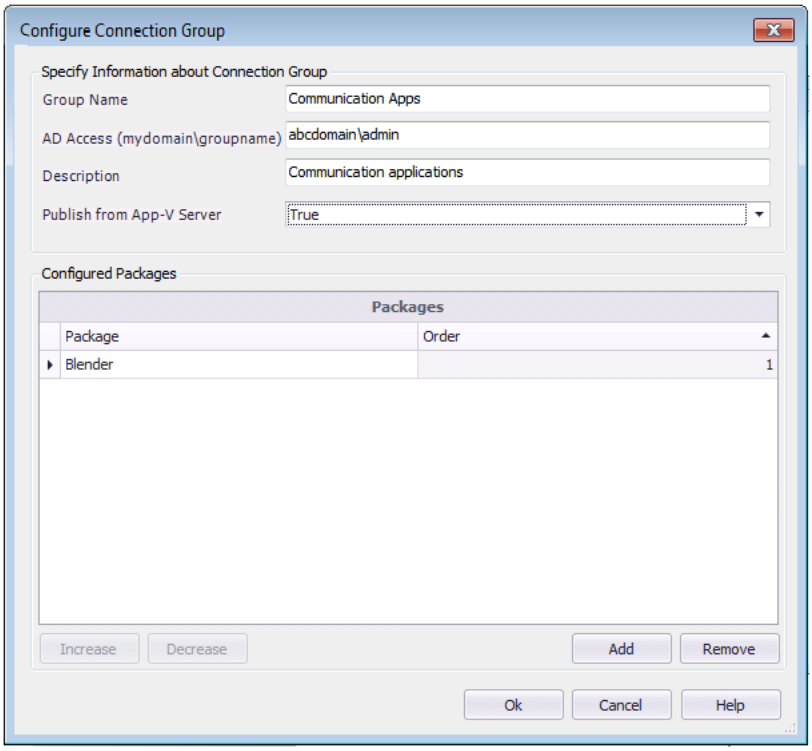
10. Under **Applications**, select an application that contains an App-V 5.0 package. The App-V 5.0 package is listed in the lower pane.

Note • *If you select an application that does not have an App-V 5.0 deployment type, nothing will be listed in the lower pane.*

11. Select the App-V 5.0 package and click **Apply**.



The App-V 5.0 package is now listed under **Configured Packages** on the **Configure Connection Group** dialog box.



12. Repeat above steps to add additional App-V 5.0 packages to the connection group.

Note • *The order of packages in the connection group is important. This determines the order in which the package contents are merged. So, if there was a conflict (example: same registry value), the content of the first package would be used.*

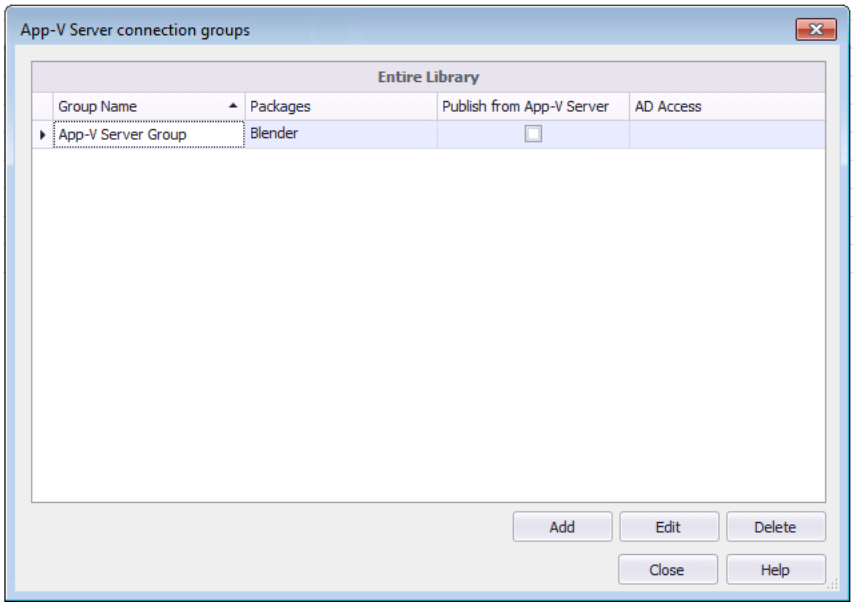
13. When you are done adding App-V 5.0 packages to the connection group, click **OK**. The new connection group is now listed on the **App-V Server Connection Groups** dialog box.
14. Click **Close**.

Editing an Existing App-V Server Virtual Environment

To edit an existing App-V Server connection group, perform the following steps:

Task ***To edit an existing App-V Server connection group:***

1. Open the **Catalog** tab of Application Manager.
2. Click **App-V Virtual Environments > App-V Server Environment** in the ribbon. The **App-V Server Connection Groups** dialog box opens, listing any defined App-V Server connection groups.



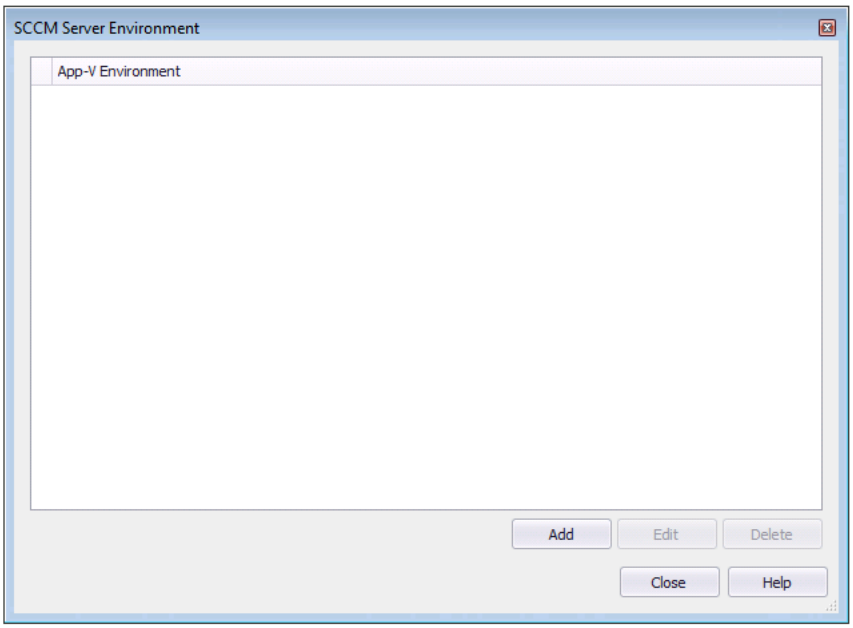
3. Select the App-V Server connection group that you want to edit and click **Edit**.
4. Proceed with your edits, as described in Creating an App-V Server Virtual Environment.

Creating a System Center Configuration Manager Server Virtual Environment

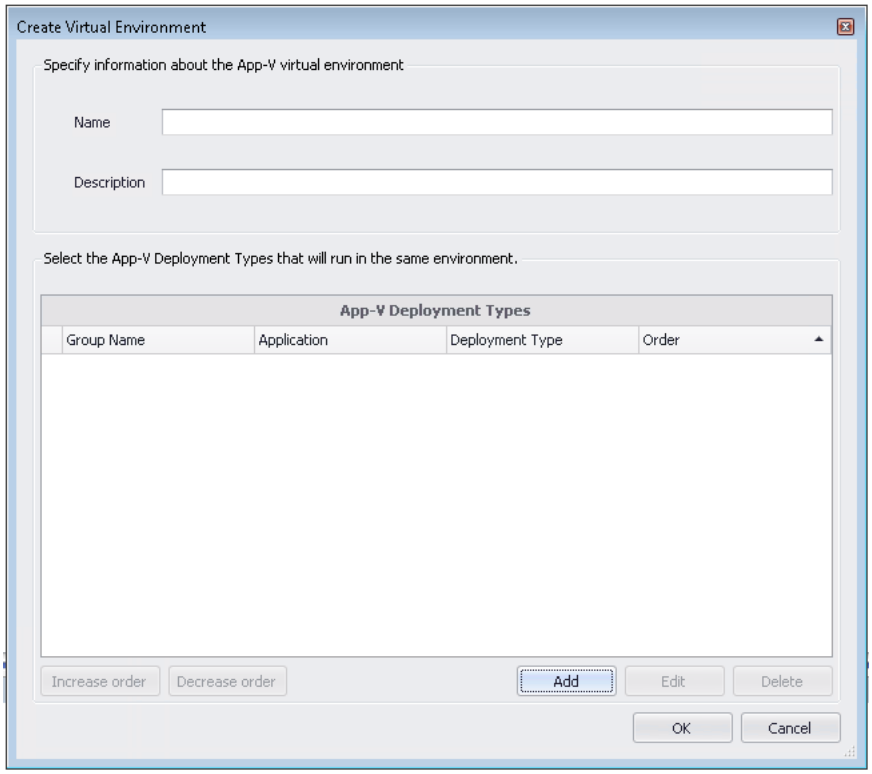
To create a System Center Configuration Manager Server App-V virtual environment for App-V 5.0 packages, perform the following steps:

Task ***To create a System Center Configuration Manager Server App-V virtual environment:***

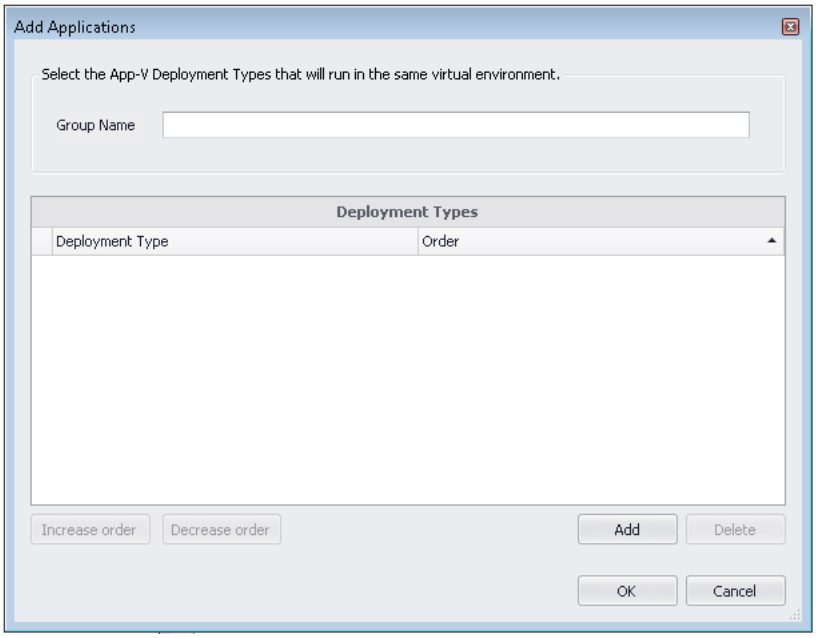
1. Open the Catalog tab of Application Manager.
2. Select a package in the tree and open the **Deployment Data** subtab of the **Catalog Deployment Type View**.
3. Click **App-V Virtual Environments** in the ribbon and then select **SCCM Server Environment**. The **SCCM Server Environment** dialog box opens.



4. Click **Add**. The **Create Virtual Environment** dialog box opens.

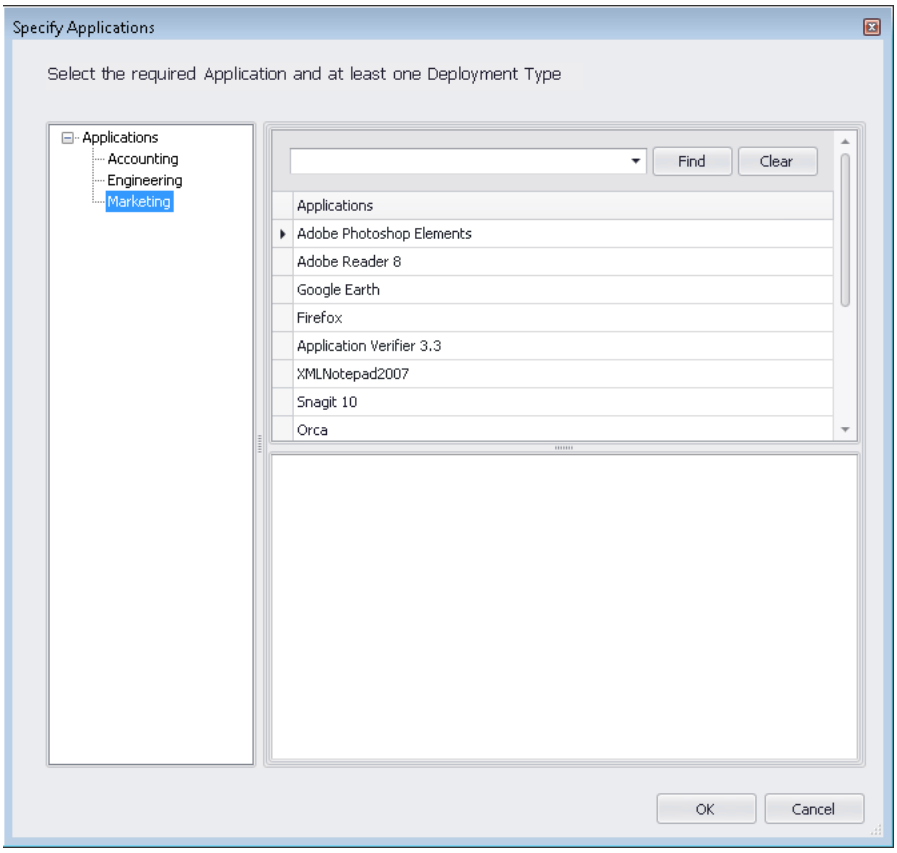


5. In the **Name** field, enter a name to identify this virtual environment.
6. In the **Description** field, enter a description of the purpose of this virtual environment.
7. Click **Add** to add an App-V deployment type group. The **Add Applications** dialog box opens.



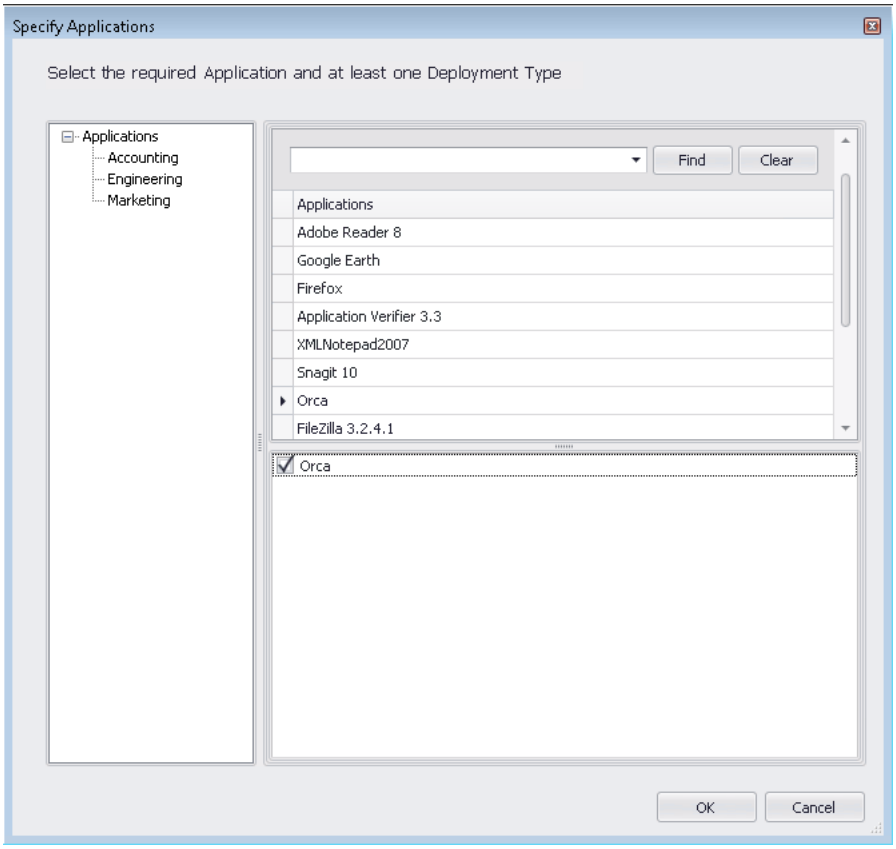
8. Enter a **Group Name** to identify the group of App-V 5.0 packages that you are going to add.

9. Click **Add**. The **Specify Applications** dialog box opens, which provides a tree structure that you can use to select an App-V 5.0 application.



10. In the tree structure on the left, select the group that contains the App-V 5.0 package that you want to add. The names of the applications in that group are listed in the top pane.

11. In the top pane, select the application that contains the App-V 5.0 package that you want to add. The App-V 5.0 deployment type is listed in the lower pane.



12. Select the App-V 5.0 deployment type and click **OK**. The selected package is now listed on the **Add Applications** dialog box.

Note • *If more than one deployment type is listed on the **Add Applications** dialog box, you could use the **Increase order** and **Decrease order** buttons to reorder the list. When multiple virtual applications modify the same file system or registry values on a client computer, the application with the highest order will take precedence.*

13. Click **OK**. The group containing the selected App-V 5.0 package is now listed on the **Create Virtual Environment** dialog box.

Note • *If more than one group is listed on the **Create Virtual Environment** dialog box, you could use the **Increase order** and **Decrease order** buttons to reorder the list. When multiple virtual applications modify the same file system or registry values on a client computer, the application with the highest order will take precedence.*

14. Click **OK**. The new App-V virtual environment is now listed on the **SCCM Server Environment** dialog box.

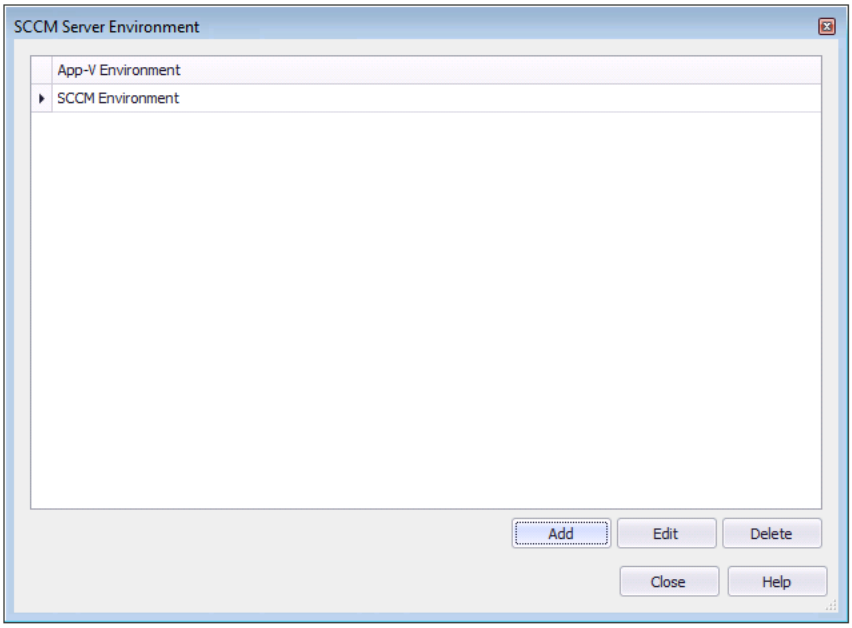
15. Click **Close**.

Editing an Existing System Center Configuration Manager Server Virtual Environment

To edit an existing System Center Configuration Manager Server virtual environment, perform the following steps:

Task ***To edit an existing System Center Configuration Manager Server virtual environment:***

1. Open the Catalog tab of Application Manager.
2. Select a package in the tree and open the **Deployment Data** subtab of the **Catalog Deployment Type View**.
3. Click **App-V Virtual Environments** in the ribbon and then select **SCCM Server Environment**. The **SCCM Server Environment** dialog box opens, listing any defined App-V virtual environments.



4. Select the virtual environment that you want to edit and click **Edit**.
5. Proceed with your edits, as described in Creating a System Center Configuration Manager Server Virtual Environment.

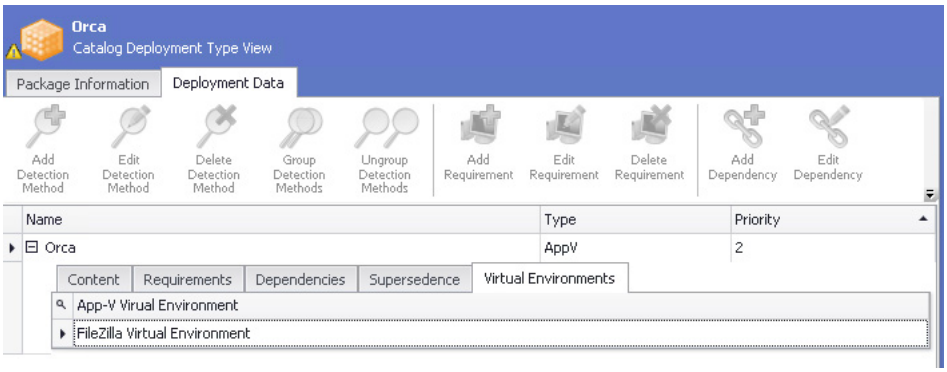
Viewing a Package's System Center Configuration Manager Server Virtual Environments

You can view the virtual environments that a package is a member of on the **Virtual Environments** subtab of the **Catalog Deployment Type View > Deployment Data** tab of an App-V 5.0 package.

Task ***To view an existing App-V virtual environment:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Select an App-V 5.0 package in the tree. The **Catalog Deployment Type View** opens.

3. Click the **Deployment Data** tab and open the **Virtual Environments** subtab. Existing virtual environments that the package is a member of are listed.



Viewing Additional Package Data

If you click on the plus sign to expand a package in the Application Manager **Catalog Deployment Type View**, a node is listed for each available constituent view. For example, for a Windows Installer package when the **Catalog** tab is selected, the following nodes are listed:

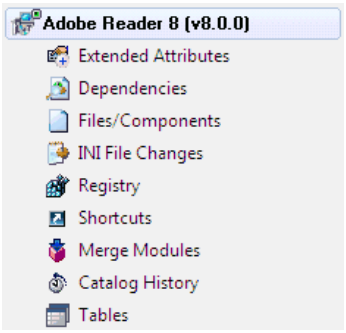


Figure 7-23: Windows Installer Package Nodes / **Catalog** Tab

When you select one of these nodes, a constituent view opens in the right pane. The following types of package data can be viewed by selecting a package subnode in the **Catalog Deployment Type View**:

- Viewing and Editing Package Extended Attributes
- Viewing Package Dependencies
- Viewing Package Files, Components, and Directories
- Viewing Windows Installer Package INI File Changes
- Viewing Registry Information
- Viewing Package Shortcuts
- Viewing Windows Installer Package Merge Modules
- Viewing Package Catalog History
- Viewing App-V Package History

- Viewing Package Tables
- Viewing App-V Package File Type Associations
- Viewing App-V Package Environment Variables

Viewing and Editing Package Extended Attributes

Extended attributes are optional attributes for packages, defined by an Package Extended Attribute Description File (in XML format). Because you can manually create the description file, you have the flexibility to include information about each package that may be specific to your organization—such as the users or business groups that receive the package.

Extended attributes can be edited in the **Extended Attributes View** on a package-by-package basis.

The following tasks and concepts relate to extended attributes:

- Using Package Extended Attributes
- Package Extended Attribute Description File
- Integrating Package Extended Attribute Data with a Workflow Request

Note • *In addition to Windows Installer packages, you can also view and edit Extended Attributes for Microsoft App-V, Citrix XenApp, and VMware ThinApp virtual packages, as well as for non-Windows Installer legacy packages.*

Using Package Extended Attributes

Assuming you have created a package extended attribute description file (or are using the default provided file), you can configure Application Manager to use it with the current Application Catalog.

Task ***To use extended attributes in Application Manager:***

1. On the Application Manager tab menu, click **Options**. The **Options** dialog box opens.
2. Under **General Options**, click **General**. The **General** tab opens.
3. In the **Extended Attribute Description File** field, specify or browse to the extended attribute description file (**.xml**) containing the extended attributes you want to use for Application Manager.
4. Click **OK**.

The **Extended Attributes View** is available under each package in Application Manager.

Caution • *The default Extended Attribute description file is named **EA_Default.xml**, and is installed in the **AdminStudio Shared** folder. You can modify the data displayed in the **Extended Attributes** view, but to do this, do not edit the **EA_Default.xml** file. Instead, copy the **EA_Default.xml** file, rename it, make your edits to the new file, and then enter the new file name and location in the **Extended Attribute Description File** field on the **General** tab of the Application Manager **Options** dialog box.*

Package Extended Attribute Description File

Application Manager uses an XML file to describe the data that appears in a package's **Extended Attributes** view. The name and location of this XML file can be specified on the **General** tab of the Application Manager **Options** dialog box.

Caution • *The default package Extended Attribute description file is named* ***EA_Default.xml****, and is installed in the* ***AdminStudio Shared*** *folder. You can modify the data displayed in the* ***Extended Attributes*** *view, but to do this, do not edit the* ***EA_Default.xml*** *file. Instead, copy the* ***EA_Default.xml*** *file, rename it, make your edits to the new file, and then enter the new file name and location in the* ***Extended Attribute Description File*** *field on the* ***General*** *tab of the Application Manager* ***Options*** *dialog box.*

Description File Properties

The description file, which is in XML format, contains tags for each extended attribute (up to a limit of 400 attributes). It supports text or file values. The following list explains each tag available in the description file.

Table 7-20 • Description File Tags

Attribute	Description
UniqueIdentifier	This value, which Application Manager uses to validate that the XML file is for extended attributes, must be set to ISASEA40.
Name	The name of the attribute as it appears in the Extended Attributes view. This cannot exceed 255 characters.
Type	The extended attribute type. This can be Text, File, or Selection. If no type is specified, then Application Manager defaults the attribute to text.
DefaultValue	This tag, available only for Text types, provides the default value for the attribute. This optional value cannot exceed 512 characters.
DefaultFileExtension	This tag, available only for File types, provides the default file extension when you browse for the file. Examples of this could be *.txt, *.bmp, *.doc, or *.* (representing all files).
FileFilter	Provide the file types to populate the File type filter in the Browse dialog box. These must be in pairs, and in the format Longname (*.ext)|*.ext. Before the closing </FileFilter> tag, you must have two pipe symbols (||). For example, to include filters for text files, bitmaps, and all files, use the following line: `<FileFilter>Text Document (*.txt)|*.txt|Bitmap (*.bmp)|*.bmp|All Files (*.*)|*.*||</FileFilter>` This value cannot exceed 255 characters.
Caption	The caption for the Browse dialog box when using File types. This cannot exceed 255 characters.

Table 7-20 • Description File Tags

Attribute	Description
Values	Used only for Selection types, this is a semicolon-delimited list of possible values for the selection. These will appear in a drop-down list for the extended attribute. The first value is used as the default. The total number of characters of all the values and necessary semicolons cannot exceed 255 characters.
HelpText	Text that appears below the value field for either Text or Selection attributes. You can use it to provide additional information to help users know what to input. This cannot exceed 512 characters.

Description File Format

An example of an extended attribute description file follows:

```
<Extended_Attribute UniqueIdentifier="ISASEA40">
   <AttributeDetails>
      <Name>Owner</Name>
      <Type>Text</Type>
      <DefaultValue></DefaultValue>
      <HelpText>Provide the name of the package's owner.
      </HelpText>
   </AttributeDetails>
   <AttributeDetails>
      <Name>Test Script</Name>
      <Type>File</Type>
      <DefaultFileExtension>*.*</DefaultFileExtension>
      <FileFilter>All Files (*.*)|*.*||</FileFilter>
      <Caption>Test Script Files</Caption>
   </AttributeDetails>
   <AttributeDetails>
      <Name>Program Type</Name>
      <Type>Selection</Type>
      <Values>Office Application;Utility;
      Graphic Application;Programming Application;Game;Other
      </Values>
      <HelpText>Select the type of application from the
      above list.
      </HelpText>
   </AttributeDetails>
</Extended_Attribute>
```

Integrating Package Extended Attribute Data with a Workflow Request

Note • *AdminStudio Workflow Manager is a Web-based application management system that has integrated functionality with AdminStudio.*

Application Manager allows you to integrate extended attributes with AdminStudio Workflow Manager. This option is enabled by selecting the **Integrate with Workflow Manager** option on the **General** tab of the Application Manager **Options** dialog box.

When the **Integrate with Workflow Manager** option is selected, you can associate extended attribute data for packages in Application Manager with workflows in Workflow Manager. This is accomplished by right-clicking on the package name in the Application Manager tree and selecting **Associate with Workflow Manager Workflow Request** from the shortcut menu.

Task ***To associate a package with a Workflow Manager workflow request:***

1. Open Application Manager.
2. Connect to the AdminStudio Enterprise Server Application Catalog. See Connecting AdminStudio Client Tools to the AdminStudio Enterprise Server Application Catalog.
3. On the **Application Manager** tab menu, click **Options**. The **Options** dialog box opens.
4. In the **Extended Attributes** area of the **General** tab, confirm that the **Integrate with Workflow Manager** option is selected.
5. In the Application Manager tree, right-click on the product that you want to link to Workflow Manager and select **Associate with Workflow Manager Workflow Request** from the shortcut menu.

   The **Associate with Workflow Manager Workflow Request** dialog box opens.
6. Pick the application in Workflow Manager with which you want to associate this product.

Assuming that Workflow Manager is configured to use the same extended attributes file, if you enter new data into the **Extended Attributes** view in Application Manager for a package, Workflow Manager automatically detects it; if changes are made in Workflow Manager, they are automatically reflected in Application Manager.

By design, extended attributes data in Application Manager and Workflow Manager data have a one-to-one relationship. You can only associate one Workflow Manager workflow with a package in Application Manager; once the workflow is associated, it is no longer available for association with other Application Manager packages.

***Note** • Another integration feature between AdminStudio and Workflow Manager is that when you associate a package with a Workflow Manager workflow request and then view that workflow request's Workflow Report, there is a link to open the Package Report of its associated package. There is also a link on the Package Report to open the Workflow Report of its associated workflow request.*

Viewing Package Dependencies

You can view package dependency information for both Windows Installer and App-V 4.x packages:

- Viewing Windows Installer Package Dependencies
- Viewing App-V Package Dependencies

Viewing Windows Installer Package Dependencies

On the **Dependencies View**, which is accessed by selecting the **Dependencies** node under a Windows Installer package in the **Catalog Deployment Type View,** you can view a list of all of the files of a selected package that have dependencies with files used by other packages or operating systems in the Application Catalog. This view is displayed for Windows Installer **.msi** packages in which file dependency information exists.

***Note** • If the **Only Display View Nodes With Data** option on the **General** tab of the Application Manager **Options** dialog box is selected, if no dependencies are found, the **Dependencies** node will not be displayed.*

File-level package dependency information is extracted using the **Auto detect dependencies** option of the **Dependency Wizard**, as described in Scanning for Dependencies.

Task ***To view Windows Installer package dependencies:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer package in the Application Manager tree and select the **Dependencies** node. The **Dependencies View** opens.
3. Make selections from the **Files With Dependencies** list to further refine this listing, or select **(All)** to display all dependencies.
4. Review the following information:

Option	Description
File Name	Name of the file contained in the Windows Installer package; all other columns describe dependencies for this file.
Architecture	Machine architecture for the file.
16 bit	Signifies whether the file is meant for 16-bit machines.
Terminal Server Aware	Signifies whether the file is Terminal Server aware or not.
.NET Assembly	Shows **NotCLR** if the file is not a .NET assembly; otherwise it displays the version of .NET it depends upon.
SubSystem	Signifies the sub-system for the file.
Signed	Signifies whether the file is digitally signed.
Signee	If the file is signed, this columns lists the name of the signee.
PE Dependent on	Lists other files that this one depends on.
PE Language	The language for the file.

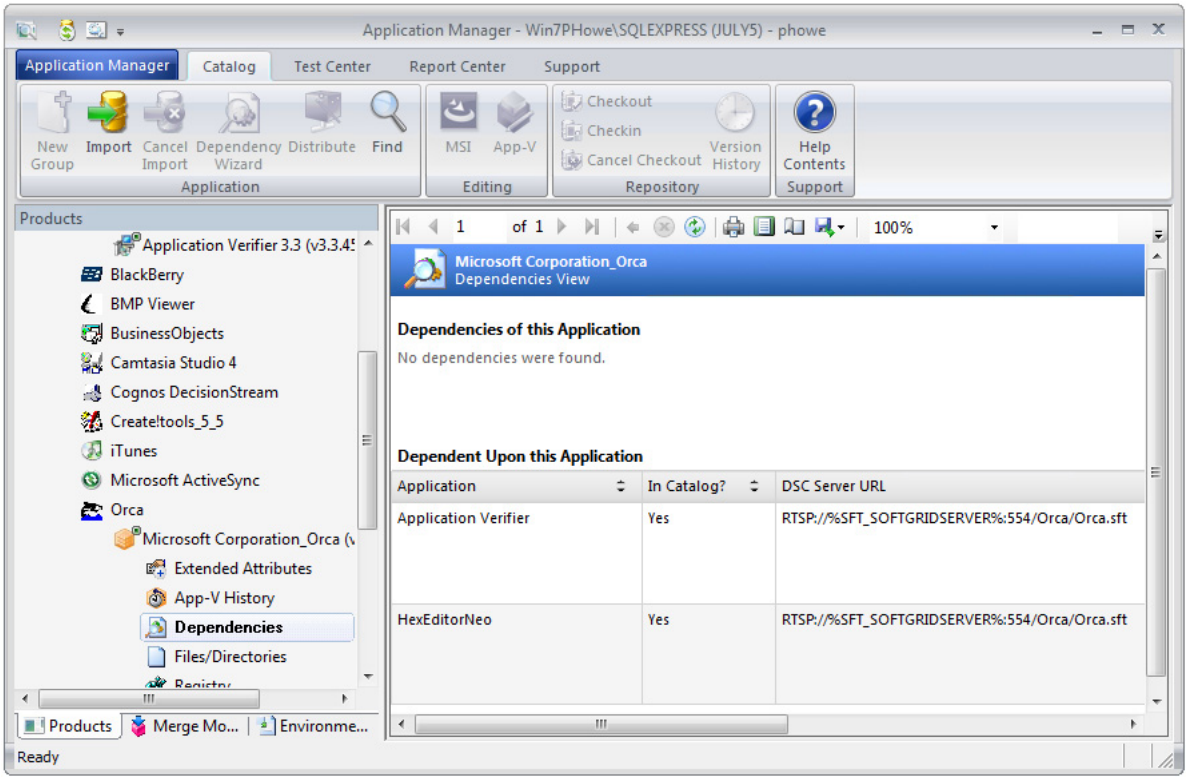
Viewing App-V Package Dependencies

Note • *This information applies to App-V 4.x packages.*

The App-V **Dependencies View** lists both the applications the App-V package is dependent on and the applications dependent upon this App-V package. To view App-V package dependencies, perform the following steps.

Task ***To view App-V package dependencies:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. In the tree, expand an App-V package and select the **Dependencies** node. The **Dependencies View** opens.



This view lists both the applications this App-V package is dependent on and the applications dependent upon this App-V package. For each dependency, the following information is listed:

- Application
- In Catalog? (Yes / No)
- DSC Server URL
- Server URL
- Mandatory? (Yes / No)

Viewing Package Files, Components, and Directories

You can view files, components, and directories information for both Windows Installer and App-V packages:

- Viewing Windows Installer Package Files and Components
- Viewing App-V Package Files and Directories

Viewing Windows Installer Package Files and Components

To display the files and components in a Windows Installer package, expand the Windows Installer package in the Application Manager tree and select the **Files/Components** node.

Task ***To view Windows Installer package Files/Components:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer package in the Application Manager tree and select the **Files/Components** node. The **Files/Components View** opens.
3. Review the following information:

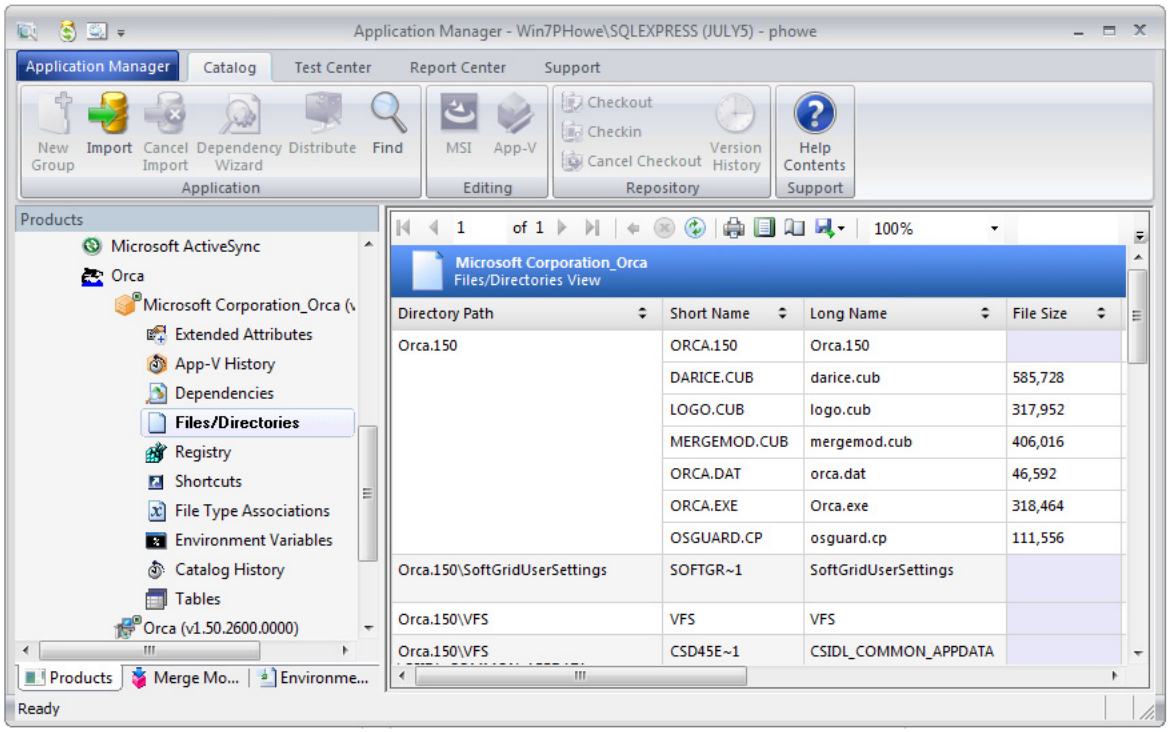
Column	Description
Component	Name of component that the file listed in the FileName column is associated with.
FileName	Name of file.
FileSize	Size of the file listed in the FileName column.
Version	Version of the file listed in the FileName column.
Path	Installation location of the file listed in the FileName column.

Viewing App-V Package Files and Directories

The App-V **Files/Directories View** lists the files and directories included in the App-V package.To view App-V package files and directories, perform the following steps.

Task ***To view App-V package files and directories:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. In the tree, expand an App-V package and select the **Files/Directories** node. The **Files/Directories View** opens.



The following information is listed for each file/directory:

Column	App-V 4.x	App-V 5
Directory Path	**X**	**X**
Short Name	**X**	
Long Name	**X**	
File Name		**X**
File Size	**X**	**X**
VFS Path	**X**	
Feature Block 1	**X**	**X**
App-V Version	**X**	
App-V Data Type	**X**	

Viewing Windows Installer Package INI File Changes

To display any INI file changes made by a Windows Installer package, expand the Windows Installer package in the Application Manager tree and select the **INI File Changes** node.

Task ***To view Windows Installer package INI file changes:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer package in the Application Manager tree and select the **INI File Changes** node. The **INI File Changes View** opens.
3. Review the following information:

Column	Description
Component	Name of component that makes an entry in the INI File.
FileName	Name of INI File that the component listed in the Component column makes an entry in.
DirProperty	The directory location where the INI File will be installed.
Section	The section of the INI file where this entry is made.
Key	The Key used in the INI File entry
Value	The Value used in the INI File entry.

Viewing Registry Information

You can view registry information for both Windows Installer and App-V packages:

- Viewing Windows Installer Package Registry Information
- Viewing App-V Package Registry Information

Viewing Windows Installer Package Registry Information

To display any registry entries created or changed by a Windows Installer package, expand the Windows Installer package in the Application Manager tree and select the **Registry** node.

Task ***To view Windows Installer package Registry information:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer package in the Application Manager tree and select the **Registry** node. The **Registry View** opens.
3. Review the following information:

Column	Description
Component	The name of the component that is creating a Registry entry.

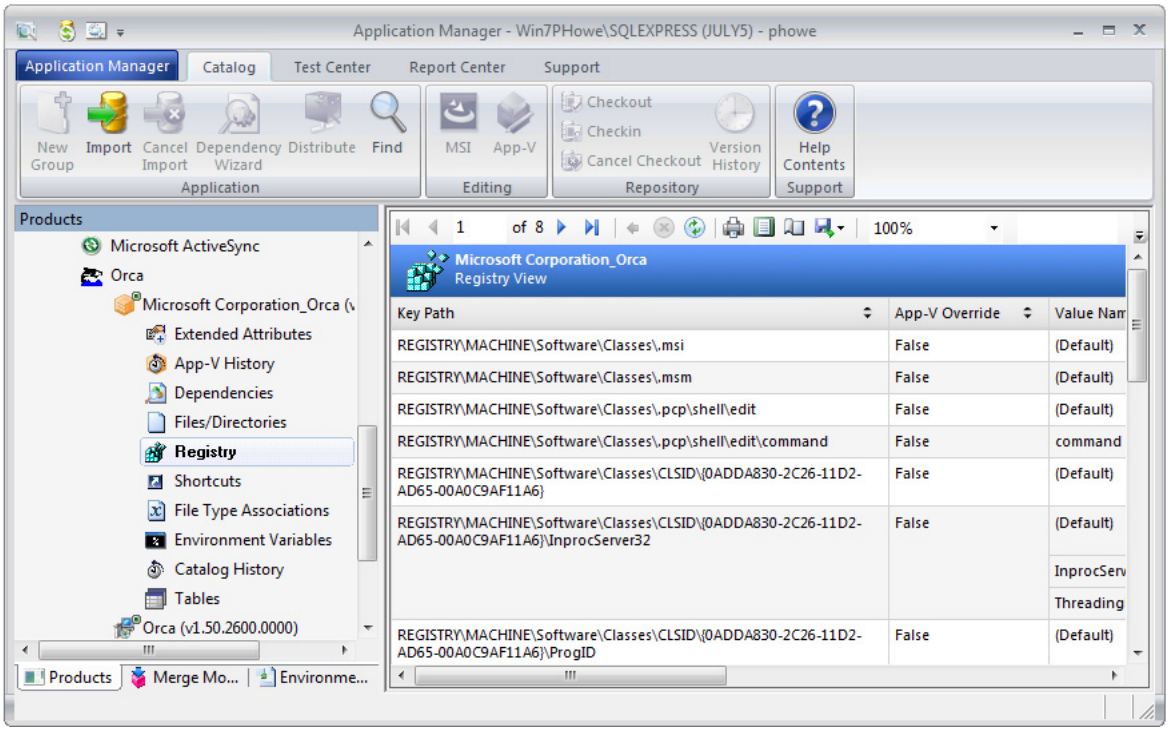
Column	Description
Root	Default value of Key.
Key	Key of the Registry Entry that this component is making.
Name	Name of the Registry Entry that this component is making.
Value	Value of the Registry Entry that this component is making.

Viewing App-V Package Registry Information

The App-V **Registry View** lists any registry entries created or changed by the App-V package. To view the App-V **Registry View**, perform the following steps.

Task ***To view App-V package Registry information:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. In the tree, expand an App-V package and select the **Registry** node. The **App-V Registry View** opens.



For each registry entry, the following information is listed:

- Key Path
- App-V Override
- Value Name

- Data
- Type

Viewing Package Shortcuts

You can view shortcut information for both Windows Installer and App-V packages:

- Viewing Windows Installer Package Shortcuts
- Viewing App-V Package Shortcuts

Viewing Windows Installer Package Shortcuts

To display any shortcuts created by a Windows Installer package, expand the Windows Installer package in the Application Manager tree and select the **Shortcuts** node.

Task ***To view Windows Installer package Shortcuts:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer package in the Application Manager tree and select the **Shortcuts** node. The **Shortcuts View** opens.
3. Review the following information:

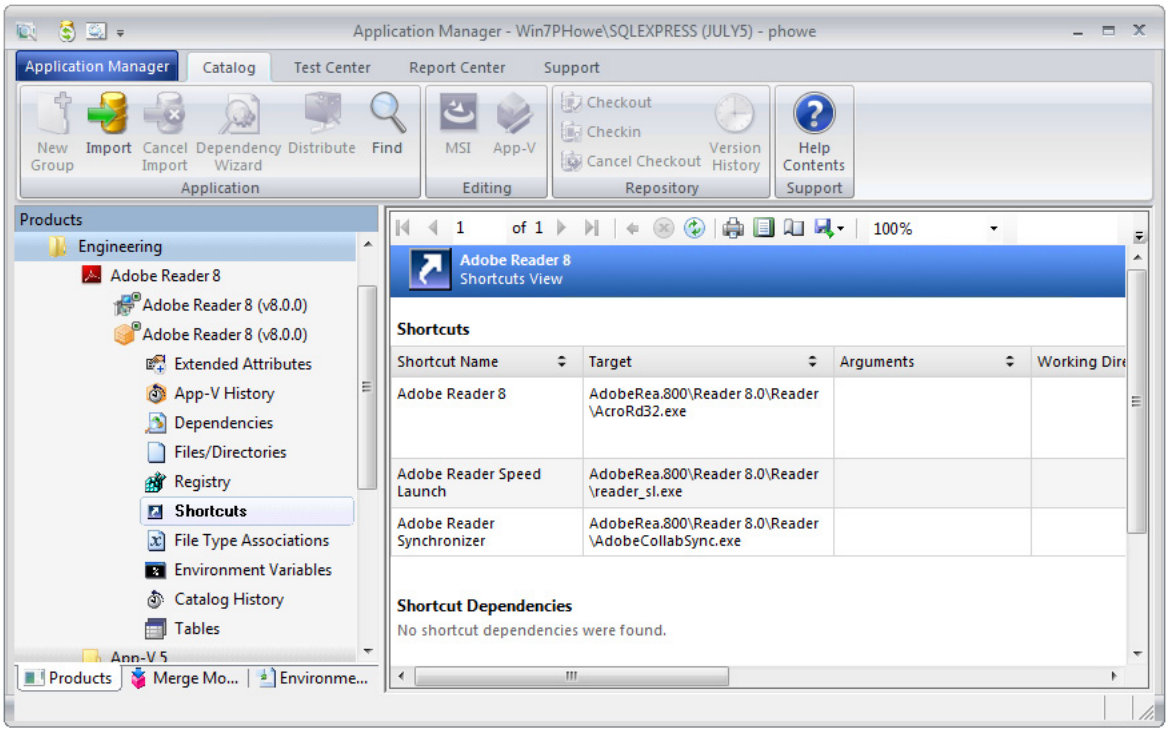
Column	Description
Component	Name of the component that the shortcut listed in the Name column is associated with.
Name	Name of the shortcut.
Directory_	Directory where the shortcut will exist.
Target	Directory and executable that the shortcut invokes.

Viewing App-V Package Shortcuts

The App-V **Shortcuts View** lists any shortcuts created by the App-V package. To view the App-V **Shortcuts View**, perform the following steps.

Task ***To view App-V package shortcuts:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. In the tree, expand an App-V package and select the **Shortcuts** node. The **Shortcuts View** opens.



Under the **Shortcuts** subheading, the following information is listed for each shortcut:

- Shortcut Name
- Target
- Arguments
- Working Directory
- Target Version
- Location

Under the **Shortcut Dependency** subheading, the following information is listed for each shortcut dependency:

- Shortcut Name
- Href
- GUID
- Is Mandatory

Under the **Shortcut Script** subheading, the following information is listed for each shortcut script:

- Shortcut Name
- Body (of script)

Important • *The **Shortcut Dependency** and **Shortcut Script** subheadings only apply to App-V 4.x packages.*

Viewing Windows Installer Package Merge Modules

To display any merge modules included with a Windows Installer package, expand the Windows Installer package in the Application Manager tree and select the **Merge Modules** node.

Task ***To view a Windows Installer package's Merge Modules:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer package in the Application Manager tree and select the **Merge Modules** node. The **Merge Modules View** opens.
3. Review the following information:

Column	Description
Title	The title of the Merge Module included with this package.
ModuleID	The number which uniquely identifies the Merge Module listed in the Title column.
Version	The version of the Merge Module listed in the Title column.
Language	The language that the Merge Module listed in the Title column was written for.

Viewing Package Catalog History

The tracking of change history is a critical operation within the Enterprise environment. Maintaining this information, displaying it, and allowing it to be a filter will gives you the information you need to monitor and maintain the integrity of your software packages.

In AdminStudio, any operation that materially changes a software package or the data associated with the package is tracked, and can be viewed in the Application Manager **Catalog History** view.

Task ***To view a package's catalog history:***

1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. In the tree, expand a Windows Installer or App-V package node and select the **Catalog History** node. The **Catalog History** view opens, displaying the following information:

Item	Description
Action	Name of the event which was logged: • Import/Reimport • Validation • Conflict Detection • Conflict Resolution • Extended Attribute Modification • Package Description Modification • Package Move/Copy • Patch Impact Analysis
Date	Date and time logged event occurred.
User	User who performed the logged event.
Description	Description providing details of the logged event.

Note • *If a package was replicated into another Application Catalog, its history data would not be replicated.*

Deleting Package History

To delete all of the entries in a package's History Log File, perform the following steps:

Task ***To delete package history:***

1. Open **Application Manager**.
2. Select the package and right-click to open the shortcut menu.
3. On the shortcut menu, point to **Delete** and click **History Log Information**.

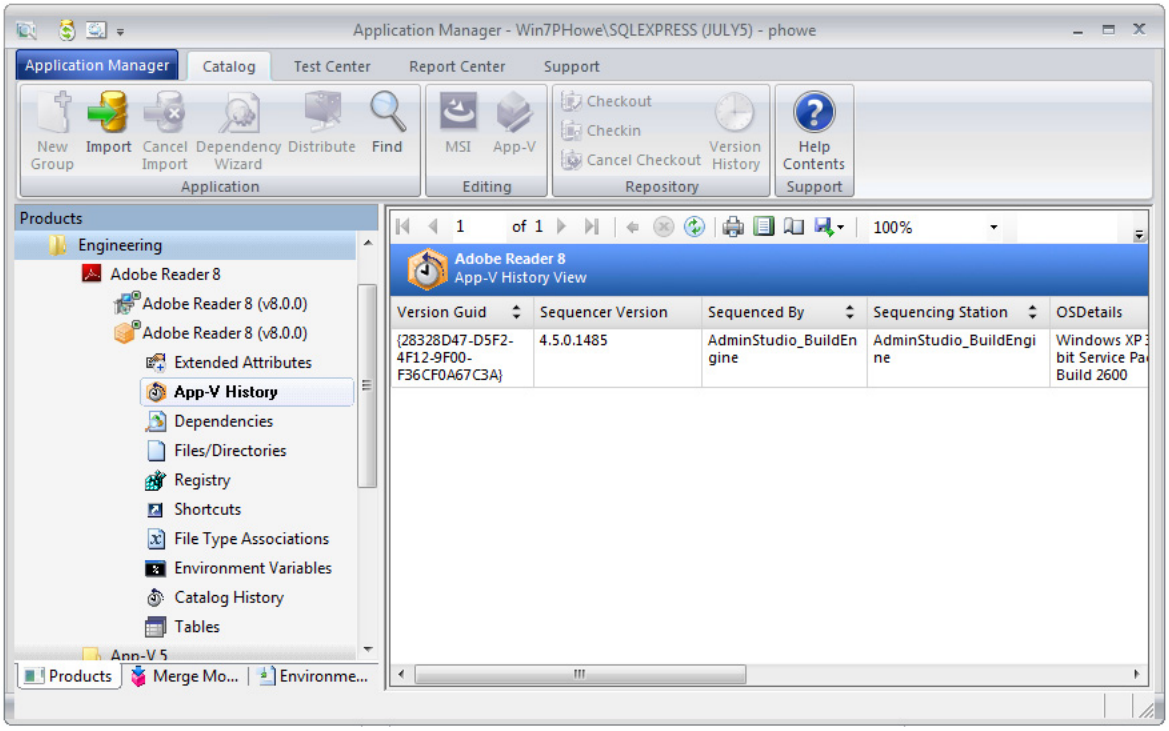
Viewing App-V Package History

Note • *This information applies to App-V 4.x packages.*

The **App-V History View** lists an entry for each time the App-V package has been saved. To view App-V package history, perform the following steps.

Task ***To view App-V package history:***

1. Open **Application Manager** and select the **Catalog** tab in the ribbon.
2. In the tree, expand an App-V package and select the **App-V History** node. The **App-V History View** opens, listing an entry for each time this App-V package has been saved.



For each entry, the following information is displayed:

- Version GUID
- Sequencer Version
- Sequenced By
- Sequencing Station
- OSDetails
- System Folder
- Windows Folder

- User Folder
- .Net Framework Version
- IEVersion

Viewing Package Tables

The **Tables** view provides a way to view table data for a Windows Installer or App-V package in the Application Catalog.

Most tables are derived directly from standard MSI tables, as described in the Windows Installer SDK online help. When building your own ACE rules to use for conflict identification, it is important to understand the data available for packages so you can construct the necessary rule.

To display table information for a package, expand the package in the Application Manager tree and select the **Tables** node.

Task ***To view package tables:***

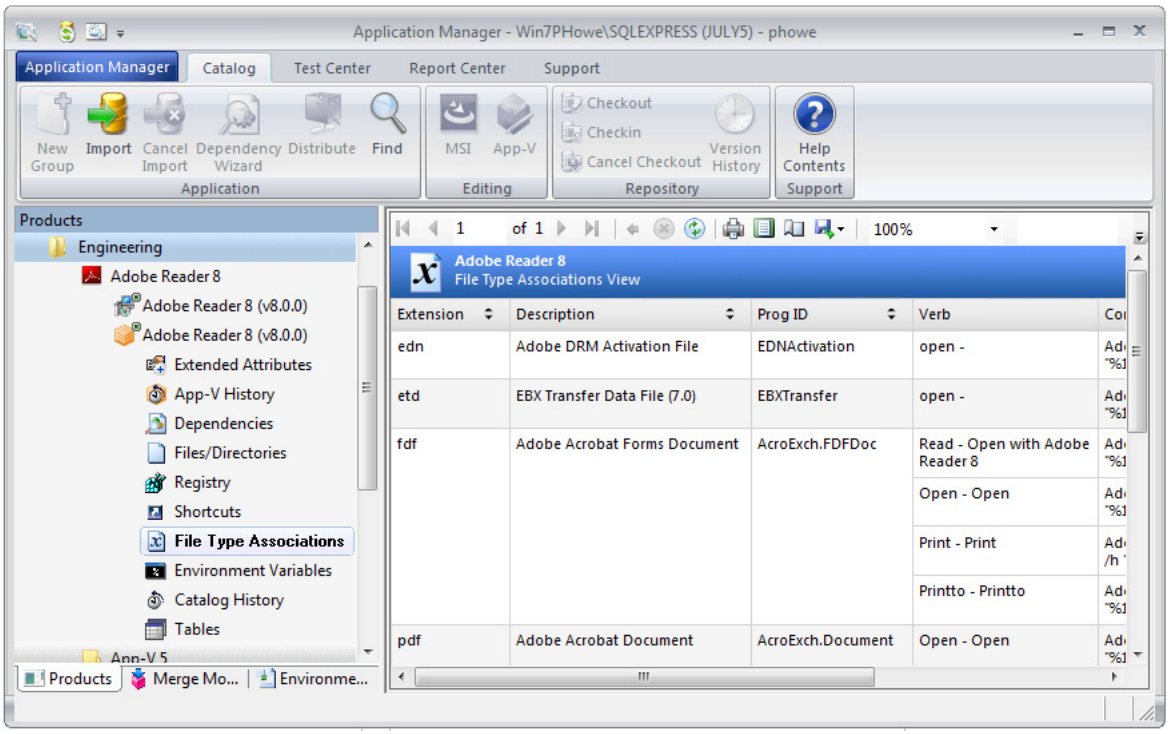
1. Open Application Manager and select the **Catalog** tab of the ribbon.
2. Expand a Windows Installer or App-V package in the Application Manager tree and select the **Tables** node. The **Tables** view opens.
3. Select the specific table you want to view from the **Tables** list at the top of the view.

Viewing App-V Package File Type Associations

The App-V **File Type Associations View** lists an App-V package's file type associations. To view the App-V **File Type Associations View**, perform the following steps.

Task ***To view App-V package file type associations:***

1. Open **Application Manager** and select the **Catalog** tab in the ribbon.
2. In the tree, expand an App-V node and select the **File Type Associations** node. The **File Type Associations View** opens.



The following information is listed for each file type association:

- Extension
- Description
- Prog ID
- Verb
- Command

Viewing App-V Package Environment Variables

The App-V **Environment Variables View** lists an App-V package's environment variables. To view the App-V **Environment Variables View**, perform the following steps.

Task ***To view App-V package file type associations:***

1. Open **Application Manager** and open the **Catalog** tab in the ribbon.
2. In the tree, expand an App-V node and select the **Environment Variables** node. The **Environment Variables View** opens. The following information is listed for each variable:
   - Name
   - Value

Using the Conversion Wizard

Edition • *The Conversion Wizard is included with AdminStudio Professional and Enterprise Editions, and you can use it to perform automated repackaging on a virtual machine. However, if you want to also use it to perform conversion to virtual packages, you need to also purchase the Application Virtualization add-on pack.*

You can use the Application Manager **Conversion Wizard** to perform the following tasks from within Application Manager:

- Convert an App-V 4.x package to App-V 5.0 format
- Convert one or multiple Windows Installer packages or legacy installers to virtual packages using either default or customized Automated Application Converter settings
- Perform automated repackaging of one or multiple Windows Installer packages or legacy installers on a virtual machine.

Information about using the Conversion Wizard is presented in the following topics:

- Setting Conversion Wizard Options
- Converting App-V 4.x Packages to App-V 5.0 Format
- Using the Conversion Wizard to Perform Express Conversion to Virtual Packages or Automated Repackaging

Setting Conversion Wizard Options

Before you can perform conversions using the Conversion Wizard, you must first create an Automated Application Converter settings file and set additional default options.

- Creating an Automated Application Converter Settings File
- Specifying the Default Automated Application Converter Settings File
- Setting App-V 5.0 Conversion Options

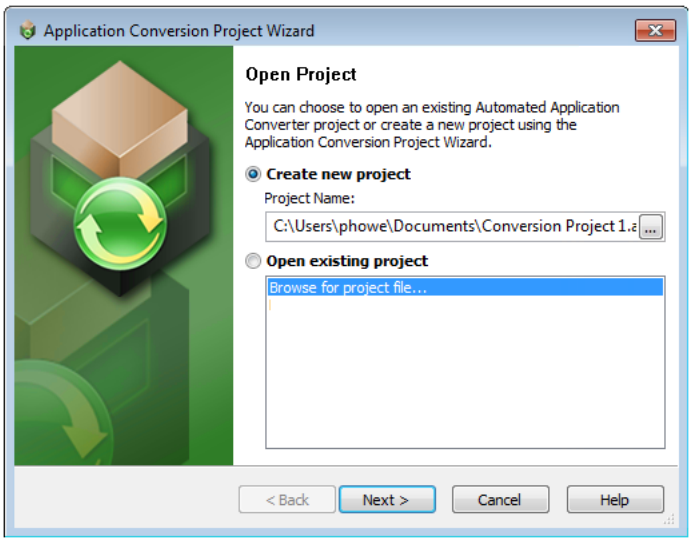
Creating an Automated Application Converter Settings File

In order to use the Conversion Wizard to perform an express conversion of one or multiple Windows Installer packages or legacy installers to virtual packages, you must first create an Automated Application Converter settings file that contains virtual machine login information and conversion defaults.

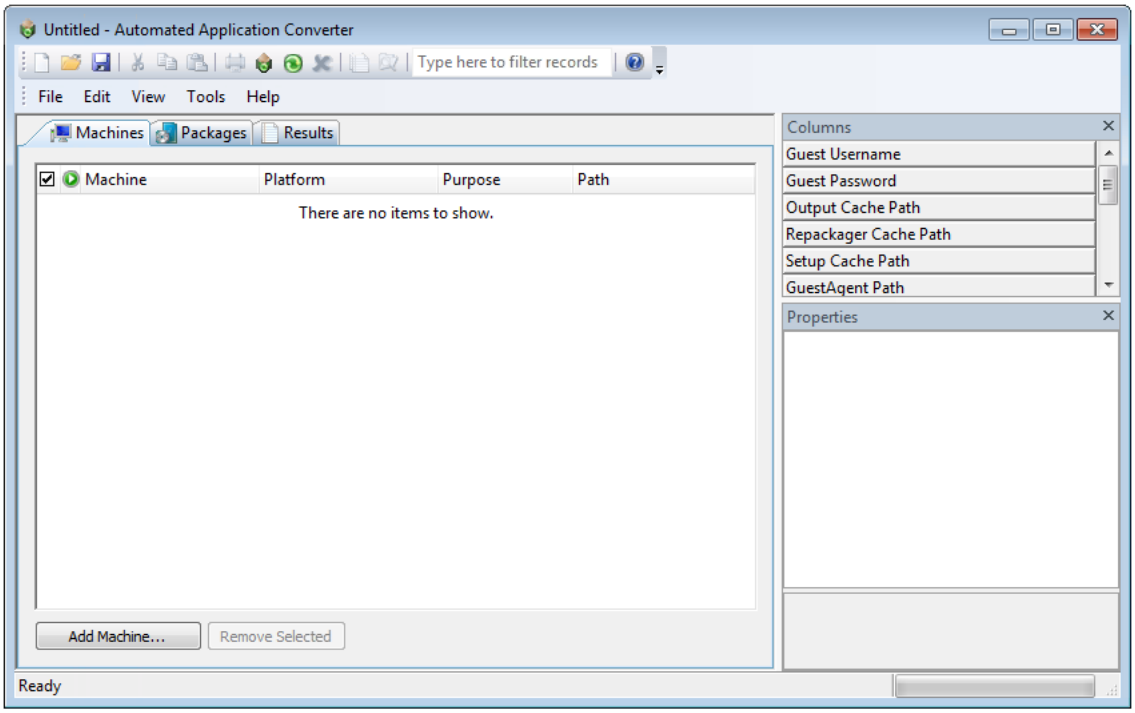
To create an Automated Application Converter settings file, perform the following steps.

Task ***To create an Automated Application Converter settings file:***

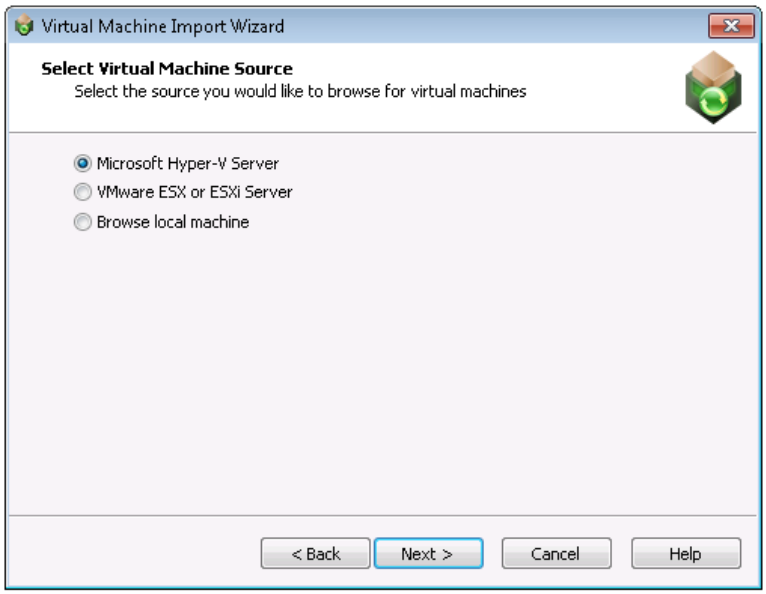
1. Launch Automated Application Converter. The **Open Project** dialog box opens.



2. Click **Cancel**. An untitled project is opened in Automated Application Converter.



3. On the **Machines** tab click **Add Machine**. The **Virtual Machine Import Wizard Welcome** panel opens.
4. Click **Next**. The **Select Virtual Machine Source** panel opens, prompting you to select the type of virtual machine that you are adding.

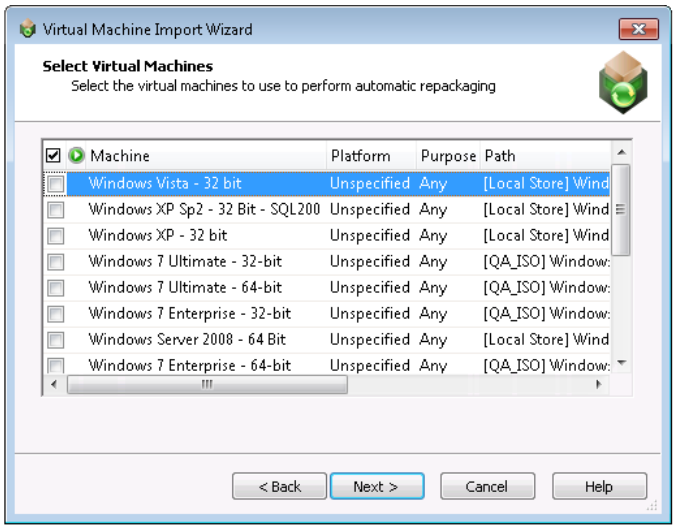


5. Select one of the following options and click **Next**.
   - **Microsoft Hyper-V Server**—Select this option to add a virtual image from a Microsoft Hyper-V Server.
   - **VMware ESX or ESXi Server**—Select this option to add a virtual image from a VMware ESX or ESXi Server.
   - **Browse local machine**—Select this option to add a virtual image from a local installation of VMware Workstation
6. Based upon your selection on the **Select Virtual Machine Source** panel, enter the following information:

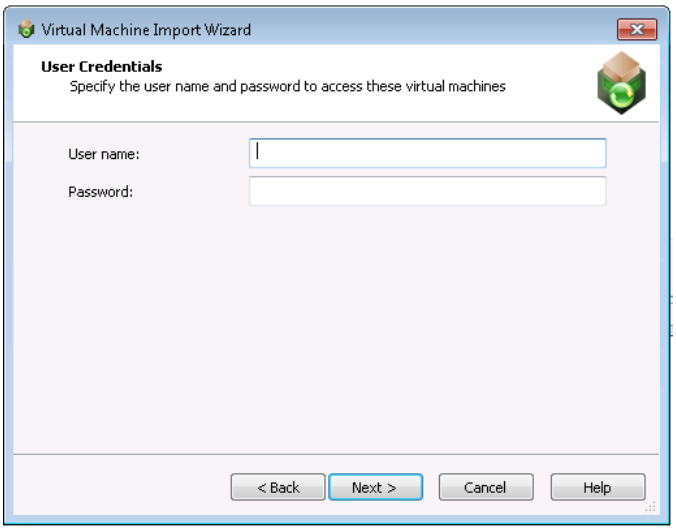
Virtual Machine Source	Steps to Take
Microsoft Hyper-V Server	On the **Select Virtual Machines from a Microsoft Hyper-V Server** panel, enter the following information: • **Server Name**—Enter the server name of the Microsoft Hyper-V Server that you want to connect to. • **Authentication**—Select **Windows Authentication** if you want to use the credentials of the logged in user to login to the Hyper-V Server. Select **Server Authentication** if you want to connect to the Hyper-V Server using the specified **User name** and **Password**.
VMware ESX or ESXi Server	On the **Select Virtual Machines from VMware ESX or ESXi Server** panel, enter the following information: • **Server Name**—Enter the name of the VMware ESX or ESXi server. • **User name**—Enter the login ID for the VMware ESX or ESXi server. • **Password**—Enter the password for the VMware ESX or ESXi server.

Virtual Machine Source	Steps to Take
Browse local machine	On the **Select Virtual Machines** panel, do one of the following: ***To add an individual virtual machine:*** 1. Click **Browse Files**. The **Select Virtual Machine Image File** dialog box opens. 2. Select the virtual machine image you want to add to the project and click **Open**. ***To add all of the virtual machines in a specific directory:*** 1. Click **Browse Folders**. The **Browse for Folder** dialog box opens. 2. Select a directory that contains the virtual machine images that you want to add to your project and click **OK**.

When you have finished this step, the virtual machines will be listed (but not selected) on the **Select Virtual Machines** panel.



7. On the **Select Virtual Machines** panel, select the virtual machine images that you want to use to perform automated repackaging.
8. For each selected image, click in the **Platform** column and identify its platform.
9. Click **Next**. The **User Credentials** panel opens, prompting you to specify the login credentials to use to access the selected virtual machines.



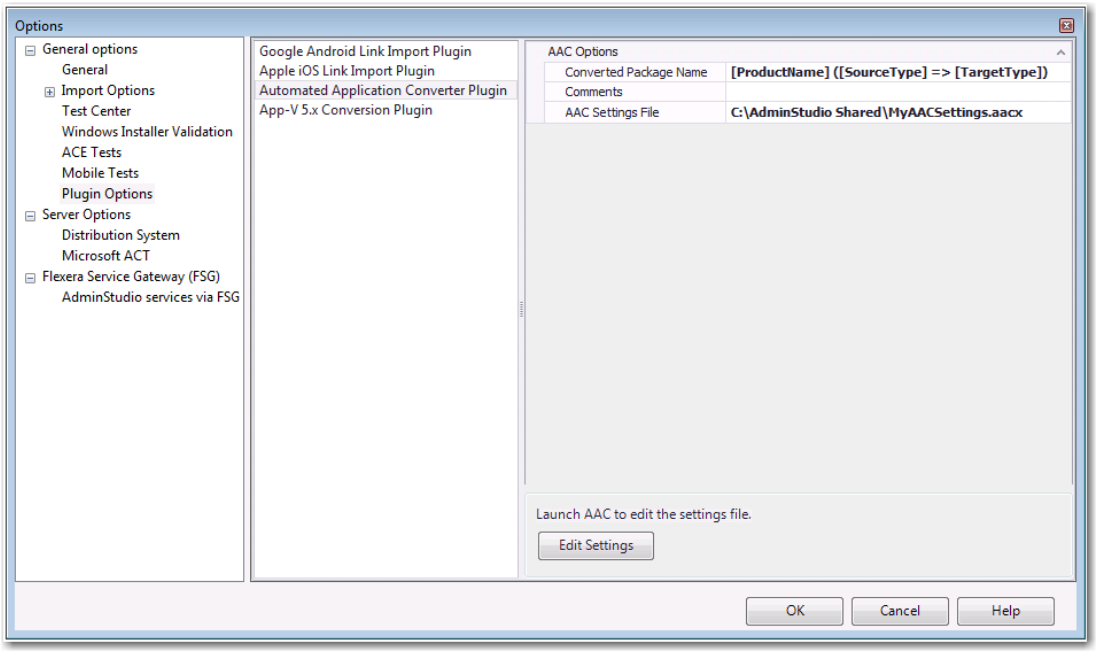
10. Enter the user credentials and click **Next**. The **Virtual Machine Import Wizard Complete** panel opens.
11. Click **Finish** to close the wizard and add the selected virtual machines to your project.
12. On the **File** menu, click **Save** and enter a name for this project file.

Specifying the Default Automated Application Converter Settings File

After you create an Automated Application Converter settings file, as described in Creating an Automated Application Converter Settings File, perform the following steps to specify the default Automated Application Converter settings file.

Task ***To set Automated Application Converter options:***

1. In Application Manager, select **Options** on the Application Manager menu. The **Options** dialog box opens.
2. Open the **General options** > **Plugin Options** tab.
3. In the middle pane, select **Automated Application Converter Plugin**. The Automated Application Converter options are displayed in the right pane.



4. In the **Converted Package Name** field, enter a name to differentiate the converted version of the package from the original version. By default, this field will be populated with the original package name `[ProductName]`. For example:

   - `[ProductName]`
   - `[Manufacturer]_[ProductName]`
   - `[ProductName]_v5`

5. In the **Comments** field, enter metadata that you would like to add to each converted package. This text will be displayed in the **Administrator Comments** field on the **Package Information** tab of the **Catalog Deployment Type View** for each package.

6. In the **AAC Settings File** field, browse to the Automated Application Converter settings file you created in Creating an Automated Application Converter Settings File.

7. Click **OK**.

Editing the Default Automated Application Converter Settings File From Application Manager

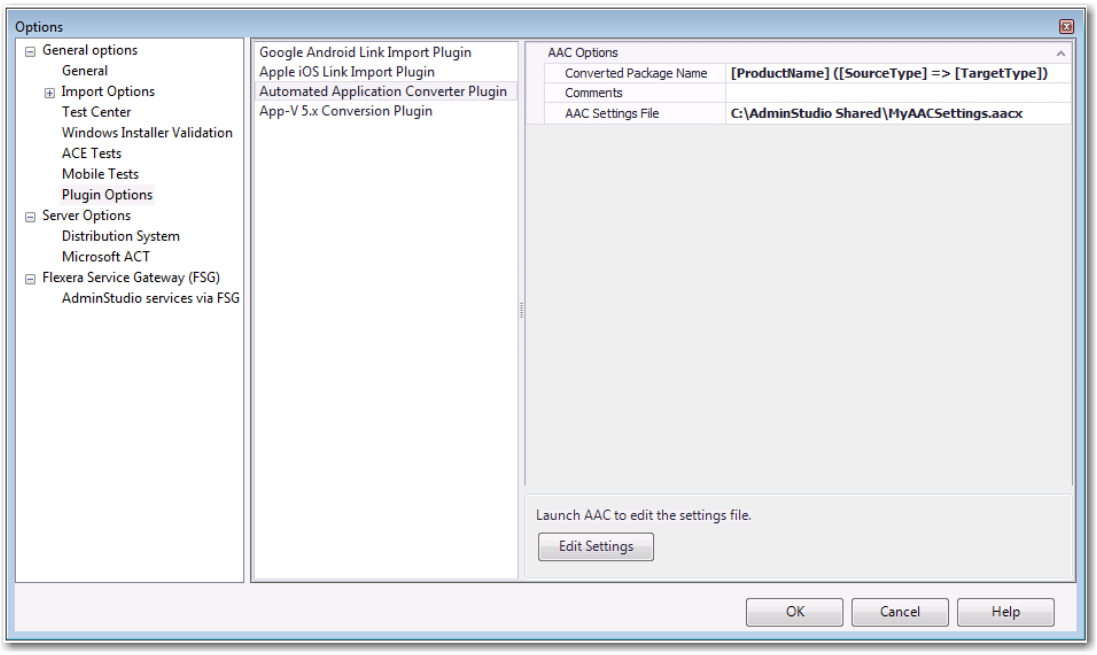
You can easily modify the settings in the default Automated Application Converter Settings file—which is specified on the **Plugin Options** > **Automated Application Converter Plugin** tab of the **Options** dialog box—by clicking the **Edit Settings** button.

Task ***To edit the default Automated Application Converter settings file from Application Manager:***

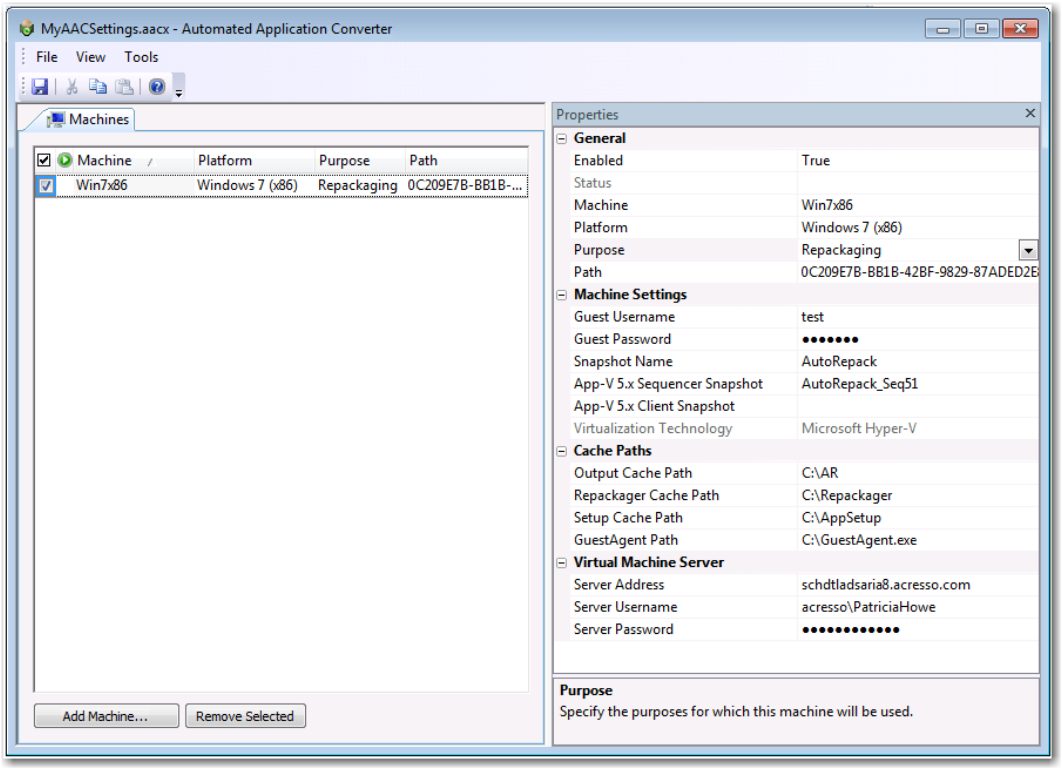
1. In Application Manager, select **Options** on the Application Manager menu. The **Options** dialog box opens.

2. Open the **General options** > **Plugin Options** tab.

3. In the middle pane, select **Automated Application Converter Plugin**. The Automated Application Converter options are displayed in the right pane.



4. Click **Edit Settings**. A limited version of Automated Application Converter opens, displaying the **Machines** tab.



5. Edit any of these default conversion settings, as desired.

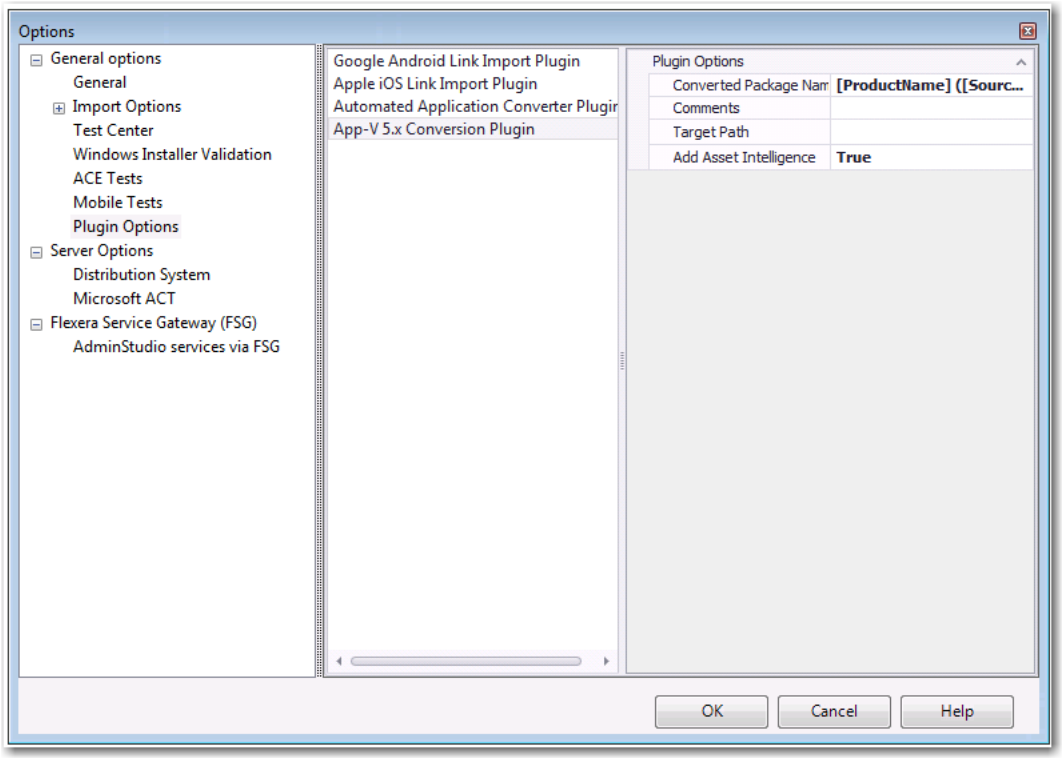
6. Save the settings file and exit Automated Application Converter.

Setting App-V 5.0 Conversion Options

Prior to using the Conversion Wizard to convert an App-V 4.x package to App-V 5.0 format, as described in Converting App-V 4.x Packages to App-V 5.0 Format, you first need to perform the following steps to set App-V 5.0 conversion options in Application Manager.

Task ***To set App-V 5.0 conversion options:***

1. In Application Manager, select **Options** on the Application Manager menu. The **Options** dialog box opens.
2. Open the **General options** > **Plugin Options** tab.
3. In the middle pane, select **App-V 5 Conversion Plugin**. The App-V 5.0 conversion options are displayed in the right pane.



4. In the **New Package Name** field, enter a name to differentiate the converted version of the package from the original version. By default, this field will be populated with the original package name `[ProductName]`. For example:
   - `[ProductName]`
   - `[ProductName]_v5`
   - `[Manufacturer]_[ProductName]_v5`
5. In the **Comments** field, enter metadata that you would like to add to each converted package. This text will be displayed in the **Administrator Comments** field on the **Package Information** tab of the **Catalog Deployment Type View** for each package.
6. In the **Target Path** field, specify the output folder where you want the converted packages to be located.

7. Asset intelligence is used to enhance the inventory capabilities of Microsoft System Center 2012 Configuration Manager by extending hardware inventory and adding license management functionality. The asset intelligence features can report application data such as digital PID, MSI product codes, and publisher names for each virtual application registered on a client computer. To add asset intelligence information to a converted App-V 5.x package, set this option to **True**.
8. Click **OK**.

Converting App-V 4.x Packages to App-V 5.0 Format

You can upgrade an App-V 4.x package or group of packages to App-V 5.0 format directly from Application Manager using the Conversion Wizard.

Important • *To perform this upgrade, the Microsoft Application Virtualization Sequencer Version 5.0 must be installed on the same machine as AdminStudio.*

Important • *If AdminStudio is installed on a Windows 7 (x64) machine, you will need to first set the PowerShell execution policy to "unrestricted" before attempting to use the Conversion Wizard to upgrade an App-V 4.x package to App-V 5.0 format. To do this, execute the following command on an elevated Windows PowerShell (x86) utility:*

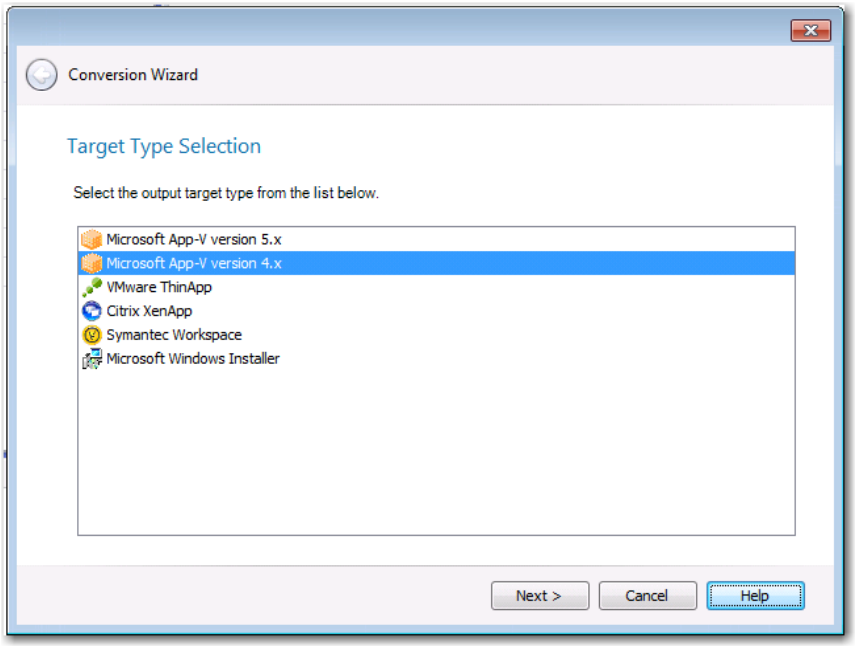
```
Set-ExecutionPolicy Unrestricted
```

Important • *AdminStudio relies on the App-V Sequencer to perform the conversion from 4.x to 5.0. Some elements of highly customized App-V packages are not carried to the 5.0 package during the conversion by the App-V Sequencer. Some of these customizations include OSD scripting and dependencies.*

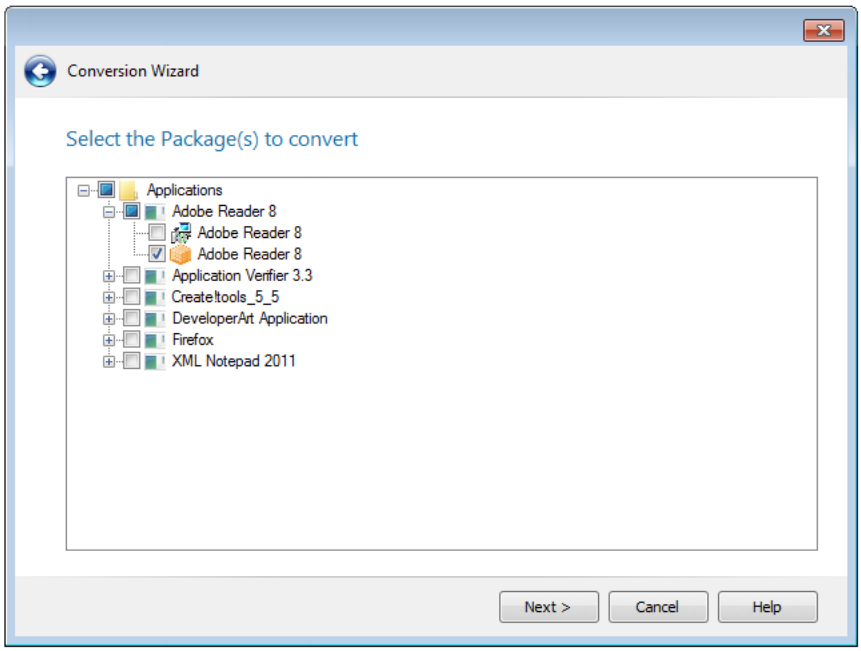
To upgrade App-V packages from version 4.x to 5.0, perform the following steps:

Task ***To upgrade an App-V 4.x package to App-V 5.0 package:***

1. Set App-V 5.0 conversion options, as described in Setting App-V 5.0 Conversion Options.
2. On the Application Manager **Catalog** tab, right-click on one of the following in the tree:
   - App-V 4.x package
   - Application containing an App-V 4.x package
   - Group containing one or multiple App-V 4.x packages
- Select **Launch Conversion Wizard** from the shortcut menu. The **Target Type Selection** panel opens.

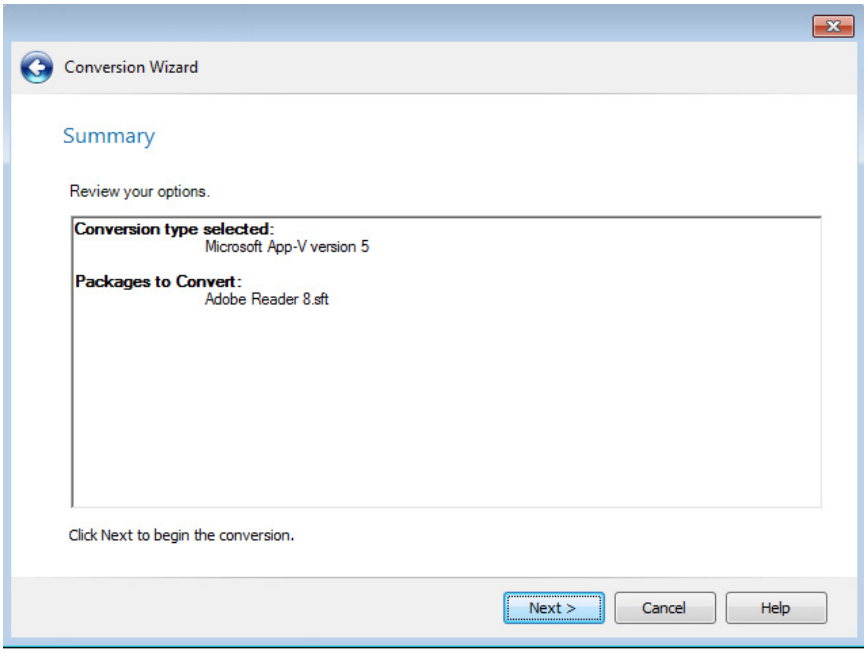


3. Select **Microsoft App-V version 5** and click **Next**. The **Select the Package(s) to convert** panel opens, and the App-V 4.x packages or packages that you had selected when you invoked the Conversion Wizard are selected.

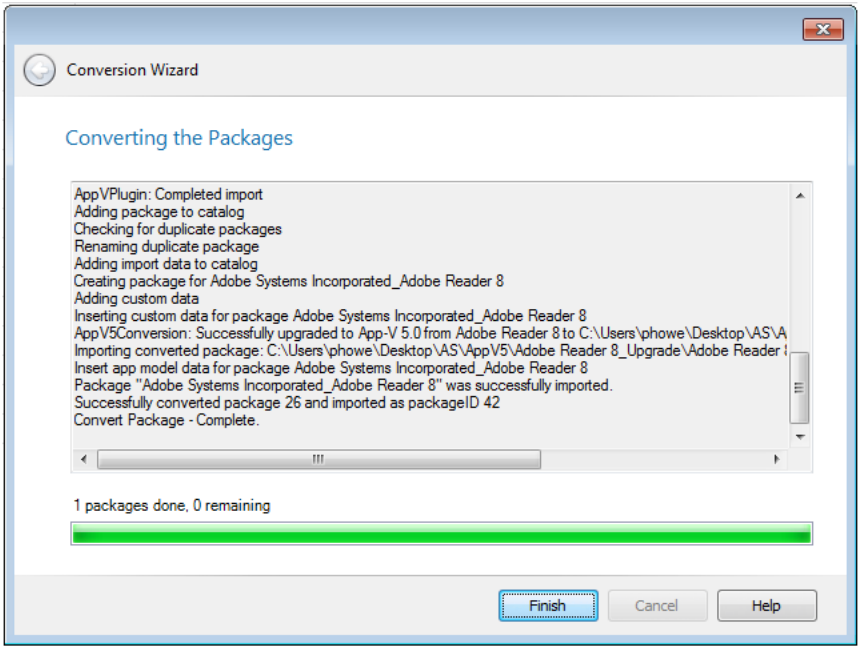


Tip • *In addition to converting App-V 4.x packages to App-V 5.0, you can also use the Conversion Wizard to convert Windows Installer and legacy installers to App-V 5.0 format. See Using the Conversion Wizard to Perform Express Conversion to Virtual Packages or Automated Repackaging.*

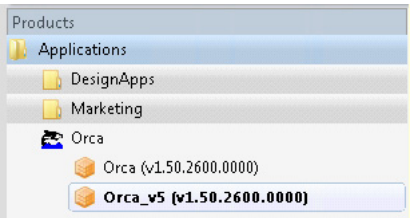
4. Select additional packages, if desired, and click **Next**. The **Summary** panel opens.



5. Click **Next** to begin the conversion. The **Converting the Packages** panel opens.
6. Click **Next**. When conversion is complete, the **Summary** panel opens, confirming that the upgrade has been performed.



7. Click **Finish**. The converted App-V 5.0 package is now listed in the tree, next to the 4.x package.



Using the Conversion Wizard to Perform Express Conversion to Virtual Packages or Automated Repackaging

Edition • *The Conversion Wizard is included with AdminStudio Professional and Enterprise Editions, and you can use it to perform automated repackaging on a virtual machine. However, if you want to also use it to perform express conversion to virtual packages, you need to also purchase the Application Virtualization add-on pack.*

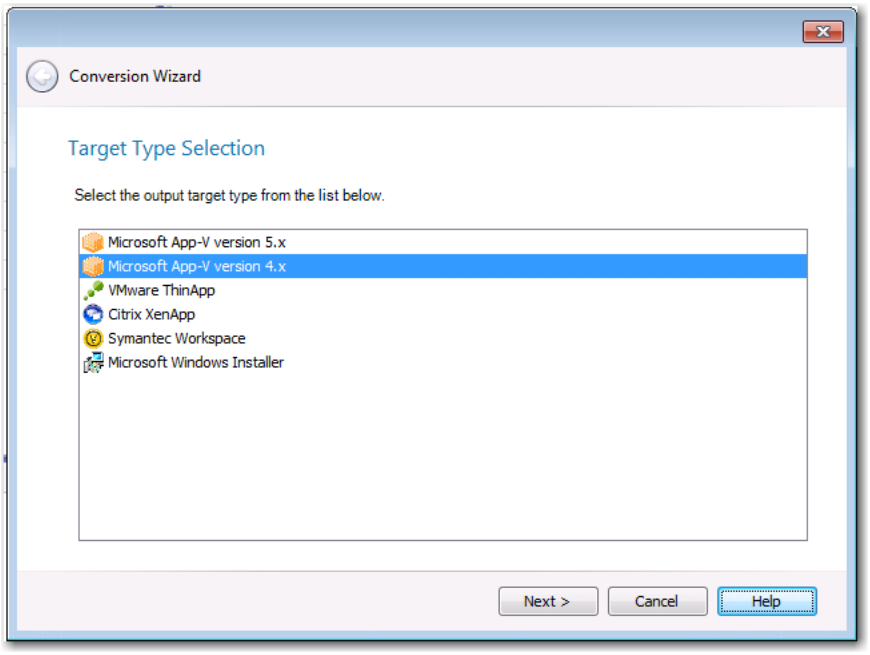
As described in Performing Virtualization and Repackaging Using the Automated Application Converter, you can use the Automated Application Converter tool to convert a single package or a group of packages into Microsoft App-V, VMware ThinApp, Citrix XenApp, and Symantec Workspace virtual application formats. Using Automated Application Converter to perform this task enables you to make a wide variety of customizations by editing a package's general and App-V-related properties prior to conversion.

However, you can also use the Application Manager **Conversion Wizard** to quickly convert one or multiple Windows Installer packages or legacy installers to virtual packages (of the specified type) or repackaged Windows Installer packages using either the *default* Automated Application Converter settings or using settings that are customized for that run of the Conversion Wizard.

To use the Conversion Wizard to perform virtual package conversion or repackaging, perform the following steps:

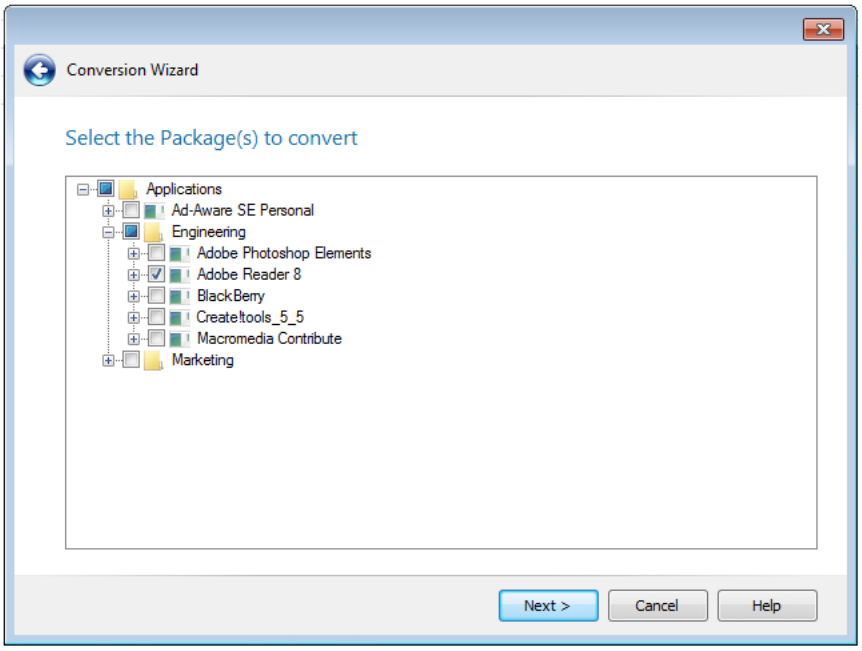
Task ***To use the Conversion Wizard to perform virtual package conversion or repackaging:***

1. On the Application Manager **Catalog** tab, right-click on a Windows Installer package or legacy installer (or a group containing packages of that type) in the tree and select **Launch Conversion Wizard** from the shortcut menu. The **Target Type Selection** panel opens.

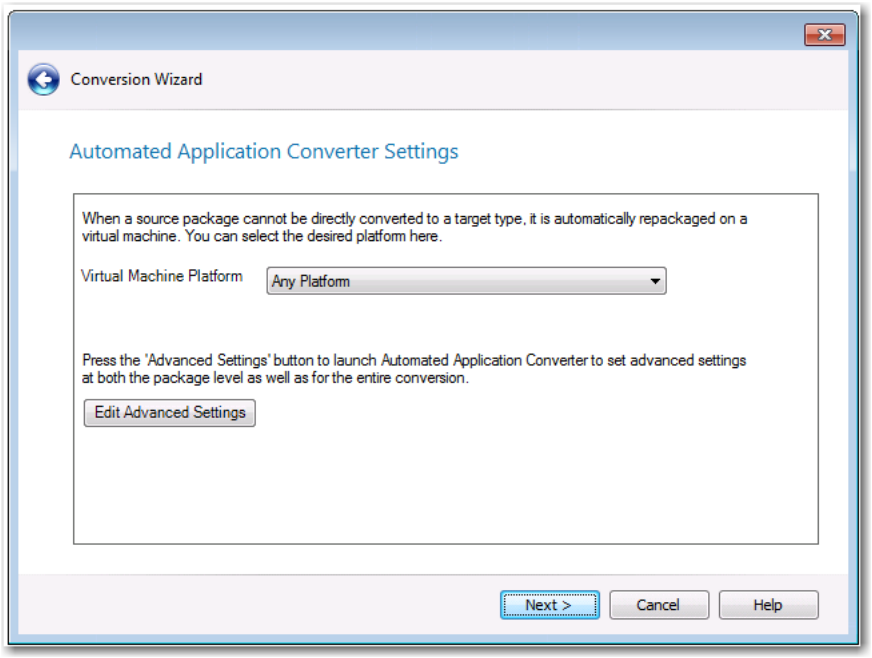


Note • *You can only convert to one virtual package type at a time.*

2. Select the desired virtual package conversion type and click **Next**. The **Select the Package(s) to convert** panel opens, and only the package or groups of packages that you had selected when you invoked the Conversion Wizard is selected.

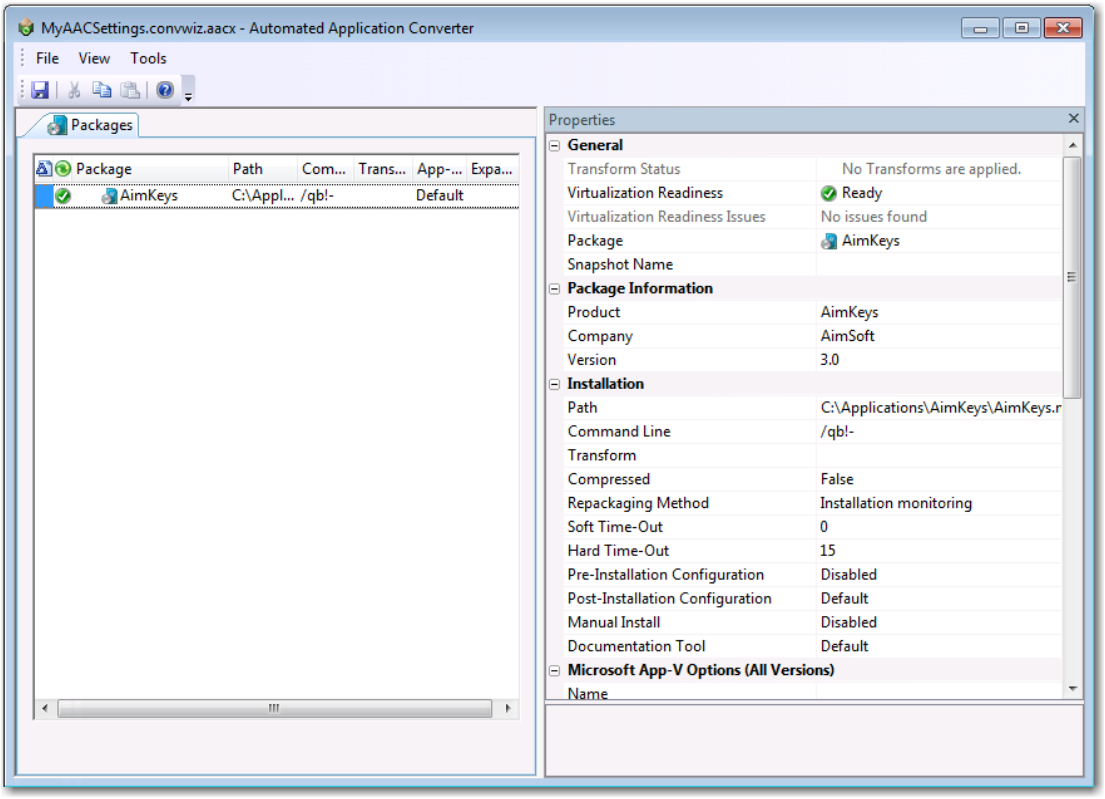


3. Select additional packages, if desired, and click **Next**. The **Automated Application Converter Settings** panel opens.



4. The virtual machine platforms defined in the settings file (that is specified on the **Plugin Options > Automated Application Converter Plugin** tab of the **Options** dialog box) are listed in the **Virtual Machine Platform** list. Select the platform to use for this run of the Conversion Wizard.

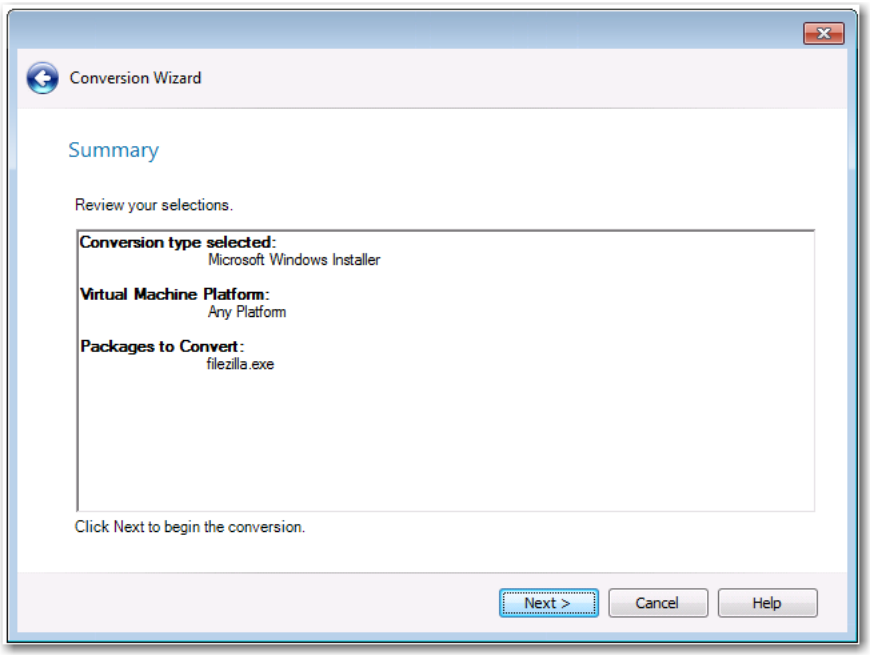
5. If you want to edit additional advanced settings, click the **Edit Advanced Settings** button. A copy of the default conversion settings file is opened, displaying the **Packages** tab of Automated Application Converter.



6. Modify these settings, if desired, and then save the file and exit Automated Application Converter. You are returned to the **Automated Application Converter Settings** panel of the Conversion Wizard.

Important • *Changes that you make to these settings are only used for this run of the Conversion Wizard. To change the default settings, you need to edit the settings file that is specified on the* ***Plugin Options > Automated Application Converter Plugin*** *tab of the* ***Options*** *dialog box.*

7. Click **Next**. The **Summary** panel opens.



8. Click **Next** to begin the conversion. The **Converting the Packages** panel opens.
9. Click **Next**. When conversion is complete, the **Summary** panel opens, confirming that the conversion has been performed.
10. Click **Finish**. The converted package is now listed in the tree; an additional deployment type has been added to the source package's parent application.

Using Test on Virtual Machine Wizard

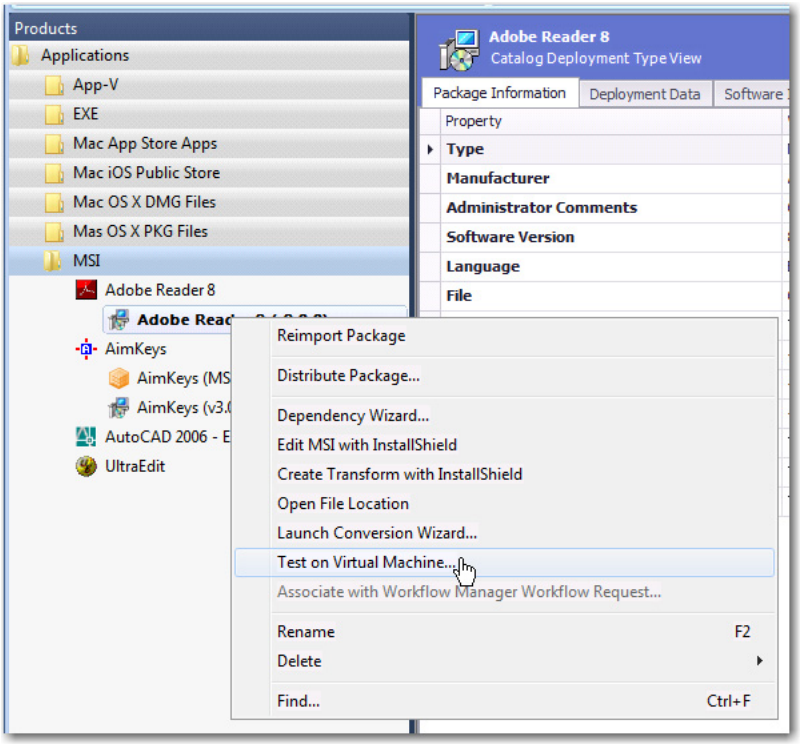
You can use the **Test on Virtual Machine Wizard** to quickly launch a specified virtual machine and install a selected Windows Installer (.msi) or installation executable (.exe) package (both legacy installers and complex installation executables) for testing. This wizard uses the capability of the Automated Application Converter tool to spin up the selected virtual machine and install the selected package.

Note • *Both legacy installers and complex installer executables (which contain bundled Windows Installer packages) can be tested using the Test on Virtual Machine Wizard.*

To use the Test on Virtual Machine Wizard to test a package, perform the following steps.

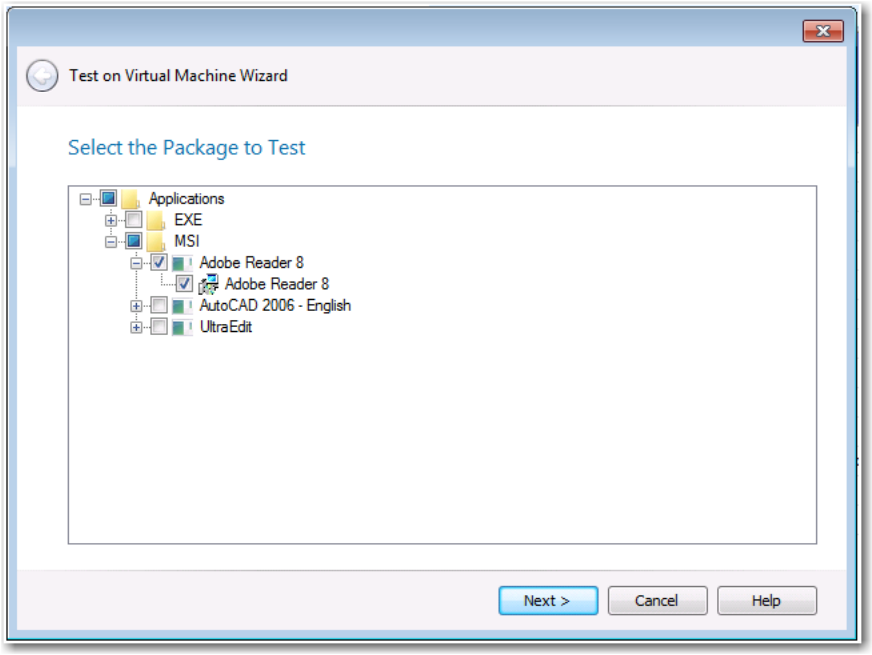
Task ***To use the Test on Virtual Machine Wizard to test a package:***

1. In the Application Manager tree, click a Windows Installer (**.msi**) or installer executable (**.exe**) package (or on an application containing an **.msi** or **.exe** package) and select **Test on Virtual Machine** from the shortcut menu.



Note • *The* ***Test on Virtual Machine*** *selection on the shortcut menu is available on both the* ***Catalog*** *and the* ***Test Center*** *tabs of Application Manager.*

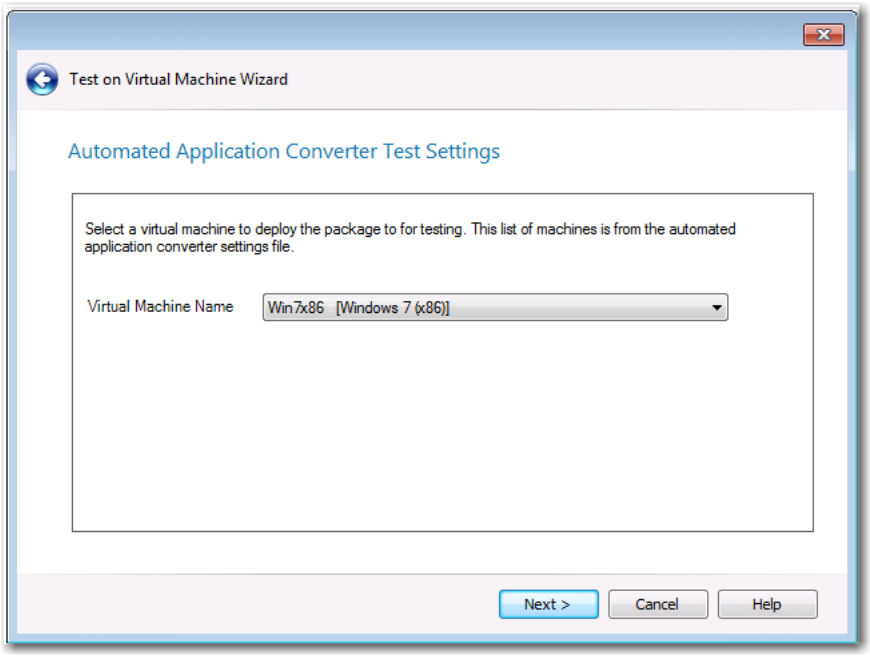
The **Select Package to Test** panel opens. The Application Manager tree is displayed, with the package that was selected when you opened the wizard automatically selected.



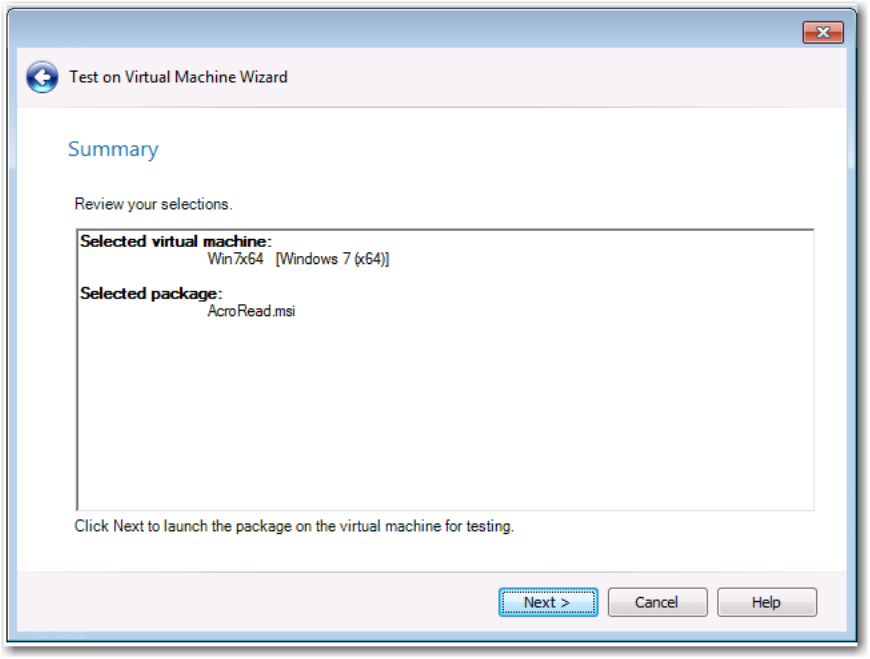
2. Confirm the selection of the package that you want to test and click **Next**.

Note • *You can only select one package for testing.*

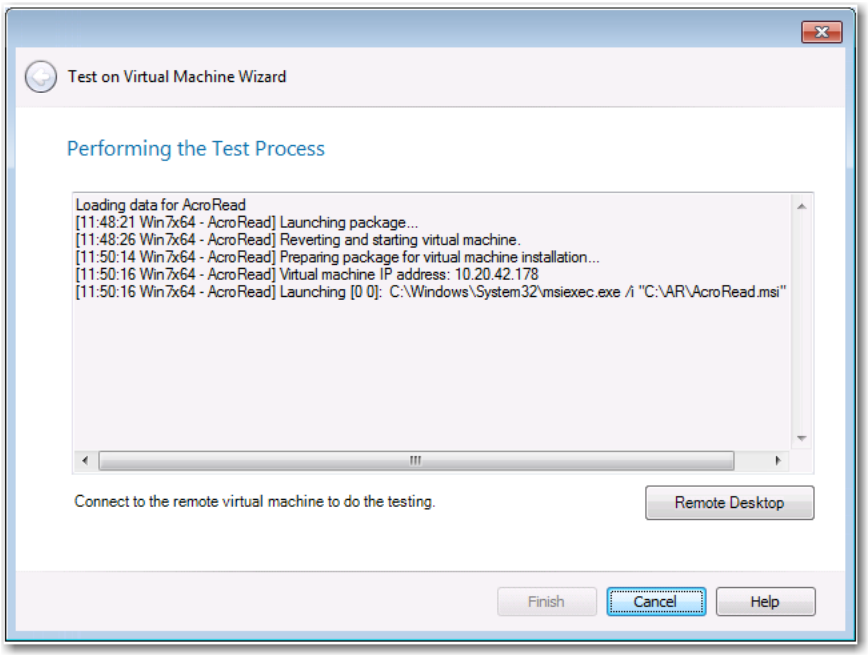
The **Automated Application Converter Test Settings** panel opens, listing the virtual machines defined in the Automated Application Converter settings file that is selected on the **Plugin Options > Automated Application Converter Plugin** tab of the **Options** dialog box:



3. From the **Virtual Machine Name** list, select the name of the virtual machine that you want to use for testing and click **Next**. The **Summary** panel opens.

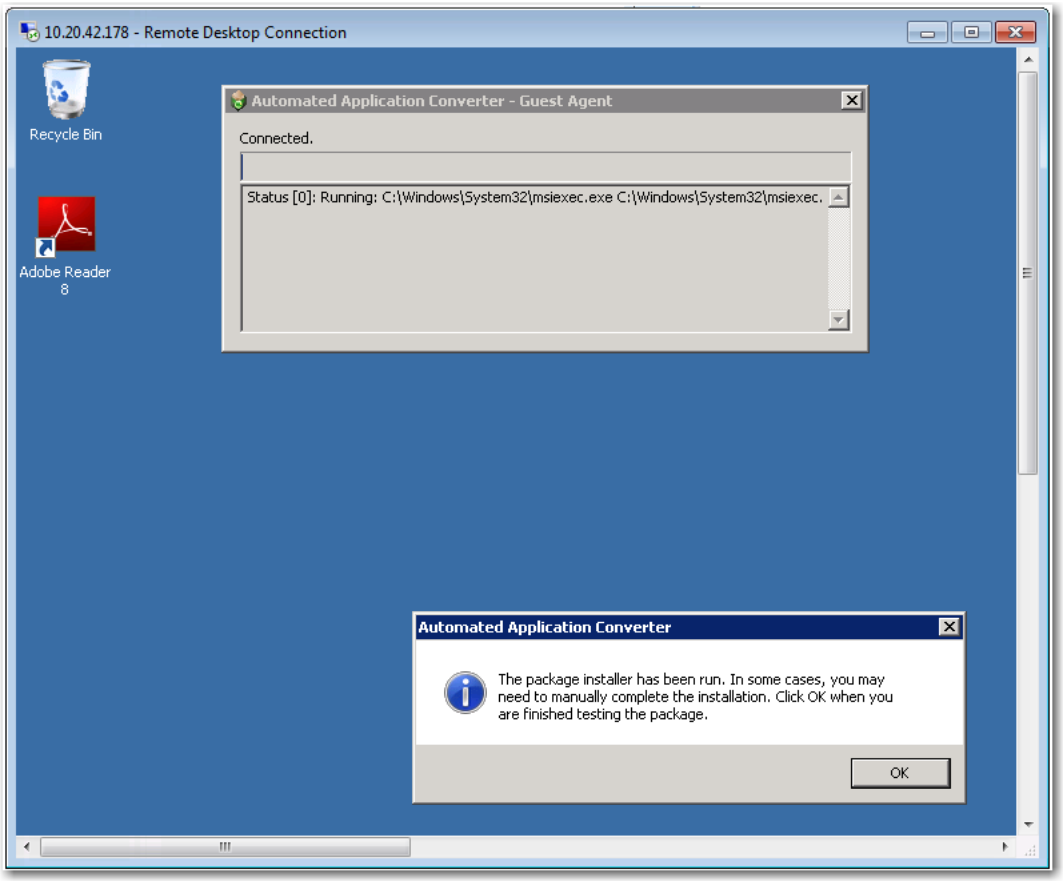


4. Click **Next** to launch the package on the specified virtual machine for testing. The **Performing the Test Process** panel opens, listing progress messages.



When the package has been installed and launched on the virtual machine, the **Remote Desktop** button will become enabled.

5. Click **Remote Desktop** to connect to the virtual machine and perform testing. You may be prompted for login credentials to the virtual machine image. A Remote Desktop session opens displaying the virtual image where this package has been installed.



6. Use the installed shortcuts to launch the package and perform the desired testing.
7. When you have finished testing the package, click **OK** to close the Remote Desktop session and shut down the virtual machine.
8. Return to the **Test on Virtual Machine Wizard** and click **Finish** to close the wizard.

Using the Software Repository

Edition • *The Software Repository feature is available in AdminStudio Enterprise Edition.*

A Windows Installer, virtual, or mobile app package is made up of many files that are executed when the package is either installed or is run. However, only the main installation or application file (such as a **.msi**, **.sft**, **.appv**, **.xpf**, **.exe**, **.profile**, **.ipa**, **.appx,** or **.apk**) is imported into the Application Catalog database.

To safeguard these additional files against alteration or being misplaced, you can choose to manage packages using the Software Repository. The Software Repository gives you a secure, transparent storage system for your AdminStudio data, especially packages used in the enterprise.

Important • *When Application Manager is connected to a Software-Repository-enabled Application Catalog, all of the packages that are imported into that Application Catalog are automatically added to the Software Repository.*

The AdminStudio tools are tightly integrated into the Software Repository, particularly Application Manager, Virtual Package Editor, and InstallShield Editor. Certain concepts within AdminStudio itself, such as package version management, require the Software Repository in order to operate.

Note • *You can store multiple versions of a Windows Installer or App-V package in the Software Repository. Instead of reimporting a package that has changed, you can check out a package and then check it back in either as a new package version or you can overwrite the existing version. When a package is checked out, it cannot be modified by another user. You can also view version history and include it in reports. See Using Version Management Features and Viewing Package Catalog History for more information.*

When a package is managed within the Software Repository, its main installation or application file and all of its other associated files and subfolders are imported into a subfolder of the Software Repository location identified for that Application Catalog.

Information on the AdminStudio Software Repository is presented in the following sections:

- Enabling the Software Repository and Editing Software Repository Settings
- Identifying Software Repository Packages in Application Manager
- Using Version Management Features
- Software Repository Integration into Other AdminStudio Tools

Enabling the Software Repository and Editing Software Repository Settings

To be able to import packages into the Software Repository of an Application Catalog, the Application Catalog must first have the Software Repository enabled. You can only choose to enable the Software Repository feature when you are creating a new Application Catalog.

Important • *You cannot enable the Software Repository after you have created an Application Catalog; this option can only be enabled during Application Catalog creation.*

When an Application Catalog is enabled for the Software Repository, a Software Repository directory location must be specified. You must specify that location and the proxy account credentials for that location during Application Catalog creation, but you can edit those entries at any time.

- Enabling the Software Repository in a New Application Catalog
- Editing the Software Repository Location or Proxy Account Credentials

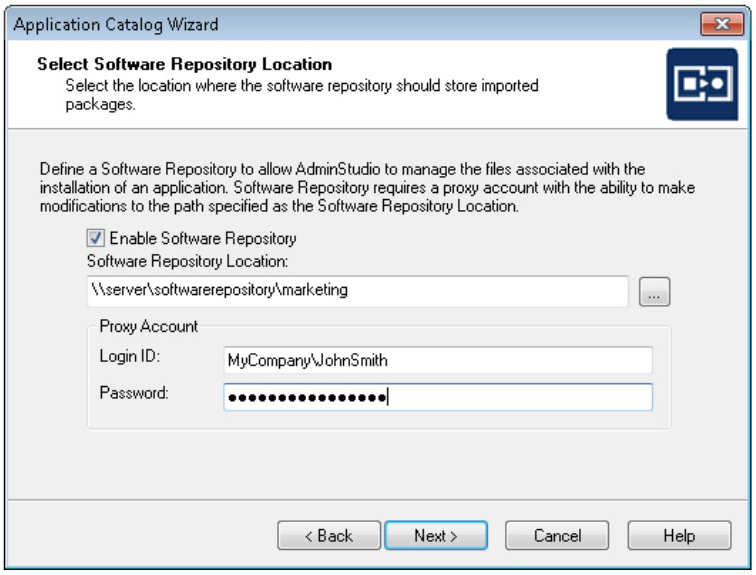
Enabling the Software Repository in a New Application Catalog

To enable the Software Repository in a new Application Catalog, perform the following steps.

Task ***To enable the Software Repository in a new Application Catalog:***

Create the new Application Catalog as described in Creating New Application Catalogs, but on the Select Software Repository Location Panel, do the following:

1. Choose the **Enable the Software Repository** option.
2. In the **Software Repository Location** field, enter or select the directory location of the Software Repository for this Application Catalog.
3. Specify the **Login ID** and **Password** for a **Proxy Account** that AdminStudio can use to access and modify the specified **Software Repository Location** folder.



Note *• You cannot use Windows Authentication for this Proxy Account.*

Note *• The Proxy Account needs full control on the* ***Software Repository Location*** *folder at the directory level as well as at the sharing level. Only such accounts can be used as a Proxy Account to access the* ***Software Repository Location*** *directory.*

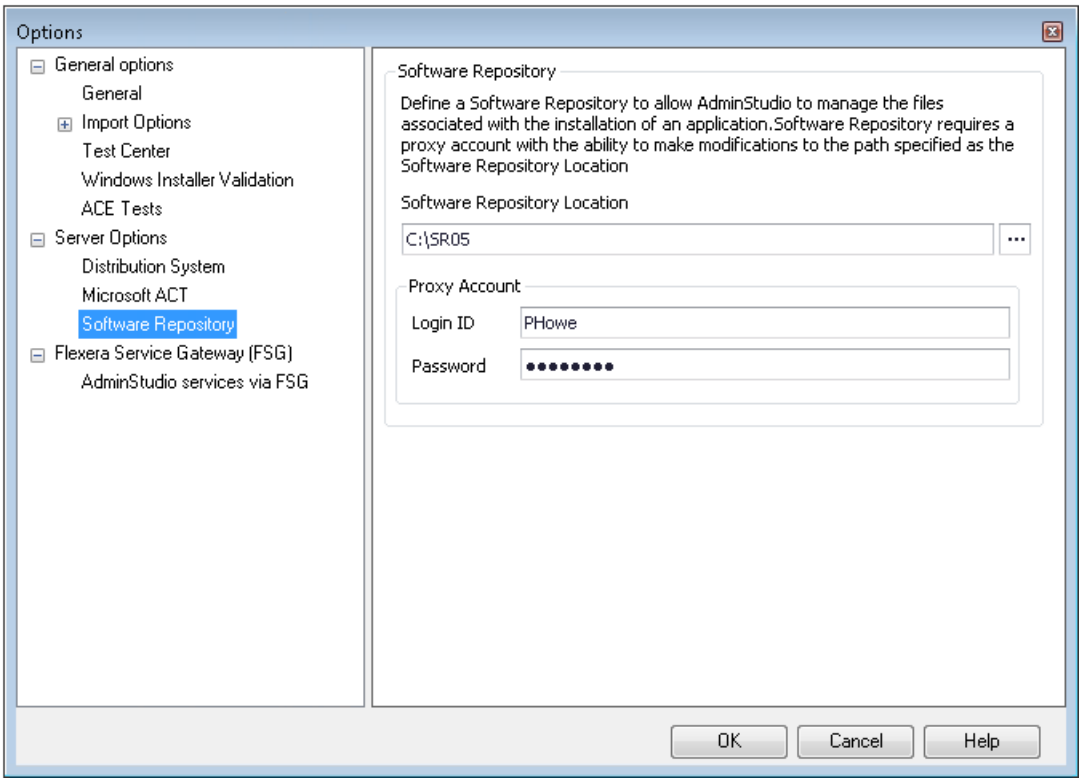
4. Complete the wizard to create the software-repository-enabled Application Catalog.

Editing the Software Repository Location or Proxy Account Credentials

While you can only enable the Software Repository when you create an Application Catalog, you can edit an Application Catalog's **Software Repository Location** or associated **Proxy Account** at any time.

Task ***To edit the Software Repository Location or Proxy Account:***

1. Launch Application Manager and connect to the software-repository-enabled Application Catalog.
2. On the **Application Manager tab** menu, select **Options**. The **Options** dialog box opens.
3. Open the **Software Repository** tab.



Note • *If you are not connected to a software-repository-enabled application catalog, the* ***Software Repository*** *tab will not be displayed.*

4. Edit the **Software Repository Location** and/or **Proxy Account** fields and click **OK**.

Identifying Software Repository Packages in Application Manager

In Application Manager, packages that are managed within the Software Repository have a different icon than those that are not:

Table 7-21 • Application Manager Icons Identifying Software Repository

Icon	Description
	Package is not managed within the Software Repository.
	Package is managed within the Software Repository.
	Package is managed within the Software Repository and is checked out.
	Merge Module is managed within the Software Repository.

Note • *Similar overlays are displayed on virtual package and mobile app icons that are listed under the* ***Application*** *node.*

Also, when a Software Repository package is selected in the Application Manager tree, the statement `Managed within the Software Repository` is listed in the **File** field of the **Catalog Deployment Type View**. Below is an example of a Software Repository package in Application Manager:

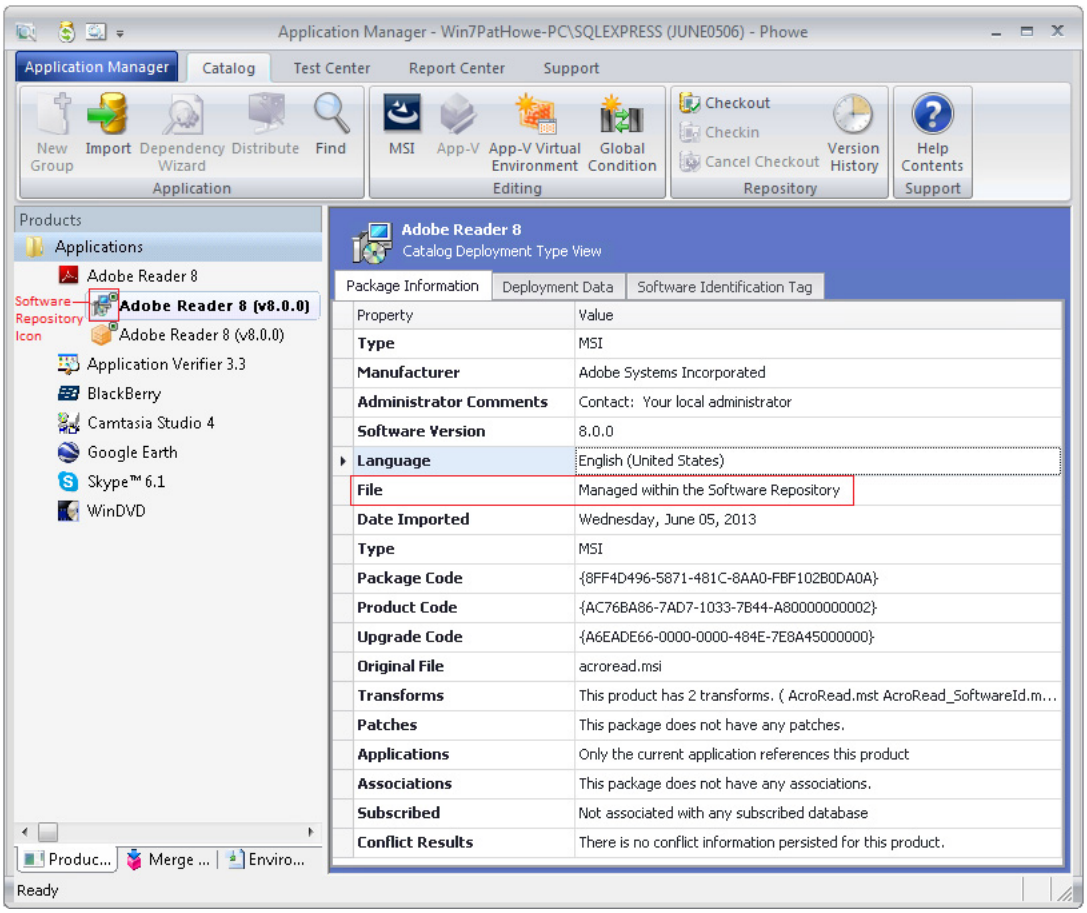


Figure 7-24: MSI Package Managed Within the Software Repository

Using Version Management Features

For those Windows Installer and App-V packages which are part of the Software Repository, you can store multiple versions of those packages in the Software Repository. Instead of reimporting a package that has changed, you can check out a package and then check it back in either as a new package version or by overwriting the existing version.

The Software Repository version management features are described in the following topics:

- Checking-Out and Checking-In Packages
- Cancel Check Out
- Getting a Copy of the Latest Version of a Package
- Viewing Package Version History

Checking-Out and Checking-In Packages

For those Windows Installer and App-V packages which are part of the Software Repository, you can store multiple versions of a package. Instead of reimporting a package that has changed, you can check out a package and then check it back in either as a new package version or you can overwrite the existing version.

To check packages in and out of the Software Repository, use the buttons in the **Repository** section of the **Catalog** tab of the Application Manager ribbon.

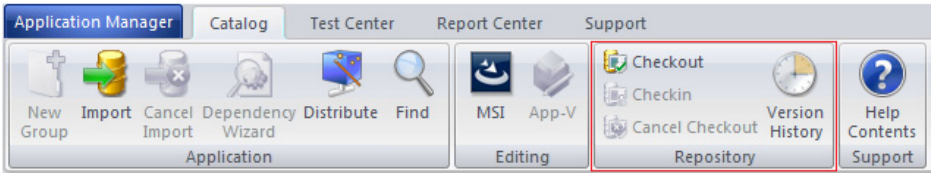

Figure 7-25: Software Repository Buttons in Application Catalog Ribbon

When you check out a package, AdminStudio makes a local copy of the package files into the following directory:

C:\Documents and Settings*UserName*\My Documents\AdminStudio*PackageName_PackageVersion*

or, for Windows 7 and 8, into this directory:

C:\Users*UserName*\Documents\AdminStudio*PackageName_PackageVersion*

When you check in a package, it will be imported into the Application Catalog and either the new package will be added as a new version of an existing package or the old package will be overwritten.

Cancel Check Out

If you checked out a package and then decide that you do not want to modify it, you can choose to cancel the check out by right-clicking on the package, and then selecting **Cancel Check Out** from the shortcut menu.

Unless a user is assigned to a Role with advanced Software Repository permissions, only the user who checked out the package will have the **Cancel Check Out** enabled. After the user confirms the operation, the local package files are deleted.

Getting a Copy of the Latest Version of a Package

If you want to get a copy of a package that is in the Software Repository, but you do not want to check it out, you can get a copy of that package by right-clicking the package, and then selecting **Get Latest Version** from the shortcut menu. The package and all of its associated files will then be copied to the user's profile directory:

`C:\Users\UserName\Documents\AdminStudio\PackageName_PackageVersion`

For example:

```
C:\Users\JohnSmith\Documents\AdminStudio\Adobe Reader 8.0
```

***Note** • The location where Software Repository files are copied to when you select **Get Latest Version** cannot be changed. The files are always copied to a subdirectory of the current user's "Documents" directory.*

Viewing Package Version History

If you are connected to a Software Repository-enabled Application Catalog and you select a package in the Software Repository, the **Version History** button in the **Repository** section of the Application Catalog ribbon is enabled.

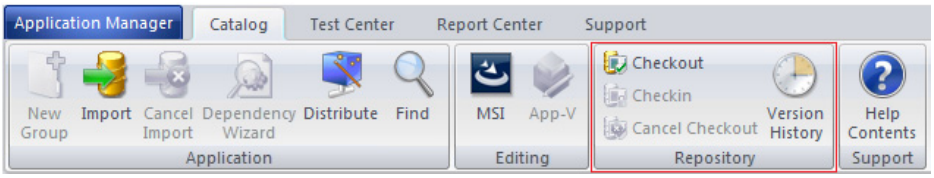

Figure 7-26: Software Repository Buttons in Application Catalog Ribbon

If you click the V**ersion History** button, the **Package Versions** dialog box opens, listing all of the versions of the selected package.

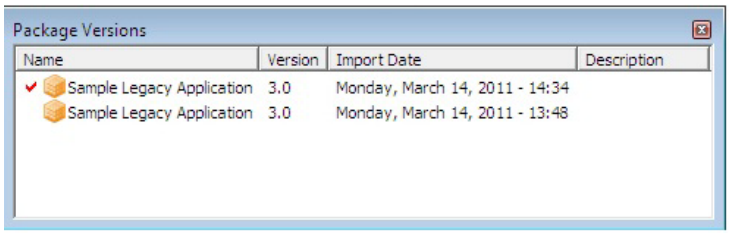

Figure 7-27: View Package Version History

Software Repository Integration into Other AdminStudio Tools

The Software Repository feature is integrated into several other AdminStudio tools:

- InstallShield Editor
- Virtual Package Editor
- Distribution Wizard
- Automated Application Converter

InstallShield Editor

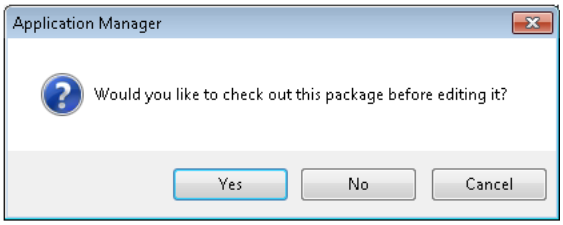
The Software Repository feature is integrated with InstallShield Editor in the following ways:

- You can launch InstallShield Editor from the Application Manager.
- From InstallShield Editor, you can browse for packages that are stored in the Software Repository and select them for edit. You can either check a file out for edit or simply get the latest version of the file to edit. You can also undo a check out from InstallShield Editor.
- From the InstallShield Editor, you can add a package to the Software Repository.
- You can add a package to the Software Repository via the InstallShield Editor build process.

For more information on InstallShield Editor's integration with AdminStudio, see InstallShield Editor Integration with Application Manager and the Software Repository.

Virtual Package Editor

When you launch Virtual Package Editor from Application Manager by right-clicking on an App-V package and then selecting **Edit with Virtual Package Editor** from the shortcut menu, you are prompted to check out the package:



Distribution Wizard

You can launch the Package Distribution Wizard from Application Manager by right-clicking on a package node (not an application node) and then selecting **Distribute Package** from the shortcut menu. When you do this, the package name displayed on the **Package Information** panel is already entered. The ability to edit this entry depends upon whether the package you are distributing is managed by the Software Repository:

- **Not in the Software Repository**—The full name and path of the Windows Installer file is displayed, and you can edit this entry or click **Browse** and select a different package.
- **In the Software Repository**—Only the name of the Windows Installer file is displayed (not the full path) and this entry cannot be edited or changed.

Automated Application Converter

When publishing packages from Automated Application Converter to a Software-Repository-enabled Application Catalog, the files will be added to the Software Repository.

Taking OS Snapshots

The OS Snapshot Wizard provides a simple way to capture your basic operating system configuration. Using the OS Snapshot Wizard, you can scan your computer's operating system and record the files, INI files, shortcuts, and registry entries present. The Wizard then creates an .osc file representing the system contents. You can import this snapshot file into the an Application Catalog database to identify potential conflicts between Windows Installer-based setups and your operating system.

To provide maximum flexibility during the OS Snapshot process, you can create an exclusion list (similar to the Repackager exclusion list) that identifies files, INI files, shortcuts, and registry entries that the OS Snapshot Wizard should disregard during the scan. Using this list, you can eliminate unnecessary files, shortcuts, or registry entries, and reduce the time it takes to perform the OS Snapshot.

The following topics are included in this section:

- OS Snapshot Best Practices
- Configuring OS Snapshot Analysis Options
- Capturing an OS Snapshot

Caution • *OS Snapshots should only be used for comparison in Application Manager. You should never attempt to convert an OS Snapshot into an MSI package.*

OS Snapshot Best Practices

Before capturing OS Snapshots, consider the following:

Table 7-22 • OS Snapshot Best Practices

Guideline	Description
Capture on a Clean System	For optimal OS Snapshots, you should only capture on a clean system. This ensures an accurate baseline of files necessary for the operating system. This also means that you should never attempt to capture other packages in addition to the operating system. Use Repackager when you need to capture applications.
Exit Other Applications	Shut down all other applications besides OS Snapshot prior to capture. Ideally, this should be done from the Windows Task Manager. This ensures that files are not locked during capture, and unnecessary temporary files are not inadvertently captured.
Only Use OS Snapshot for Import into Application Manager	Never attempt to convert an OS Snapshot file into a Windows Installer package to install an operating system. AdminStudio does not support this use of OS Snapshots.
OS Snapshots Take Time	Depending on the operating system configuration, OS Snapshot often takes a significant amount of time to capture the base OS state. Consider that many typical OS installations exceed 500MB and contain tens of thousands of files, translating into a lengthy operation of cataloging and converting the files into an OS Snapshot file.
Take Multiple OS Snapshots	If your environment contains either multiple operating systems, or variations on the same operating system, take snapshots of each OS or variation. You can store all of these in your Application Catalog, allowing you to make comparisons between MSI packages and each OS.
OS Snapshots and Repackaging Are Not the Same	OS Snapshots, as the name implies, is for snapshots of the operating system only. Repackaging is only for traditional installation packages. These operations, although similar, are still very specialized and should only be used for their respective purposes.

Configuring OS Snapshot Analysis Options

Task ***To configure analysis options for OS snapshot captures:***

1. Launch the **OS Snapshot Wizard** by clicking on its icon in the AdminStudio Tools Gallery. The **Welcome** panel opens.
2. Click **Next**. The **Project Information** panel opens.
3. Click **Edit**. The **Analysis Options** dialog box opens.
4. Configure the types of data you want to capture (Files, INI files, Shortcuts, and/or Registry data), and specify if you want to restrict the snapshot to a specific drive.
5. Click **OK** to return to the **Project Information** panel.
6. Click **Start**.

Capturing an OS Snapshot

You use the OS Snapshot Wizard to capture OS Snapshots.

Task ***To capture an OS Snapshot:***

1. Launch the **OS Snapshot Wizard** by clicking on its icon in the AdminStudio Tools Gallery or by making a selection from the **Start** menu. The **Welcome** panel opens.
2. Click **Next**. The **Project Information** panel opens.
3. Provide the OS Snapshot project name and OS Snapshot project folder for the OS Snapshot file.
4. Optionally, click **Edit** to configure analysis options. See Configuring OS Snapshot Analysis Options.
5. Click **Start** to perform the OS Snapshot.
6. On completion of the OS Snapshot, review the results in the **Summary** panel.
7. Click **Finish**.

Note • *The OS Snapshot is stored as an OSC file in the folder defined in the* ***Project Information*** *panel.*

Capturing an OS Snapshot on a Clean Machine

If you would like to capture an OS snapshot on a clean machine, you can choose to either run the OS Snapshot Wizard remotely or to install it on a clean machine.

- **Installing OS Snapshot Wizard with Standalone Repackager**—The OS Snapshot Wizard is installed along with Standalone Repackager. For instructions on how to install OS Snapshot Wizard along with Standalone Repackager on a clean machine, see Installing Repackager on a Clean Machine.

- **Launching OS Snapshot Wizard remotely**—You can launch OS Snapshot Wizard remotely from the clean machine. For instructions, use the same method described in the Launching Repackager Remotely help topic.

Reference

This section contains information on the Application Manager views, dialog boxes and wizards that are accessible when the **Catalog** tab is selected in the ribbon. This Application Manager functionality is used when managing, connecting to, import data into, or sharing application catalogs.

- Products Tree/Catalog Tab Views
- Merge Module Tree Views
- Environment Tree Views
- Dialog Boxes
- Wizards
- User Permissions in Application Manager
- Database Server Permissions
- Application Manager Command-Line Functionality

Application Manager Interface

The Application Manager user interface consists of following areas: the ribbon, the navigation window, the details pane, and the output window. Both the navigation window and the Output window are dockable.

- **Ribbon**—The ribbon provides quick access to Application Manager commands and functionality, and consists of the Application Manager tab menu and four additional tabs: **Catalog**, **Test Center**, **Report Center**. and **Support**.
- **Shortcut menu**—Additional commands are available on the shortcut menu, which opens when you right-click on a group, application, or package in the Application Manager tree.
- **Navigation window**—The navigation window consists of three tabs: **Products**, **Merge Modules**, and **Environment**.
- **Details pane**—When you select different items in the tabs of the navigation window, the details pane displays corresponding information about that item.
- **Output window**—The output window consists of tabs where output is displayed during different Application Manager processes.

This section details the Application Manager interface and includes the following topics:

- Application Manager Ribbon Interface
- Application Manager Tree and Subnode Icons
- Shortcut Menus
- Output Window

Application Manager Ribbon Interface

Starting with AdminStudio 11.0, Application Manager includes a ribbon interface to provide quick and easy access to Application Manager tasks.

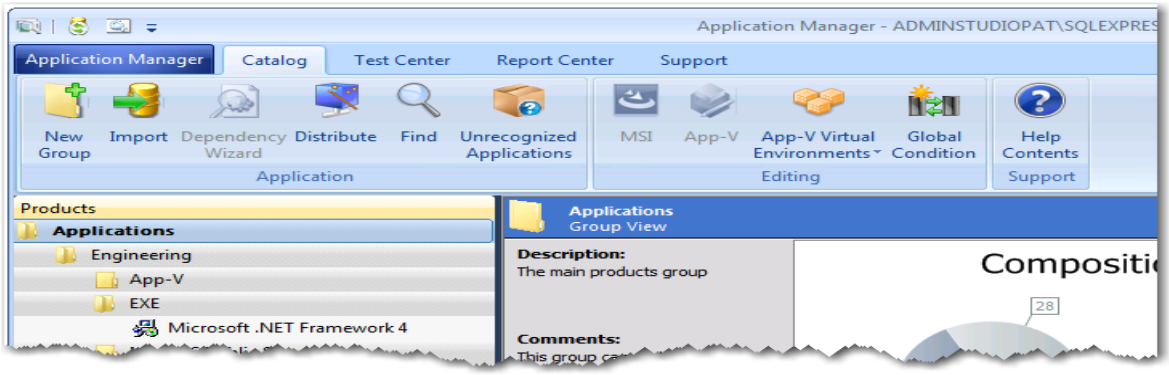


Figure 7-28: Application Manager's Ribbon Interface

The ribbon interface includes the Application Manager tab menu, along with buttons that are grouped in four additional tabs: **Catalog**, **Test Center**, **Report Center**, and **Support**.

- Application Manager Tab Menu
- Catalog Tab of Application Manager Ribbon
- Test Center Tab of Application Manager Ribbon
- Report Center Tab of Application Manager Ribbon
- Support Tab of Application Manager Ribbon

Application Manager Tab Menu

The Application Manager tab menu is opened by clicking the Application Manager tab:

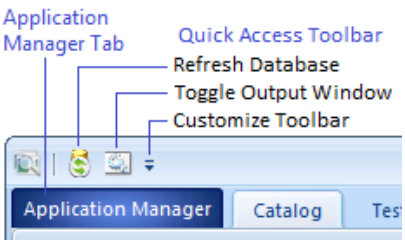

Figure 7-29: Application Manager Tab and Quick Access Toolbar

The Application Manager tab menu includes database connection related tasks, as well as commands for setting catalog properties and application options, and exiting from the application.

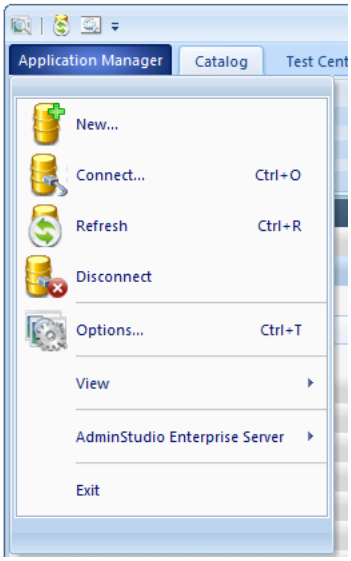

Figure 7-30: Application Manager Tab Menu

The Application Manager tab menu, and the Quick Access Toolbar, provide access to the following tasks:

Table 7-23 • Application Manager Tab Menu & Quick Access Toolbar

Command	Description
New	Opens the **Application Catalog Wizard**, which you can use to create a new Application Catalog.
Connect	Displays the **Connect Application Catalog** dialog box, where you can open an existing Application Catalog.
Refresh	Refreshes the current views. This is particularly useful if multiple people are working on the same Application Catalog. You can also click the Refresh Database control in the Quick Access Toolbar.
Disconnect	Closes the currently open Application Catalog.
Options	Click to open the Options Dialog Box, where you can change various settings including whether to perform testing automatically after package import, default conflict tests to run, and connection information for Configuration Manager and a Microsoft ACT database.
View	Use to toggle the display of the **Status Bar** and **Output Window**.
AdminStudio Enterprise Server	Select one of the following options: • **Change AES Password**—Change the password of the current user to log in to the AdminStudio Enterprise Server. • **Log Out**—Log out of the AdminStudio Enterprise Server.

Table 7-23 • Application Manager Tab Menu & Quick Access Toolbar

Command	Description
Exit	Click to closes Application Manager.
Toggle Output Window	Click this icon in the Quick Access Toolbar to toggle the display of the Output Window.
Customize Toolbar	Click this icon to toggle whether to display the Quick Access Toolbar above or below the ribbon.

Catalog Tab of Application Manager Ribbon

The **Catalog** tab includes buttons to import packages into the Application Catalog, edit packages, use Software Repository commands, and distribute packages.

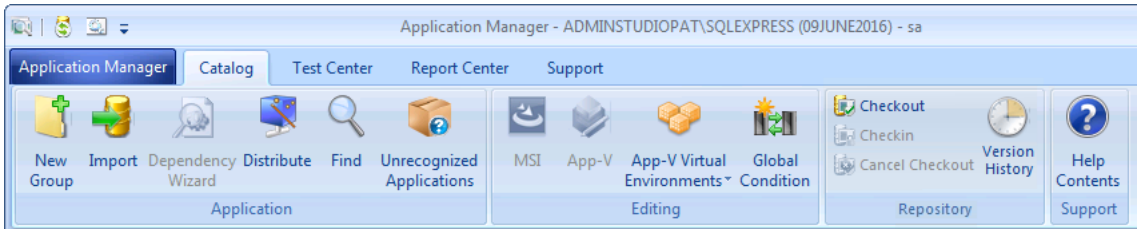

Figure 7-31: Catalog Tab of Application Manager Ribbon

The **Catalog** tab of the Application Manager ribbon provides access to the following tasks:

Table 7-24 • Catalog Tab of Application Manager Ribbon

Group	Button	Description
Application	**New Group**	Create a new group in the tree.
	Import	Launches the Import Wizard, allowing you to import Windows Installer packages, virtual packages (Microsoft App-V, VMware ThinApp, and Citrix), and web applications.
	Cancel Import	Cancel the import of an application or package.
	Dependency Wizard	Launch the Dependency Wizard. See Specifying Package Dependencies Deployment Data.
	Distribute	Distribute the selected application or package using Distribution Wizard.
	Find	Use to search for data in various tables in the Application Catalog.
	Unrecognized Applications	Used to generate a list of all applications in the Application Catalog that do not have an associated Flexera Identifier. See Managing an Application's Flexera Identifier.

Table 7-24 • Catalog Tab of Application Manager Ribbon

Group	Button	Description
Editing	**MSI**	Open the selected package in InstallShield Editor in Direct Edit Mode.
	App-V	Open the selected package in the Virtual Package Editor.
	Global Condition	Open the Global Conditions dialog box, where you can create new global conditions and edit existing global conditions.
Repository	**Checkout**	Check selected package out of Software Repository.
	Checkin	Check selected package into the Software Repository.
	Cancel Checkout	Cancel the checkin of a package.
	Version History	Open the **Package Versions** dialog box.
Support	**Help**	Open the AdminStudio help library.

Note • *Many of these commands can also be accessed through Shortcut Menus.*

Test Center Tab of Application Manager Ribbon

The **Test Center** tab includes buttons to analyze a package's application compatibility and best practices compliance, and to detect and resolve package conflicts.

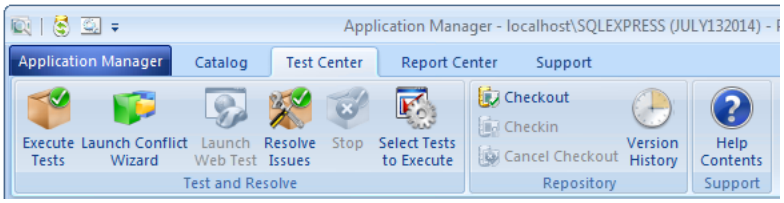

Figure 7-32: Test Center Tab of Application Manager Ribbon

The **Test Center** tab of the Application Manager ribbon provides access to the following tasks:

Table 7-25 • Test Center Tab of Application Manager Ribbon

Group	Button	Description
Test and Resolve	**Execute Tests** Shortcut: F4	Execute all of the tests currently selected on the **Select Tests to Execute** dialog box on the selected package, application, or group. For more information, see Performing Compatibility, Best Practices, and Risk Assessment Testing, Performing Static Testing of Web Applications, and Performing Application Conflict Testing.
	Launch Conflict Wizard Shortcut: F5	Launches the Conflict Wizard to perform application conflict testing. For more information, see Performing Application Conflict Testing.
	Launch Web Test Shortcut: F6	Launch interactive testing of a web application for browser compatibility. For more information, see Performing Dynamic Testing of Web Applications.
	Resolve Issues Shortcut: F7	Resolve any automatically resolvable conflicts that have been detected for the selected package. For more information, see Resolving Issues.
	Stop	Stops the text execution or conflict analysis.
	Select Tests to Execute	Opens the **Select Tests to Execute** dialog box, where you select the tests to use during package testing. For more information, see Configuring Testing.
Repository	**Checkout**	Check selected package out of Software Repository.
	Checkin	Check selected package into the Software Repository.
	Cancel Checkout	Cancel the checkin of a package.
	Version History	Open the **Package Versions** dialog box.
Support	**Help**	Open the AdminStudio help library.

Report Center Tab of Application Manager Ribbon

When you select the **Report Center** tab of the Application Manager ribbon, you can view detailed reports on the status of the applications and packages in the Application Catalog.

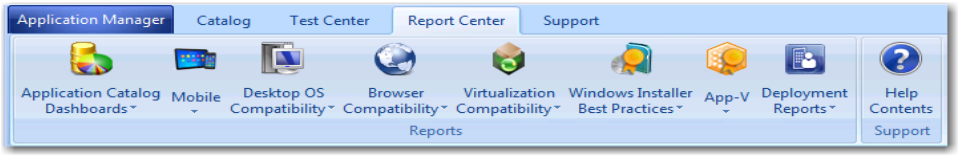

Figure 7-33: Report Center Tab of Application Manager Ribbon

For more information, see Viewing Application Testing and Analysis Reports on the Report Center Tab.

Support Tab of Application Manager Ribbon

The **Support** tab includes buttons to give you quick access to the AdminStudio help library and information specific to the current release of AdminStudio.

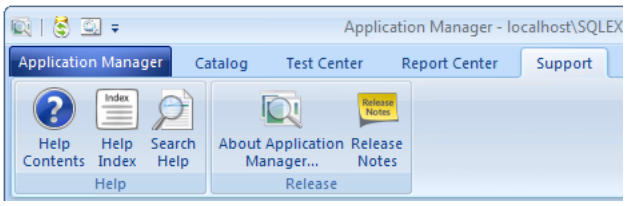

Figure 7-34: Support Tab of Application Manager Ribbon

The **Support** tab of the Application Manager ribbon provides access to the following tasks:

Table 7-26 • Catalog Tab of Application Manager Ribbon

Group	Button	Description
Help	**Help Contents**	Open the **Contents** tab of the AdminStudio Help Library
	Help Index	Open the **Index** tab of the AdminStudio Help Library.
	Search Help	Open the **Search** tab of the AdminStudio Help Library.
Release	**About Application Manager**	Open the product's **About** dialog box, which contains release information.
	Release Notes	Open an HTML version of the current AdminStudio Release Notes.

Application Manager Tree and Subnode Icons

The icons used in the Application Manager tree and its subnodes are described in this section.

- Application Manager Tree Icons
- Application Manager Subnode Icons

Application Manager Tree Icons

These icons are used on the Application Manager **Products**, **Merge Modules**, and **Environment** tabs in the tree:

Table 7-27 • Application Manager Tree Icons

Name	Icon	Description
Group		A group, which is used to organize your data.
Application		An application that has been imported into the Application Catalog database. The application can include multiple deployment types—such as a Windows Installer package, a Microsoft App-V package, a VMware ThinApp package, etc. Each deployment type is indicated by a separate subnode of this application node. For most applications, an icon included in the application files is used to represent it in the tree. If an application does not include an icon, this default icon is used. In the following example, the application includes a Microsoft App-V package, a Citrix XenApp package, a VMware ThinApp package, and a Windows Installer package. 
Windows Installer package		Windows Installer package (**.msi**) that has been imported into the Application Catalog
App-V virtual package		Microsoft App-V virtual package (**.sft** or **.appv**) that has been imported into the Application Catalog
XenApp virtual package		Citrix XenApp virtual package (**.profile**) that has been imported into the Application Catalog
ThinApp virtual package		VMware ThinApp virtual package (**.exe**) that has been imported into the Application Catalog
Symantec Workspace virtual package		Symantec Workspace virtual package (**.xpf**) that has been imported into the Application Catalog
iOS mobile app (local)		Apple iOS mobile app (**.ipa**) that has been imported into the Application Catalog
iOS mobile app (public store)		A link to an iOS mobile app in the Apple Store that has been imported into the Application Catalog.

Table 7-27 • Application Manager Tree Icons (cont.)

Name	Icon	Description
Windows Store mobile app		Microsoft Windows Store mobile app (**.appx**) that has been imported into the Application Catalog
Windows Store mobile app (public store)		A link to a Windows Store mobile app in the Microsoft Windows Store that has been imported into the Application Catalog.
Google Android mobile app (local)		Google Android mobile app (**.apk**) that has been imported into the Application Catalog
Google Android mobile app (public store)		A link to a Google Android mobile app in the Google Play Store that has been imported into the Application Catalog.
Web application		Imported web application (**.htm**, **.html**), which you can test for browser compatibility. You can import a local web application by specifying its root page or its virtual directory, or a deployed web application by specifying its URL.
Web deploy package		A Microsoft Web Deploy package (.zip), which can be used for deployment of web applications to Microsoft IIS web servers or to Microsoft Azure websites. In a web deploy package, the content, configuration, databases and other artifacts of a web application are packaged in a .zip file.
Legacy application		A legacy application (**.exe**) that has been imported into the Application Catalog.
Unresolved question overlay	  	An "!" overlay on an icon indicates that the package has an unresolved question with its associated files (or that one of an application's deployment types has an unresolved question with its associated files). One or more files, transforms, or patch files associated with a package is either missing from the original import directory or its last modified date does not match the last modified date stored in the Application Catalog. When a package icon with this overlay is selected, a message appears in the view identifying the files in question and prompting you to take action to resolve the problem. For transforms, it is either missing from the original import directory or its last modified date does not match the last modified date stored in the Application Catalog.
Software Repository overlay	 	This overlay icon indicates that the package is managed within the Software Repository. This overlay icon is only displayed in Application Manager.

Table 7-27 • Application Manager Tree Icons (cont.)

Name	Icon	Description
Checked out overlay		This overlay icon indicates that the package is managed within the Software Repository and is checked out. This overlay icon is only displayed in Application Manager.
OS Snapshot		On **Environment** tab. An OS snapshot, which is a file representing a particular computer system's contents.
OS Security Patch		On **Environment** tab. Click to open the **Patch** view, which displays information about the selected OS Security Patch.
Enterprise Policy Configuration file		On **Environment** tab. Click to open the **Enterprise Policy View** view, which displays information about the selected Enterprise Policy Configuration.
Merge Module		On **Merge Modules** tab. Indicates both the All Merge Modules view, the root node of the merge modules explorer containing a list of all merge modules in the Application Catalog, and an individual Merge Module.
Merge Module managed within the Software Repository		On **Merge Modules** tab. A Merge Module managed within in the Software Repository.

Application Manager Subnode Icons

When you select a subnode of package in the Application Manager tree, you see specialized views that provide information on that package. The subnodes that are available for a package depend upon which tab of the ribbon is selected (**Catalog** or **Test Center**).

Catalog Tab Subnodes

The following subnodes are available on the **Catalog** tab:

Table 7-28 • Application Manager Subnode Icons / Catalog Tab

Name	Icon	Description
Extended Attributes		Click to display the optional Extended Attributes associated with the package. See Extended Attributes View (Packages) for more information.
App-V History		Click to open a view which lists an entry for each time this App-V package has been saved.  ***Note*** • *This information applies to App-V 4.x packages.*

Table 7-28 • Application Manager Subnode Icons / Catalog Tab (cont.)

Name	Icon	Description
Dependencies		Click to display the Dependencies associated with the package. See Dependencies View for more information.  ***Note*** • *This information does not apply to App-V 5 packages.*
Files/ Components, Files/Directories		Click to display the Files/Components or Files/Directories view for this package.
INI File Changes		Click to display the INI File Changes View, listing any INI file changes made by the product.  ***Note*** • *Windows Installer packages only.*
Registry		Click to display any registry entries created or changed by the package.
Shortcuts		Click to display any shortcuts created by the package.
File Type Associations		App-V packages only. Click to view a list of the file type associations for this App-V package.
Environment Variables		App-V packages only. Click to display the environment variables used in this App-V package.
Merge Modules		Click to display any merge modules included the package.
Catalog History		Click to view a list of logged events for the selected package.
Tables		Click to view the data for a given package in the Application Catalog.
Components		Merge modules on Merge Modules tab. Select to display any components created or changed by the merge module.
Dependency		Merge modules on Merge Modules tab. Select to display any dependencies in the merge module.
Exclusion		Merge modules on Merge Modules tab. Select to display any exclusions in the merge module.
Files		Merge modules on Merge Modules tab. Select to display any files in the merge module

Table 7-28 • Application Manager Subnode Icons / Catalog Tab (cont.)

Name	Icon	Description
Products		Merge modules on Merge Modules tab. Select to display any products in the Application Catalog that use the merge module.

Test Center Tab Subnodes

The following subnodes are available on the **Test Center** tab:

Table 7-29 • Application Manager Subnode Icons / Test Center Tab

Name	Icon	Description
Patch Impacts		Click to access the Windows Installer package's Patch Impacts Analysis View, which lists patches for which there is patch impact data persisted against the product, and identifies the patch that caused the impact. ***Note*** • *Windows Installer packages only.*
Associated Patches		Click to display the product's Associated Patches View, which displays a list of imported patches that, if installed, would update the selected package. ***Note*** • *Windows Installer packages only.*

Shortcut Menus

Application Manager includes several shortcut menus which can be accessed by right-clicking on nodes on the **Products**, **Merge Modules**, and **Environment** tabs. These menus provide specific functionality in relation to what is clicked and what tab of the ribbon is selected (**Catalog** or **Test Center**).

- Groups and Applications
- Packages

Note • *This topic lists the shortcut menu commands available on the Application Manager **Products** tab. However, commands that are only available on the **Environment** or **Merge Modules** tabs are also noted.*

Groups and Applications

The shortcut menu that is displayed when a group or application is selected varies depending upon whether the **Catalog** tab or the **Test Center** tab of the ribbon is selected.

Catalog Tab of Ribbon

When you right-click on a group or application in the Application Manager tree, the following commands are available through the shortcut menu when the **Catalog** tab of the ribbon is selected

Table 7-30 • Group/Application Shortcut Menu Commands / Catalog Tab

Command	Description
Import / Import Package	Select this option to launch the Import Wizard to import Windows Installer and virtual packages into the Application Catalog.
Distribute Group / Distribute Application	Select to publish an application or group of applications to Configuration Manager. For more information, see Publishing Packages to Microsoft System Center Configuration Manager.
Launch Conversion Wizard	Select to open the Conversion Wizard, where you can upgrade App-V 4.x packages to App-V 5.0 format, or can convert a Windows Installer package to a virtual application. For more information, see Using the Conversion Wizard.
New Group	Creates a new group within the selected group. ***Note*** • *For groups only.*
Rename	Allows you to rename the selected group or application.
Copy	Used in conjunction with the **Paste** command to enable you to share packages with multiple groups. See Copying and Sharing Packages in the Application Catalog. ***Note*** • *For applications only.*
Paste	Used in conjunction with the **Copy** command to enable you to share packages with multiple groups. See Copying and Sharing Packages in the Application Catalog. ***Note*** • *For applications only.*
Delete	Removes the selected group/application from the Application Catalog, including all of its contents.
Find	Select to perform a search for data in the various tables of the Application Catalog. See Searching an Application Catalog for more information.
Properties	Opens the **Properties** dialog box.

Test Center Tab of Ribbon

When you right-click on a group or application in the Application Manager tree, the following commands are available through the shortcut menu when the **Test Center** tab of the ribbon is selected:

Table 7-31 • Group/Application Shortcut Menu Commands / Test Center Tab

Command	Description
Execute Tests	Select to perform application compatibility and best practices testing on the packages in the selected group or application. Tests from the following test groups are run, depending upon the selections made on the **Select Tests to Execute** dialog box: • Operating System Compatibility • Browser Compatibility • Remote Application Publishing Compatibility • Best Practices and Risk Assessment • Application Virtualization Compatibility
Resolve Issues	Select to resolve all detected issues for which an automatic resolution is available.
Launch Conflict Wizard	Select to launch the Conflict Wizard to perform conflict analysis on the packages in the selected group or application. The Conflict Wizard opens directly to the **Target Information** panel.
Launch Patch Impact Analysis Wizard	Launches the Patch Impact Analysis Wizard, which you can use to identify conflicts between Microsoft operating system patches and packages or OS Snapshots in the Application Catalog.

Packages

The shortcut menu that is displayed when a package is selected varies depending upon whether the **Catalog** tab or the **Test Center** tab of the ribbon is selected.

Catalog Tab of Ribbon

When you right-click on a package in the Application Manager tree, the following commands are available through the shortcut menu when the **Catalog** tab of the ribbon is selected:

Table 7-32 • Package Shortcut Menu Commands / Catalog Tab

Command	Description
Reimport Package	Select to reimport the selected package into the Application Catalog.

Table 7-32 • Package Shortcut Menu Commands / Catalog Tab (cont.)

Command	Description
Refresh Package Auto Import	Rather than waiting until the next scheduled automatic update is performed, select this option to manually re-import a Windows Installer or App-V package that is being monitored in a Remote Application Catalog.  ***Note*** • *Supported for Windows Installer packages only.*
Distribute Package	Launch the Distribution Wizard.
Dependency Wizard	Launch the Dependency Wizard. For more information, see Specifying Package Dependencies Deployment Data.  ***Note*** • *Supported for Windows Installer packages only.*
Edit MSI with InstallShield	Open this package in InstallShield Editor, where you can directly edit the package.  ***Note*** • *Supported for Windows Installer packages only.*
Create Transform with InstallShield	Create a transform file for the selected package and open it in InstallShield Editor.  ***Note*** • *Supported for Windows Installer packages only.*
Edit with Virtual Package Editor	Open this App-V package in Virtual Package Editor, where you can view and edit package data.  ***Note*** • *Supported for App-V packages only.*
Associate Package	Manually associate a virtual package with its source Windows Installer package. See Associating a Virtual Package with its Source Windows Installer Package.  ***Note*** • *Supported for App-V packages only.*
Get Package To	Use to get a copy of the virtual package from the Software Repository to a location you specify.  ***Note*** • *Supported for virtual packages only.*

Table 7-32 • Package Shortcut Menu Commands / Catalog Tab (cont.)

Command	Description
Associate with Workflow Manager Workflow Request	Launches the **Associate with Workflow Manager Workflow Request** dialog box, from which you can pick a package in Workflow Manager with which to associate the extended attribute data for the selected product. ***Note*** • *Supported for Windows Installer packages only.*
Check Out	Check out the package from the Software Repository.
Check In As	Check in the package to the Software Repository as either a new package version or overwriting the existing version.
Cancel Check Out	Cancel the check out of the package from the Software Repository.
Get Latest Version	Select if you want to get a copy of a package that is in the Software Repository, but you do not want to check it out,. The package and all of its associated files will then be copied to the user's profile directory.
Rename	Rename the selected package.
Delete	When an application is selected, selecting **Delete** deletes the application and all of its deployment types. When a Windows Installer or virtual package is selected, you have the following options: • **Package**—Removes the product from the current Application. • **Package from all Applications**—Removes the package from all Applications and removes it from the Application Catalog. • **All Extended Attributes**—Removes all extended attributes from the selected package. • **History Log Information**—Removes all change history data for the selected package. • **Package Association**—Removes association with Windows Installer package. (Virtual packages only.) When a patch is selected on the **Environment** tab, you have the following options: • **Patch** • **Patch from all Groups** • **Patch Impact Data** When a merge module is selected on the **Merge Modules** tab, clicking **Delete** deletes the merge module from the Application Catalog.
Find	Select to perform a search for data in the various tables of the Application Catalog. See Searching an Application Catalog for more information.

Table 7-32 • Package Shortcut Menu Commands / Catalog Tab (cont.)

Command	Description
Import Merge Module	Launches the Import Wizard directly to the **MSM Source Information** panel. ***Note*** • *Available when you select the root-level Merge Modules node or an individual merge module in the **Merge Modules** tab.*

Test Center Tab of Ribbon

When you right-click on a package in the Application Manager tree, the following commands are available through the shortcut menu when the **Test Center** tab of the ribbon is selected:

Table 7-33 • Package Shortcut Menu Commands / Test Center Tab

Command	Description
Execute Tests	Select to perform application compatibility and best practices testing on the selected package. Tests from the following test groups are run, depending upon the selections made on the **Select Tests to Execute** dialog box: • Operating System Compatibility • Browser Compatibility • Best Practices and Risk Assessment • Application Virtualization Compatibility • Remote Application Publishing Compatibility
Resolve Issues	Select to resolve all detected issues for which an automatic resolution is available.
Launch Conflict Wizard	Launches the Conflict Wizard directly to the **Target Information** panel.
Launch Patch Impact Analysis Wizard	Launches the Patch Impact Analysis Wizard, which you can use to identify conflicts between Microsoft patches and packages and OS Snapshots in your Application Catalog.
Generate Report	Select to generate a Patch Report for that patch. ***Note*** • *Available only when an OS security patch is selected on the **Environment** tab.*

Output Window

When processes are performed on items in the Application Catalog or when a search is performed, the output messages and results of those wizards are displayed in the various tabs of the Output Window.

Table 7-34 • Output Window Tabs

Tab	Description
Output Tab	When testing is performed, messages are displayed in this tab.
Patch Impact Tab	After the Patch Impact Analysis Wizard is run to identify conflicts between a Microsoft patch and a Windows Installer package or OS Snapshot, all of the impacts that were generated are listed in a table format. Each table row lists the following information: • **Patch**—Name of the patch that caused the conflict. • **Product**—Name of the impacted product. • **Type**—The type of impact. • **Description**—Description of the conflict that was found between the patch and the product. The following is an example of a conflict description: `Package 'WindowsXP v5.00' uses version '6.0.9589' of file 'SystemFolder\expsrv.dll' but Patch 'Windows2000-KB837001-x86-ENU' uses version '6.0.72.9589' of the same file` If you double-click on a row in this window, the conflicting file on the target product that is being impacted by the patch will be displayed and highlighted in the Tables View. For further information on the impacts generated by the Patch Impact Analysis, you may want to generate a Patch Report, or view the Product tab's Patch Impacts Analysis View, Dependencies View, and Associated Patches View. See Analyzing the Impact of Installing a Microsoft Operating System Patch for more information.
Search Results Tab	When Find is used to search for data in Application Catalog tables, the data that is found is displayed in this tab, in the following format: 

Application Manager Report Center Tab

***Edition** • The **Report Center** tab is included with AdminStudio Enterprise Edition.*

On the **Report Center** tab, AdminStudio provides a wide array of reports containing Application Catalog summary information on the Windows Installer and App-V packages in your Application Catalog, giving you insight into the readiness of those packages for distribution and for conversion to virtual packages.

These reports include test results from operating system compatibility, browser compatibility testing, best practices testing, application conflict testing, and remote application publishing compatibility. They also include information about the App-V packages in your Application Catalog, as well as Microsoft System Center Configuration Manager deployment information.

For more information, see Viewing Application Testing and Analysis Reports on the Report Center Tab.

Products Tree/Catalog Tab Views

The following views are displayed when the Application Manager **Products** tree is selected and the **Catalog** tab is selected in the ribbon.

- Group View
- Application View
- Catalog Deployment Type View
- Catalog Deployment Type View Subnode Views

Group View

The Group view, which is displayed on the right side of Application Manager whenever a group is selected, consists of pie charts that summarize the following information in the selected group:

- **Composition**—Displays the number of subgroups, applications, and packages in the selected group.
- **Packages**—Displays the number of packages in each of the following categories: installers (Windows Installer packages and legacy installers), virtual packages, mobile apps, web applications, and other.
- **Deployments**—Displays the number of packages that are deployed
- **Virtualizable**—Displays the number of virtual packages.

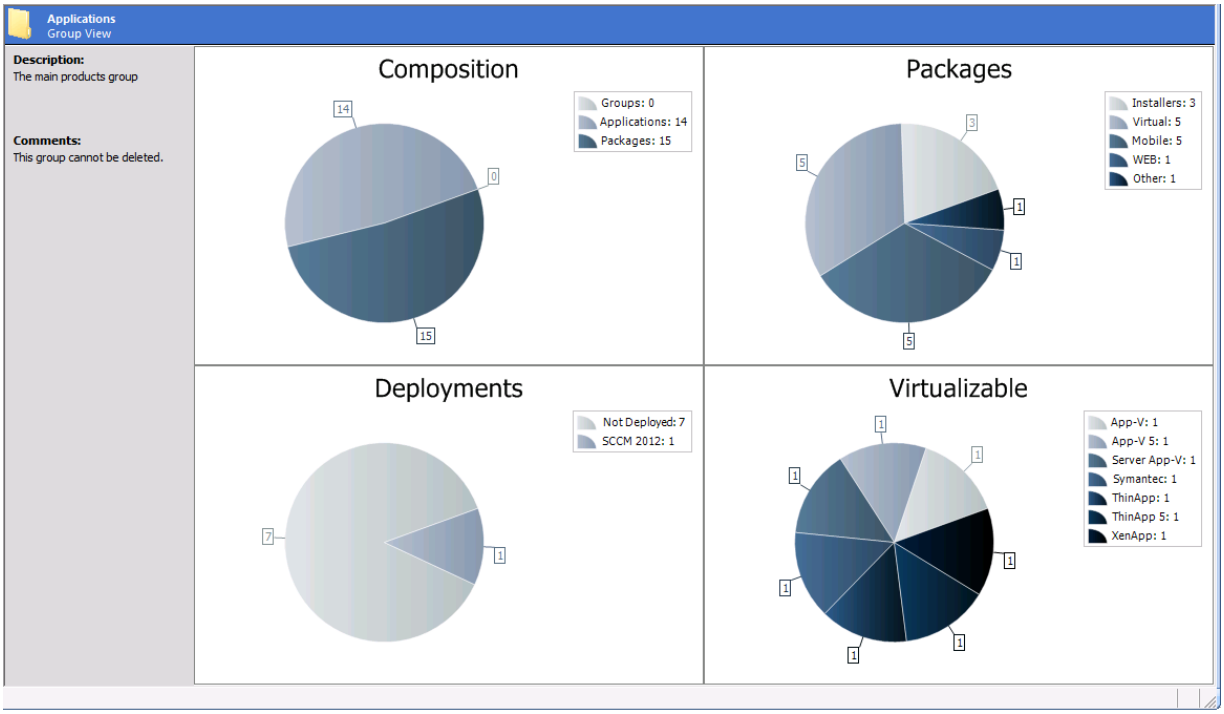

Figure 7-35: Catalog Tab / Group View

If you select an application or package in the Group View, properties for that application or package are displayed in the right pane.

Application View

When the **Catalog** tab is selected in the Application Manager ribbon and an application is selected in the tree, the **Application View** opens, which provides summary information about the application, deployment data for each of its deployment types, dependencies/supersedences information, and Microsoft System Center Configuration Manager and/or Citrix XenApp deployment status. Much of this information is used during deployment to Microsoft System Center Configuration Manager.

The **Application View** presents this information on the following tabs:

- General Information Tab
- Deployment Types Tab
- References Tab
- Deployment Status Tab
- App Portal Information Tab
- XenApp Deployment Types Tab
- Altiris Deployment Types Tab
- AirWatch Deployment Types Tab
- Extended Attributes Tab

General Information Tab

The **General Information** tab of the **Application View** lists summary information about the application that AdminStudio gathered during package import. Click in the **Value** column to edit a value.

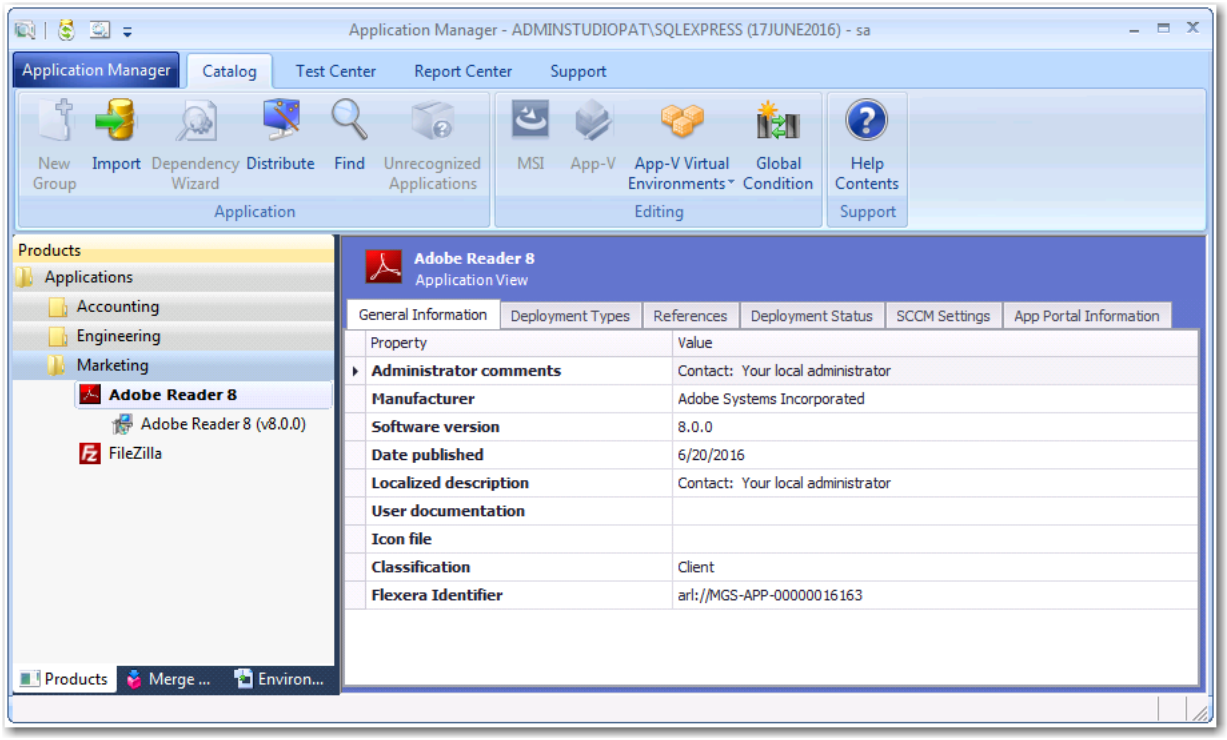

Figure 7-36: Application View / General Information Tab

The **General Information** tab of the **Application View** includes the following properties:

Table 7-35 • General Information Tab of Application View

Property	Description
Administrator comments	Comments related to this application, possibly regarding support for this application.
Manufacturer	Manufacturer of the application, as discovered from its deployment types.
Software version	Version of the application, as discovered from its deployment types.

Table 7-35 • General Information Tab of Application View

Property	Description
Date published	The purpose of this field is to display the date the application was published to System Center 2012 Configuration Manager. When you create an application in Application Manager (usually by importing a package), this field is left blank. • If you do not enter a value in this field, when you publish the application to System Center 2012 Configuration Manager, this field will be automatically updated to display the published date. • If you enter a value in this field, and then publish the application to System Center 2012 Configuration Manager, the date that you entered will be listed as the published date in Configuration Manager.
Localized description	Description of this application written in the language of the target user.
User documentation	Location of documentation provided with this application.
Icon file	Icon used in the Application Manager tree to represent this application. Click the browse button to open the **Change Icon** dialog box to specify a different icon by selecting an **.exe**, **.dll**, or **.ico** file.
Classification	Identifies whether this is a **Client** or **Server** application, or whether the application classification is **Unknown**. By default, this property is set to **Client** for all applications.
Flexera Identifier	A unique identifier assigned to applications by the FlexNet Manager Suite and stored in its libraries. The FlexNet Manager Suite Application Recognition Library uniquely identifies over 110,000 applications (including multiple versions and editions) from over 14,000 publishers. The Flexera Identifier key is used to link application information from Application Manager with application information in App Portal and FlexNet Manager Suite.  ***Note*** • *A single Flexera Identifier represents an application and all of its deployment types.*  ***Note*** • *This field is only populated with a Flexera Identifier if you have entered valid Flexera Service Gateway connection information on the Application Manager* ***Options*** *dialog box. For a description of the possible informational messages that could appear in this field, see Flexera Identifier Messages.*

Flexera Identifier Messages

When packages are imported into the Application Catalog, or when you click the **FlexNet Manager Platform** button on the **Flexera Service Gateway (FSG)** tab of the Application Manager **Options** dialog box, AdminStudio queries FlexNet Manager Suite for the Flexera Identifier of the imported applications, and messages are returned.

Information on an individual application's Flexera Identifier is displayed in the **Flexera Identifier** field on the **General Information** tab of the **Application View**.

Information on messages relating to an application's Flexera Identifier and communicating with FlexNet Manager Suite are described in the following sections:

- Flexera Identifier Field Messages
- Flexera Service Gateway (FSG) Tab of Options Dialog Box / Import Wizard Messages

Flexera Identifier Field Messages

The following messages are displayed in the **Flexera Identifier** field on the **General Information** tab of the **Application View** for an individual application.

Table 7-36 • Flexera Identifier Messages on Application View

Message	Description
[Blank]	Connection information to the Flexera Service Gateway is not entered on the **Flexera Service Gateway (FSG)** tab of the Application Manager **Options** dialog box.
`arl://MGS-APP-`*nnnnnnnnnnn*	Indicates that a matching Flexera Identifier was found in the FlexNet Manager Suite Application Recognition Library (ARL).
`Flexera Identifier not found`	Indicates that a Flexera Identifier was not found in the FlexNet Manager Suite ARL.
`Multiple applications detected`	Indicates that because a Windows Installer package has multiple software tags, AdminStudio did not query FlexNet Manager Suite for a Flexera Identifier.

Flexera Service Gateway (FSG) Tab of Options Dialog Box / Import Wizard Messages

The following messages related to obtaining application Flexera Identifiers are listed on the **Flexera Service Gateway (FSG)** tab of the **Options** dialog box and in the messages displayed on the **Running the Import** panel of the Import Wizard:

Table 7-37 • Flexera Identifier Messages on Options Dialog Box / Import Wizard

Message	Description
`Flexera Identifier: arl://MGS-APP-00000034807`	Appears in the **Running the Import** panel of the Import Wizard when the Flexera Identifier for the imported package is successfully found.

Table 7-37 • Flexera Identifier Messages on Options Dialog Box / Import Wizard

Message	Description
`Error while fetching Flexera Identifier`	Appears in the **Running the Import** panel of the Import Wizard when one of the following occurs: • FlexNet Manager Suite is not registered with the Flexera Service Gateway. • FlexNet Manager Suite web service is not available. • Logged-in user does not have access to the FlexNet Manager Suite web service.
`Flexera Identifier has not been assigned for this application`	Appears in the **Running the Import** panel of the Import Wizard when a Flexera Identifier was not found in the FlexNet Manager Suite ARL for that application.
`Not synchronized with FlexNet Manager Platform`	Is displayed on the **Options** dialog box after you have upgraded an existing Application Catalog that was created using a version of AdminStudio prior to 11.5 SP2.

Note • *When you click the* ***FlexNet Manager Platform*** *button on the* ***Flexera Service Gateway (FSG)*** *tab of the Application Manager* ***Options*** *dialog box, AdminStudio first searches the ARL for an application's first Windows Installer package. If a Flexera Identifier is found, that ID is used. If a Flexera Identifier is not found for the Windows Installer package, AdminStudio then searches the ARL for the application's first App-V package, and if that is also not found, it searches for the application's first* ***.exe*** *file. If that is also not found, AdminStudio searches the ARL for the application's deployment type that was imported first.*

Deployment Types Tab

The **Deployment Types** tab of the **Application View** lists data for all of the application's deployment types. It contains the same information that is displayed on the Deployment Data Tab for each of its associated deployment types (packages).

Compressed View

The compressed view of the **Deployment Data** tab of the **Application View** lists the application's associated packages.

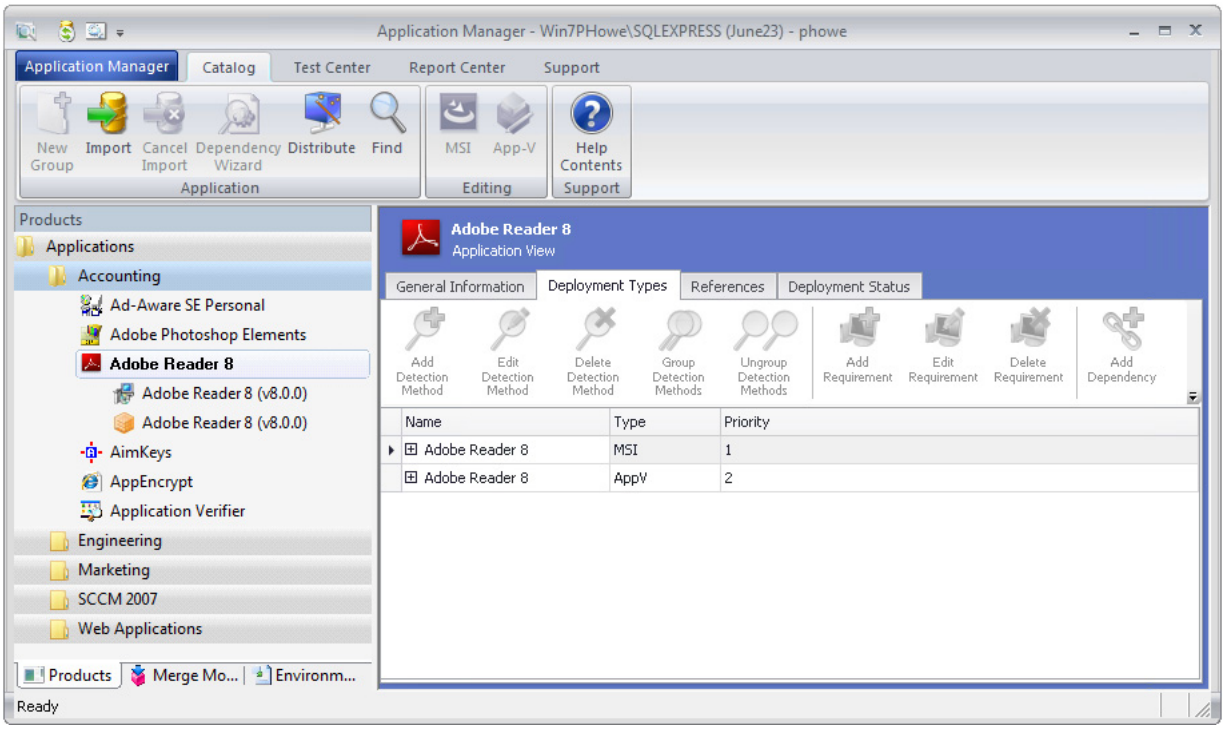

Figure 7-37: Application View / Deployment Types Tab (Compressed)

The compressed view of the **Deployment Types** tab of the **Application View** includes the following properties:

Table 7-38 • Application View / Deployment Types Tab (Compressed)

Property	Description
Name	Name of the package (deployment type).
Type	Indication of the package's deployment type: **MSI**, **App-V**, **Citrix**, or **ThinApp**.
Priority	Indicates the package's priority ranking among the application's other packages.

Expanded View

When you click the plus sign next to a package name, it expands to list the same deployment information that is displayed on the **Deployment Data** tab of the **Catalog Deployment Type View** for the selected package.

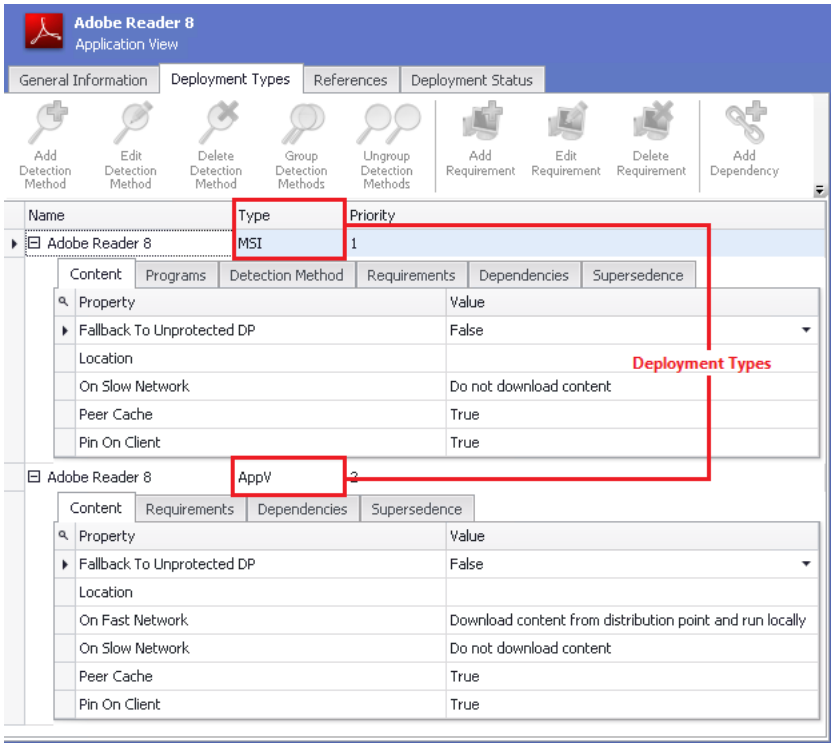

Figure 7-38: Application View / Deployment Types Tab (Expanded)

For a description of the properties displayed on these subtabs for each of an application's packages, see Deployment Data Tab.

References Tab

On the **References** tab of the **Application View**, you can view a list of packages that are dependent upon this application or that supersede this application.

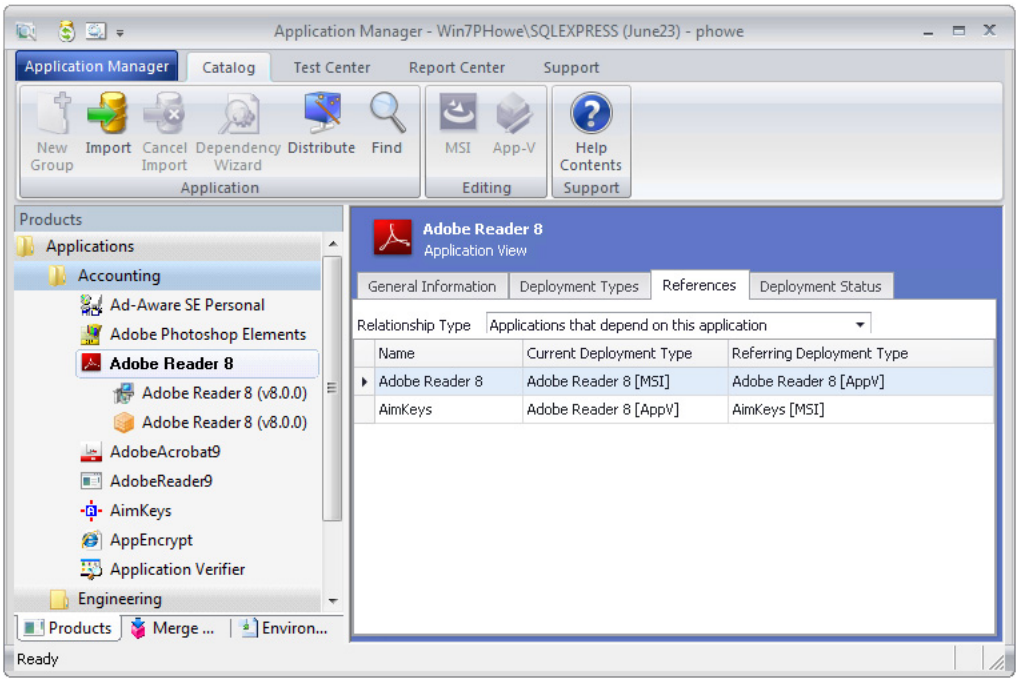

Figure 7-39: Application View / References Tab

These dependencies are defined on the **Dependencies** and **Supersedence** subtabs of the **Deployment Data** tab of the **Catalog Deployment Type View** for a selected package. If another package has specified that it is dependent upon or supersedent to this package, that package will be listed here.

For more information, see Specifying Package Dependencies Deployment Data and Specifying Package Supersedences Deployment Data.

The **References** tab of the **Application View** includes the following properties:

Table 7-39 • Application View / References Tab

Property	Description
Relationship Type	Select one of the following: • **Applications that supersede this application**—Select to view applications that contain a package which supersedes a package in this application. If both packages were installed on a target machine, the supersedent package would be used. • **Applications that depend on this application**—Select to view applications that contain a package which is dependent upon a package in this application. In order to run properly, the dependent package requires that the package that it is dependent upon be installed on the same target machine
Name	Name of application that contains a package that is dependent upon or supersedent to this application.
Current Deployment Type	Name of the deployment type of this application that is involved in this supersedence or dependency relationship.

Table 7-39 • Application View / References Tab

Property	Description
Referring Deployment Type	Name of the deployment type of the referring application that is involved in this supersedence or dependency relationship.

Deployment Status Tab

The **Deployment Status** tab of the **Application View** lists data from System Center Configuration Manager that is specific to this application, not to its deployment types. The data is read from the active System Center Configuration Manager server that has been specified on the **Server Options** > **Distribution System** tab of the Application Manager **Options** dialog box.

Note • *If Application Manager is unable to establish an active link to the System Center Configuration Manager server, then a message indicating that there is no active connection will be displayed.*

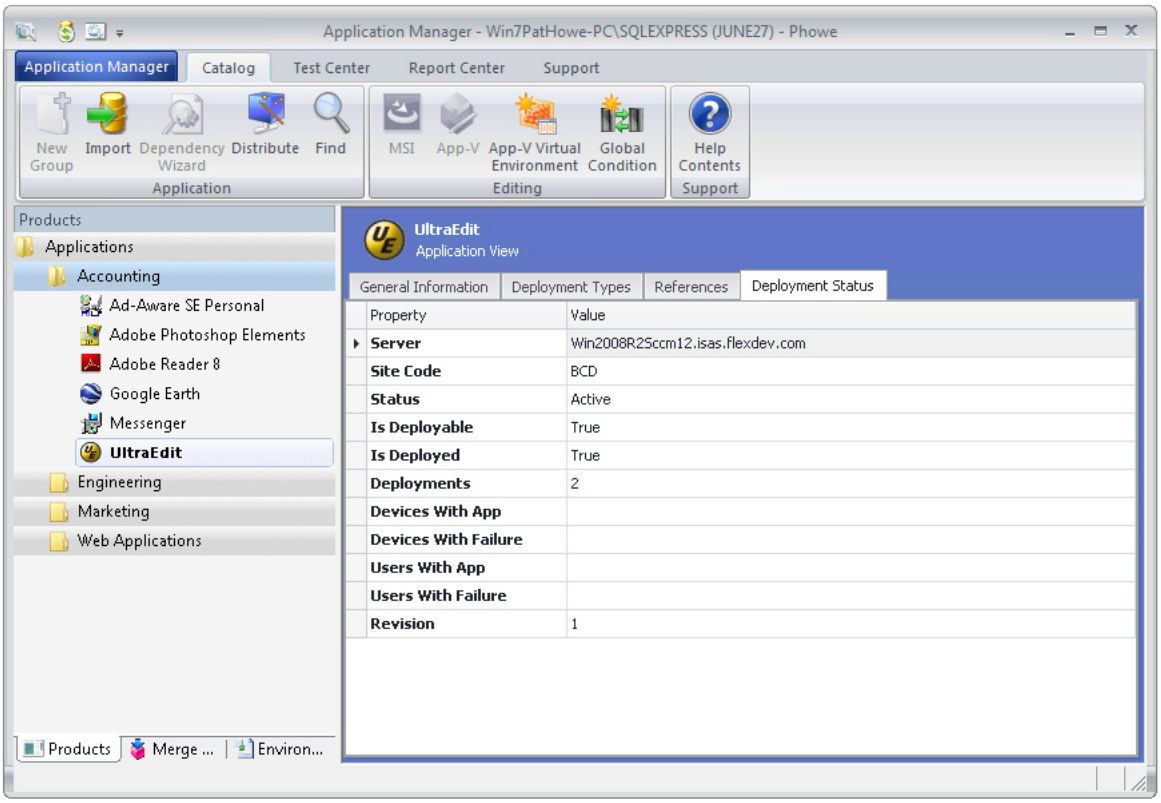

Figure 7-40: Application View / Deployment Status Tab

The **Deployment Status** tab of the **Application View** includes the following properties:

Table 7-40 • Application View / Deployment Status Tab

Property	Description
Server	Name of server where this application has been published.
Site Code	Site code of the System Center 2012 Configuration Manager server where this application has been published.
Status	Indicates the status of the application on the System Center 2012 Configuration Manager server as **Active** or **Retired**. You can retire or reinstate an application in System Center 2012 Configuration Manager by changing this value, without even being required to republish the application. To change an application's status on System Center 2012 Configuration Manager select one of the following options: • **Retire**—Select this option to make this application unavailable for distribution by System Center 2012 Configuration Manager. • **Active**—Select this option to reinstate this application, making a formerly retired application once again available for distribution by System Center 2012 Configuration Manager.  ***Note*** • *When you retire an application, it is no longer available for deployment but the application and any deployments of the application are not deleted. Existing copies of this application that have been installed on client computers will not be removed. If an application that has no deployments is retired, it will be deleted from the Configuration Manager console after 60 days. However, any installed copies of the application are not removed.*  ***Note*** • *If the application has not been published to System Center 2012 Configuration Manager, the following message will be displayed:* `Not published to System Center Configuration Manager`
Is Deployable	Indicates whether the application is ready to be deployed by System Center Configuration Manager. Values are **True** or **False**.
Is Deployed	Indicates whether the application has been deployed by System Center Configuration Manager. Values are **True** or **False**.
Deployments	Number of times this application has been deployed by System Center Configuration Manager.

Table 7-40 • Application View / Deployment Status Tab

Property	Description
Devices With App	Number of machines that this application has been successfully deployed to by System Center Configuration Manager.
Devices With Failure	Number of machines that System Center Configuration Manager attempted to deploy this application to but was unsuccessful.
Users With App	Number of users this application has been successfully deployed to by System Center Configuration Manager.
Users With Failure	Number of users that System Center Configuration Manager attempted to deploy this application to but was unsuccessful.
Revision	Revision of application.

SCCM Settings Tab

The **SCCM Settings** tab of the **Application View** lists an application's System Center Configuration Manager settings. The **SCCM Settings** tab is only displayed if you have set up a connection to a System Center Configuration Manager server.

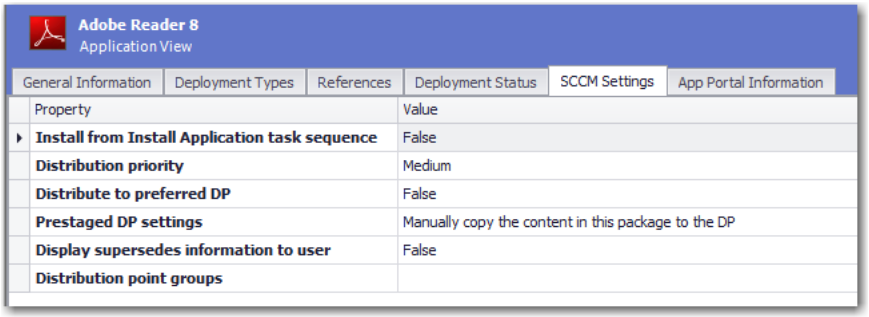

Figure 7-41: SCCM Settings Tab of Application View

The **SCCM Settings** tab includes the following properties:

Table 7-41 • SCCM Settings Tab

Properties	Description
Install from Install Application task sequence	Select **True** to deploy this application when deploying an operating system, as part of an Install Application task sequence. Select **False** to install this application manually.

Table 7-41 • SCCM Settings Tab

Properties	Description
Distribution priority	When you are sending multiple packages to a distribution point, those packages are sent in priority order, with higher priority packages being sent first. Use this property to specify a package's priority. The following options are available: • **High** • **Medium** • **Low**
Distribute to preferred DP	To enable on-demand content distribution to preferred distribution points, select **True**. When enabled, the content is distributed to all preferred distribution points in the list when a client requests the content for the package and the content is not available on any preferred distribution points.
Prestaged DP settings	Select one of the following options to specify how you want to distribute content to prestaged distribution points: • **Automatically download content when packages are assigned to DP**—Select to ignore the prestage settings and distribute content to the distribution point. • **Download only content changes to the DP**—Select to prestage the initial content to the distribution point, and then distribute content changes to the distribution point. • **Manually copy the content in this package to the DP**—Select to always prestage content on the distribution point. (Default)
Display supersedes information to user	Set this option to **True** to allow users to see deployments for this application and all applications that it supersedes in the Application Catalog. This may result in the user installing multiple applications on the same device, if the requirements for these applications are met.
Distribution point groups	Specify the System Center 2012 Configuration Manager distribution point groups to which this application's content will be distributed.  ***Note*** • *If AdminStudio is integrated with App Portal, this is a required field. If no distribution point group is entered, the App Portal administrator will be required to manually enter this information in System Center Configuration Manager before App Portal will be able to distribute this application.*

App Portal Information Tab

If AdminStudio and App Portal are integrated (by being connected to the same Flexera Service Gateway), the **App Portal Information** tab is displayed on the **Application View**.

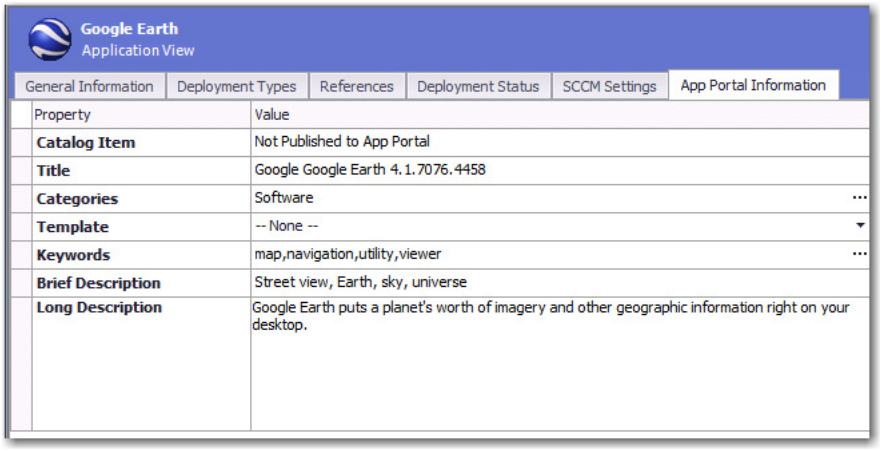

Figure 7-42: App Portal Information Tab

On this tab, you can control whether or not an App Portal catalog item is automatically created when you publish this application to System Center 2012 Configuration Manager or Symantec Altiris Server, and you can also specify the following App Portal catalog item information:

- Catalog Item Category
- Catalog Item Template
- Search Keywords
- Brief Description and Long Description

The **App Portal Information tab** includes the following properties:

Table 7-42 • App Portal Information Tab'

Property	Description
Catalog Item	If published to App Portal, its catalog item number is listed. If it is not published to App Portal, the following is listed: `Not Published to App Portal`
Title	(Read only) This field is a concatenation of the application's **Manufacturer** and **Software version** fields on the **General Information** tab with the application name in the Application Manager tree. This field simulates the same concatenation that App Portal will perform in order to fill in the **Title** field on the **General > Title & Description** tab of the App Portal **Catalog Item Properties** dialog box when this application is published to an App Portal-linked distribution system. ***Note*** • *The value in the App Portal **Title** field will identify the application in the App Portal storefront, as shown in Brief Description.*

Table 7-42 • App Portal Information Tab'

Property	Description
Categories	(Required) Click the browse button in this field to open the **Categories** dialog box, where you can both indicate that you want to automatically create an App Portal catalog item when this application is published (by selecting the **Notify Flexera Software App Portal on publish of current Application** option), and specify the App Portal category or categories the catalog item will appear in. After a category is selected, it will be listed in this field. ***Note*** • *For more information, see Categories Dialog Box.*
Template	(Optional) In App Portal, you can use templates to automatically assign a defined set of properties to a catalog item. All of the templates defined in your installation of App Portal are listed in this field. Select a template from the list to apply it to the catalog item that will be created when this application is published to an App Portal-linked distribution system. ***Tip*** • *For catalog items that require a complex set of properties, it would be beneficial to create an App Portal template that contains all of those settings and properties. Then, whenever a new catalog item is created, properties and settings can be automatically loaded by selecting that template.*
Keywords	(Optional) In App Portal, end users can search for a catalog item by performing a search on the **Browse Catalog** tab. To assist in that search, keywords can be assigned to a catalog item. To assign keywords to the catalog item that will be created when this application is published to an App Portal-linked distribution system, click the browse button to open the **Keywords** dialog box, where you can create and assign keywords. ***Note*** • *For more information, see Keywords Dialog Box and Edit Keywords Dialog Box. Also see Specifying Catalog Item Keywords.*
Brief Description **Long Description**	(Optional) When you view an App Portal catalog item on the **Browse Catalog** tab, the catalog item's **Title**, **Brief Description**, and **Full Description** properties are displayed. In these fields, enter the text that you want to use for the App Portal **Brief Description** and **Long (Full) Description** for this application. ***Note*** • *For an example of how the Brief and Long (Full) description is displayed in App Portal, see Creating a General Catalog Item in the App Portal Help Library.*

XenApp Deployment Types Tab

The **XenApp Deployment Types** tab of the **Application View** lists Citrix XenApp data for all of the application's deployment types. It contains the same information that is displayed on the XenApp Deployment Data Tab for each of its associated deployment types (packages).

Compressed View

The compressed view of the **XenApp Deployment Types** tab of the **Application View** lists the application's associated packages. You can view XenApp data for the application's App-V 4.x and Citrix XenApp packages.

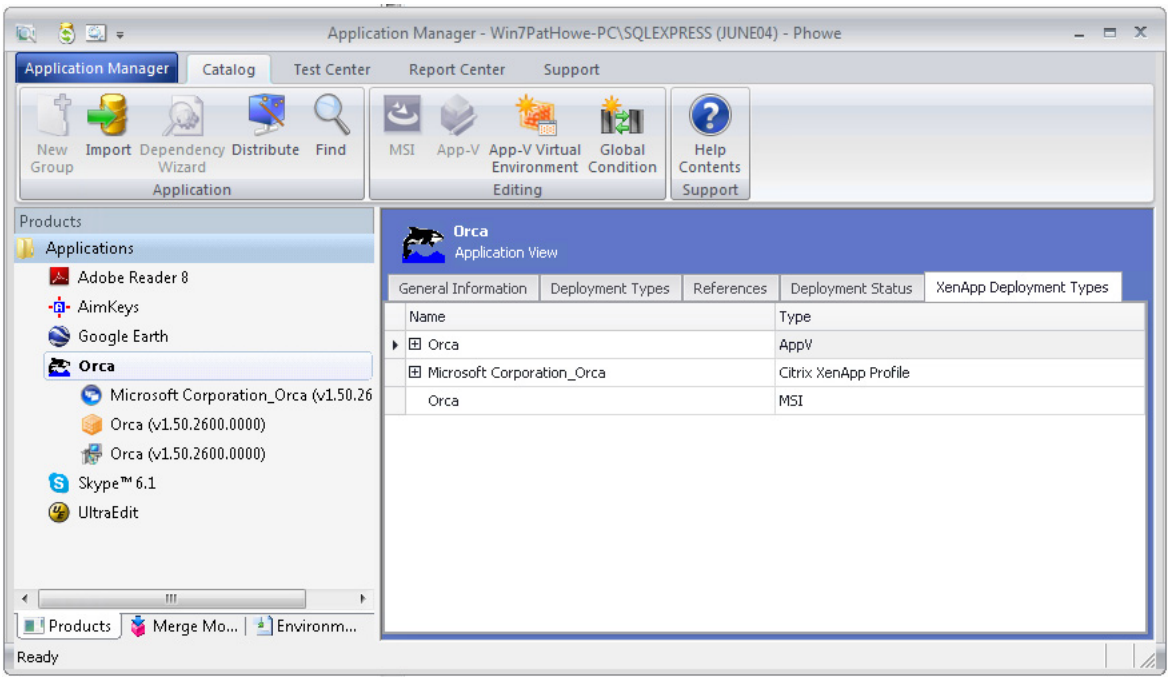

Figure 7-43: Application View / XenApp Deployment Types Tab (Compressed)

The compressed view of the **XenApp Deployment Types** tab of the **Application View** includes the following properties:

Table 7-43 • Application View / XenApp Deployment Types Tab (Compressed)

Property	Description
Name	Name of the package (deployment type). ***Note*** *• You can only view deployment data for an application's App-V 4.x and XenApp packages. The application's other deployment types will be listed on the* ***XenApp Deployment Types*** *tab, but no XenApp deployment information is displayed.*
Type	Indication of the package's deployment type: **MSI**, **AppV**, **Citrix**, **ThinApp**, or **Symantec**.

Expanded View

When you click the plus sign next to a package name, it expands to list the same deployment information that is displayed on the **XenApp Deployment Data** tab of the **Catalog Deployment Type View** for the selected package.

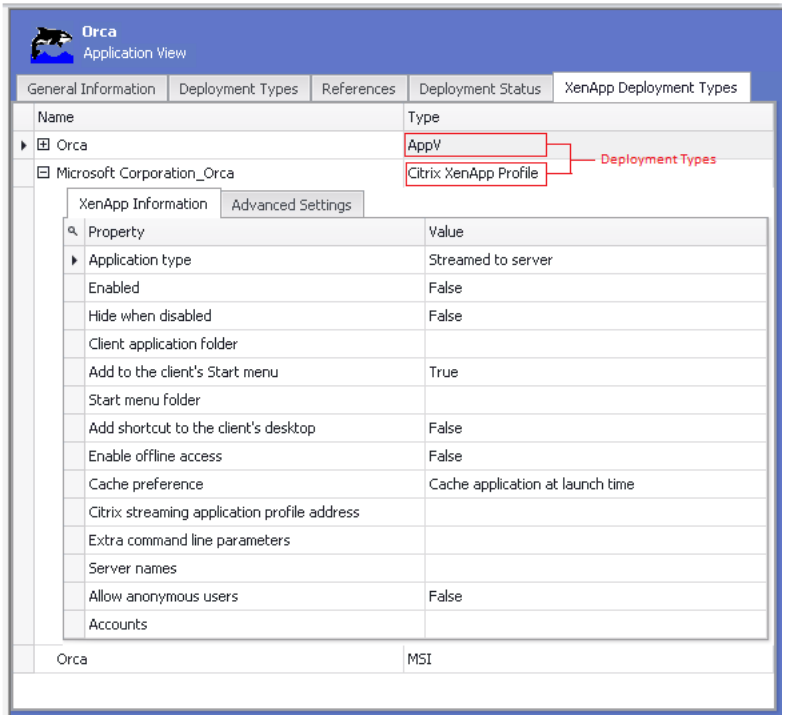

Figure 7-44: Application View / XenApp Deployment Types Tab (Expanded)

For a description of the properties displayed on these subtabs for each of an application's packages, see XenApp Deployment Data Tab.

Altiris Deployment Types Tab

The **Altiris Deployment Types** tab of the **Application View** list Altiris data for all of the application's deployment types. It contains the same information that is displayed on the Altiris Deployment Data Tab for each of its associated deployment types (packages).

Compressed View

The compressed view of the **Altiris Deployment Types** tab of the **Application View** lists the application's associated packages. You can view Altiris data for the application's Windows Installer, Symantec Workspace, VMware ThinApp and legacy installer packages.

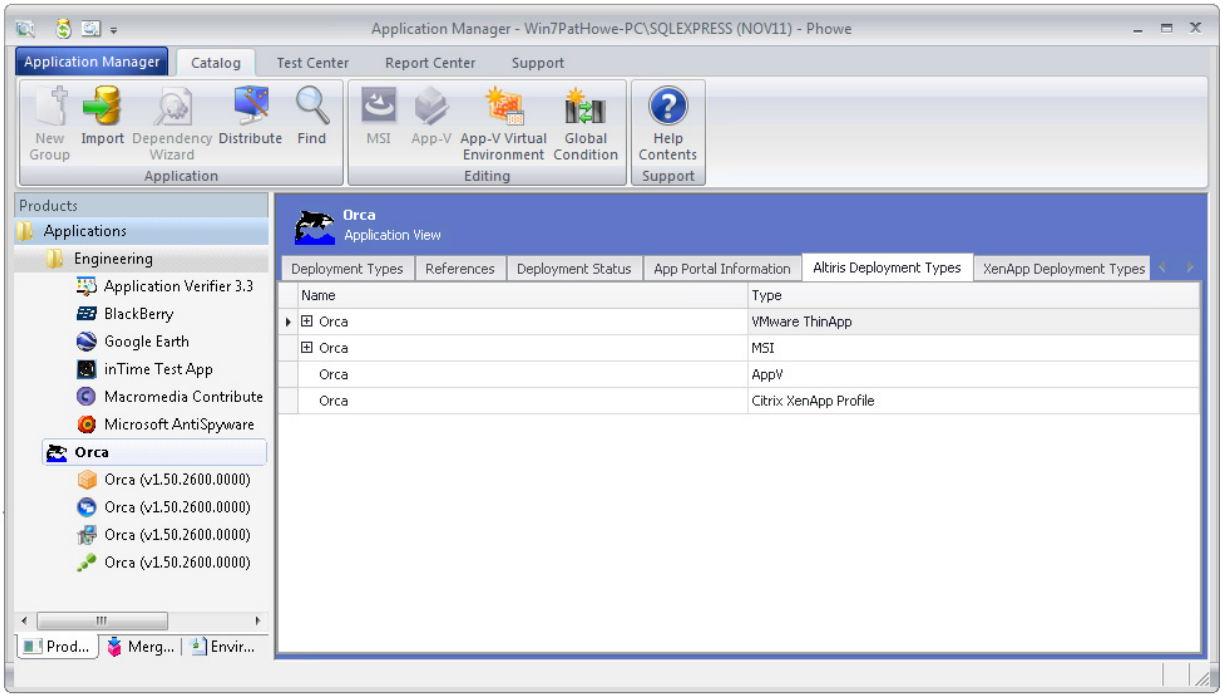

Figure 7-45: Application View / Altiris Deployment Types Tab (Compressed)

The compressed view of the **Altiris Deployment Types** tab of the **Application View** includes the following properties:

Table 7-44 • Application View / Altiris Deployment Types Tab (Compressed)

Property	Description
Name	Name of the package (deployment type). ***Note*** • *You can only view deployment data for an application's Windows Installer, Symantec Workspace, VMware ThinApp and legacy installer packages. The application's other deployment types will be listed on the* ***Altiris Deployment Types*** *tab, but no Altiris deployment information is displayed.*
Type	Indication of the package's deployment type, such as: **MSI**, **AppV**, **Citrix XenApp Profile**, **ThinApp**, or **Symantec**.

Expanded View

When you click the plus sign next to a package name, it expands to list the same deployment information that is displayed on the **Altiris Deployment Data** tab of the **Catalog Deployment Type View** for the selected package.

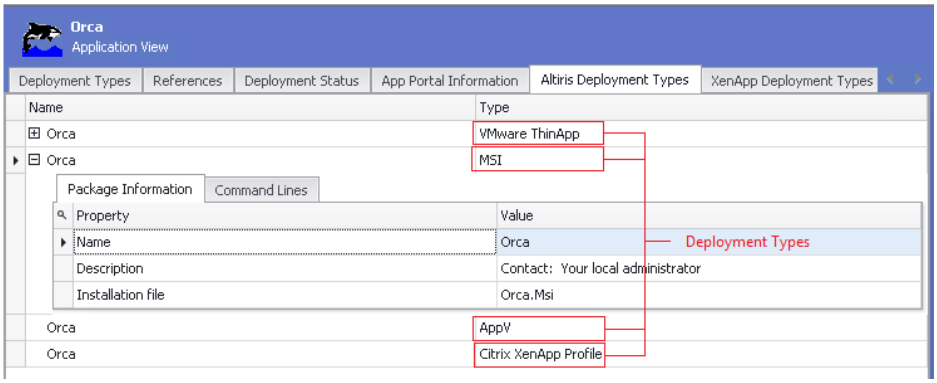

Figure 7-46: Application View / Altiris Deployment Types Tab (Expanded)

For a description of the properties displayed on these subtabs for each of an application's packages, see Altiris Deployment Data Tab.

AirWatch Deployment Types Tab

The **AirWatch Deployment Types** tab of the **Application View** lists AirWatch data for all of the application's Apple iOS (local and public store) and Google Android (local and public store) packages. It contains the same information that is displayed on the AirWatch Deployment Data Tab for each of its associated iOS and Android packages.

Compressed View

The compressed view of the **AirWatch Deployment Types** tab of the **Application View** lists the application's associated packages. You can view AirWatch data for the application's Apple iOS (local and public store) and Google Android (local and public store) packages.

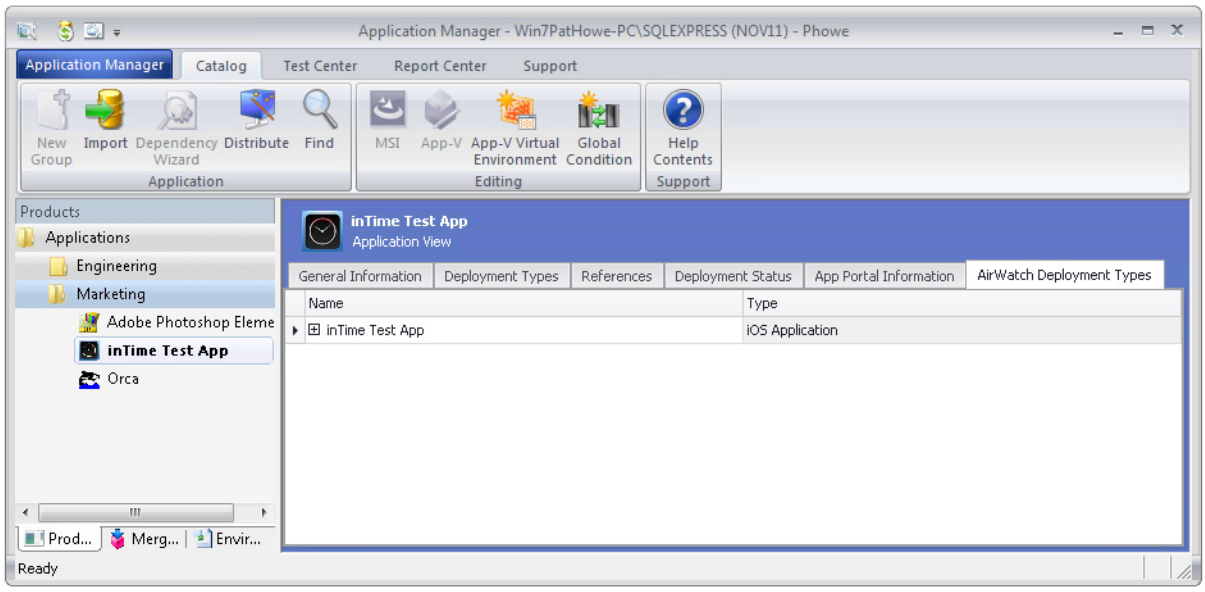

Figure 7-47: Application View / AirWatch Deployment Types Tab (Compressed)

The compressed view of the **AirWatch Deployment Types** tab of the **Application View** includes the following properties:

Table 7-45 • Application View / AirWatch Deployment Types Tab (Compressed)

Property	Description
Name	Name of the package (deployment type). ***Note*** *• You can only view deployment data for an application's Apple iOS (local and public store) and Google Android (local and public store) packages. If an application contains an iOS or Android package as well as a package of another deployment type, those other deployment types will be listed on the* ***AirWatch Deployment Types*** *tab, but no AirWatch deployment information will be displayed.*
Type	Indication of the package's deployment type, such as: **iOS App**, **iOS Public App**, **Android App**, **Android Public App**, **MSI**, **AppV**, **Citrix XenApp Profile**, **ThinApp**, or **Symantec**.

Expanded View

When you click the plus sign next to a package name, it expands to list the same deployment information that is displayed on the **AirWatch Deployment Data** tab of the **Catalog Deployment Type View** for the selected package.

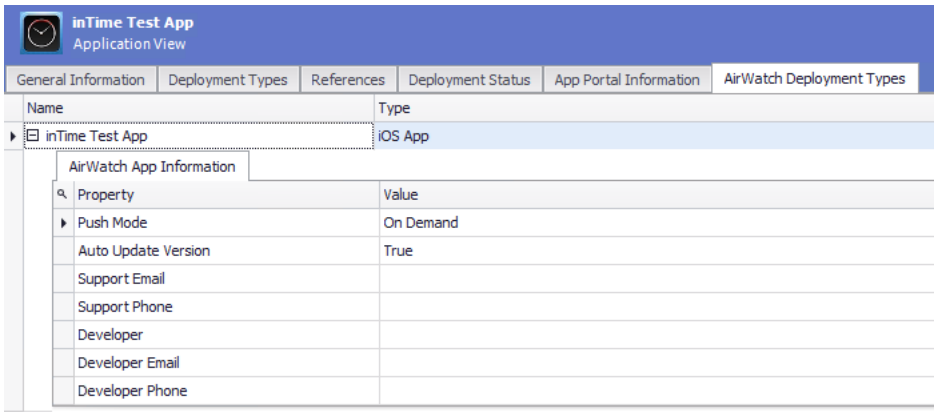

Figure 7-48: Application View / AirWatch Deployment Types Tab (Expanded)

For a description of the properties displayed on these subtabs for each of an application's packages, see AirWatch Deployment Data Tab.

Extended Attributes Tab

If you want to record custom data for applications, you can define custom extended attributes and display those attributes on the **Extended Attributes** tab of the **Application View**.

To enable the **Extended Attributes** tab of the **Application View**, you need to open a provided sample **ApplicationExtendedAttributes.SQL** script file, edit that script file to define your application attributes, and then run that SQL script on your Application Catalog.

***Important** • For information on enabling the Extended Attributes tab and defining attributes, see Enabling Application Extended Attributes.*

After you edit and run that SQL script, the extended attributes that you have defined are listed on the **Extended Attributes** tab.

***Important** • The **Extended Attributes** tab will only be visible for applications imported into the Application Catalog after the **ApplicationExtendedAttributes.SQL** script is run.*

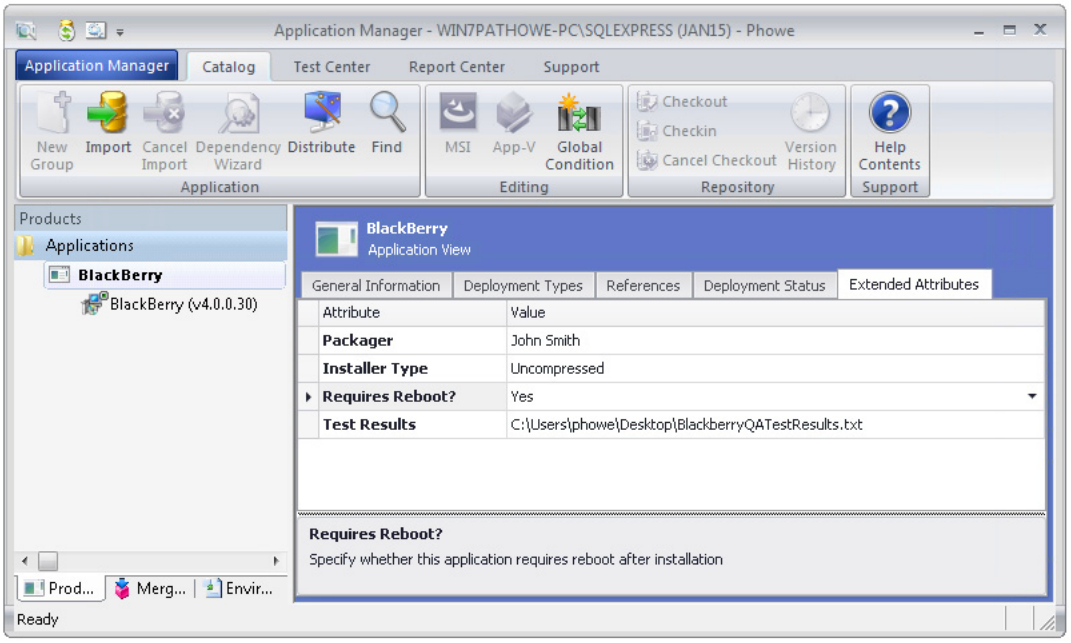

Figure 7-49: Application View / Extended Attributes Tab

Catalog Deployment Type View

When the **Catalog** tab is selected in the Application Manager ribbon and a package is selected in the tree, the **Catalog Deployment Type View** opens, which provides summary information about the package, its deployment data, and software ID tag information. The **Catalog Deployment Type View** presents this information on the following tabs:

- Package Information Tab
- Deployment Data Tab
- XenApp Deployment Data Tab
- Software Identification Tag Tab
- Altiris Deployment Data Tab
- AirWatch Deployment Data Tab

Package Information Tab

When you select a package in the tree and select the **Package Information** tab in the **Catalog Deployment Type View**, details about that package are displayed.

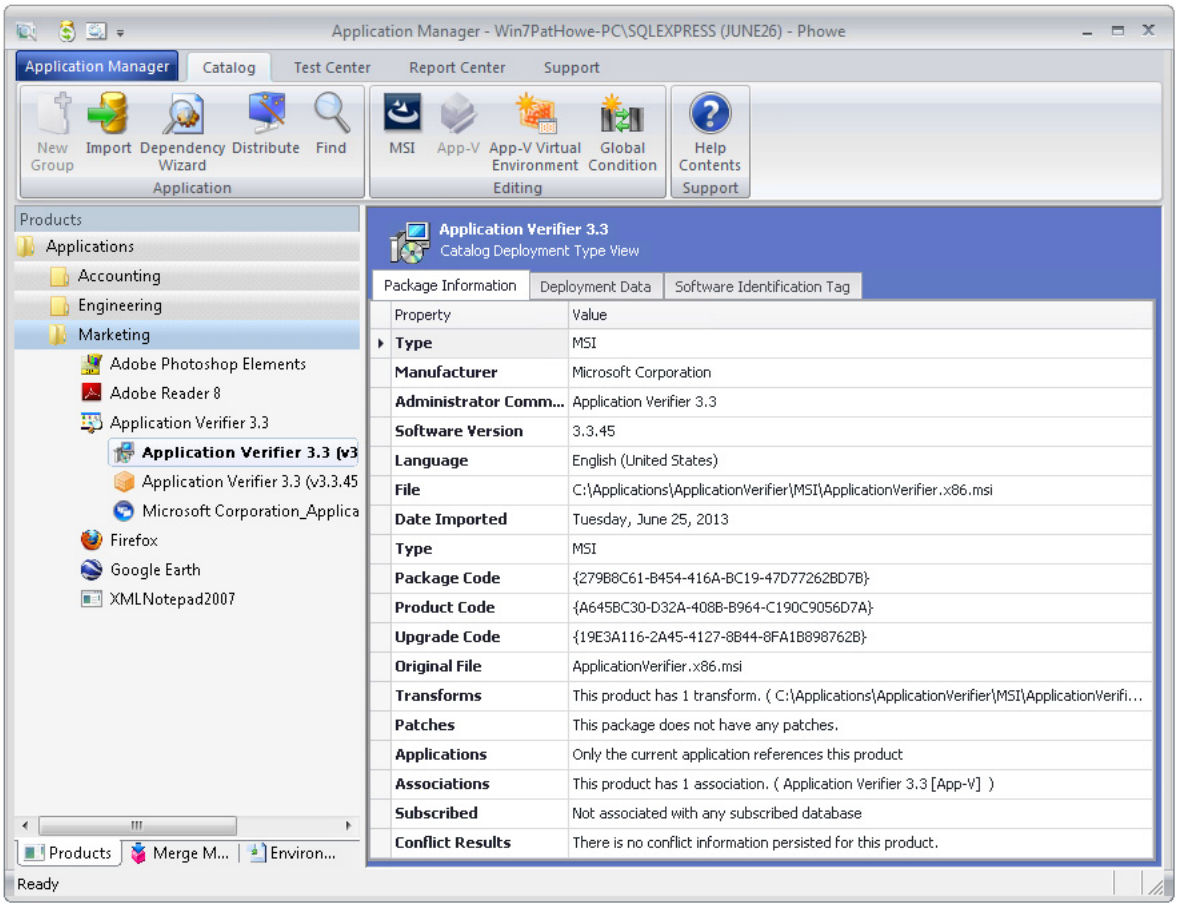

Figure 7-50: Catalog Deployment Type View / Package Information Tab

The **Package Information** tab of the **Catalog Deployment Type View** includes the following properties.

Table 7-46 • Catalog Deployment Type View / Package Information Tab

Field	Description
Type	Identifies the package's deployment type as one of the following: • Android App • Android Public App • Apple Mac Public App • Citrix XenApp Profile • iOS App • iOS Public App • Legacy Installer • Mac Installer Package • Microsoft App-V • MSI • Symantec Workspace Virtualization • VMware ThinApp 4.x • Web Application • Windows App Package • Windows Store Public App
Manufacturer	Manufacturer of the application, as discovered from its deployment types.
Administrator Comments	Comments related to this application, possibly regarding support for this application.
Software Version	Version of this package.
Language	Identifies the language of the intended target user of this package.
File	Identifies the location of this package. It can be either a hard-coded path or a UNC path. If the package is part of the Software Repository, the following statement appears: `Managed within the Software Repository`
Date Imported	The date and time the package was imported.
Displayed Product Name	Lists the property that is mapped to the **File Name** property in Casper.  ***Note*** • *Displayed for Mac OS X DMG and PKG packages only.*

Table 7-46 • Catalog Deployment Type View / Package Information Tab (cont.)

Field	Description
Genre(s)	Categories assigned to this application in the public store. ***Note*** • *Displayed for public store applications only.*
Virtual Directory\URL	Identifies the web application's URL address or the location of the virtual directory containing the web application. ***Note*** • *Displayed for web applications only.*
Domain **User Name** **Password**	If login credentials were entered on the **Web Site Details** panel of the Import Wizard, those credentials are listed here. ***Note*** • *Displayed for web applications only.*
Package Id	Unique identifier that is associated with this App-V package. ***Note*** • *Displayed for App-V packages only.*
Version Id	Unique identifier that is associated with this version (revision) of the App-V package. ***Note*** • *Displayed for App-V packages only.*
Package Version	Package version number of the App-V package. ***Note*** • *Displayed for App-V packages only.*
Supported OS	Operating systems that this App-V package supports. ***Note*** • *Displayed for App-V packages only.*
Primary Feature Block Size	Size of the App-V package's primary feature block, feature block 1. Feature block 1 must contain the core functionality of the App-V application that is necessary to launch the application. At application launch, all of the files in feature block 1 are streamed to the client in one unit. ***Note*** • *Displayed for App-V packages only.*

Table 7-46 • Catalog Deployment Type View / Package Information Tab (cont.)

Field	Description
Total Size	Total size of this App-V application, including all feature blocks.  ***Note*** • *Displayed for App-V packages only.*
Server URL Location	For App-V 4.x packages, the location on the App-V server from which this package can be streamed.  ***Note*** • *Displayed for App-V 4.x packages only.*
Compressed	Indicates whether this App-V package is compressed.  ***Note*** • *Displayed for App-V packages only.*
Client Version	Minimum version number of the App-V client that is required to use the App-V package.  ***Note*** • *Displayed for App-V packages only.*
Package Code	The globally unique identifier (GUID) for the setup package.  ***Note*** • *Displayed for Windows Installer, XenApp, ThinApp, and Symantec Workspace packages.*
Product Code	A string that uniquely identifies the product.  ***Note*** • *Displayed for Windows Installer, XenApp, ThinApp, and Symantec Workspace packages.*
Upgrade Code	A string used to upgrade the application. The upgrade code for a package groups that package into a specific product family.  ***Note*** • *Displayed for Windows Installer packages only.*

Table 7-46 • Catalog Deployment Type View / Package Information Tab (cont.)

Field	Description
Original File	When a user selects a Windows Installer package (**.msi**) along with one or more patch files (**.msp**) to import, AdminStudio first performs an administrative installation to merge the **.msi** and **.msp** files into one **.msi** file, and then imports the merged **.msi** file into the Application Catalog. In this instance, the **Original File** field lists the name and path of the original Windows Installer package that the patches were applied to, while the **File** field lists the name and path of the merged **.msi** file that was imported. If the package is part of the Software Repository, the following statement appears: `Managed within the Software Repository`  ***Note*** • *When a Windows Installer package that was imported without a patch is selected, the entry of the* ***Original File*** *and* ***File*** *fields is identical.*
Transforms	Lists the number of transforms associated with a Windows Installer package, and the transform file locations.  ***Note*** • *Displayed for Windows Installer packages only.*
Patches	Lists the number of patches associated with a Windows Installer package, and the patch file locations.  ***Note*** • *Displayed for Windows Installer packages only.*
Applications	Lists this package's associated applications.  ***Note*** • *Displayed for Windows Installer, XenApp, ThinApp, Symantec Workspace Virtualization, and legacy packages.*

Table 7-46 • Catalog Deployment Type View / Package Information Tab (cont.)

Field	Description
Associations	Lists this package's associated packages: • **For virtual packages**, it lists the packages associated source Windows Installer package. • **For Windows Installer packages**, it lists its associated virtual packages. By associating a virtual package with the Windows Installer package which originated it, you have the convenience of being able to easily locate the virtual package's originating Windows Installer package, modify the original Windows Installer package, and then regenerate the virtual package. In order for packages to be listed here, the package has to have already been imported into the Application Catalog and must be associated with the selected package. For more information, see Associating a Virtual Package with its Source Windows Installer Package. ***Note*** • *Displayed for Windows Installer, Citrix XenApp, VMware ThinApp, and Symantec Workspace Virtualization packages.*
Conflict Results	Date and time that conflict testing was last performed on this package. ***Note*** • *Displayed for Windows Installer packages only.*

Viewing Package Version History from the Catalog Deployment Type View

If you are connected to a Software Repository-enabled Application Catalog and you select a package that has more than one version, the **Version History** button in the **Content** tab of the Application Manager ribbon is enabled. If you click on this link, the **Package Versions** dialog box opens, listing all of the versions of the selected package.

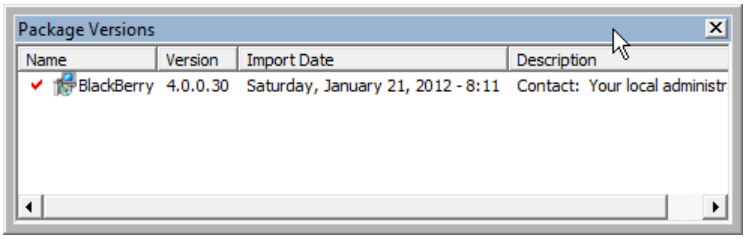

Figure 7-51: Package Versions Dialog Box

Note • *If the package and/or transforms are no longer in their original import directory, you can locate the file(s) from the provided hyperlink. You are also informed if the last modified date for the package in the Application Catalog does not match the last modified date of the package in its external location. You are given the opportunity to reimport the package to keep it synchronized in the Application Catalog.*

Deployment Data Tab

Note • *The **Deployment Data** tab does not apply to ThinApp applications, XenApp profiles, Symantec Workspace virtual packages, and web applications.*

When a package is imported into the Application Catalog, Application Manager mines package elements for deployment data such as detection methods, dependencies, and requirements. You can view and modify this data and add new data by editing the properties on the subtabs of the **Deployment Data** tab and by using the easy-to-use wizards provided on the **Detection Methods**, **Requirements**, **Dependencies**, and **Supersedence** subtabs. AdminStudio displays deployment data for all of an application's packages (deployment types) in a multi-tabbed, organized format that is easy to navigate through and to update.

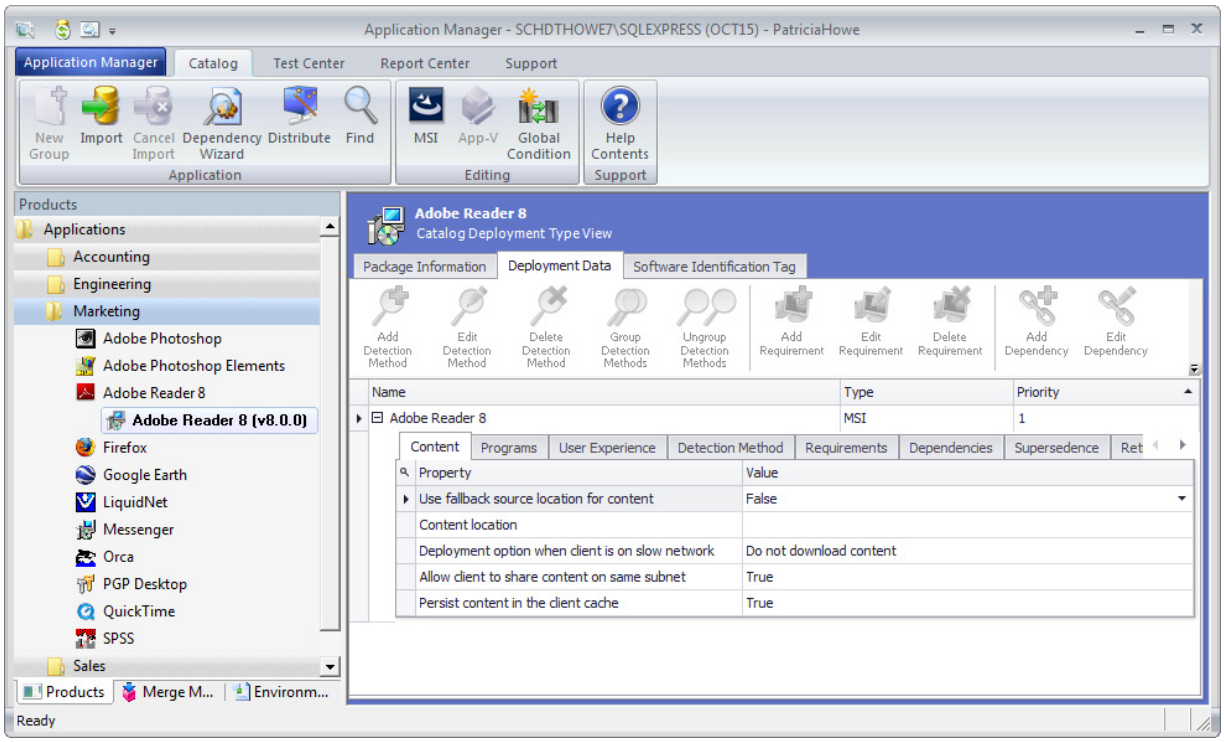

Figure 7-52: Catalog Deployment Type View / Deployment Data Tab

This deployment data is used by Microsoft System Center Configuration Manager when deploying packages. The data displayed on the **Deployment Data** tab of the **Catalog Deployment Type View** corresponds to the application model data stored for applications and packages in Microsoft System Center 2012 Configuration Manager. When packages are published from the Application Catalog to Microsoft System Center Configuration Manager, this data is also published, which helps to ensure successful deployment.

The **Deployment Data** tab of the **Catalog Deployment Type View** has the following subtabs:

- Deployment Data Tab / Content Subtab
- Deployment Data Tab / Programs Subtab
- Deployment Data Tab / User Experience Subtab
- Deployment Data Tab / Detection Method Subtab

- Deployment Data Tab / Requirements Subtab
- Deployment Data Tab / Dependencies Subtab
- Deployment Data Tab / Supersedence Subtab
- Deployment Data Tab / Return Codes Subtab
- Deployment Data Tab / Detection Method AppX Subtab
- Deployment Data Tab / Framework Subtab
- Deployment Data Tab / Virtual Environments Subtab
- XenApp Deployment Data Tab
- XenApp Deployment Data Tab / XenApp Information Subtab
- XenApp Deployment Data Tab / Advanced Settings Subtab

Deployment Data Tab / Content Subtab

Note • *The **Deployment Data** tab does not apply to ThinApp applications, XenApp profiles, Symantec Workspace virtual packages, and web applications.*

The **Content** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists general information about package contents.

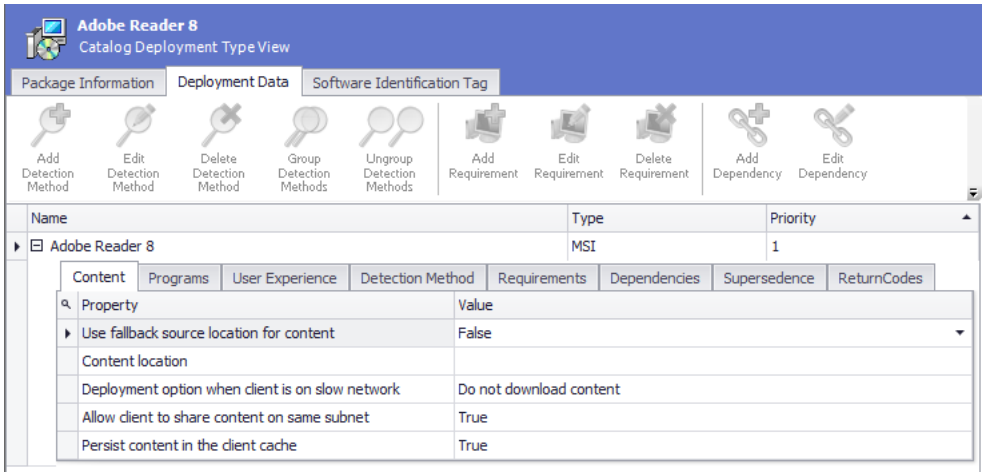

Figure 7-53: Deployment Data Tab / Content Subtab

The **Content** subtab of the **Deployment Data** tab includes the following deployment properties:

Table 7-47 • Deployment Data Tab / Content Subtab

Property	Description
Use fallback source location for content	To enable clients to "fall back" to using an unprotected distribution point if the package is not available on a protected (preferred) distribution point, set this option to **True**. By default, this option is set to **False**.
Content location	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options > Distribution System** tab of the **Options** dialog box, and published from there.
Deployment option when client is on fast (LAN) network  ***Note*** • *App-V packages only.*	Select one of the following options to specify how the client should download content when on a fast network: • **Download content from distribution point and run locally**—Select this option to download the content from the distribution point and run it locally. • **Stream content from distribution point**—Select this option for App-V packages to stream content from the distribution point.
Deployment option when client is on slow network	Select one of the following options to specify whether the client should download content when on a slow network: • **Do not download content**—When the client is connected within a slow or unreliable network boundary, do not download content. Select this option to save network bandwidth. (Default) • **Download content from distribution point and run locally**—Select this option if, when the client is connected within a slow or unreliable network boundary, you want it to download the content from the distribution point and run it locally. • **Stream content from distribution point**—Select this option to stream content from the distribution point.  ***Note*** • *The **Stream content from distribution point** option is only available for App-V packages.*

Table 7-47 • Deployment Data Tab / Content Subtab

Property	Description
Enable peer-to-peer content distribution ***Note*** • *App-V packages only.*	Select this option to reduce load on the network by allowing clients to download content from other clients on the network that have already downloaded and cached the content. This option utilizes Windows BrancheCache and can be used on computers running Windows Vista SP2 and later.
Allow client to share content on same subnet ***Note*** • *MSI and EXE packages only.*	To reduce the load on the network by allowing clients to download content from other local clients on the network that have already downloaded and cached the content, select **True**.
Persist content in the client cache	To retain content in the cache on the client computer indefinitely even if it has already been run, select **True**. ***Note*** • *Setting this property to **True** will reduce the available cache space. This might cause a large deployment to fail at a later point if there is insufficient space available in the cache.*
Load content to App-V cache ***Note*** • *App-V packages only.*	Entire package (instead of just Feature Block 1) is loaded completely into the App-V cache prior to launch.

Deployment Data Tab / Programs Subtab

Note • *The **Programs** subtab is only displayed for Windows Installer and legacy installer packages.*

The **Programs** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists command line parameters for package installation and uninstallation.

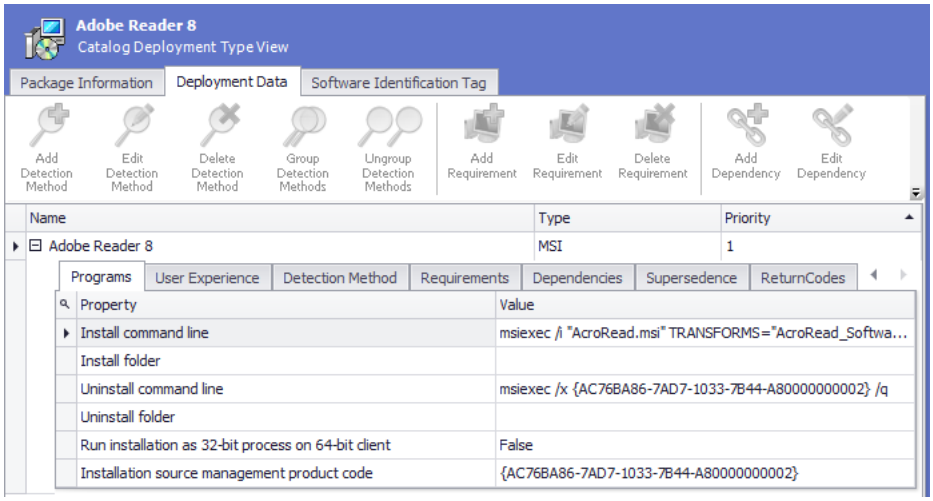

Figure 7-54: Deployment Data Tab / Programs Subtab

The **Programs** subtab of the **Deployment Data** tab includes the following deployment properties:

Table 7-48 • Deployment Data Tab / Programs Subtab

Property	Description
Install command line	Specify the command line that Configuration Manager will use to install this package on a client machine, including any required installation parameters.
Install folder	Specify the folder that contains the installation program for the deployment type. This folder can be an absolute path on the client or a path to the distribution point folder that contains the installation files. This field is optional.
Uninstall command line	Specify the command line that Configuration Manager will use to uninstall this package from a client machine, including any required parameters.
Uninstall folder	Specify the folder that contains the uninstall program for the deployment type. This folder can be an absolute path on the client or a path relative to the distribution point folder that contains the package. This field is optional.
Run installation as 32-bit process on 64-bit client	Select **True** to run the installation of this deployment type as a 32-bit process on a 64-bit client. To run it as a 64-bit process on a 64-bit client, select **False**.

Table 7-48 • Deployment Data Tab / Programs Subtab

Property	Description
Installation source management product code	To enable installation source management, enter the Windows Installer product code. ***Note*** • *In System Center Configuration Manager, installation source management enables a Windows Installer file to automatically be updated or repaired from content source files on an available distribution point.*

Deployment Data Tab / User Experience Subtab

Note • *The **User Experience** subtab is only displayed for Windows Installer packages, legacy installer packages, and Windows Store mobile apps.*

The **User Experience** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists parameters relating to the user experience during installation.

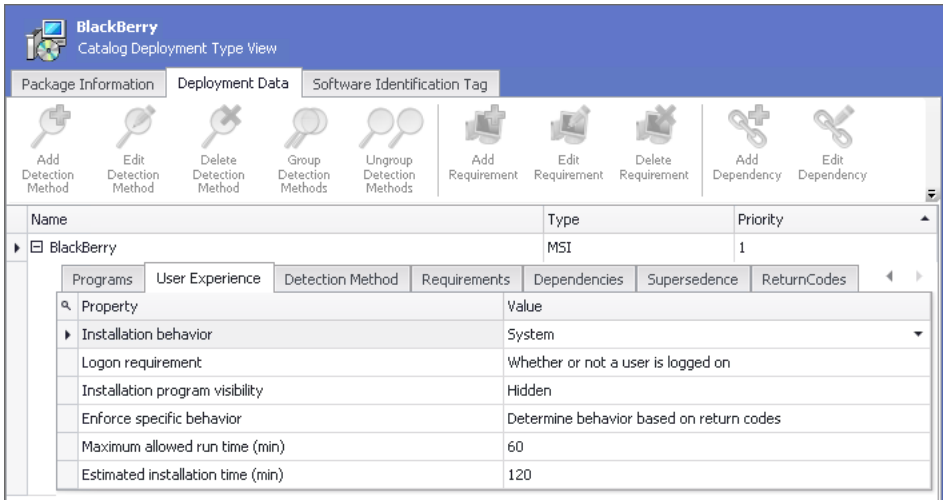

Figure 7-55: Deployment Data Tab / User Experience Subtab

The **User Experience** subtab of the **Deployment Data** tab includes the following deployment properties:

Table 7-49 • Deployment Data Tab / User Experience Subtab

Property	Description
Installation behavior	Select one of the following options: • **User**—The application installs for only the user who it is deployed to. • **System**—The application installs only once and is available to all users. • **Any**—If the application is deployed to a device, then it will install for all users. If the application is deployed to a user, then it will install for only that user.
Logon requirement	Select one of the following options to specify the login requirements for installing this application: • **Only when a user is logged on** • **Whether or not a user is logged on** • **Only when no user is logged on**  ***Note*** • *If you have set the* ***Installation behavior*** *property to* ***User****, this option will default to* ***Only when a user is logged on*** *and cannot be changed.*
Installation program visibility	Select one of the following options to specify the mode in which the deployment type will run on client devices: • **Maximized**—The deployment type runs maximized on client devices. Users will see all installation activity. • **Normal**—The deployment type runs in the normal mode based on system and program defaults. This is the default mode. • **Minimized**—The deployment type runs minimized on client devices. Users might see installation activity in the notification area or task bar. • **Hidden**—The deployment type runs hidden on client devices and users will see no installation activity.

Table 7-49 • Deployment Data Tab / User Experience Subtab

Property	Description
Enforce specific behavior	Select one of the following options to enable Configuration Manager to enforce specific OS reboot behavior regardless of the application's intended behavior: • **Determine behavior based on return codes**—Handle reboots based on the codes configured on the Return Codes tab. • **No specific action**—No reboot required after installation. • **The software installation program might force a device restart**—Configuration Manager will not control reboot; the actual installation might force a reboot without warning. • **Configuration Manager client will force a mandatory device restart**—Configuration Manager will force a device reboot—either by notifying the user or without notification.
Maximum allowed run time (min)	Specifies the maximum time (in minutes) that the program is expected to run on the client computer. This setting can be specified as a whole number greater than zero. The default setting is 120 minutes. This value is used for two purposes: • To monitor results from the deployment type. • To determine if a deployment type will be installed when maintenance windows have been defined on client devices.
Estimated installation time (min)	Specify the estimated time that the deployment type will take to install.
Allow user to view and interact with program installation	Set this property to **True** to enable the user to view and interact with the program installation in order to configure installation options. If it is set to **False**, the program installation is hidden from the user. ***Note*** • *This property can be set to* ***True*** *only when the* ***Login requirement*** *property is set to* ***Only when a user is logged on****.*

Deployment Data Tab / Detection Method Subtab

Note • *The* ***Detection Method*** *subtab is only displayed for Windows Installer and legacy installer packages.*

The **Detection Method** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists methods to detect whether this package is already installed on the target system.

- **Adding a detection method**—To add a detection method to the **Detection Method** subtab, click the **Add Detection Method** button in the ribbon toolbar to open the Detection Method Wizard.

- **Editing or deleting a detection method**—To modify an existing detection method, select the requirement and click **Edit Detection Method** in the ribbon toolbar. You can use **Delete Detection Method** to delete a detection method from the list.
- **Grouping detection method clauses together**—To group detection method clauses together, select the clauses and then click the **Group Detection Methods** button. When clauses are grouped, a left parentheses **(** is listed in the **Group Start** column before the first clause, and a right parentheses **)** is listed in the **Group End** column after the last clause. Use the **Connector** column to select an operator (**And** or **Or**) which specifies how to join multiple clauses.

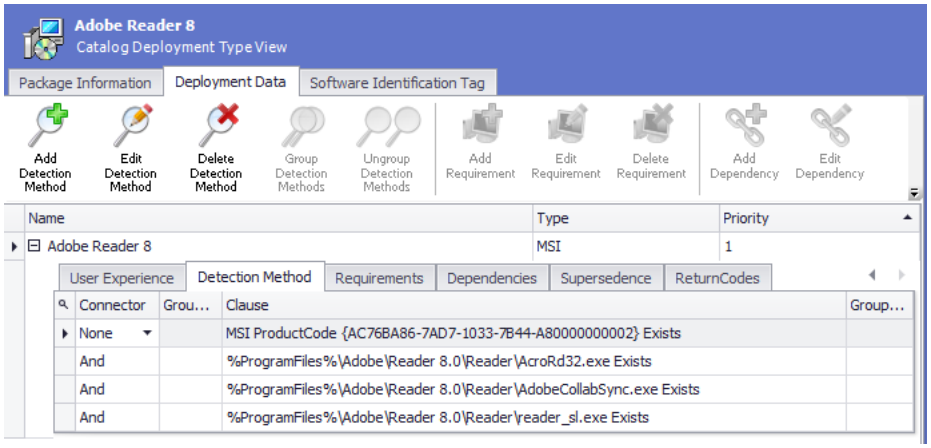

Figure 7-56: Deployment Data Tab / Detection Methods Subtab

The **Detection Method** subtab of the **Deployment Data** tab includes the following deployment properties:

Table 7-50 • Deployment Data Tab / Detection Method Subtab

Property	Description
Connector	Indicator of how the listed detection method clauses are connected. Options are: **None**, **And**, or **Or**.
Group Start	If this detection method clause is at the beginning of a clause group, a left parentheses **(** appears in this field.
Clause	List of defined clauses.
Group End	If this detection method clause is at the end of a clause group, a right parentheses **)** appears in this field.

Deployment Data Tab / Requirements Subtab

Note • *The **Requirements** subtab is displayed for Windows Installer, Windows Store, App-V, Apple iOS, Google Android, and legacy installer packages.*

You can use the **Requirements** subtab of the **Deployment Data** tab to add user or device requirements that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package.

To add a requirement to the **Requirements** subtab, click the **Add Requirement** button the ribbon toolbar to open the Requirement Wizard. You can set device requirements, custom device requirements, and user and group requirements.

To modify an existing requirement, select the requirement and click **Edit Requirement** in the ribbon toolbar. You can use **Delete Requirement** to delete a requirement from the list.

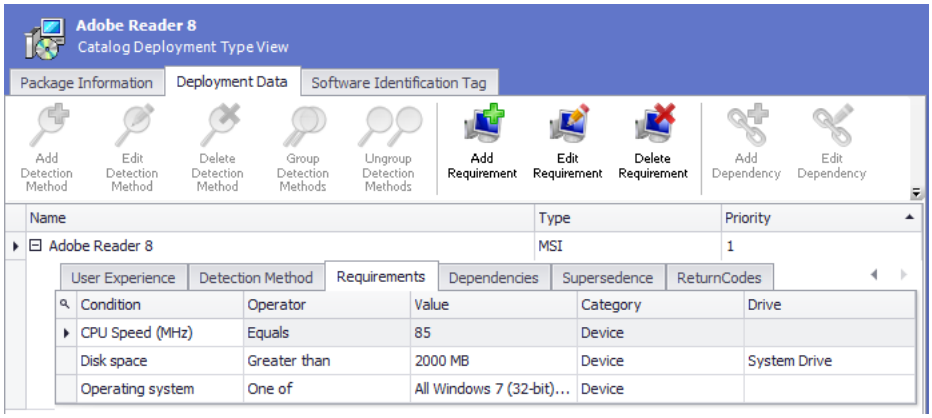

Figure 7-57: Deployment Data Tab / Requirements Subtab

The **Requirements** subtab of the **Deployment Data** tab includes the following properties:

Table 7-51 • Deployment Data Tab / Requirements Subtab

Property	Description
Condition	Lists the condition of the defined requirement.
Operator	Operator used in defined requirement.
Value	Value or values in defined requirement.
Category	Category type of defined requirement. Options are: • **Custom** • **Device** • **User**
Drive	Drive specified in defined requirement.

Deployment Data Tab / Dependencies Subtab

Note • *The **Dependencies** subtab is displayed for Windows Installer, Windows Store, App-V, and legacy installer packages.*

You can use the **Dependencies** subtab to view or edit a list of other packages in the Application Catalog that must also be deployed by Microsoft System Center Configuration Manager with this package onto the target machine in order for this package to successfully operate.

To add a dependency to the **Dependencies** subtab, click **Add Dependency** in the ribbon toolbar to open the Dependency Wizard.

To modify an existing dependency, select the dependency and click **Edit Dependency** in the ribbon toolbar. You can use **Delete Dependency** to delete a dependency from the list.

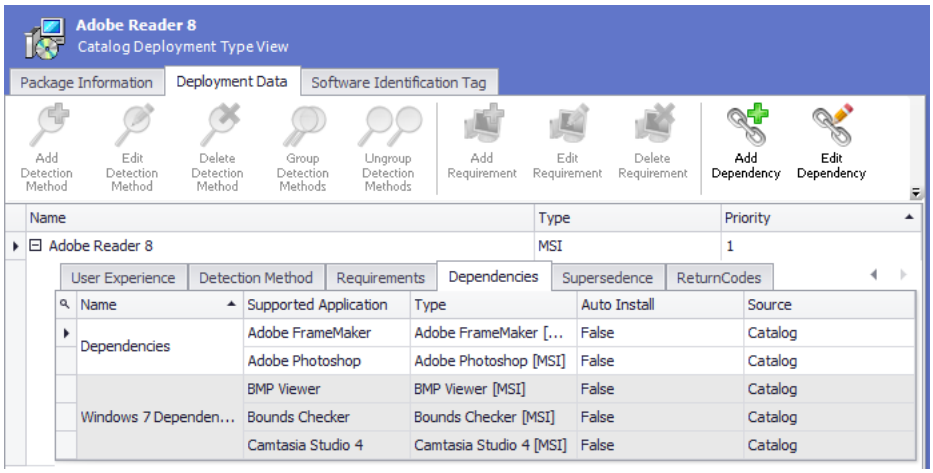

Figure 7-58: Deployment Data Tab / Dependencies Subtab

The **Dependencies** subtab of the **Deployment Data** tab includes the following deployment properties:

Table 7-52 • Deployment Data Tab / Dependencies Subtab

Property	Description
Name	Group name of dependencies.
Supported Application	Dependent application.
Type	Deployment type of dependent application.
Auto Install	Auto install setting.
Source	Location of dependent application.

Deployment Data Tab / Supersedence Subtab

***Note** • The **Supersedence** subtab is displayed for Windows Installer, App-V, Apple iOS, Windows Store, Google Android, and legacy installer packages.*

You can use the **Supersedence** subtab to view or edit a list of other packages that this package would supersede if installed on the same target machine (meaning that the package on the target system would need to be uninstalled prior to installing this package).

- **Adding a supersedent application**—To add a supersedent application to the **Supersedence** subtab, click **Add Supersedence** in the ribbon toolbar to open the Supersedence Wizard.
- **Editing or deleting a supersedent application**—To modify an existing supersedence, select the supersedence and click **Edit Supersedence** in the ribbon toolbar. You can use **Delete Supersedence** to delete a supersedent application from the list.

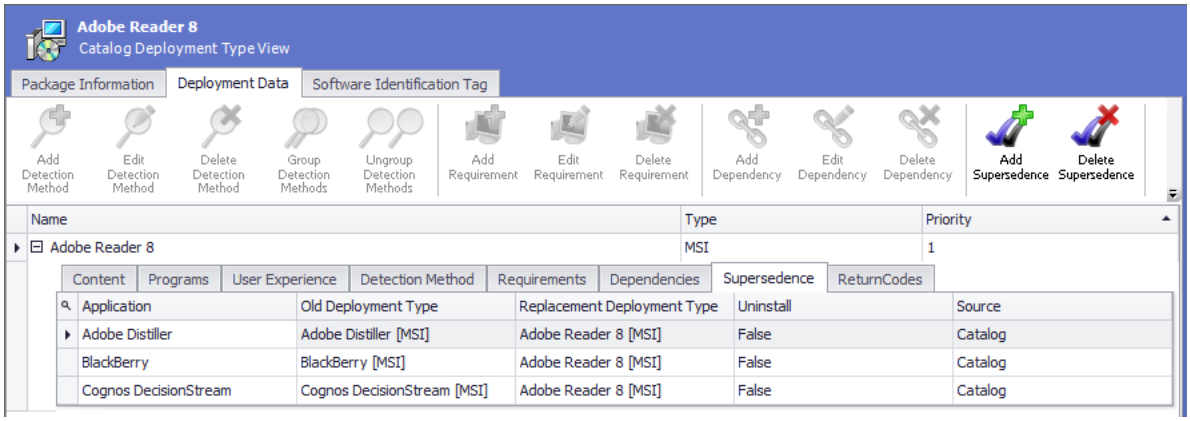

Figure 7-59: Deployment Data Tab / Supersedence Subtab

The **Supersedence** subtab of the **Deployment Data** tab includes the following properties:

Table 7-53 • Deployment Data Tab / Supersedence Subtab

Property	Description
Application	Name of supersedent application.
Old Deployment Type	Name of original deployment type.
Replacement Deployment Type	Name of replacement deployment type.
Uninstall	Uninstall setting.
Source	Location of application.

Deployment Data Tab / Return Codes Subtab

Note • *The **Return Codes** subtab is displayed for Windows Installer, App-V, Windows Store, and legacy installer packages.*

You can view and edit a MSI and EXE package's return codes on the **Return Codes** subtab of the **Deployment Types** tab. Return codes are used to indicate whether a restart is required, whether an installation is complete, and to customize the text shown to users when a specific code is returned.

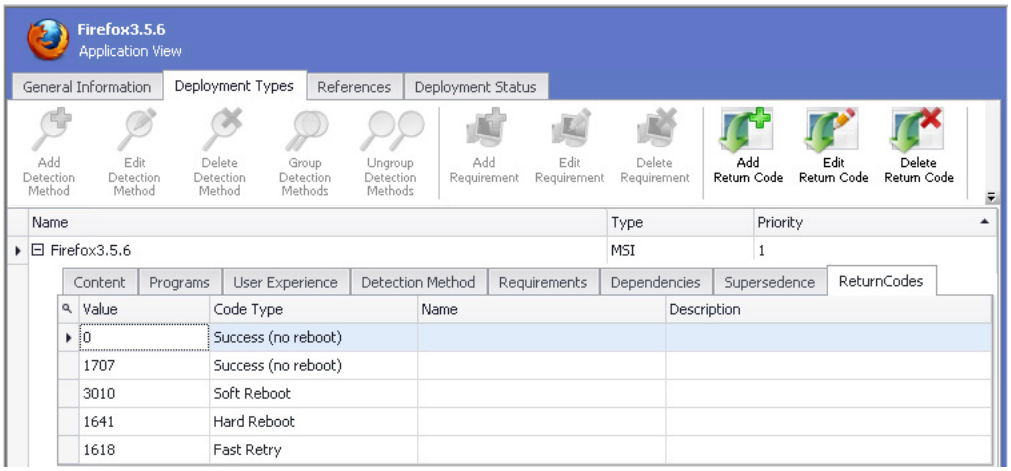

Figure 7-60: Return Codes Subtab of Deployment Types tab

The following return codes are populated by default during package import:

- **0**—Success (no reboot)
- **1707**—Success (no reboot)
- **3010**—Soft Reboot
- **1641**—Hard Reboot
- **1618**—Fast Retry

On the **Return Codes** tab, you can add, edit, and delete return codes.

- **Adding a return code**—Click **Add Return Code** in the ribbon and define a new return code on the **Add Return Code** dialog box.
- **Editing a return code**—Select a return code, click **Edit Return Code** in the ribbon, and edit the details of the return code on the **Edit Return Code** dialog box. However, the **Return Code Value** field cannot be edited.
- **Deleting a return code**—Select a return code, click **Delete Return Code** in the ribbon, and confirm the deletion.

Deployment Data Tab / Detection Method AppX Subtab

Note • *The **Detection Method AppX** subtab is displayed for Windows Store mobile apps.*

A Windows Store mobile app's defined detection methods are listed on the **Detection Method AppX** subtab of the **Deployment Types** tab on the **Catalog Deployment Type View**. Detection methods are used to detect whether this package is already installed on the target system.

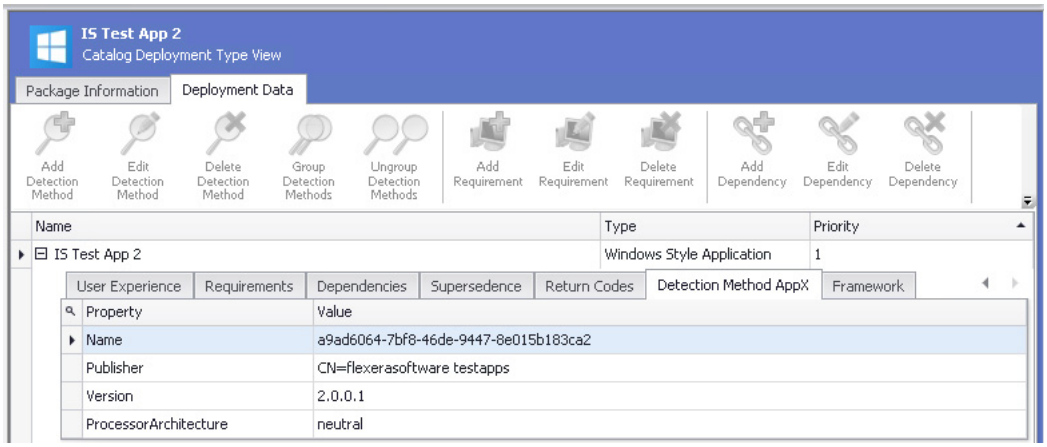

Figure 7-61: Detection Method AppX Subtab of Deployment Types Tab

The **Detection Method AppX** subtab of the **Deployment Data** tab includes the following properties:

Table 7-54 • Deployment Data Tab / Detection Method AppX Subtab

Property	Description
Name	Name of the detection method.
Publisher	Publisher of the detection method.
Version	Version of the detection method.
Resource Id	Resource ID of the detection method.
Processor Architecture	Type of processor architecture of the detection method.

Deployment Data Tab / Framework Subtab

Note • *The **Framework** subtab is displayed for Windows Store mobile apps.*

When you have a Windows Store mobile app selected in the Application Manager tree, the **Framework** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** is displayed, and displays any customizations that may have been added to this Windows Store mobile app.

Windows Store mobile app developers can use the application framework to customize a mobile app. With the framework, they can create a task or an extension to customize the application. They can extend existing functions within the application or embed new functionality with custom business logic.

If the selected Windows Store mobile app has any application framework customizations, they will be listed on the **Framework** subtab.

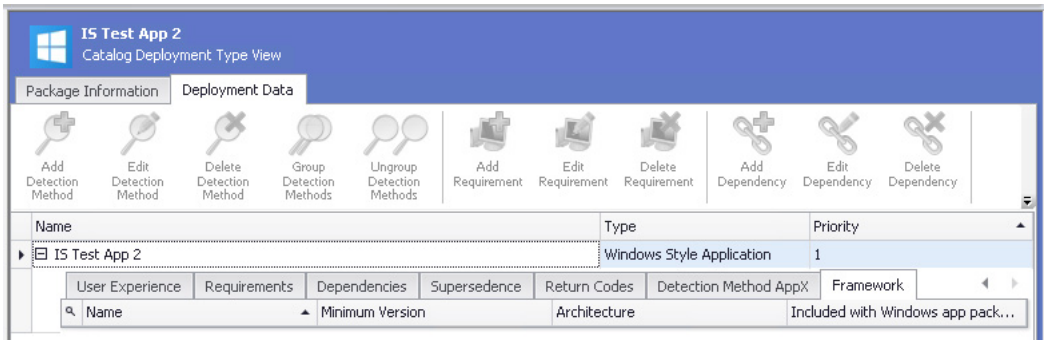

Figure 7-62: Framework Subtab of Deployment Types tab

The **Framework** subtab of the **Deployment Data** tab includes a list of application framework customizations that have been included with this Windows Store mobile app. For each item, the following information is listed:

Table 7-55 • Deployment Data Tab / Framework Subtab

Property	Description
Name	Name of framework item.
Minimum Version	Minimum version of framework item.
Architecture	Type of architecture of framework item.
Included with Windows app package	Indicates whether the framework item is included with the Windows Store mobile app.

Deployment Data Tab / Virtual Environments Subtab

In Application Manager, you can create App-V virtual environments for App-V 5.0 packages. App-V virtual environments in Microsoft System Center 2012 Configuration Manager enable deployed virtual applications to share the same file system and registry on client computers. This means that unlike standard virtual applications, these applications can share data with each other.

Tip • *Using virtual environments to group dependent packages together in App-V 5.0 is similar to the Dynamic Suite Composition feature used with App-V 4.x packages.*

Virtual environments are created or modified on client computers when the application is installed or when clients next evaluate their installed applications. You can order these applications so that when multiple applications attempt to modify the same file system or registry value on a client computer, the application with the highest order takes precedence.

For information on creating a virtual environment, see Creating an App-V Server Virtual Environment.

You can view an App-V 5.0 package's virtual environments on the **Virtual Environments** subtab of the **Deployment Types** tab.

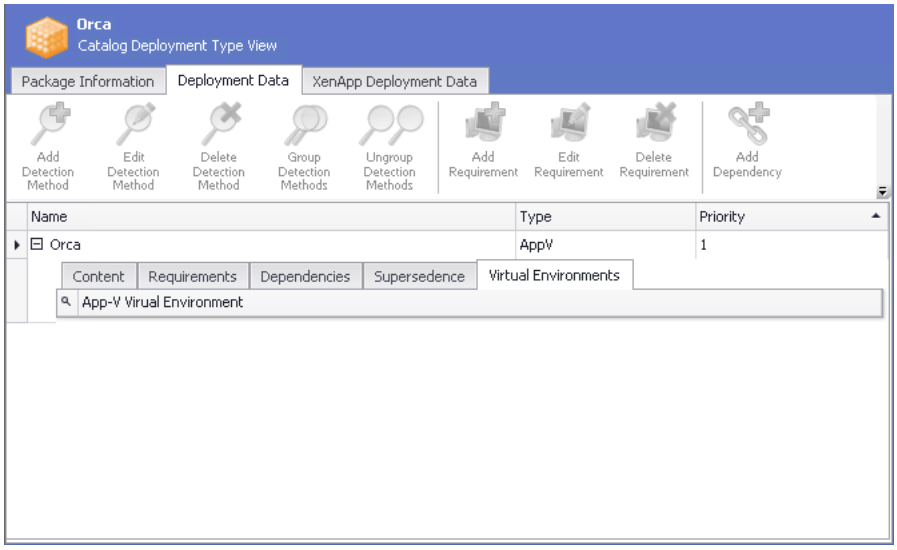

Figure 7-63: Virtual Environments Subtab of Deployment Types Tab

Bundled Packages Tab

The **Bundled Packages** tab of the **Catalog Deployment Type View** lists the child packages that are bundled in Windows **.exe** installers and Mac OS X **.dmg** and **.pkg** installers.

- Bundled Packages of Complex Installer Executable Files
- Bundled Packages of Mac OS X .pkg and .dmg Files

Bundled Packages of Complex Installer Executable Files

You can import complex installer executable files (**.exe**) that contain bundled Windows Installer packages into the Application Catalog. There are multiple installation executable types that can contain embedded Windows Installer packages, including the following:

- InstallShield InstallScript **.exe** files
- InstallShield Basic MSI installers that are compressed into a **setup.exe** file
- InstallShield Suite Installer **.exe** files
- Wise Package Studio **.exe** files
- Other executable file types that can be uncompressed by 7-ZIP

After these complex installer executables have been imported, you can view a list of the child **.msi** packages bundled within them on the **Bundled Packages** tab of the **Catalog Deployment Type View**.

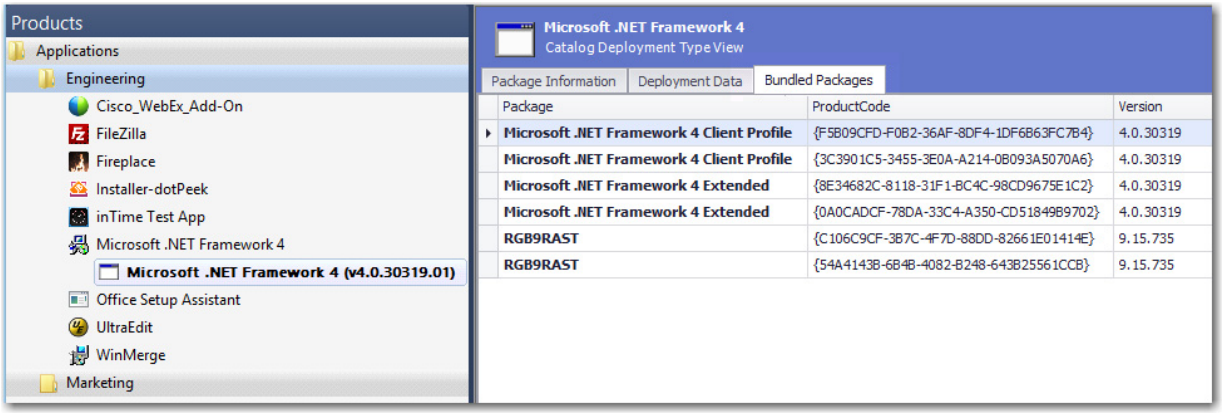

Figure 7-64: Bundled Packages Tab of Catalog Deployment Type View

When inspecting these child **.msi** packages, Application Manager extracts the information about each package, such as product name and version number. This makes it much more likely that Application Manager will be able to assign a Flexera Identifier to these applications.

You can perform operating system compatibility, application virtualization compatibility, and best practices testing on these bundled packages, and the test results will be combined. For more information, see Viewing Combined Test Results of Bundled Packages.

Note • *AdminStudio will only inspect complex installer .exe files one level deep. If a complex installer .exe file contains another complex installer .exe file bundled within it, that child .exe file will not be inspected.*

Bundled Packages of Mac OS X .pkg and .dmg Files

If an Apple installer package (**.pkg**) or disk image (**.dmg**) contains child packages bundled within it, those child packages will be listed on the **Bundled Packages** tab of the **Catalog Deployment Type** view.

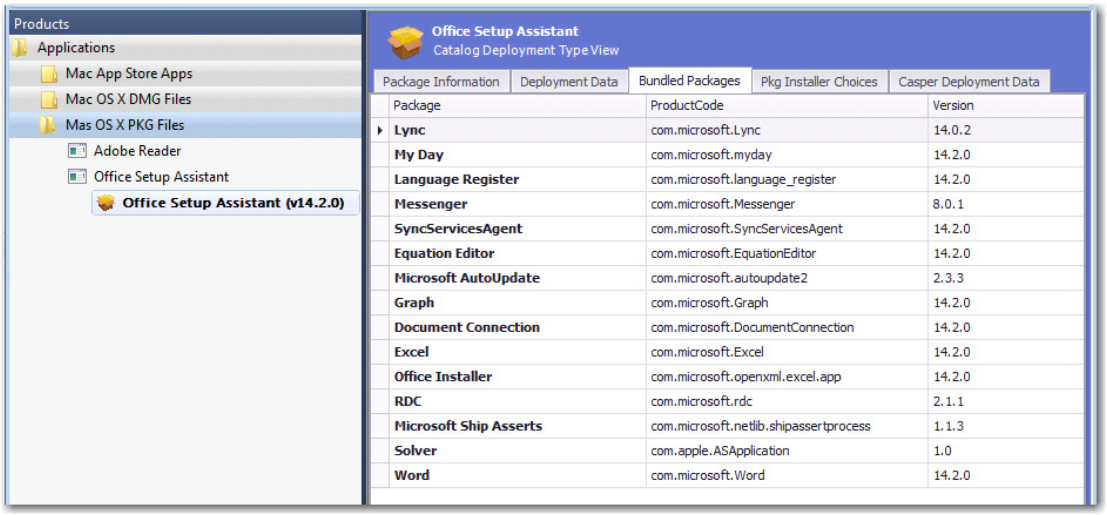

Figure 8: Bundled Packages Tab of Catalog Deployment Type View for Apple Installer Package (.pkg)

When the imported **.dmg** or **.pkg** file is tested, each of these child packages is tested, and the combined test results are listed in Test Center, as described in Viewing Combined Test Results of Child Applications of PKG and DMG Installers.

Note • *AdminStudio will only inspect Mac OS X package files one level deep. If a .dmg or .pkg package contains another .dmg or .pkg package bundled within it, that child package will not be inspected.*

PKG Installer Choices Tab

Just as a Windows Installer package can be customized by adding a transform file, an Apple installer package (**.pkg**) can be customized by editing an XML file that is embedded within it. The settings defined in the embedded XML file are displayed on the **PKG Installer Choices** tab of the package's **Catalog Deployment Type** view.

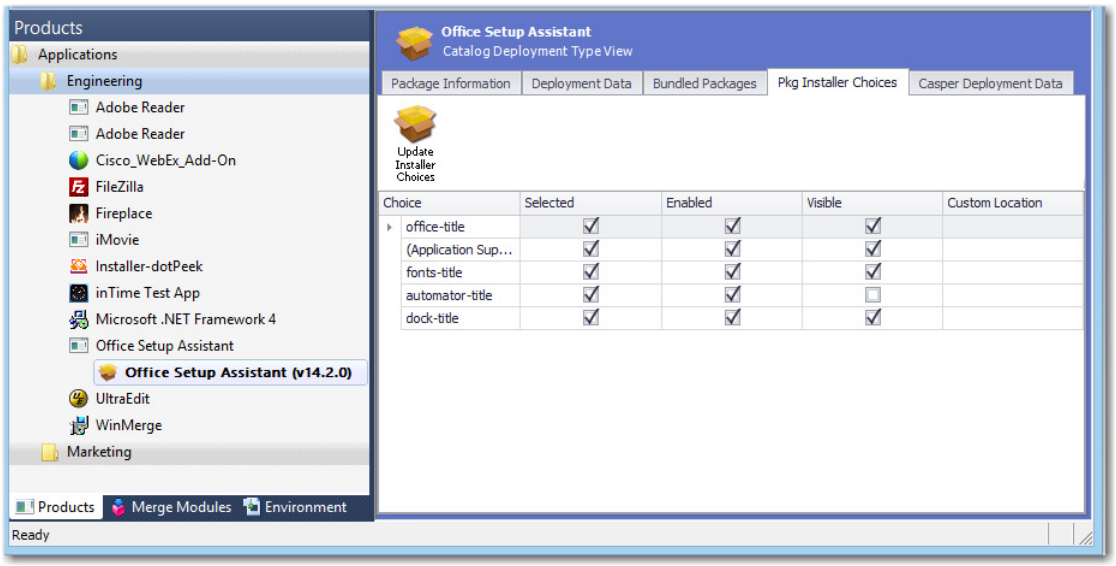

Figure 9: PKG Installer Choices Tab of Catalog Deployment Type View for Mac PKG Installer

The **PKG Installer Choices** tab lists all settings that have been defined in the embedded XML settings file by the application manufacturer. To customize this installer (such as to prepare it for silent installation by Casper), you can make changes to the settings on this tab and then click **Update Installer Choices**. AdminStudio will then save your changes in the package's embedded settings file.

For each installer **Choice** listed on the **PKG Installer Choices** tab, the following options are available:

Table 8 • PKG Installer Choices Tab

Option	Description
Visible	This option can be either selected or not selected: • **Selected**—This choice setting will be displayed in the installer. • **Not selected**—This choice setting will not be displayed in the installer.

Table 8 • PKG Installer Choices Tab

Option	Description
Selected	This option can be either selected or not selected: • **Selected**—If this choice setting is displayed in the installer, its check box will be checked. • **Not selected**—If this choice setting is displayed in the installer, its check box will not be checked.
Enabled	This option can be either selected or not selected: • **Selected**—If this choice setting is displayed in the installer, it will be enabled. • **Not selected**—If this choice setting is displayed in the installer, it will be disabled.
Custom Location	If this choice setting explicitly permits the user to specify a user-defined installation path, the path entered in this field would populate the user-defined installation path when it is displayed in the installer.

Note • *Modifying the installer choices of an Apple installer package does not affect the digital signature of the package.*

App-V Deployment Data Tab

Note • *Because Microsoft App-V server only supports App-V 5.0 packages, the* ***App-V Deployment Data*** *subtab is only displayed for App-V 5.0 packages.*

When an App-V 5.0 package is imported into the Application Catalog, Application Manager mines package elements for Microsoft App-V-specific deployment data. You can view and modify data for App-V 5.0 packages and add new data by editing the properties on the subtabs of the **App-V Deployment Data** tab. AdminStudio displays App-V deployment data in a multi-tabbed, organized format that is easy to navigate through and to update.

- App-V Information Subtab
- Advanced Settings Subtab

App-V Information Subtab

The **App-V Information** subtab of the **App-V Deployment Data** tab includes the following properties:

Table 7-1 • App-V Deployment Data Tab / App-V Information Subtab

Property	Description
Grant Access	Enter the name of the Active Directory security group that will have access to the package. Enter the group name in `domain_name\group_name` format. To specify more than one group, enter the values in comma-separated format: `asdev\group1,asdev\group2`

Table 7-1 • App-V Deployment Data Tab / App-V Information Subtab

Property	Description
Publish Package for Client	Set this property to **True** to publish this package so that it is available to users running the App-V client.

Advanced Settings Subtab

The **Advanced Settings** subtab of the **App-V Deployment Data** tab includes the following properties:

Table 7-2 • Advanced Settings Tab / App-V Information Subtab

Property	Description
Dynamic Deployment Configuration Path	Virtual application packages contain a manifest that provides all the core information for the package, including the defaults for the package settings. However, you can use XML-based dynamic configuration files to customize App-V 5.0 packages. This provides a more convenient method for package customization by removing the need to re-sequence packages using the desired settings, and provides a way to keep package content and custom settings independent, similar to the way that you can customize a Windows Installer package using a transform file (**.mst**). You can create a dynamic *deployment* configuration file to specify the default settings for this App-V package for all users. Enter the path to a dynamic deployment configuration file in the **Dynamic Deployment Configuration Path** field. This file will be used to override the default behavior provided in the package's manifest. If you do not specify a path to a dynamic deployment configuration file, the App-V agent will deploy the package with the default behavior provided in the package's manifest.  ***Note*** • *Only one dynamic deployment configuration file can be entitled to a package.*  ***Note*** • *If you specify both a dynamic **deployment** configuration file and a dynamic **user** configuration file, both will be applied: first the dynamic **deployment** configuration file and then the dynamic **user** configuration file.*

Table 7-2 • Advanced Settings Tab / App-V Information Subtab

Property	Description
Dynamic User Configuration Path	Virtual application packages contain a manifest that provides all the core information for the package, including the defaults for the package settings. However, you can use XML-based dynamic configuration files to customize App-V 5.0 packages. This provides a more convenient method for package customization by removing the need to re-sequence packages using the desired settings, and provides a way to keep package content and custom settings independent, similar to the way that you can customize a Windows Installer package using a transform file (**.mst**). In addition to being able to create a dynamic **deployment** configuration file to specify the default settings for this App-V package for all users, you can also create a dynamic **user** configuration file to customize these settings for *specified groups of users*. Enter the path to a dynamic user configuration file in the **Dynamic User Configuration Path** field. If you do not specify a path to a dynamic user configuration file, the App-V agent will deploy the package with the behavior provided by a dynamic *deployment* configuration file, if specified, or the default behavior provided in the package's manifest.  ***Important*** • *If you specify a dynamic user configuration file, but do not enter a user group in the User Configuration Grant Access field, then that dynamic user configuration file will not be applied to any users.*  ***Note*** • *Only one dynamic user configuration file can be entitled to a package.*  ***Note*** • *If you specify both a dynamic **deployment** configuration file and a dynamic **user** configuration file, both will be applied: first the dynamic **deployment** configuration file and then the dynamic **user** configuration file.*
User Configuration Grant Access	If you want to apply a dynamic user configuration file to a specific group of users, enter that group here in **domain\groupname** format. I To specify more than one group, enter the values in comma-separated format: asdev\group1,asdev\group2  ***Important*** • *If you specify a dynamic user configuration file in the Dynamic User Configuration Path field, but do not enter a user group in this field, then that dynamic user configuration file will not be applied to any users.*

Table 7-2 • Advanced Settings Tab / App-V Information Subtab

Property	Description
Connection Group	Lists the connection groups that this package has been added to. ***Note*** *• This is a read-only field that lists the connection groups that this package has been added to, as described in Creating an App-V Server Virtual Environment.*

Casper Deployment Data Tab

Note *• Because Casper only supports Mac OS X desktop packages, the* ***Casper Deployment Data*** *subtab is only displayed for* ***.pkg*** *files,* ***.dmg*** *files, and links to Apple Mac App Store apps.*

When a Mac OS X desktop package is imported into the Application Catalog, Application Manager mines package elements for Casper-specific deployment data. You can view and modify deployment data for Mac OS X desktop packages and add new data by editing the properties on the subtabs of the **Casper Deployment Data** tab. AdminStudio displays Casper deployment data in a multi-tabbed, organized format that is easy to navigate through and to update.

The **Casper Deployment Data** subtab of the **Catalog Deployment Type View** can include up to three subtabs that display Casper deployment data: **General**, **Options**, and **Limitations**. The **Options** and **Limitations** subtabs are not displayed for Mac App Store apps.

- General Subtab
- Options Subtab
- Limitations Subtab

General Subtab

The **General** subtab of the **Casper Deployment Data** tab is displayed for all Mac OS X desktop applications.

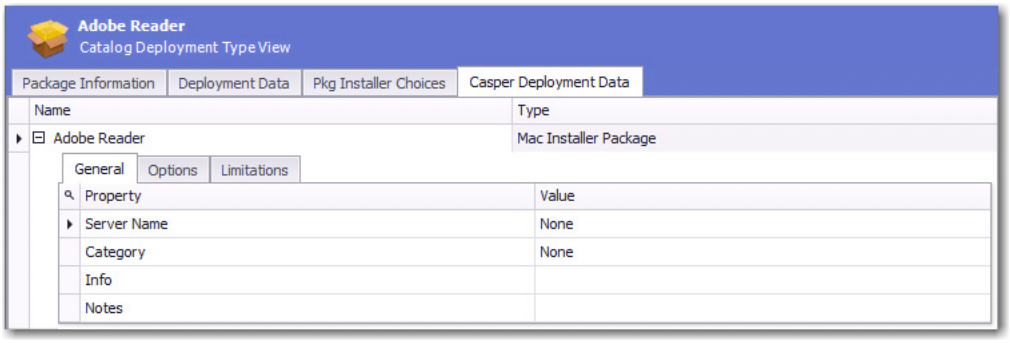

Figure 7-1: Casper Deployment Data / General Subtab

The **General** subtab of the **Casper Deployment Data** tab includes the following properties.

Table 7-3 • Casper Deployment Data Tab / General Subtab

Property	Description
Server Name	Name of the Casper server.
Category	Category in Casper that the package will be added to. ***Note*** • *Casper lets you create custom categories. If AdminStudio has matched this application to an entry in the Application Recognition Library (ARL), AdminStudio will use the ARL category when publishing to Casper, creating it if necessary.*
Info	Information to display to the administrator when the package is deployed or uninstalled
Notes	Notes to display about the package (such as the name of the person who built it and when it was built). ***Note*** • *Not displayed for Mac App Store Apps.*
Free	Indicates whether or not the Mac App Store app is available for free (**True**) or whether it requires payment (**False**). ***Note*** • *Only displayed for Mac App Store Apps.*

Options Subtab

The **Options** subtab of the **Casper Deployment Data** tab is only displayed for PKG and DMG packages.

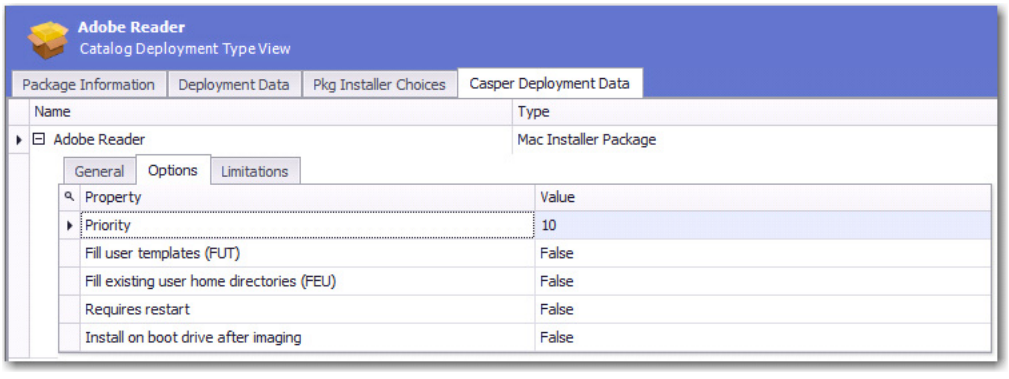

Figure 7-2: Casper Deployment Data / Options Subtab

The **Options** subtab of the **Casper Deployment Data** tab includes the following properties.

Table 7-4 • Casper Deployment Data Tab / Options Subtab

Property	Description
Priority	Priority to use for deploying or uninstalling the package. For example, a package with a priority of **1** is deployed or uninstalled before other packages. When several applications are deployed together, the one with the highest priority is installed first. Therefore, if one application requires that another application be installed first before it can be successfully installed, you should assign the required application a higher priority (lower number) than the dependent application.
Fill user templates (FUT)	Set this property to **True** to fill new home directories with the contents of the home directory in the package's **Users** folder. This setting can be changed when deploying or uninstalling the package using a policy.l  ***Note*** • *Only applicable to DMG packages.*
Fill existing user home directories (FEU)	Set this property to **True** to fill existing home directories with the contents of the home directory in the package's **Users** folder. This setting can be changed when deploying or uninstalling the package using a policy  ***Note*** • *Only applicable to DMG packages.*
Requires restart	Set this property to **True** to require that computers must be restarted after installing the package.
Install on boot drive after imaging	Set this property to **True** to ensure that the package is installed on the boot drive after imaging.  ***Note*** • *This setting is only used when deploying a package with an OS image, like with an OSD. It does not affect day-to-day package delivery.*

Limitations Subtab

The **Limitations** subtab of the **Casper Deployment Data** tab is only displayed for PKG and DMG packages.

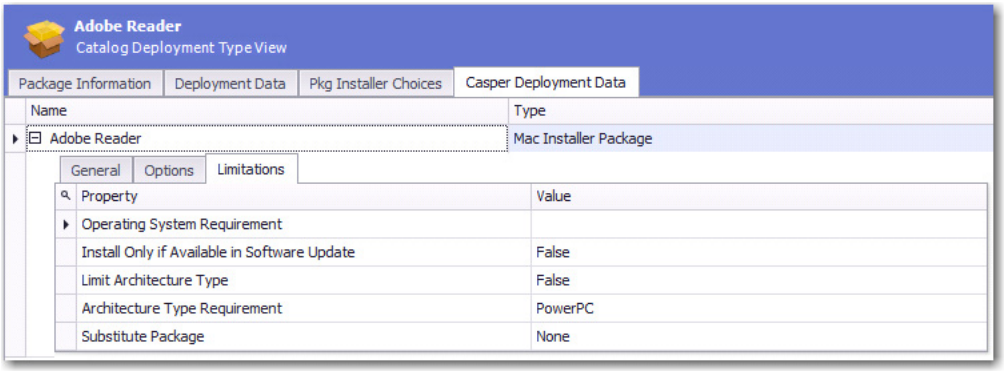

Figure 7-3: Casper Deployment Data / Limitations Tab

The **Limitations** subtab of the **Casper Deployment Data** tab includes the following properties.

Table 7-5 • Casper Deployment Data Tab / Limitations Subtab

Property	Description
Operating System Requirement	Enter operating system version numbers, separated by commas, to specify that the package only be permitted to be deployed to computers with these operating system versions. To restrict installation to OS X 10.6.8, 10.7.x, or 10.8, you would enter the following: `10.6.8, 10.7.x, 10.8`
Install Only if Available in Software Update	Set to **True** to require that this package only be installed if it is available in a software update.
Limit Architecture Type	Set to **True** to require that this package only be installed on machines matching the selected **Architecture Type Requirement**.
Architecture Type Requirement	If **Limit Architecture Type** is set to **True**, select the one of the following to specify the architecture type required to deploy the package: • PowerPC • Intel/X86
Substitute Package	If you want to specify a different package to deploy to computers that do not meet the architecture type requirement, click the Browse button in this field to open the Select Substitute Package Dialog Box, and select a substitute package from either Casper or the Application Catalog.

XenApp Deployment Data Tab

Note • *Because Citrix XenApp server only supports App-V 4.x packages and Citrix XenApp profiles, the* ***XenApp Deployment Data*** *subtab is only displayed for App-V 4.x packages and Citrix XenApp profiles.*

When a XenApp profile or App-V 4.x package is imported into the Application Catalog, Application Manager mines package elements for Citrix XenApp-specific deployment data. You can view and modify data for Citrix XenApp profiles and App-V 4.x packages and add new data by editing the properties on the subtabs of the **XenApp Deployment Data** tab. AdminStudio displays XenApp deployment data in a multi-tabbed, organized format that is easy to navigate through and to update.

- XenApp Deployment Data Tab / XenApp Information Subtab
- XenApp Deployment Data Tab / Advanced Settings Subtab

XenApp Deployment Data Tab / XenApp Information Subtab

***Note** • Because Citrix XenApp server only supports App-V 4.x packages and Citrix XenApp profiles, the **XenApp Deployment Data** subtab is only displayed for App-V 4.x packages and Citrix XenApp profiles.*

When a XenApp profile or App-V 4.x package is imported into the Application Catalog, Application Manager mines package elements for Citrix XenApp-specific deployment data. You can view and modify data for Citrix XenApp profiles and App-V 4.x packages and add new data by editing the properties on the **XenApp Information** subtab of the **XenApp Deployment Data** tab.

The **XenApp Information** subtab of the **XenApp Deployment Data** tab includes the following properties:

Table 7-6 • XenApp Deployment Data Tab / XenApp Information Subtab

Property	Description
Application type	Select one of the following options to specify how this application can be accessed by the user: • **Streamed to server**—Stream the application to the server for access by the user. (Default) • **Streamed to client**—Stream the application to the client device only. • **Streamed to client or Streamed to server**—Stream the application to the client device whenever possible. If the application cannot be streamed to the client device, stream the application to the server for access by the user.
Enabled	To allow users to open this published application, set this property to **True**. (Default) If you set this property to **False**, users will be unable to open this published application even if the application is displayed in the users' application sets (see Hide when disabled property). When users attempt to access the disabled application, they will receive the following message: `ERROR: The application you have requested is not enabled. For more information, contact your Citrix administrator.`

Table 7-6 • XenApp Deployment Data Tab / XenApp Information Subtab

Property	Description
Hide when disabled	Set this property to **True** to prevent this application from appearing in the users' application sets if it is disabled. (Default) If you set this property to **False**, this application will be listed in the users' application sets even if it is disabled. If the user then attempts to access the disabled application, they will receive an error message.
Client application folder	(Optional) Applications can be organized into folders when they are presented to the end user in the users' application set. Whether or not the application's shortcut will appear in a folder depends upon whether you enter a folder name in this property. For example: • **If you enter the folder name** of **Mobile Apps**, the shortcut to open this application will be found in the `Mobile Apps` folder of the users' application set. • **If you do not enter a folder name**, the shortcut to open this application will be found in the root directory of the users' application set.
Add to the client's Start menu	Set this property to **True** to create a shortcut to this application in the user's local Start menu. (Default)
Start menu folder	If you have set the **Add to the client's Start menu** property to **True**, use this property to enter the name of the folder that you want the shortcut to appear in, if any. If you do not enter a folder structure, the application's shortcut will appear in the root directory of Start menu. To specify more than one level of folders, separate each folder name with a backslash, such as: `Marketing\Design\Print`
Add shortcut to the client's desktop	Select one of the following values: • **False**—Do not add a shortcut to the user's local desktop. (Default) • **True**—Add a shortcut to the user's local desktop.
Enable offline access	Select one of the following values: • **False**—Do not permit users to have offline access to this package. (Default) • **True**—Permit users to have offline access to this package.
Cache preference	Select when to cache the streamed application: • **Cache application at launch time**—Caches the application when users launch it. Use this option if the number of users logging on at the same time (and pre-caching their applications) could overload the network. (Default) • **Pre-cache application at login**—Caches the application when the user logs on (selected by default). However, concurrent logons may slow network traffic.

Table 7-6 • XenApp Deployment Data Tab / XenApp Information Subtab

Property	Description
Citrix streaming application profile address	Enter the Citrix streaming application profile address, including the location of the manifest file (**.profile**). For example, enter the UNC path, such as: **\\MyCitrixServer\Shared\App-V_IntegrationKit\ AppStreamingToAppVConduit\AppStreamingToAppVConduit.profile**  ***Important*** *• This field is required for App-V packages.*
Extra command line parameters	Optionally, enter extra command-line parameters. These parameters are used when the profiled application includes asterisks (**) as a placeholder for additional parameters. If no asterisks are in the command-line string, the extra parameters are added at the end of the command-line.
Server names	Enter the server names where this application will be available. Click the browse button to open the **Servers** dialog box, where you can enter multiple server names or import a list of servers from an application server list file (***.asl**).  ***Important*** *• This is a required field.*
Allow anonymous users	Select one of the following values: • **False**—Do not grant access to anonymous users. (Default) • **True**—Grant access to anonymous users.
Accounts	Enter the accounts that you want to have access to this XenApp profile. Click the browse button to open the **Users** dialog box, where you can enter multiple user accounts or import a list of users from an application user list file (***.aul**).  ***Note*** *• If* ***Allow anonymous users*** *is set to* ***True****, this field is not required. If* ***Allow anonymous users*** *is set to* ***False****, this is a mandatory field.*

XenApp Deployment Data Tab / Advanced Settings Subtab

Note *• Because Citrix XenApp server only supports App-V 4.x packages and Citrix XenApp profiles, the* ***XenApp Deployment Data*** *subtab is only displayed for App-V 4.x packages and Citrix XenApp profiles.*

When a XenApp profile or App-V 4.x package is imported into the Application Catalog, Application Manager mines package elements for Citrix XenApp-specific deployment data. You can view and modify data for Citrix XenApp profiles and App-V 4.x packages and configure advanced settings by editing the properties on the **Advanced Settings** subtab of the **XenApp Deployment Data** tab.

The **XenApp Information** subtab of the **XenApp Deployment Data** tab includes the following properties:

Table 7-7 • XenApp Deployment Data Tab / Advanced Settings Subtab

Property	Description
Allow connections made through Access Gateway Advanced Edition (version 4.0 or later)	Set to **True** to allow connections that are made through the Citrix Access Gateway Advanced Edition (version 4.0 or later).  ***Note*** • *Access Gateway is a universal SSL VPN appliance that can be used to secure client connections to XenApp environments as well as provide secure access to other internal network resources.*
Any connection that meets any of the following filters	Set this field to **True** to only allow connections that meet one or more of the Access Gateway connection filters specified in this list.
Access gateway filters	Click the browse button to open the **Access Gateway Filter** dialog box, where you can enter Access Gateway filters.
Allow all other connections	Set this field to **True** to allow all other connections other than those made through Access Gateway.
Alternate profile locations	Click browse to open the **Alternate Profile Location** dialog box, where you can specify an alternate profile for connections that come from specific IP addresses. For example, an administrator could use an alternate profile to direct users on either side of a WAN to stream applications only from the file or web server on their side of the WAN. When an alternate profile is created, a duplicate of the primary profile is created and stored on a different file share, making it more accessible to the client device. On the **Alternate Profile Location** dialog box, enter the starting and ending IP range for which the alternate profile applies, and then select the alternate profile. After you configure the range, user devices from IP addresses within the specified range access the applications from the alternate profile instead of from the default profile.  ***Note*** • *For streamed applications only.*
Maximum instances	Select an integer from the list to specify the maximum number of concurrent connections a user can establish.
Allow only one instance of application for each user	Set this field to **True** to prevent any user from running more than one instance of this application at the same time.

Table 7-7 • XenApp Deployment Data Tab / Advanced Settings Subtab

Property	Description
Application importance	If Preferential Load Balancing is available, select one of the following options to assign importance levels to specific user sessions and applications: • **Low**, which has a value of 1 • **Normal**, which has a value of 2 (default) • **High**, which has a value of 3 Preferential Load Balancing gives administrators the ability to prioritize the allocation of CPU shares to specific users and applications and to direct important user sessions to the XenApp server running the fewest number of important sessions.  ***Note*** • *The higher the importance level of the session, the higher the percentage of CPU cycles that will be allotted to it.*
Legacy audio minimum requirement	Set to **Basic** to specify that the client system must have a sound card installed or the published application will fail to launch on the client device.
Enable legacy audio	Set to **True** to allow audio support for applications to which HDX MediaStream Multimedia Acceleration does not apply.
Enable SSL and TLS protocols	Set to **True** to request the use of the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) protocols for plug-ins connecting to the published resource.
Encryption	Select one of the following options to specify which plug-ins are allowed to connect based on their encryption level: • **Basic** • **128-Bit (RC-5)** • **40-Bit (RC-5)** • **56-Bit (RC-5)** • **128-Bit Login Only (RC-5)**  ***Note*** • *The **Basic** encryption level should not be used in a secure environment.*
Encryption required	Set this field to **True** to require encryption.
Start this application without waiting for printers to be created	Set to **True** to specify that this application will not open until the client printers are created. Set to **False** to specify that this application will open immediately.

Table 7-7 • XenApp Deployment Data Tab / Advanced Settings Subtab

Property	Description
Session window size	Select one of the following options to configure the resolution of the session size when the application session is started on the XenApp server. • **640x480** • **800x600** • **1024x768** • **1280x1024** • **1600x1200** • **Custom** • **Percent of client desktop**
Width	If you have set **Session window size** to **Custom**, select an integer from this list to set the width of the session window size. The default setting is 1024.
Height	If you have set **Session window size** to **Custom**, select an integer from this list to set the height of the session window size. The default setting is 768.
Percent	If you have set **Session window size** to **Percent of client desktop**, select an integer from this list to set the percentage. The default setting is 75.
Maximum color quality	Select one of the following options to specify the maximum color quality: • **Better Speed (16-bit)** • **Better Appearance (32-bit)** • **256-color (8-bit)**
Hide application title bar	Set to **True** to hide the application title bar.  ***Tip*** • *If the application does not have an Exit button built into the user interface, you may want to leave this option unchecked so that the user can use the red "X" to close the application.*
Maximize application at startup	Set to **True** to maximize application at startup.  ***Tip*** • *This setting is very useful for mobile devices with smaller screens, where you want the application to always start up at full resolution. On larger screen devices, where you manage multiple windows on the desktop simultaneously, you probably do not want to use this setting.*

Table 7-7 • XenApp Deployment Data Tab / Advanced Settings Subtab

Property	Description
Run application as a least-privileged user account	For applications configured to stream to client devices, you can use this setting to reduce the user privileges for the application, thus reducing security risks. To reduce the user privileges for the application, set this property to **True**. Setting this property to **True** configures all users, even those with an administrator account, to run the application with normal user privileges. The default setting is **False**.  ***Important*** • *Before you set this property to **True**, test the application with a limited access configuration. Some applications expect users to have elevated privileges and might fail to operate correctly when launched by users with a least-privileged user account.*

Software Identification Tag Tab

Important • *The **Software Identification Tag** tab is only displayed for Windows Installer packages.*

You can view and edit the software ID tag information for an individual Windows Installer package on the **Software Identification Tag** tab of the **Catalog Deployment Type View** in Application Manager.

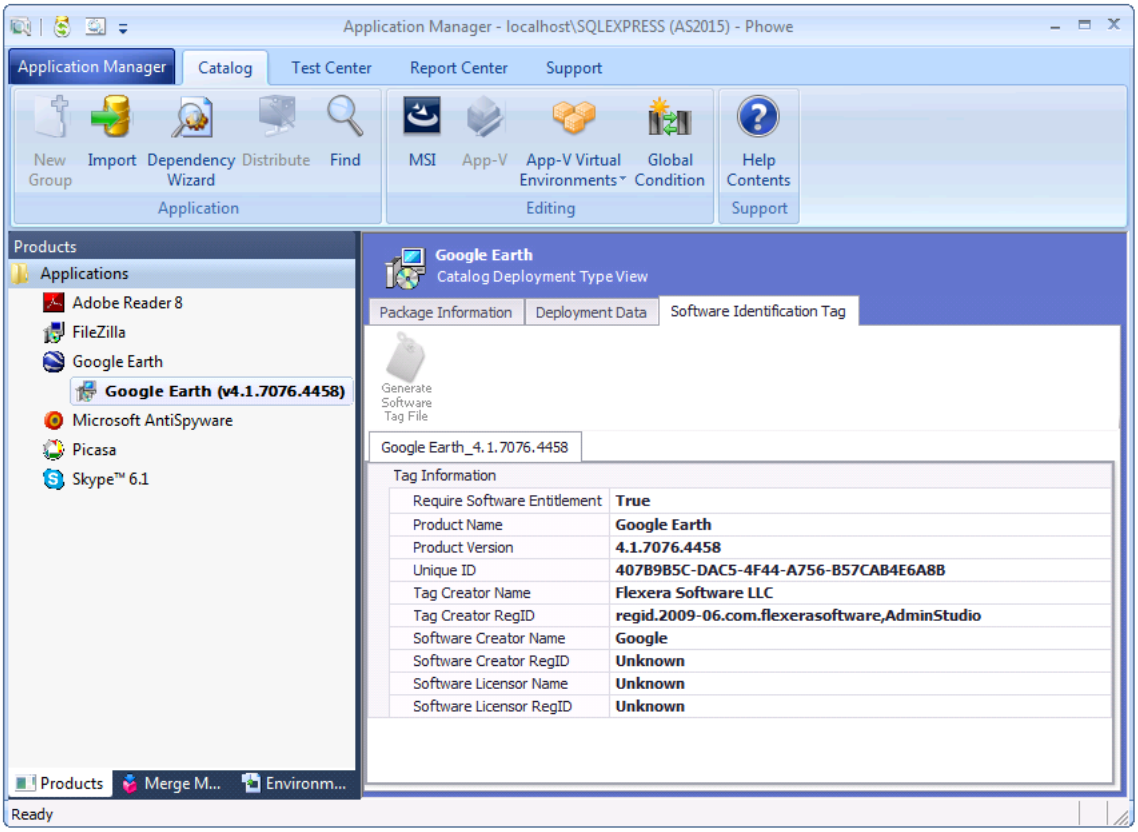

Figure 7-4: Software Identification Tag Subtab of Catalog Deployment Type View

The **Software Identification Tag** tab includes the following properties:

Table 7-8 • Catalog Deployment Type View / Software Identification Tag Subtab Properties

Property	Description
Require Software Entitlement	To specify that you want to require your product to have a corresponding software entitlement in order for software reconciliation to be considered successful, set this property to **True**. In general, if the software must be purchased, this property should be set to **True**; if the software is free, this property should be set to **False**.
Product Name	Name of the product, read from the Product Name property of the Windows Installer package.
Product Version	Version of the product, read from the Product Version property of the Windows Installer package.
Unique ID	The product GUID, which is the ProductCode of the MSI package or the unique string used for the Add and Remove Programs uninstall key name, is used to uniquely identify the product in the software identification tag file.

Table 7-8 • Catalog Deployment Type View / Software Identification Tag Subtab Properties

Property	Description
Tag Creator Name	Enter a name to identify the creator of this tag file. The default value is: `Flexera Software LLC`
Tag Creator RegID	Enter a RegID to identify the creator of this tag file, using the following format: `regid.YYYY-MM.ReversedDomainName,optional_division` For example: `regid.2009-06.com.yourcompany,GlobalProductDivision`  ***Note*** • *For more information, see About Software Tagging RegIDs and About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields.*
Software Creator Name	(Optional) Enter a name to identify the creator of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.  ***Note*** • *For more information, see About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields.*
Software Creator RegID	(Optional) Enter a RegID to identify the creator of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.  ***Note*** • *For more information, see About Software Tagging RegIDs and About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields.*
Software Licensor Name	(Optional) Enter a name to identify the licensor of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.  ***Note*** • *For more information, see About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields.*

Table 7-8 • Catalog Deployment Type View / Software Identification Tag Subtab Properties

Property	Description
Software Licensor RegID	(Optional) Enter a RegID to identify the licensor of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field. ***Note*** • *For more information, see About Software Tagging RegIDs and About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields.*
Generate Software Tag File	Click to save your edits and generate an updated tag file. When this button is clicked, Application Manager will generate a new transform file for this package that includes the newly modified tag file, and will then reimport the package into the Application Catalog along with its updated transform file. Repackager

Altiris Deployment Data Tab

Important • *The **Altiris Deployment Data** tab is only displayed for Windows Installer, Symantec Workspace, VMware ThinApp, and legacy installer packages.*

When a Windows Installer, Symantec Workspace, VMware ThinApp, or legacy installer package is imported into the Application Catalog, Application Manager mines package elements for Altiris-specific deployment data. You can view and modify data for these packages and configure command line settings by editing the properties on the **Package Information** and **Command Lines** subtabs of the **Altiris Deployment Data** tab.

Package Information Subtab

On the **Package Information** subtab of the **Altiris Deployment Data** tab, you can view and modify Altiris-specific data for packages.

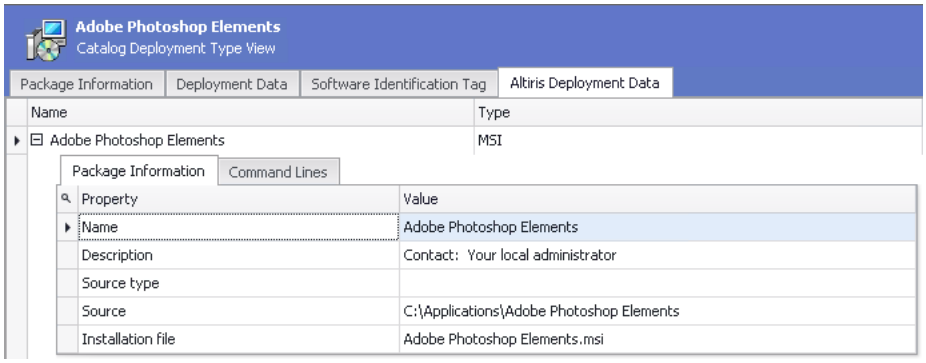

Figure 7-5: Altiris Deployment Data Tab / Package Information Subtab

The **Package Information** subtab of the **Altiris Deployment Data** tab includes the following properties:

Table 7-9 • Altiris Deployment Data Tab / Package Information Subtab

Property	Description
Name	Name that will identify this package on the Symantec Altiris server.
Description	Description that will be associated with this package on the Symantec Altiris server.
Installation file	Lists the name of the imported package file, the file that will launch the application deployment. ***Note*** • *The value in this field will populate the* ***Installation file*** *field in Altiris. An application being installed by Altiris can consist of multiple files and subfolders of files. Therefore, if additional files are added to this application on the Altiris server, the* ***Installation file*** *field will identify the one file that launches application deployment.*

Command Lines Subtab

On the **Command Lines** subtab of the **Altiris Deployment Data** tab, you can configure a package's Altiris-related command line settings.

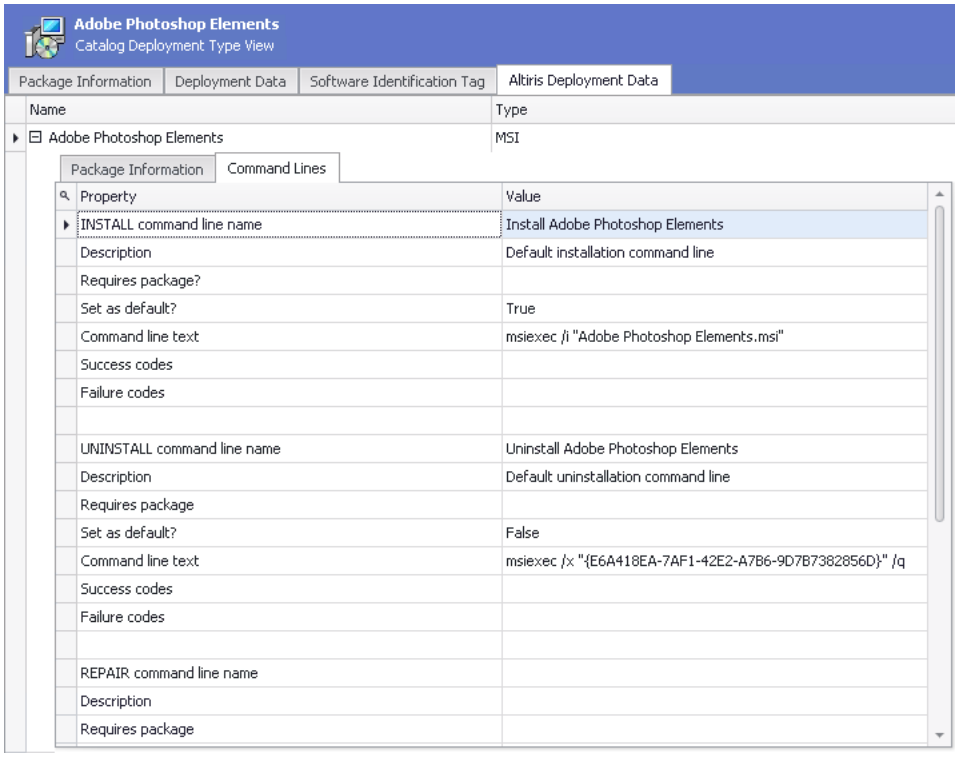

Figure 7-6: Altiris Deployment Data Tab / Command Lines Subtab

The **Command Lines** subtab of the **Altiris Deployment Data** tab includes the following properties:

Table 7-10 • Altiris Deployment Data Tab / Command Lines Subtab

Property	Description
INSTALL / UNINSTALL / REPAIR / CUSTOM Command Line Name	User-specified name of the command line resource, such as: • Uninstall Adobe Photoshop Elements • Repair Adobe Photoshop Elements
Description	Name which describes the purpose of the specified command line, such as: • Default uninstallation command line • Default repair command line
Set as default?	Select **True** to set this command line as the default for the Install, Uninstall, or Repair action when a package is deployed from the Altiris Server to a client.  ***Note*** • *For example, you can define multiple installation command lines for a software resource, but only one installation command line can be the default.*  ***Note*** • *Not required for CUSTOM command lines.*
Command line text	Actual command line code, such as: `msiexec /x "{E6A418EA-7AF1-42E2-A7B6-9D7B7382856D}" /q`
Success codes	Codes returned when this command line is successful.
Failure codes	Codes returned when this command line fails.

AirWatch Deployment Data Tab

Important • *The **AirWatch Deployment Data** tab is only displayed for Apple iOS packages.*

AirWatch is a leading global Mobile Device Management (MDM) provider. Using AdminStudio, you can manage and publish Apple iOS (local and public store) and Google Android (local and public store) packages to AirWatch. You can view and modify data for these packages by editing the properties on the **AirWatch Deployment Data** tab.

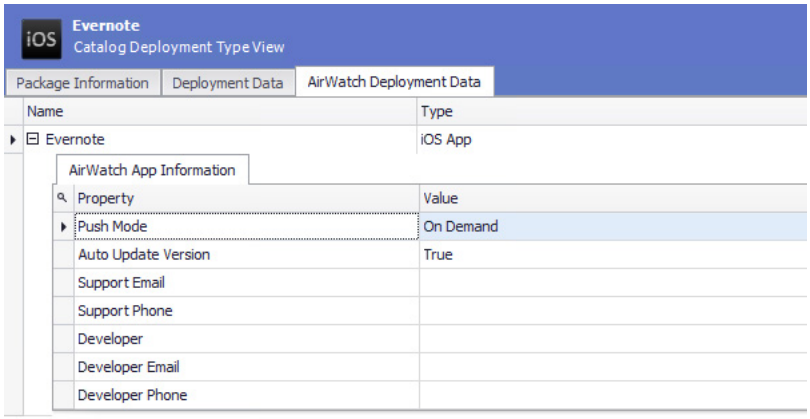

Figure 7-7: AirWatch Deployment Data Tab

The **AirWatch Deployment Data** tab includes the following properties:

Table 7-11 • AirWatch Deployment Data Tab

Property	Description
Is Reimbursable	(Apple iOS and Google Android public store mobile apps only) This property is set during import, but can be edited. Select one of the following options: • **True**—App was purchased in the App Store. • **False**—App was free.
Push Mode	Select one of the following options: • **Auto**—Install the application immediately. • **On Demand**—Have the end user install the application manually. (Default)
Auto Update Version	(Apple iOS and Google Android local mobile apps only) Select one of the following options: • **True**—Automatically update the application to the latest version. • **False**—Do not automatically update the application.
Support Email	(Apple iOS and Google Android local mobile apps only) Email address identifying the end user's Support point-of-contact for this application.
Support Phone	(Apple iOS and Google Android local mobile apps only) Phone number of the end user's Support site for this application.
Developer	(Apple iOS and Google Android local mobile apps only) Name of the developer who created this application.
Developer Email	(Apple iOS and Google Android local mobile apps only) Email address of this application's developer.

Table 7-11 • AirWatch Deployment Data Tab

Property	Description
Developer Phone	(Apple iOS and Google Android local mobile apps only) Phone number of this application's developer.

Catalog Deployment Type View Subnode Views

If you click on the plus sign to expand a package in the Application Manager Catalog Deployment Type View, a node is listed for each available constituent view. For example, for a Windows Installer package when the **Catalog** tab is selected, the following nodes are listed:

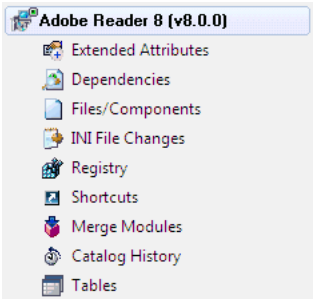

Figure 7-8: Windows Installer Package Nodes / **Catalog** Tab

When you select one of these nodes, a constituent view opens in the right pane:

- Extended Attributes View (Packages)
- Dependencies View
- Files View
- INI File Changes View
- Registry View
- Shortcuts View
- Merge Modules View
- Catalog History View
- App-V History View
- Tables View
- File Type Associations View
- Environment Variables View

Note • *The* ***Only Display View Nodes With Data*** *option on the* ***General*** *tab of the Application Manager Options Dialog Box controls whether product nodes (constituent views) appear if no data is contained in that view. If you select*

*the option, products containing views without data will not display those views. For example, if a product has no dependencies, then the **Dependencies** node is not displayed for that product.*

Extended Attributes View (Packages)

The Application Manager Extended Attributes View displays the optional extended attributes associated with the package. To open a package's Extended Attributes View, select the **Extended Attributes** node under that package in the package tree.

These attributes are dynamically populated based on an external Package Extended Attribute Description File (in XML format). You can specify the name and location of this file on the **General** tab of the Application Manager **Options** dialog box.

On the left side of the view, the name for each attribute is displayed; the right side displays the value for the attribute. These values are in read-only fields, from which you can highlight and copy text, or, in the case of file links, launch the linked file. The file location displayed represents the location from which the file was originally imported; the file is actually stored within the Application Catalog and extracted into a temp directory when you click on the file link. This temp directory is purged when Application Manager closes, as long as the file is not locked by another application or process.

If you click on the attribute name, you can either provide the value in the **Extended Attribute Property** dialog box (for text attributes) or browse for a file in a Browse dialog (for file attributes).

Dependencies View

The **Dependencies View**, which opens in the Application Manager **Catalog** tab when a package's **Dependencies** node is selected in the tree, varies by deployment type:

- Dependencies View / Windows Installer Package
- Dependencies View / App-V Package

Dependencies View / Windows Installer Package

On the **Dependencies View**, you can view a list of all of the files of a selected Windows Installer package that have dependencies with files used by other packages or operating systems in the Application Catalog. This view is displayed for Windows Installer **.msi** packages in which file dependency information exists.

The **Dependencies View** is populated when you scan a Windows Installer package for dependencies using the **Auto detect dependencies** option of the **Dependency Wizard**.

***Note** • If the **Only Display View Nodes With Data** option on the **General** tab of the Application Manager **Options** dialog box is selected, if no dependencies are found, the **Dependencies** node will not be displayed.*

The following information is displayed on the **Dependencies** view:

Table 7-12 • Dependencies View

Option	Description
File Name	Name of the file contained in the Windows Installer package; all other columns describe dependencies for this file.

Table 7-12 • Dependencies View

Option	Description
Architecture	Machine architecture for the file.
16 bit	Signifies whether the file is meant for 16-bit machines.
Terminal Server Aware	Signifies whether the file is Terminal Server aware or not.
.NET Assembly	Shows **NotCLR** if the file is not a .NET assembly; otherwise it displays the version of .NET it depends upon.
SubSystem	Signifies the sub-system for the file.
Signed	Signifies whether the file is digitally signed.
Signee	If the file is signed, this columns lists the name of the signee.
PE Dependent on	Lists other files that this one depends on.
PE Language	The language for the file.

Note • *For Microsoft App-V packages, a dependency scan is automatically performed during import into the Application Catalog, and the results are displayed on the App-V package's* ***Dependencies View****. For more information, see Viewing App-V Package Dependencies.*

Dependencies View / App-V Package

Note • *This information applies to App-V 4.x packages.*

The **Dependencies View** lists both the applications the App-V package is dependent on and the applications dependent upon this App-V package.

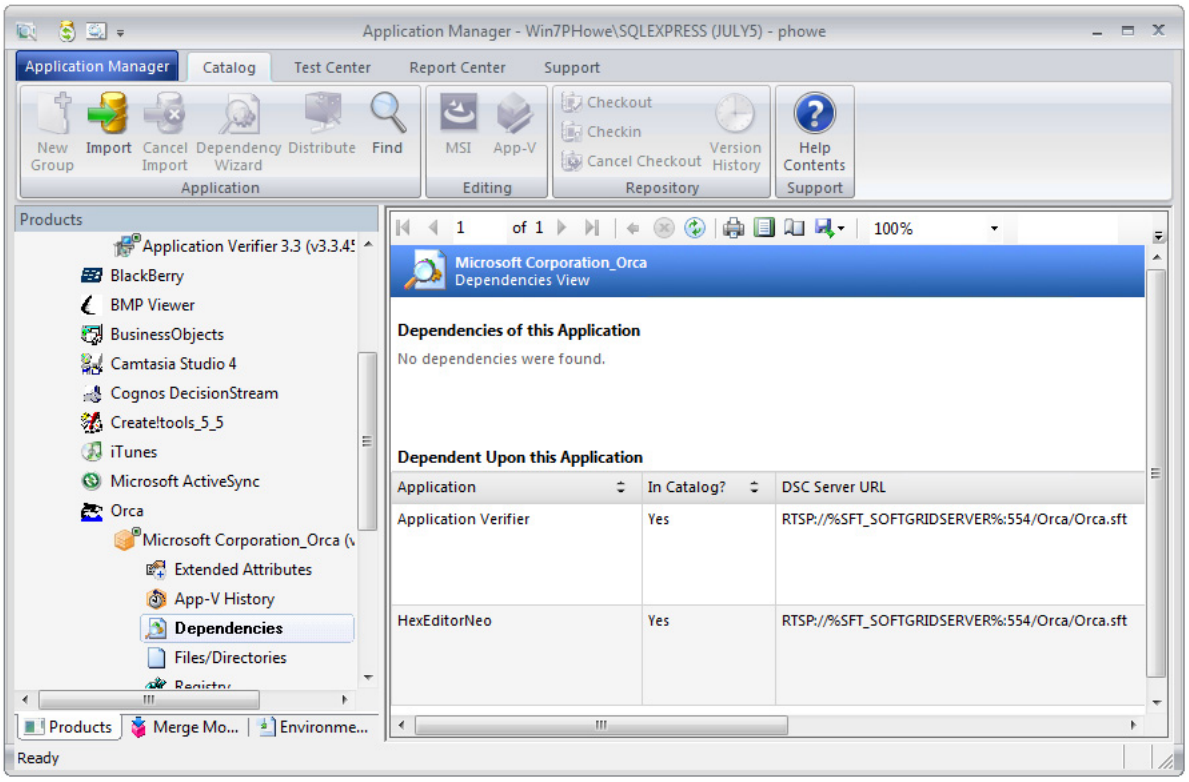

Figure 7-9: Dependencies View / App-V Package

For each dependency, the following information is listed:

- Application
- In Catalog? (Yes / No)
- DSC Server URL
- Server URL
- Mandatory? (Yes / No)

Files View

The **Files View**, which opens in the Application Manager **Catalog** tab when a package's **Files/Components** or **Files/Directories** node is selected in the tree, varies by deployment type:

- Files/Components View / Windows Installer Package
- Files/Directories View / App-V Package

Files/Components View / Windows Installer Package

The **Files/Components View** displays the files and components in the Windows Installer package. The following information is displayed:

Table 7-13 • File/Components View Information

Column	Description
Component	Name of component that the file listed in the FileName column is associated with.
FileName	Name of file.
FileSize	Size of the file listed in the FileName column.
Version	Version of the file listed in the FileName column.
Path	Installation location of the file listed in the FileName column.

Files/Directories View / App-V Package

The **App-V Files/Directories View** lists the files and directories included in the App-V package.

For each file/directory, the following information is listed:

Table 7-14 • App-V File Information

Column	App-V 4.x	App-V 5
Directory Path	X	X
Short Name	X	
Long Name	X	
File Name		X
File Size	X	X
VFS Path	X	
Feature Block 1	X	X
App-V Version	X	
App-V Data Type	X	

INI File Changes View

The **INI File Changes View**, which you open by expanding a Windows Installer package in the Application Manager tree and selecting the **INI File Changes** node, displays any INI file changes made by that package. The following information is displayed:

Table 7-15 • INI File Changes View Information

Column	Description
Component	Name of component that makes an entry in the INI File.
FileName	Name of INI File that the component listed in the Component column makes an entry in.
DirProperty	The directory location where the INI File will be installed.
Section	The section of the INI file where this entry is made.
Key	The Key used in the INI File entry
Value	The Value used in the INI File entry.

Registry View

The **Registry View**, which opens in the Application Manager **Catalog** tab when a package's **Registry** node is selected in the tree, varies by deployment type:

- Registry View / Windows Installer Package
- Registry View / App-V Package

Registry View / Windows Installer Package

The **Registry View** displays any registry entries created or changed by the Windows Installer package. The following information is displayed:

Table 7-16 • Registry View Information

Column	Description
Component	The name of the component that is creating a Registry entry.
Root	Default value of Key.
Key	Key of the Registry Entry that this component is making.
Name	Name of the Registry Entry that this component is making.
Value	Value of the Registry Entry that this component is making.

Registry View / App-V Package

The **Registry View** lists any registry entries created or changed by the App-V package.

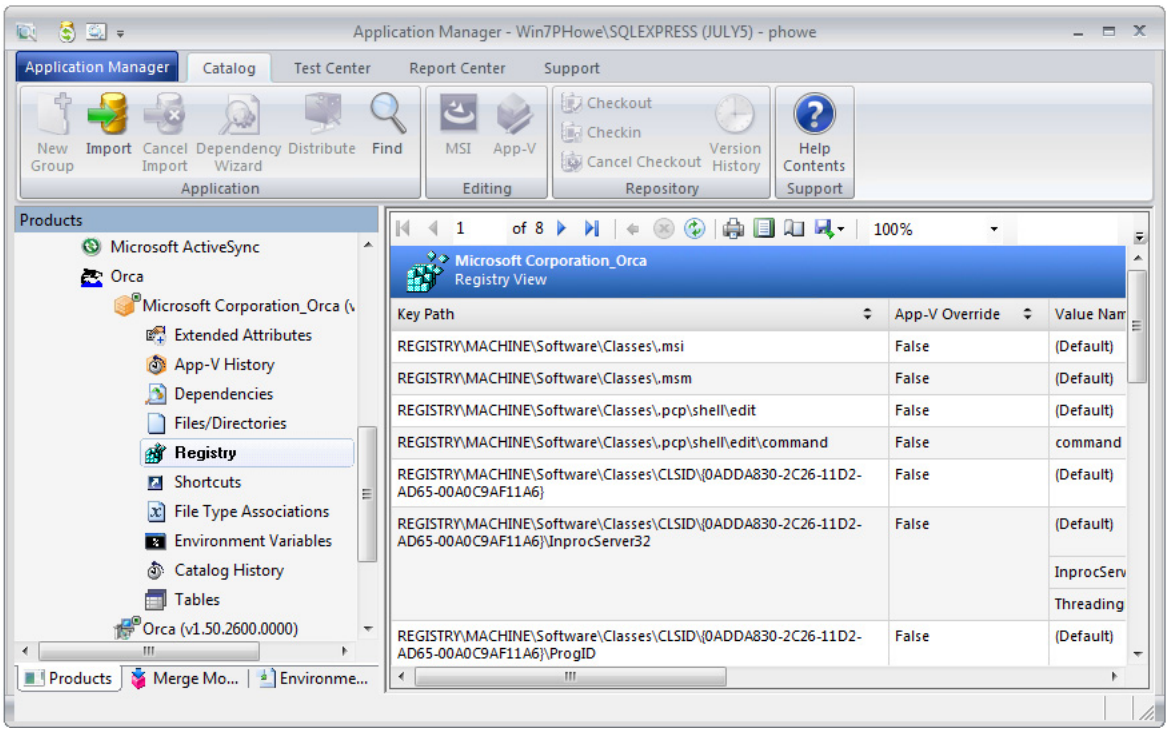

Figure 7-10: App-V Registry View

For each registry entry, the following information is listed:

- Key Path
- App-V Override
- Value Name
- Data
- Type

Shortcuts View

The **Shortcuts View**, which opens in the Application Manager **Catalog** tab when a package's **Shortcuts** node is selected in the tree, varies by deployment type:

- Shortcuts View / Windows Installer Package
- Shortcuts View / App-V Package

Shortcuts View / Windows Installer Package

The **Shortcuts View** displays any shortcuts created by the Windows Installer package. The following information is displayed:

Table 7-17 • Shortcuts View Information

Column	Description
Component	Name of the component that the shortcut listed in the Name column is associated with.
Name	Name of the shortcut.
Directory_	Directory where the shortcut will exist.
Target	Directory and executable that the shortcut invokes.

Shortcuts View / App-V Package

The **Shortcuts View** displays any shortcuts created by the App-V package.

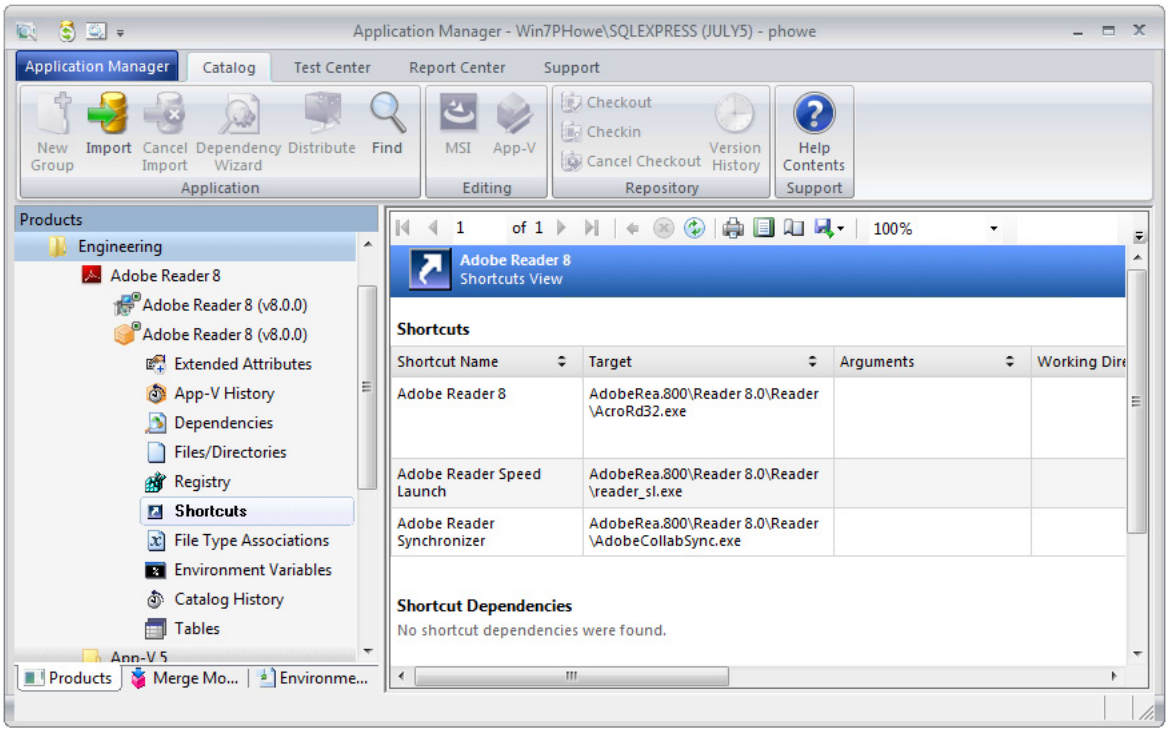

Figure 7-11: App-V Shortcuts View

Under the **Shortcuts** subheading, the following information is listed for each shortcut:

- Shortcut Name
- Target
- Arguments

- Working Directory
- Target Version
- Location

Under the **Shortcut Dependency** subheading, the following information is listed for each shortcut dependency:

- Shortcut Name
- Href
- GUID
- Is Mandatory

Under the **Shortcut Script** subheading, the following information is listed for each shortcut script:

- Shortcut Name
- Body (of script)

Important • *The **Shortcut Dependency** and **Shortcut Script** subheadings only apply to App-V 4.x packages.*

Merge Modules View

The **Merge Modules View**, which you open by expanding a Windows Installer package in the Application Manager tree and selecting the **Merge Modules** node, displays any merge modules included the package. The following information is displayed:

Table 7-18 • Merge Modules View Information

Column	Description
Title	The title of the Merge Module included with this package.
ModuleID	The number which uniquely identifies the Merge Module listed in the Title column.
Version	The version of the Merge Module listed in the Title column.
Language	The language that the Merge Module listed in the Title column was written for.

Catalog History View

The **Catalog History View**, which you open by expanding a Windows Installer package in the Application Manager tree and selecting the **Catalog History** node, displays a list of logged events for that package. The following information is included:

Table 7-19 • Information Displayed in the Catalog History View

Item	Description
Action	Name of the event which was logged: • Import/Reimport • Validation • Conflict Detection • Conflict Resolution • Extended Attribute Modification • Package Description Modification • Package Move/Copy • Patch Analysis
Date	Date and time logged event occurred.
User	User who performed the logged event.
Description	Description providing details of the logged event.

App-V History View

Note • *This information applies to App-V 4.x packages.*

The **App-V History View**, which you open by expanding an App-V package in the Application Manager tree and selecting the **App-V History** node, lists an entry for each time this App-V package was saved.

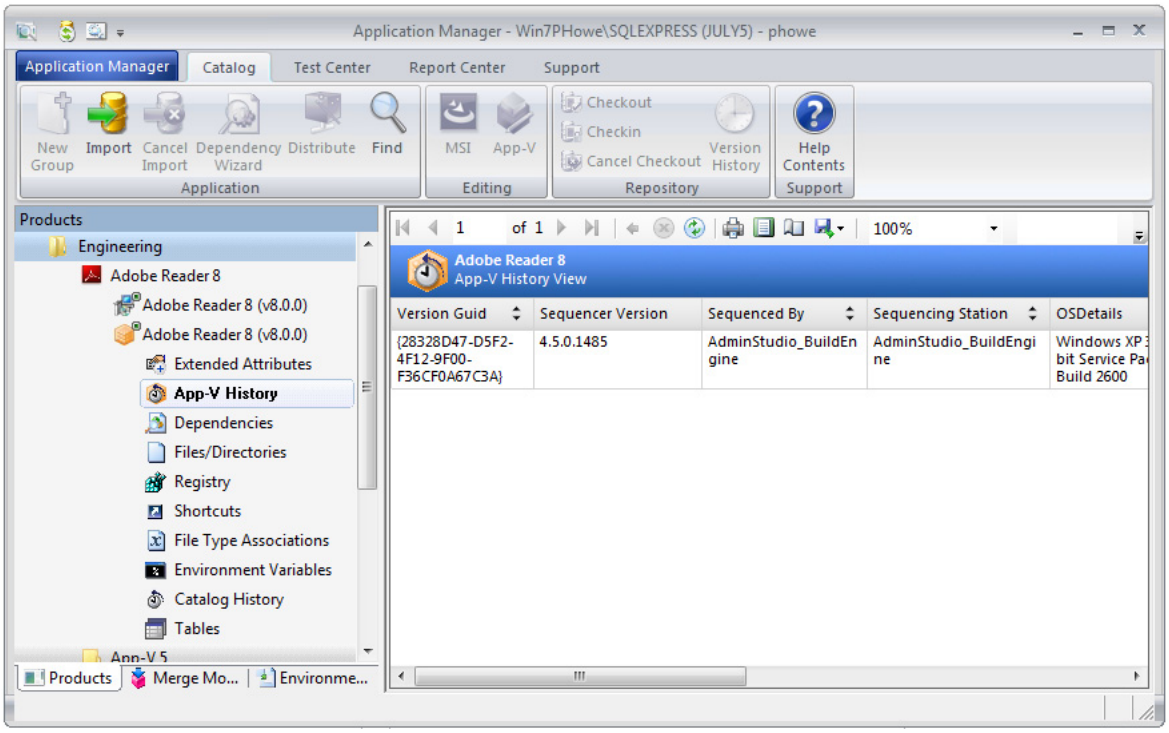

Figure 7-12: App-V History View

For each entry, the following information is displayed:

- Version Guid
- Sequencer Version
- Sequenced By
- Sequencing Station
- OSDetails
- System Folder
- Windows Folder
- User Folder
- .Net Framework Version
- IEVersion

Tables View

The **Tables View**, which opens in the Application Manager **Catalog** tab when a package's **Tables** node is selected in the tree, provides a way to view the data for a Windows Installer package, App-V package, or mobile app in the Application Catalog.

Select the specific table you want to view from the **Tables** list at the top of the view.

Note • *Most tables are derived directly from standard MSI tables, as described in the Windows Installer SDK online help. When building your own ACE rules to use for conflict identification, it is important to understand the data available for packages so you can construct the necessary rule.*

File Type Associations View

The **App-V File Type Associations View**, which you open by expanding an App-V package in the Application Manager tree and selecting the **File Type Associations** node, displays a list of this package's file type associations.

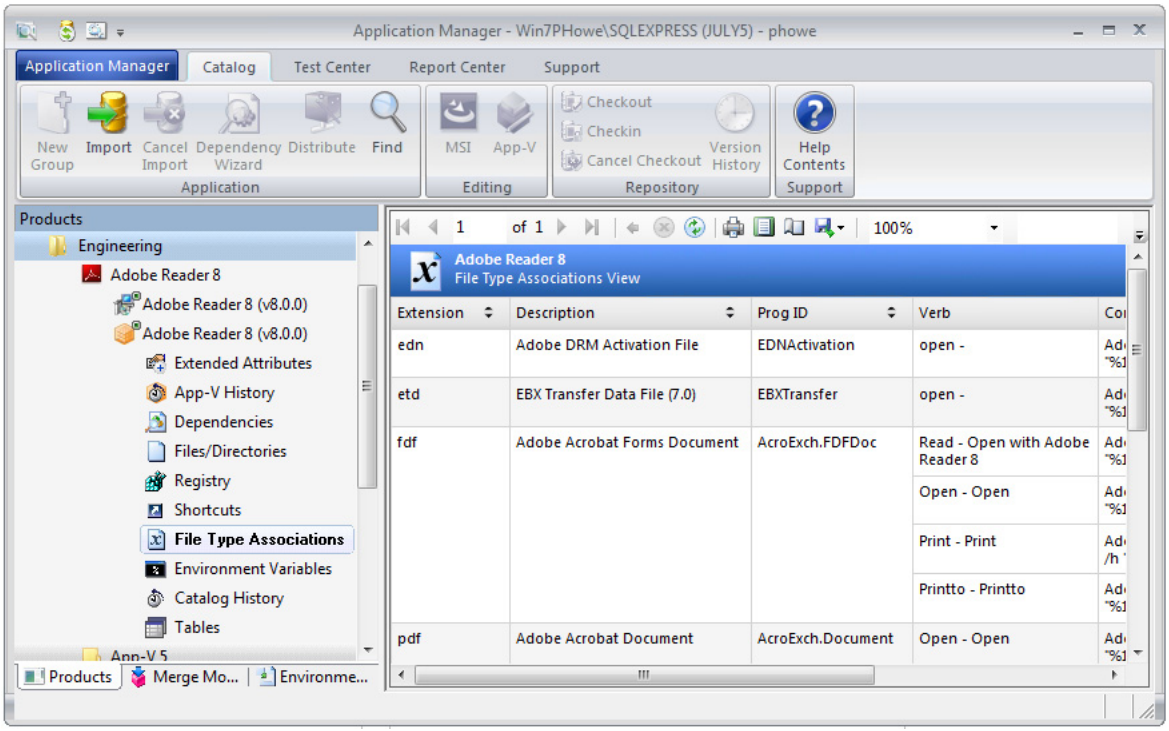

Figure 7-13: App-V File Type Associations View

For each file type association, the following information is listed:

- Extension
- Description
- Prog ID
- Verb
- Command

Environment Variables View

The **App-V Environment Variables View**, which you open by expanding an App-V package in the Application Manager tree and selecting the **Environment Variables** node, lists the environment variables used in this App-V package.

For each environment variable, the following information is listed:

- Name
- Value

Merge Module Tree Views

When the **Merge Modules** tab is selected in the Application Manager tree, you can access the following views:

- **All Merge Modules View**—Select this option to view a list of all of the Merge Modules in your catalog. See All Merge Modules View.
- **Merge Module View**—Select an individual Merge Module to see detailed information on that module. See Merge Module View.

All Merge Modules View

The All Merge Modules view is the root node of the merge modules explorer. It contains a list of all merge modules in the Application Catalog, including titles, versions, languages, and identifiers for each module.

Double-click on a merge module to see information about it in the Merge Module View.

Merge Module View

When you select a merge module in the merge modules explorer, details are displayed in this view.

These details include:

Table 7-20 • Merge Module View Information

Field	Description
Version	The version of the Merge Module.
Language	The language that the Merge Module was written for.
Identifier	String that uniquely identifies the Merge Module.
File	The path and file name of the Merge Module file that was imported.
Imported On	The date and time the Merge Module was imported.

Click the plus sign next to the Merge Module to view these Merge Module constituent views:

- Components View
- Dependency View
- Exclusion View
- Files View

- Products View

Components View

When you expand a merge module in the merge modules explorer, you can click on Components to display any components created or changed by the merge module.

The following information is displayed for each component included in this merge module:

- Component
- ComponentId
- Directory_
- csFullPath

Dependency View

When you expand a merge module in the merge modules explorer, you can click on Dependency to display any dependencies in the merge module.

The following information is displayed for each dependency included in this merge module:

- ModuleLanguage
- RequiredID
- RequiredLanguage
- RequiredVersion

Exclusion View

When you expand a merge module in the merge modules explorer, you can click on Exclusion to display any exclusions in the merge module.

The following information is displayed for each exclusion included in this merge module:

- ModuleLanguage
- ExcludedID
- ExcludedLanguage
- ExcludedMaxVersion
- ExcludedMinVersion

Files View

When you expand a merge module in the merge modules explorer, you can click on Files to display any files in the merge module.

The following information is displayed:

Table 7-21 • Merge Module Files View Information

Column	Description
Component_	Name of component that this Merge Module file is associated with.
File	Name of this Merge Module file.
FileName	File name of this Merge Module file.
FileSize	Size of this Merge Module file.
Version	Version of this Merge Module file.

Products View

When you expand a merge module in the merge modules explorer, you can click on Products to display any products in the Application Catalog that use the merge module.

The following information is displayed:

Table 7-22 • Merge Module Products View Information

Column	Description
ProductName	Name of product associated with this Merge Module.
ProductVersion	Version of product associated with this Merge Module.
Manufacturer	Manufacturer of the product associated with this Merge Module.

Environment Tree Views

When the **Environment** tab is selected in the Application Manager tree, you can view information about the Security Patches and OS Snapshots that have been imported into the Application Catalog. The following views are available:

Table 7-23 • Environment Tree Views

View	Description
Security Patches Group View	Opens when the root group in the **Environment** tab is selected, and lists all of the groups that have been created in the **Environment** tab.
New Security Patches Group View	All new patches are imported into the **New Security Patches** group, and this view lists all of the patches in that group.

Table 7-23 • Environment Tree Views (cont.)

View	Description
Group View of a Selected Group	Opens when a group other than the root group in the **Environment** tab is selected. For each selected group, a list of all of the patches in that group is displayed.
Patch View	Lists general content information on a selected patch.
OS Snapshot View	Lists information detailing an imported OS Snapshot.

Security Patches Group View

The **Security Patches Group View** opens when the **Security Patches** group of the **Environment** tab is selected. The **Security Patches Group View** lists all groups that have been created in the **Environment** tab.

All new patches are imported into the **New Security Patches** group, and then you can organize the patches into other groups according to your business needs. See Organizing Your Application Catalog Using Groups.

The **New Security Patches** group is automatically created during installation. While it can be renamed, it cannot be deleted.

Shortcut Menu Options

When the **Security Patches** group in the **Environment** tab is selected, the following items are available on the shortcut menu:

- **Refresh**—Refresh the patch listing to reflect the most recent modifications.
- **Import Patches**—Import a Microsoft Operating System Security Patch.
- **New Group**—Create a new group.
- **Rename**—Rename the selected group.
- **Properties**—Open the **Group Properties** dialog box.

New Security Patches Group View

The **New Security Patches Group View** opens when the **New Security Patches** group on the Application Manager **Environment** tab is selected. All new patches are imported into the **New Security Patches** group. You can then organize the patches into other groups according to your business needs. See Organizing Your Application Catalog Using Groups.

The **New Security Patches** group is automatically created during installation. While it can be renamed, it cannot be deleted.

The **New Security Patches Group View** displays a list of all of the patches in that group, including the following information:

Table 7-24 • New Security Patches Group View Information

Option	Description
Name	Name of patch file.
Description	Description of the patch file.
Release Date	Date the patch was released by Microsoft.
Import Date	Date the patch was imported into the Application Catalog.

If you select a patch in this list, detailed patch properties are displayed in the area to the left of the list, including the **Title**, **Summary**, and **Release Date** of the patch.

Shortcut Menu Options

When the **New Security Patches** group in the **Environment** tab is selected, the following items are available on the shortcut menu:

- **New Group**—Create a new group.
- **Rename**—Rename the selected group.
- **Properties**—Open the **Group Properties** dialog box.

Group View of a Selected Group

The Group View of a selected group opens when a group other than the root group or the **New Security Patches** group in the **Environment** tab is selected. For each selected group, a list of all of the patches in that group is displayed, including the following information:

Table 7-25 • Group View of a Selected Group Information

Option	Description
Name	Name of patch file.
Description	Description of the patch file.
Release Date	Date the patch was released by Microsoft.
Import Date	Date the patch was imported into the Application Catalog.

If you select a patch in this list, detailed patch properties are displayed in the area to the left of the list, including the **Title**, **Summary**, and **Release Date** of the patch.

Shortcut Menu Options

When a group other than the root group or the **New Security Patches** group in the **Environment** tab is selected, the following items are available on the shortcut menu:

- **New Group**—Create a new group.
- **Rename**—Rename the selected group.
- **Delete**—Delete the selected group.
- **Properties**—Open the **Group Properties** dialog box.

Patch View

The **Patch View**, which is displayed when a patch is selected on the **Environment** tab, lists general information on the selected patch. The following information is included:

Table 7-26 • Patch View Information

Option	Description
ID	Microsoft Security Bulletin ID. Click this link to view this bulletin on the Microsoft website.
Title	Title of patch.
Release Date	Date the patch was released by Microsoft.
KB Article	Microsoft Knowledge Base article ID. Click this link to view this article on the Microsoft website.
Imported On	Date patch was imported into the Application Catalog
Groups	List of all of the groups that this patch is included in.
Description	You can enter a description of the patch in this field.

In the Application Manager, you can view additional detailed patch information by right-clicking on a patch and then selecting **Properties** from the shortcut menu.

Shortcut Menu Options

When you right-click on a patch in the **Environment** tab, the following items are available on the shortcut menu:

- **Rename**—Rename the selected patch.
- **Delete**—Delete the selected patch.
- **Generate Report**—Generate a Patch Impact Analysis Report for that patch. See Generating the Patch Report.
- **Properties**—Open the **Patch Properties** dialog box for that patch.

OS Snapshot View

When you click on an OS Snapshot in the Application Manager Environment View, details about the snapshot appear in the right pane of the user interface.

The following information is displayed:

Table 7-27 • OS Snapshot View Information

Field	Description
Version	Version of the operating system of the OS Snapshot, such as Windows 7 - 5.1.2600.
Language	The language the operating system was written for.
File	This can be either a hard-coded path or a UNC path.
Imported On	The date and time the OS Snapshot was imported.
Description	You can edit this with additional information about the OS Snapshot.

Click the plus sign next to the OS Snapshot icon to view these OS Snapshot constituent views:

- Files View for OS Snapshots
- INI File Changes View for OS Snapshots
- Registry View for OS Snapshots
- Shortcuts View for OS Snapshots

Files View for OS Snapshots

When you expand an OS Snapshot in the **Environment** tab of the Application Manager tree, you can click on **Files** to display a list of the files included in the OS Snapshot.

The following information is displayed for each of the files included in the OS Snapshot:

Table 7-28 • Files View Information

Column	Description
FileName	Name of the file.
csFilePath	Path
FileSize	Size of the OS Snapshot file.
Version	Version of the OS Snapshot file.
Language	Language that the OS Snapshot file was written for.
Attributes	Any attributes associated with the file.

INI File Changes View for OS Snapshots

When you expand an OS Snapshot in the **Environment** tab of the Application Manager tree, you can click on **INI File Changes** to display any INI file changes made by the snapshot.

The following information is displayed for each change to the INI file that is made by the snapshot:

Table 7-29 • INI File Changes View Information

Column	Description
FileName	Name of INI File that the OS Snapshot makes an entry in.
csFilePath	Path
Section	The section of the INI File where this entry is made.
Key	The Key used in the INI File entry
Value	The Value used in the INI File entry.

Registry View for OS Snapshots

When you expand an OS Snapshot in the **Environment** tab of the Application Manager tree, you can click on **Registry** to display any registry entries created or changed by the product.

The following information is displayed for each Registry Entry:

Table 7-30 • Registry View Information

Column	Description
Root	Default value of Key.
Key	Key of the Registry Entry that this component is making.
Name	Name of the Registry Entry that this component is making.
Value	Value of the Registry Entry that this component is making.

Shortcuts View for OS Snapshots

When you expand an OS Snapshot in the **Environment** tab of the Application Manager tree, you can click on **Shortcuts** to display any shortcuts that were found on this OS Snapshot's operating system.

The following information is displayed:

Table 7-31 • Shortcuts View Information

Column	Description
Name	Name of shortcut.

Table 7-31 • Shortcuts View Information

Column	Description
Directory	Location of shortcut.
Target	The application executable that the shortcut points to.

Tables View for OS Snapshots

The **Tables View** for an OS Snapshot is identical to the **Tables View** shown when a package is selected on the **Products** tab of the Application Manager tree. See Tables View in the Application Manager Catalog Deployment Type View section.

Enterprise Policy View

When you click on an Enterprise Policy in the Application Manager Environment View, the properties of the Enterprise Policy appear in the right pane of the user interface.

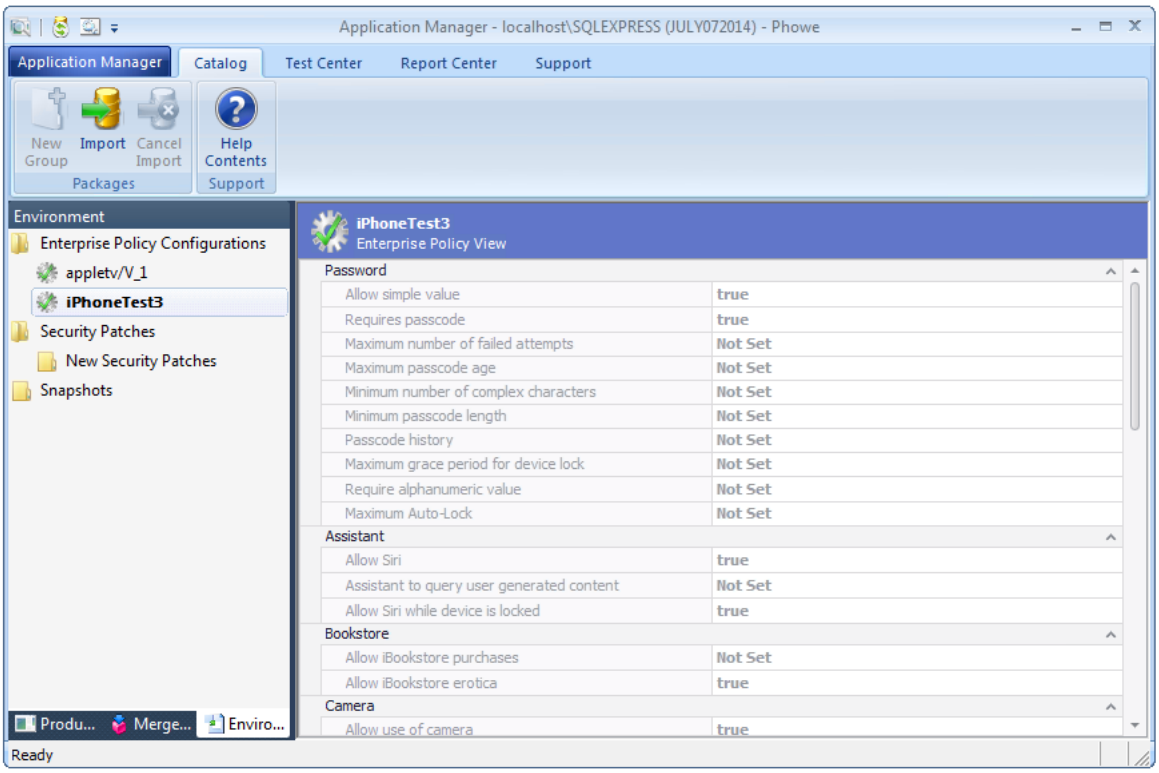

Figure 7-14: Enterprise Policy View

Dialog Boxes

The following dialog boxes are available in Application Manager when the **Catalog** tab is selected in the ribbon:

- Add Applications Dialog Box

- Add Connection Group Packages Dialog Box
- Add/Edit Applications Dialog Box
- Add/Edit Return Code Dialog Box
- AdminStudio Host Dialog Box
- App-V Server Connection Groups Dialog Box
- App-V Virtual Environments Dialog Box
- Application Search Results Dialog Box
- Associate with Workflow Manager Workflow Request Dialog Box
- Categories Dialog Box
- Change Deployment Type Priority Dialog Box
- Change Enterprise Server Password Dialog Box
- Command-Line Parameters Dialog Box
- Configure Connection Group Dialog Box
- Connect Application Catalog Dialog Box
- Create Global Condition Dialog Box
- Create Virtual Environment / Properties Dialog Box
- Default Application Catalog Dialog Box
- Edit Keywords Dialog Box
- Extended Attribute Property Dialog Box
- Find Dialog Box
- Flexera Identifier Dialog Box
- Flexera Local Identifier Dialog Box
- Global Conditions Dialog Box
- Keywords Dialog Box
- Login Required Dialog Box
- Properties Dialog Box
- Options Dialog Box
- References Dialog Box
- SCCM Server Environment Dialog Box
- Select Application Catalog Dialog Box
- Select AdminStudio Enterprise Server URL Dialog Box
- Select Substitute Package Dialog Box
- Servers Dialog Box

Add Applications Dialog Box

On the **Add Applications** dialog box, which is opened by clicking **Add** on the **Create Virtual Environment** dialog box, you can add an App-V deployment type group to a System Center Configuration Manager Server virtual environment.

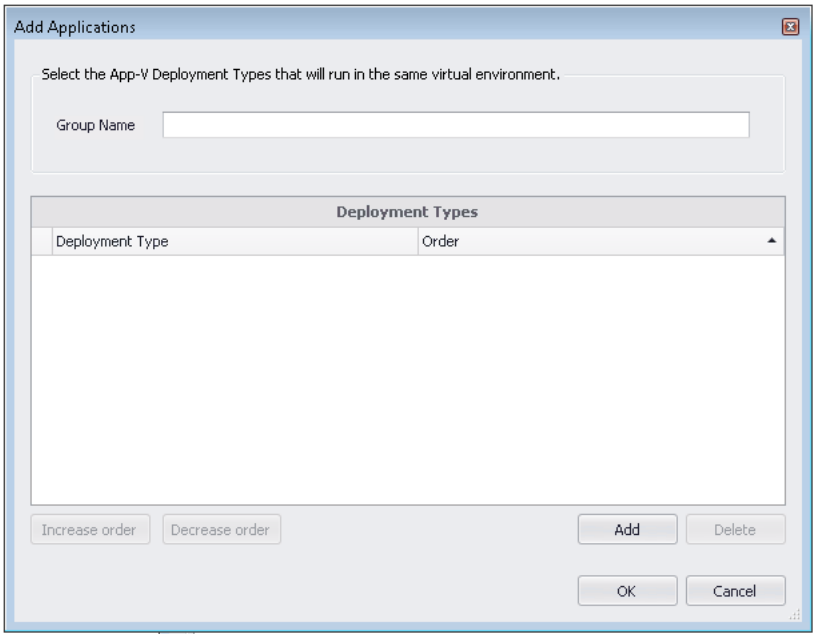

Figure 7-15: Add Applications Dialog Box

The **Add Applications** dialog box includes the following properties:

Table 7-32 • Add Applications Dialog Box Properties

Property	Description
Group Name	Enter a name to identify the group of App-V 5.0 packages that you are going to add.
Deployment Types list	List of **Deployment Types** in this App-V deployment type group, along with their **Order**. Click **Add** to add applications to this list. When multiple virtual applications modify the same file system or registry values on a client computer, the application with the highest order will take precedence.
Add	Click to open the **Specify Applications** dialog box, where you can add applications to the deployment type group.

Table 7-32 • Add Applications Dialog Box Properties

Property	Description
Delete	Click to delete the selected deployment type group.
Increase order **Decrease order**	If more than one deployment type is listed in the **Deployment Types** list, you can use the **Increase order** and **Decrease order** buttons to reorder the list. When multiple virtual applications modify the same file system or registry values on a client computer, the application with the highest order will take precedence.

Add Connection Group Packages Dialog Box

On the **Add Connection Group Packages** dialog box, which is opened by clicking **Add** on the **Configure Connection Group** dialog box, you select App-V 5.0 packages to add to an App-V Server Virtual Environment.

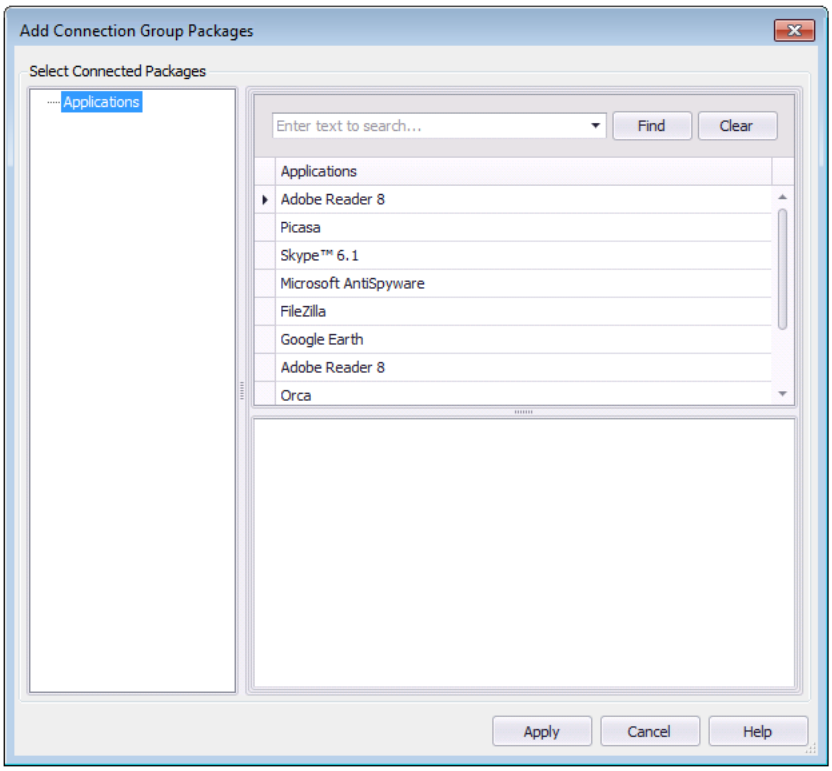

Figure 7-16: Add Connection Group Packages Dialog Box

The **Add Connection Group Packages** dialog box includes the following properties:

Table 7-33 • Add Connection Group Packages Dialog Box Properties

Property	Description
Select Connected Packages tree	Expandable tree listing the groups in the Application Catalog. When you select a group, all of the applications in the group are listed in the **Applications** list.

Table 7-33 • Add Connection Group Packages Dialog Box Properties

Property	Description
Search box	Use search the application in the **Applications** list.
Applications list	List of all of the applications in the selected Application Catalog group. Select an application to display its App-V 5.0 packages in the lower pane. ***Note*** • *If you select an application that does not have an App-V 5.0 deployment type, nothing will be listed in the lower pane.*
Apply	Click to add the selected App-V 5.0 package to the connection group.

Add/Edit Applications Dialog Box

On the **Add/Edit Applications** dialog box, which is opened by clicking **Add** or **Edit** on the **Create Virtual Environment** dialog box, you can enter a group name to identify the group of App-V 5.0 packages that are going to be members of the virtual environment, and add deployment types to the virtual environment.

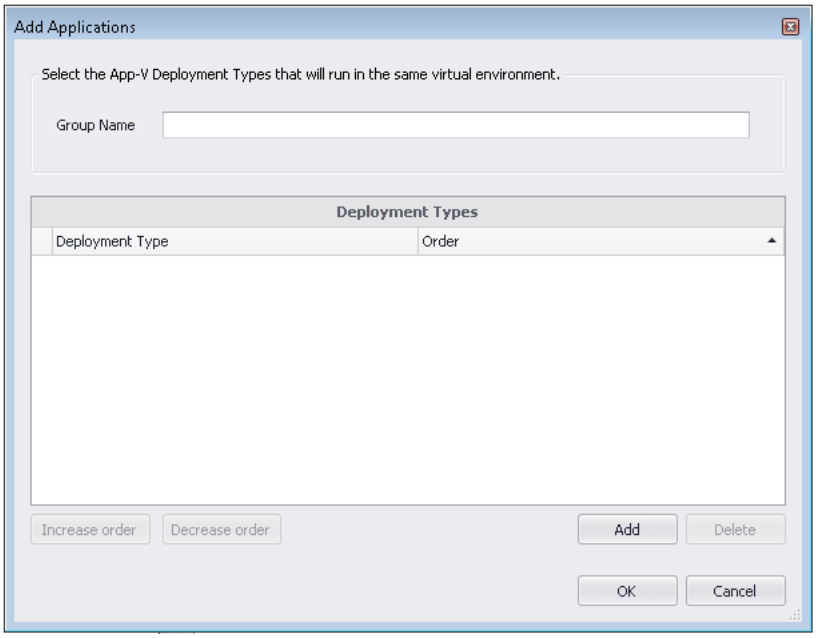

Figure 7-17: Add/Edit Application Dialog Box

The Add/Edit Application dialog box includes the following properties:

Table 7-34 • Add/Edit Application Dialog Box

Property	Description
Group Name	Name that identifies this group of App-V 5.0 packages.

Table 7-34 • Add/Edit Application Dialog Box

Property	Description
Deployment Types	List of deployment types (App-V 5.0 packages) that are members of this virtual environment.
Add	Click to open the Specify Applications dialog box, where you can select an App-V 5.0 package to add to this virtual environment.
Delete	Click to delete the selected deployment type (App-V 5.0 package).
Increase order **Decrease order**	If more than one deployment type is listed, you can use the **Increase order** and **Decrease order** buttons to reorder the list. When multiple virtual applications modify the same file system or registry values on a client computer, the application with the highest order will take precedence.

Add/Edit Return Code Dialog Box

Return codes are used to indicate whether a restart is required, whether an installation is complete, and to customize the text shown to users when a specific code is returned. A package's return codes are populated by default when the package is imported.

You can edit a MSI and EXE package's return codes on the **Return Codes** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View**. If you click the **Add Return Code** or **Edit Return Code** button in the **Deployment Data** tab ribbon, the **Add/Edit Return Code** dialog box opens.

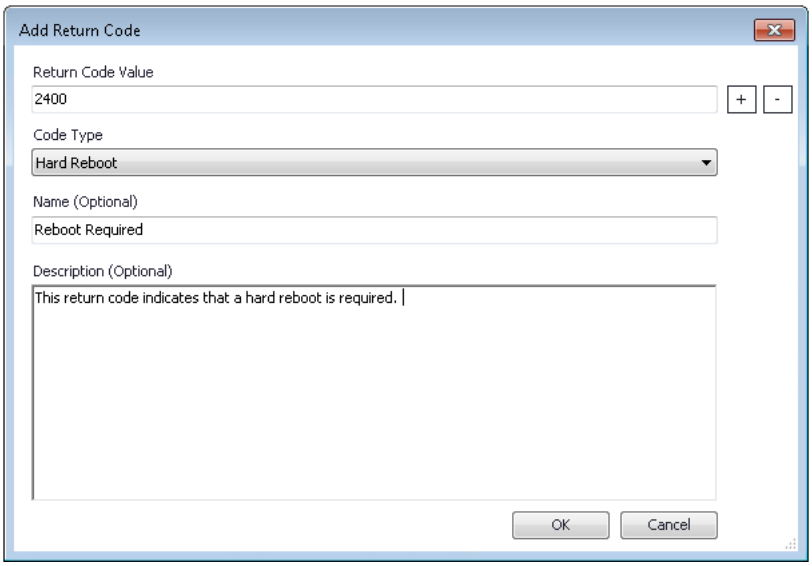

Figure 7-18: Add Return Code Dialog Box

The **Add/Edit Return Code** dialog box includes the following properties:

Table 7-35 • Add/Edit Return Code Dialog Box

Property	Description
Return Code Value	Enter a unique value. The following return codes are populated by default during import: • **0**—Success (no reboot) • **1707**—Success (no reboot) • **3010**—Soft Reboot • **1641**—Hard Reboot • **1618**—Fast Retry  ***Note*** • *When you are editing an existing return code, this field cannot be edited.*
Code Type	Select one of the following options to identify the return code's type: • **Success (no reboot)** • **Failure (no reboot)** • **Hard Reboot** • **Software Reboot** • **Fast Retry**
Name (Optional)	Enter a name to identify this return code.
Description (Optional)	Enter text to explain the meaning of this return code.

AdminStudio Host Dialog Box

Starting with AdminStudio 2013, most of Application Manager's core functionality now resides in the AdminStudio Host Process, separate from its user interface.

Using a host process gives AdminStudio better scalability and enables the development of clients that use Application Manager's core functionality. For example the Application Manager user interface and the Platform PowerShell APIs are now clients to this AdminStudio Host process.

- Opening the AdminStudio Host Dialog Box
- Ability to Run as a Windows Process or a Windows Service

Important • *AdminStudio Host must be running in order to use Application Manager or the Platform API.*

Opening the AdminStudio Host Dialog Box

When Application Manager is launched, the AdminStudio Host process is automatically started, and its icon is added to the System Tray.

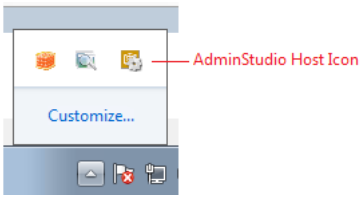

Figure 7-19: AdminStudio Host Icon in System Tray

AdminStudio Host Icon in System Tray

To open the **AdminStudio Host** dialog box double-click its icon in the System Tray:

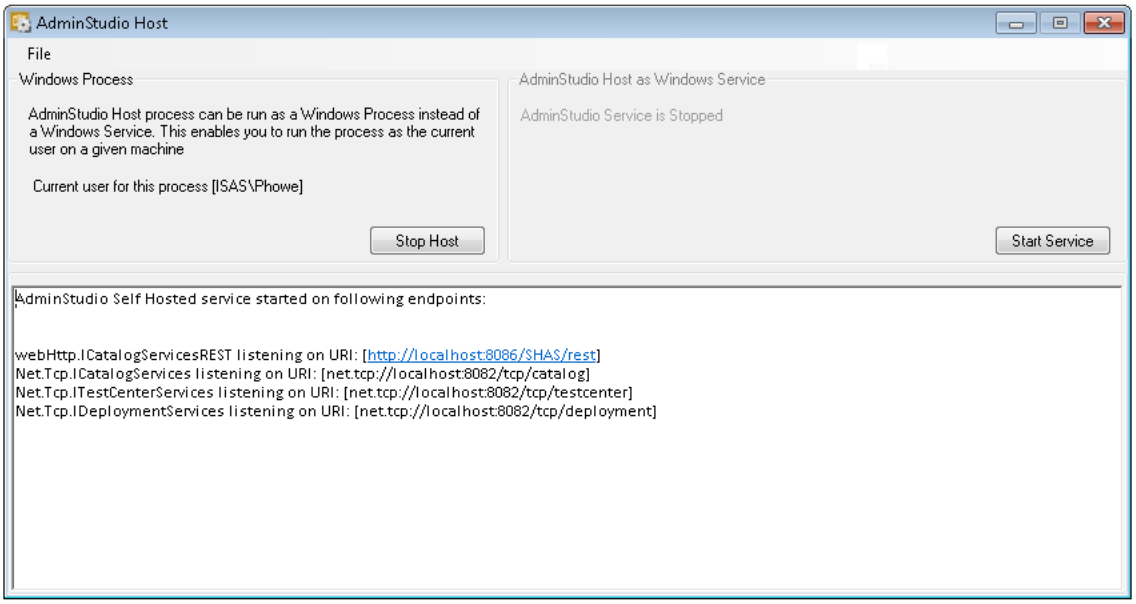

Figure 7-20: AdminStudio Host Dialog Box

Ability to Run as a Windows Process or a Windows Service

AdminStudio Host can run either as a standalone Windows Process (the default setting) or as a Windows Service running under a given account (which is, by default, the `LocalSystem` user account).

- **Run as Windows Process to use Windows Authentication**—It is more advantageous to run AdminStudio Host as a Windows Process than as a Windows Service because, while running as a current user, any code executed by this server component will run under the current user's context. This enables Application Manager to use Windows Authentication to automatically connect to System Center Configuration Manager, a System Center Configuration Manager publishing location, or an SQL Server.
- **Run as a Windows Service to configure Application Manager as a server application**—If you set up Application Manager as a server application on a server machine, you could then run AdminStudio Host as a Windows Service using one central user account, eliminating the need for user logins.

Note • *The ability to set up Application Manager as a server application will be included in a future release.*

For information on changing the AdminStudio Host run modes, see Changing AdminStudio Host Run Modes.

App-V Server Connection Groups Dialog Box

App-V Server virtual environments are called connection groups. You can create App-V 5.0 connection groups to generate connections between virtualized applications that allow the applications to communicate with each other while they run in the virtual environment.

The **App-V Server Connection Groups** dialog box, which is opened by clicking the **App-V Virtual Environments** button in the ribbon and selecting **App-V Server Environment**, lists the connection groups that have already been defined. You click **Add** on this dialog box to create a new connection group or **Edit** to edit an existing connection group.

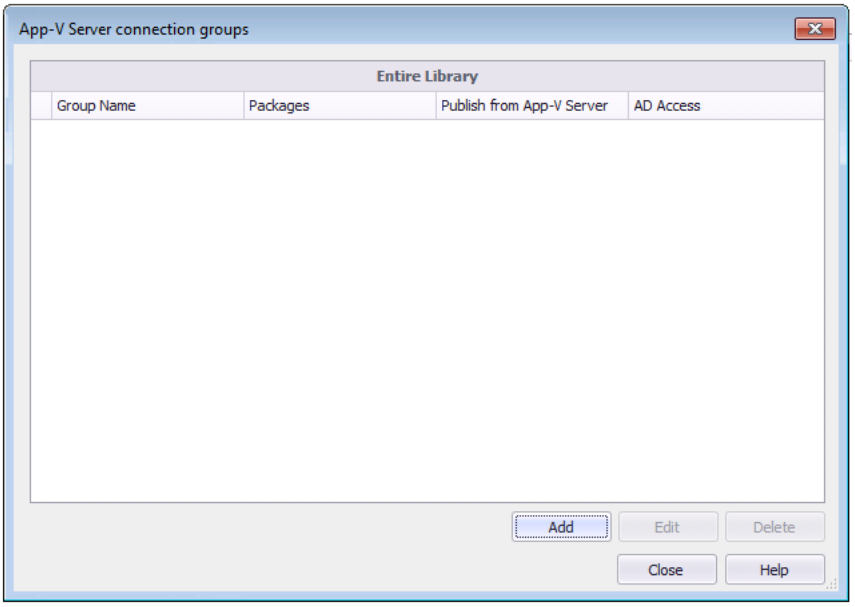

Figure 7-21: App-V Server Connection Groups Dialog Box

Note • *You can also open the **App-V Server Connection Groups** dialog box by selecting an App-V 5.0 package in the tree, and then clicking in the **Connection Group** field on the **Catalog Deployment Type View** > **App-V Deployment Data** > **Advanced Settings** tab.*

The App-V Server Connection Group dialog box includes the following properties:

Table 7-36 • App-V Server Connection Group Dialog Box

Property	Description
Group Name	Name that identifies the connection group.

Table 7-36 • App-V Server Connection Group Dialog Box

Property	Description
Packages	List of packages in the connection group.
Publish from App-V Server	Icon indicating whether the **Publish from App-V Server** option is set to **True** or **False**. A checked checkbox indicates that it was set to **True**, while an empty checkbox indicates that it is set to **False**.
AD Access	Active Directory group that has access to this connection group.
Add	Click to open the **Configure Connection Group** dialog box where you can create a new connection group.
Edit	Click to open the **Configure Connection Group** dialog box where you can edit the selected connection group.

App-V Virtual Environments Dialog Box

On the **App-V Virtual Environments** dialog box, which is opened by clicking the **App-V Virtual Environment** button in the Application Manager ribbon, existing App-V virtual environments are listed. From this dialog box you can add a new virtual environment or edit an existing one.

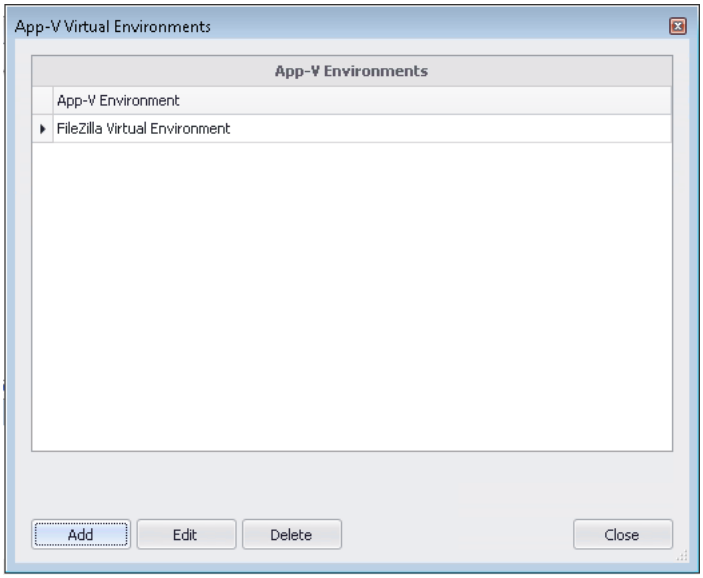

Figure 7-22: App-V Virtual Environments Dialog Box

App-V virtual environments in Microsoft System Center 2012 Configuration Manager enable deployed virtual applications to share the same file system and registry on client computers. This means that unlike standard virtual applications, these applications can share data with each other.

Tip • *Using virtual environments to group dependent packages together in App-V 5.0 is similar to the Dynamic Suite Composition feature used with App-V 4.x packages.*

The App-V Virtual Environments dialog box includes the following properties:

Table 7-37 • App-V Virtual Environments Dialog Box

Property	Description
App-V Environment	List of existing App-V virtual environments.
Add	Click to open the **Create Virtual Environment** dialog box, where you can create a new Virtual Environment. See Create Virtual Environment / Properties Dialog Box.
Edit	Select a virtual environment in the list and click to open its **Properties** dialog box, where you can edit its settings.

Application Search Results Dialog Box

When you click **Unrecognized Applications** in the toolbar of the Application Manager **Catalog** tab, the **Application Search Results** dialog box opens, listing all applications in the Application Catalog that do not have an associated Flexera Identifier

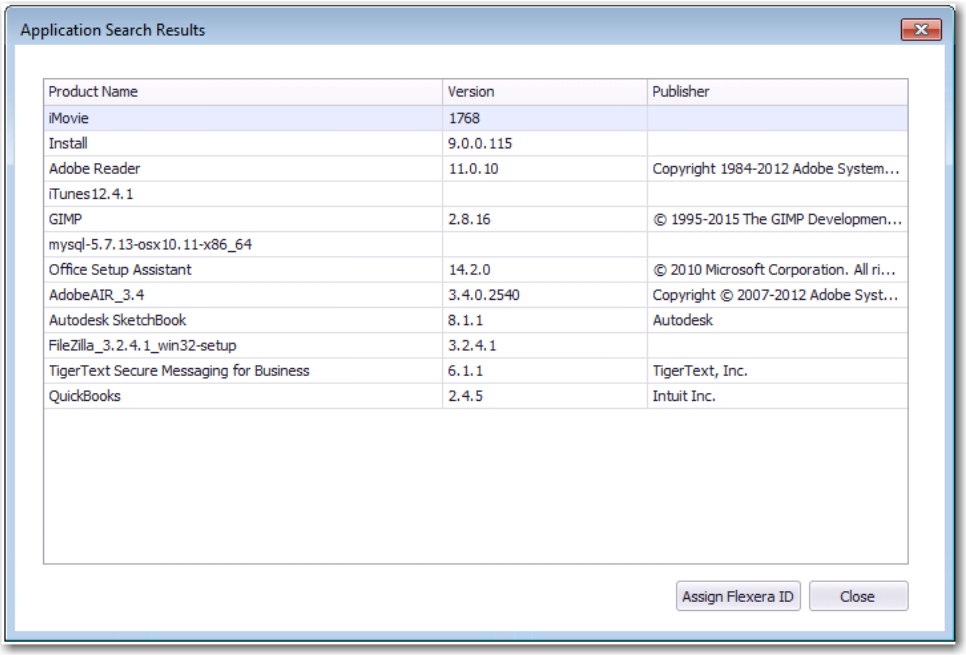

Figure 7-23: Application Search Results Dialog Box

To search for an existing Flexera Identifier or create a local Flexera Identifier, select an application in the list and click **Assign Flexera ID** to open the **Flexera Identifier** dialog box.

Associate with Workflow Manager Workflow Request Dialog Box

***Note** • AdminStudio Workflow Manager is a Web-based application management system that has integrated functionality with AdminStudio.*

The **Associate with Workflow Manager Workflow Request** dialog box is displayed when you right-click on a package in the Application Manager tree and then select **Associate with Workflow Manager Workflow Request** from the shortcut menu. It allows you to associate extended attribute data for a package with a Workflow Manager workflow request.

***Note** • This dialog (and its corresponding command) are only available if you select the **Integrate with Workflow Manager** option on the **General** tab of the Application Manager **Options** dialog box.*

***Note** • Be sure to select a Workflow Manager workflow request that uses a workflow template that contains at least one major data group that was specified with the group's extended attribute description file, as described in the AdminStudio Workflow Manager user documentation.*

Categories Dialog Box

On the **Categories** dialog box, which is opened by clicking the browse button in the **Categories** field on the **App Portal Information** tab of the **Application View**, you can specify whether to create an App Portal catalog item when this application is published to System Center 2012 Configuration Manager or Symantec Altiris Server, and you can also specify the category or categories that you want the application's catalog item to be placed in.

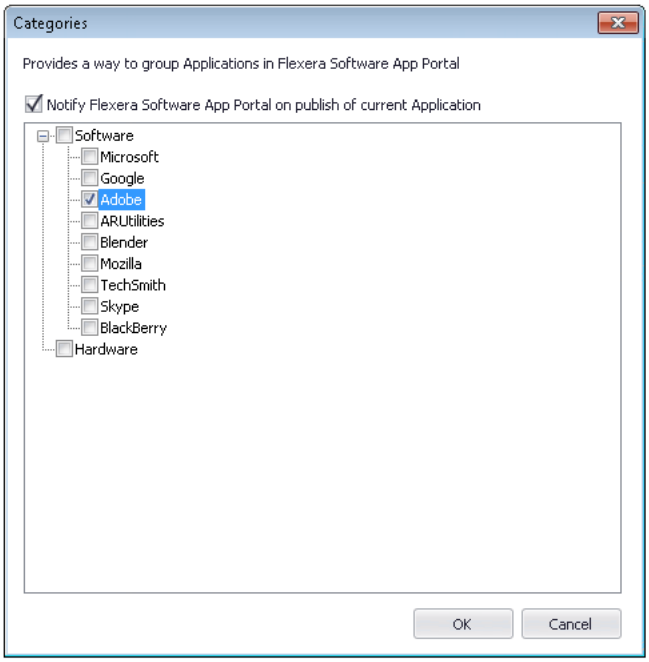

Figure 7-24: Categories Dialog Box

When an end user browses the App Portal catalog on the **Browse Catalog** tab, catalog items are organized into categories. In the image below, the **Software > Google** category contains two catalog items.

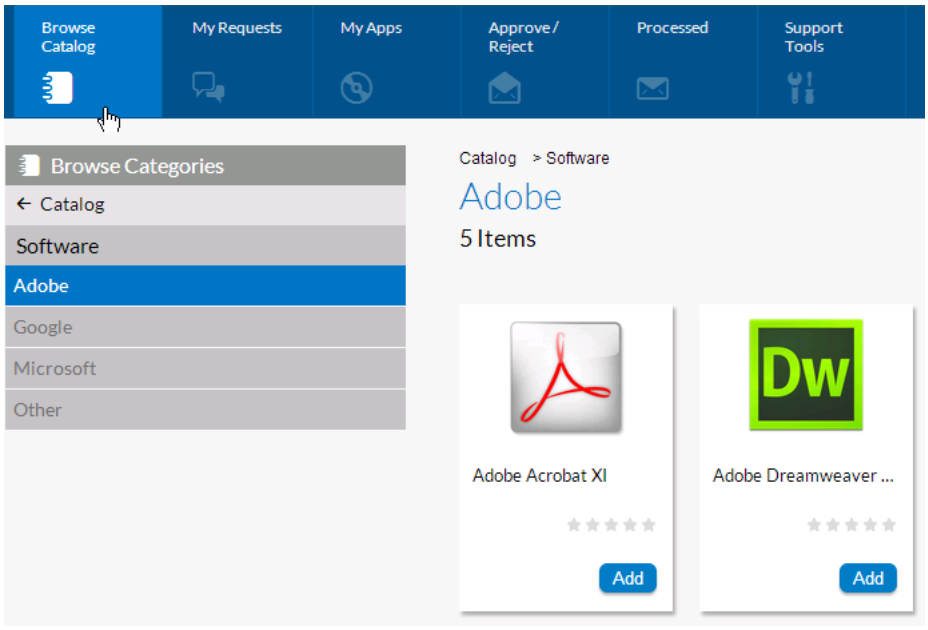

Figure 7-25: Categories Displayed on the App Portal Browse Catalog Tab

When a catalog item is created in App Portal, a category must be specified. On the **Categories** dialog box, you can select the category or categories that you want the application's catalog item to be placed in.

The **Categories** dialog box includes the following options:

Table 7-38 • Categories Dialog Box

Option	Description
Notify Flexera Software App Portal on publish of current Application	If you want a new catalog item to be created in App Portal when this application is published to System Center 2012 Configuration Manager or Symantec Altiris Server, select this option.
Category list	All of the categories that have been defined in App Portal are listed. Select the category or categories that you want this application's App Portal catalog item to be placed in.

Change Deployment Type Priority Dialog Box

When an application has multiple deployment types, the order in which they will be evaluated in System Center 2012 Configuration Manager depends upon the deployment type's assigned priority. When a deployment type meets the specified requirements, it will be run and then no further deployment types on the priority list will be evaluated. By default, Application Manager assigns a deployment type a priority based upon their import order.

You can modify the priority setting of an application's deployment types on the **Change Deployment Type Priority** dialog box, which is opened by clicking the **Change Priority** button in the **Deployment Types** tab ribbon.

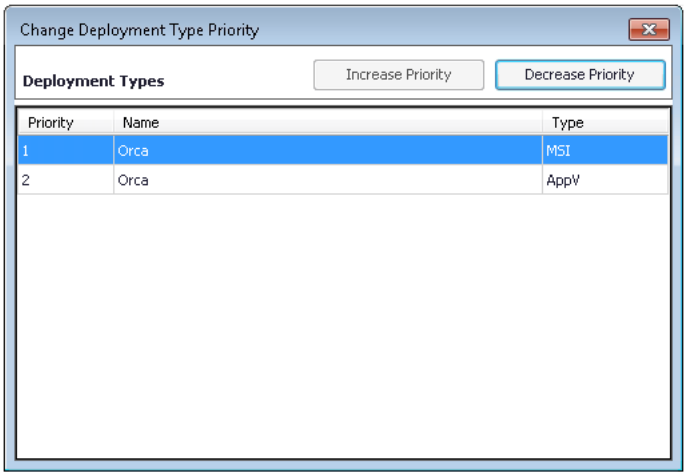

Figure 7-26: Change Deployment Type Priority Dialog Box

Just select the deployment type and click **Increase Priority** or **Decrease Priority** to move it up and down in the list.

Note • *You can only assign a priority to Windows Installer, App-V, and .exe packages. All other packages are assigned a priority of -1, which cannot be changed.*

Change Enterprise Server Password Dialog Box

This dialog box, which is opened by selecting **AdminStudio Enterprise Server > Change AES Password** on the Application Manager tab menu, allows you to change your password to connect to the AdminStudio Enterprise Server Application Catalog (which is the same password you use to log in to the AdminStudio Enterprise Server). The **Change AES Password** selection is enabled when you are connected to the AdminStudio Enterprise Server Application Catalog.

Note • *If you are not connected to the AdminStudio Enterprise Server Application Catalog, the **Change AES Password** selection is disabled.*

Table 7-39 • Change Enterprise Server Password Dialog Box

Option	Description
User Name	(Read Only) User name of user who is connected to the AdminStudio Enterprise Server Application Catalog.
Old Password	Enter the existing password for current user.
New Password	Enter the new password.
Confirm New Password	Enter the new password a second time.

Command-Line Parameters Dialog Box

This dialog box is displayed when running Application Manager from the command line using the -? parameter. Information in this dialog box is covered in the Application Manager Command-Line Functionality topic.

Configure Connection Group Dialog Box

On the **Configure Connection Group** dialog box, which is opened by clicking **Add** on the **App-V Server Connection Groups** dialog box, you enter the properties for an App-V Server connection group and add App-V 5.0 packages to it.

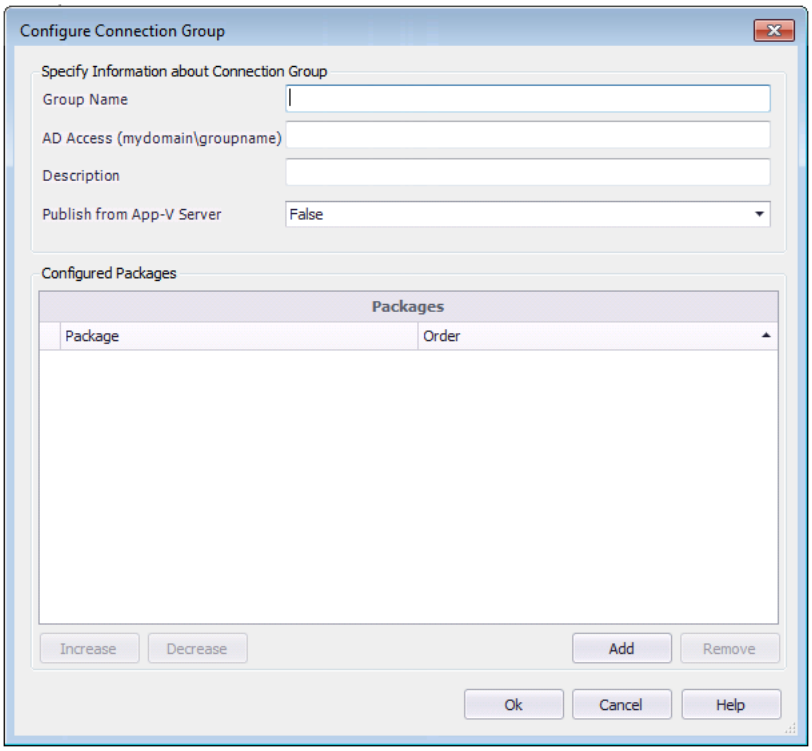

Figure 7-27: Configure Connection Group Dialog Box

The **Configure Connection Group** dialog box includes the following properties:

Table 7-40 • Configure Connection Group Dialog Box Properties

Property	Description
Group Name	Enter a name to identify this App-V Server connection group.
AD Access	Enter the name of the Active Directory group that will have permission to access this connection group.
Description	Enter a description of this connection group.
Publish from App-V Server	Select **True** or **False** to specify whether to publish this connection group from the App-V Server.

Table 7-40 • Configure Connection Group Dialog Box Properties

Property	Description
Configured Packages	Lists the App-V 5.0 packages that have been added to this connection group. To add an App-V 5.0 package to this list, click Add.
Add	Click to **Add** to open the **Add Connection Group Packages** dialog box, where you can add App-V 5.0 packages to this connection group.
Remove	Click to remove the selected App-V 5.0 package from this connection group.
Increase **Descrease**	The order of packages in the connection group is important. This determines the order in which the package contents are merged. So, if there was a conflict (example: same registry value), the content of the first package would be used. Use the **Increase** and **Decrease** buttons to change the order of the selected package.

Connect Application Catalog Dialog Box

The Connect Application Catalog dialog box opens when you choose to open an existing Application Catalog. This dialog box has three tabs:

- **Enterprise Server**—Select this tab to open the AdminStudio Enterprise Server Application Catalog database. See Enterprise Server Tab.
- **Standalone**—Select this tab to open an Application Catalog database other than the AdminStudio Enterprise Server Application Catalog. See Standalone Tab / Specify Database Information.
- **Recent**—Provides a list of recently opened Application Catalogs. When you select an Application Catalog and click **OK**, either the Application Catalog opens or you are prompted for login information (if you need authentication to the Application Catalog). See Recent Tab.

Making this the Default Shared Application Catalog

If you select the **Make this the default shared Application Catalog** option, the Application Catalog you are opening will become the default Application Catalog (and be recorded as such in the **AdminStudio Shared** directory).

If the Application Catalog is made the default, all other AdminStudio users that use the same shared directory will automatically connect to the default Application Catalog when AdminStudio is launched. Therefore, you should only set this option if you want to affect all AdminStudio users who access that shared directory.

Note • *In the AdminStudio Enterprise Edition, only the AdminStudio Administrator or users with the Change Default Database permission will see the* ***Make this the default shared Application Catalog*** *option. This allows the AdminStudio Administrator to configure the default Application Catalog, and then subsequent installations of AdminStudio will automatically connect to the default Application Catalog if they use the same shared directory.*

Enterprise Server Tab

To connect to the AdminStudio Enterprise Server Application Catalog, you log in on the **Enterprise Server** tab of the **Connect Application Catalog** dialog box.

Table 7-41 • Connect Application Catalog / Enterprise Server Tab Options

Option	Description
URL	Location of the AdminStudio Enterprise Server associated with this installation of AdminStudio. If the AdminStudio Enterprise Server has not yet been configured with the AdminStudio client tools (such as when it is set to its default value of **http://localhost**), click the URL link to open the **Select AdminStudio Enterprise Server URL** dialog box, and enter the URL for location of the AdminStudio Enterprise Server associated with this installation of AdminStudio.
Authentication	Select one of the following options: • Windows Authentication • AdminStudio Enterprise Server User  ***Note*** • *When using **AdminStudio Enterprise Server User** authentication, if Anonymous authentication is turned off in IIS, both the user's machine and the AdminStudio Enterprise Server need to be on the same domain in order for login to succeed.*
User Name and Password	If you selected **AdminStudio Enterprise Server User**, enter your AdminStudio Enterprise Server `User Name` and **Password** (provided by your System Administrator).

Login Troubleshooting

If you are using a Web Portal with custom security zone settings, your AdminStudio Enterprise Server URL is using an IP address, and you receive Error 0x800A1518 when you attempt to login, change the AdminStudio Enterprise Server URL to the NetBios equivalent and then try again. For example, if you are connecting to **http://120.12.1.15**, the NetBios equivalent would be **http://wfmportal**.

Standalone Tab / Specify Database Information

On the **Standalone** tab of the **Connect Application Catalog** dialog box and the **Specify Database Information** panel of the Application Catalog Wizard, enter the information required to login to the specified Application Catalog or enter the name of the Application Catalog that you are creating.

Table 7-42 • Connect Application Catalog / Standalone Tab Options

Option	Description
Server	Select one of the available SQL Servers on the network from this list. You can also manually enter the name of the SQL Server to which you want to connect.

Table 7-42 • Connect Application Catalog / Standalone Tab Options (cont.)

Option	Description
Authentication	Select one of the following options: • **Windows Authentication**—Choose to use Windows network authentication (your network login ID) to log into this Application Catalog. • **Server Authentication**—Choose to use SQL Server login identification for authentication. • **Login ID and Password**—If you chose Server Authentication, enter the appropriate Login ID and Password.
Catalog	Do one of the following: • If you are connecting to an **existing** Application Catalog, select the catalog from those available on the Server. • If you are creating a **new** Application Catalog, enter a name for this new catalog.
Test	Click this button to test whether a connection can be made to the database.
Make this the default shared Application Catalog Connect Application Catalog Dialog Box Only	When this option is selected, the Application Catalog you are trying to open or create will become the default Application Catalog (and be recorded as such in the **AdminStudio Shared** directory). If the Application Catalog is made the default, all other AdminStudio users that use the same shared directory will automatically connect to the default Application Catalog when AdminStudio is launched. Therefore, you should only set this option if you want to affect all AdminStudio users who access that shared directory.

Recent Tab

The **Recent** tab displays a list of all Application Catalogs that have recently been open. To login to one of these Application Catalogs, select it and click OK.

- If you are opening a standalone SQL Server Application Catalog, you will be prompted for login information.
- If you are opening the AdminStudio Enterprise Server Application Catalog, you are prompted for AdminStudio Enterprise Server login information before the Application Catalog will open.

Create Global Condition Dialog Box

The **Create Global Condition** dialog box, which is opened by clicking the **Create** button on the **Create Custom Requirements** panel of the **Requirements Wizard**, is used to create a condition to use in the custom requirement.

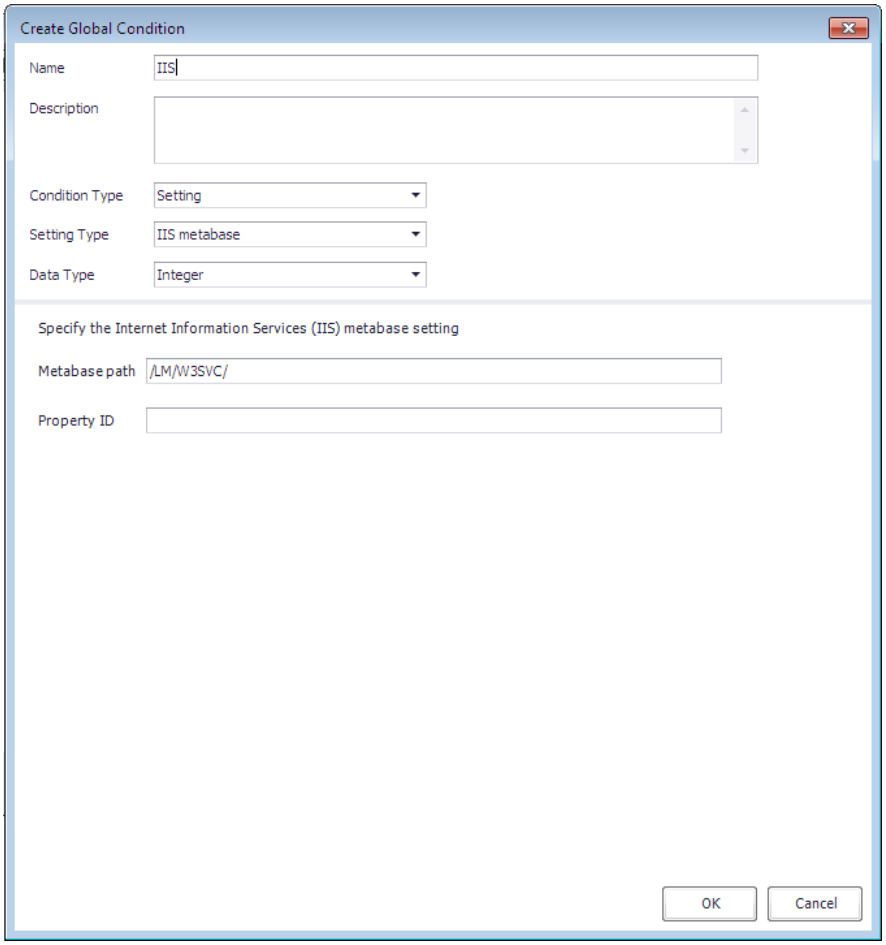

Figure 7-28: Create Global Condition Dialog Box

The fields displayed on this dialog box depend upon what is selected in the **Setting Type** field. The **Create Global Condition** dialog box includes the following properties:

Table 7-43 • Create Global Condition Dialog Box Properties

Property	Description
Name	Enter a name for this global condition.
Description	Enter a description to identify the purpose of this global condition.
Condition Type	Select one of the following options: • **Setting**—Select to create a standard condition. • **Expression**—Select to create a condition which contains expressions, as described in Building Expressions.

Table 7-43 • Create Global Condition Dialog Box Properties

Property	Description
Setting Type	Select one of the following options to identify the type of global condition that you are creating (the item you want this condition to assess for compliance): • **File system**—Select to specify a condition to assess a file or folder. • **IIS metabase**—Select to specify a condition to assess an IIS metabase. • **Registry key**—Select to specify a condition to assess a registry key. • **Registry value**—Select to specify a condition to assess a registry value. • **Script**—Select to specify a condition to find a script and return a value to be assessed. • **SQL query**—Select to specify a condition to assess an SQL query. • **Wql query**—Select to specify a condition to assess a Windows Management Instrumentation Query Language (WAL) script. • **XPath query**—Select to specify a condition to assess an XML file and XPath query.
Data Type	Select one of the following options to identify this condition's data type: • **String** • **Date and Time** • **Integer** • **Floating point** • **Version** • **Boolean** • **String array** • **Integer array**  ***Note*** • *Only displayed for conditions with a* ***Setting Type*** *of* ***IIS metabase***, ***Registry value***, ***Script***, ***Sql query***, ***Wql query***, *and* ***XPath query****. Also, the number* ***Data Type*** *options that are listed depends upon the* ***Setting Type*** *selected.*

The rest of the properties on the **Create Global Condition** dialog box are dependent upon the **Setting Type** selection:

Table 7-44 • Create Global Condition Dialog Box / Properties for Each Setting Type

Setting Type	Property	Description
File system	**Type**	Select either **File** or **Folder**.
	Path	Enter the path to the file or folder you want to use to assess for compliance on computers.
	File or folder name	Enter the file or folder name.
	Include subfolders	Select to include the file or folder's subfolders in the condition.
	This file or folder is associated with a 64 bit application	Select if the specified file or folder is associated with a 64-bit application.
IIS metabase	**Metabase path**	Enter the path to the IIS metabase. ***Note*** • *The metabase is a structure for storing Microsoft IIS configuration settings. It performs some of the same functions as the Windows system registry but is specific to IIS.*
	Property ID	Enter the property ID of the specified IIS metabase.
Registry key	**Hive**	Select the hive of the registry key that you want to use in this condition.
	Key	Enter the registry key that you want to use in this condition.
	This registry key is associated with a 64-bit application	Select if the specified registry key is associated with a 64-bit application.
Registry value	**Hive**	Select the hive of the registry key that contains the value that you want to use in this condition.
	Key	Enter the registry key that contains the value that you want to use in this condition.
	Value	Enter the registry value that you want to use in this condition.
	This registry value is associated with a 64-bit application	Select if the specified registry value is associated with a 64-bit application.

Table 7-44 • Create Global Condition Dialog Box / Properties for Each Setting Type

Setting Type	Property	Description
Script	**Script Type**	Select one of the following options: • **PowerShell** • **VBScript** • **JScript**
	Script box	Click **Browse** and select the script that you want to use in this condition. After you have selected a script, the contents of that script will be listed in this box.
	Run script by using the logged on user credentials	Select this option if you want to run the script using the credentials of the logged on user.
Sql query	**SQL server instance**	Select one of the following options to specify the server instances you want to use in this condition: • **Use default instance** • **All instances** • **Instance name**
	Database	Specify database.
	Column	Specify column.
	Transact SQL statement	Enter SQL statement.
Wql query	**Namespace**	Enter the namespace that contains the WQL script.
	Class	Enter class.
	Property	Enter property.
	WQL query WHERE Clause	Enter WQL query.

Table 7-44 • Create Global Condition Dialog Box / Properties for Each Setting Type

Setting Type	Property	Description
XPath query	**Path**	Enter path.
	File Name	Enter file name.
	Include sub folders	Select to include subfolders.
	This file is associated with 64 bit application	Select to indicate that this file is associated with a 64-bit application.
	XPath Query	Click the **Namespace** button to open the **XML Namespaces** dialog box, where you can specify the XML namespaces and prefixes that you want to use when this XPath query runs. Click **Open** to select a text or XML file containing an XPath query. Click **Clear** to clear the text box.  ***Note*** • *For information on adding a namespace, see XML Namespaces Dialog Box.*

Building Expressions

To create a global condition that uses expressions, select **Expression** from the **Condition Type** list. When you select **Expression** from this list, an expression builder interface is displayed.

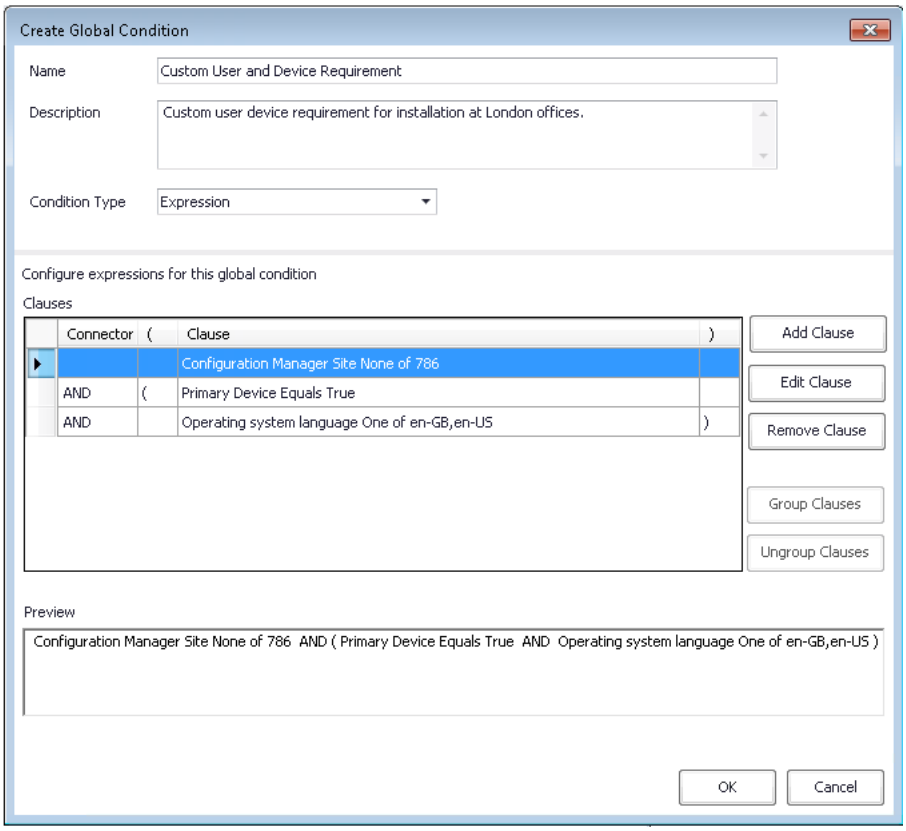

Figure 7-29: Building an Expression on the Create Global Condition Dialog Box

You can use the expression builder interface to form an expression using existing User/Device/Custom requirements. After you add multiple requirements, you can then connect them using **AND** or **OR** operators, and can group sets of clauses, which enables you to create complex requirements.

The expression building area of this dialog box includes the following options:

Table 7-45 • Create Global Condition Dialog Box

Option	Description
Add Clause	Click to open the Requirement Wizard, which you can use to add a User/Device/Custom requirement. When you click Finish on the wizard, the new requirement will be listed in the **Clauses** list. When you add the first requirement the **Connector** will be set to **None**. When adding subsequent requirements, the **Connector** will be set to **AND** by default.
Edit Clause	Click to edit the selected requirement using the Requirement Wizard.
Remove Clause	Click to delete the selected requirement.
Group Clauses	Click to group the selected requirements (if the grouping criteria matches). If grouping is successful, then the selected requirements will be marked as grouped and parentheses will be displayed the **(** and **)** columns.

Table 7-45 • Create Global Condition Dialog Box

Option	Description
Ungroup Clauses	Click to ungroup the selected requirements, if the ungroup criteria matches.
Preview	Lists the full expression.

Create Virtual Environment / Properties Dialog Box

On the **Create Virtual Environment** dialog box, which is opened by clicking **Add** on the **SCCM Server Environment** dialog box, you build a new virtual environment. On this dialog box, you enter the name and description of the virtual environment, and specify the groups of deployment types that will be included in this virtual environment.

Note • *When you select an existing virtual environment on the* ***SCCM Server Environment*** *dialog box and click* ***Edit****, this same dialog box opens, displaying the settings of the selected virtual environment, but its name is now* ***[Virtual_Environment_Name] Properties****.*

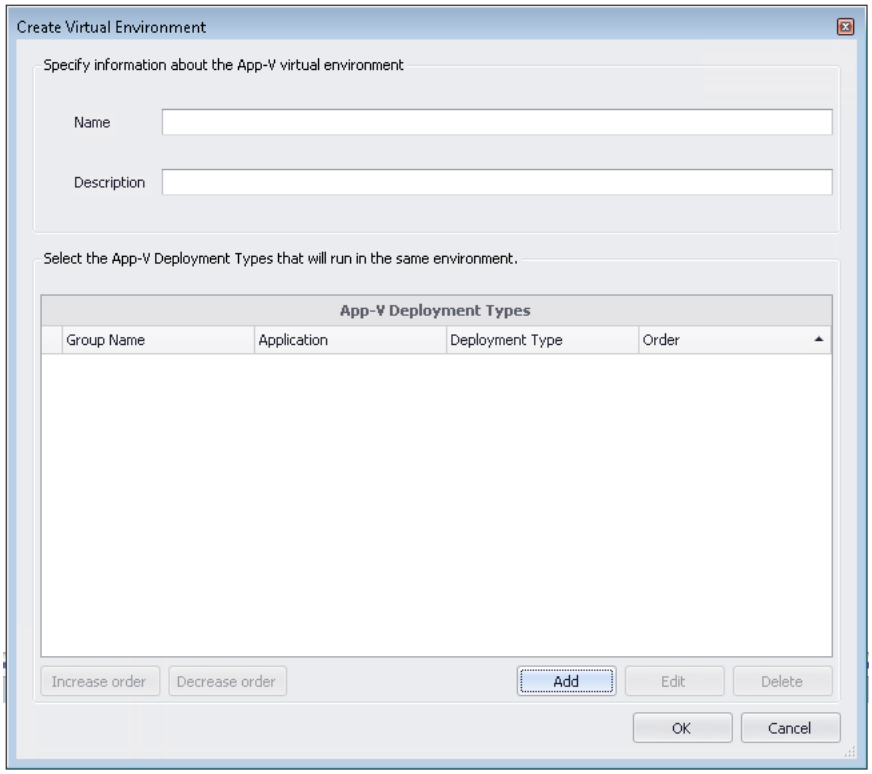

Figure 7-30: Create Virtual Environments Dialog Box

The Create Virtual Environments dialog box includes the following properties:

Table 7-46 • Create Virtual Environments Dialog Box

Property	Description
Name	Enter a name to identify this virtual environment.
Description	Enter a description of the purpose of this virtual environment.
App-V Deployment Types list	List of App-V deployment type groups that have been added to this virtual environment.
Add	Click to open the **Add Applications** dialog box, where you can add a group of App-V deployment types.
Edit	Click to open the **Edit Applications** dialog box, where you can edit an existing App-V deployment type group.
Delete	Click to delete an App-V deployment type group from the virtual environment.
Increase order **Decrease order**	If more than one group were listed, you could use the **Increase order** and **Decrease order** buttons to reorder the list. When multiple virtual applications modify the same file system or registry values on a client computer, the application with the highest order will take precedence.

Default Application Catalog Dialog Box

When you initially open AdminStudio, because a default Application Catalog has not yet been set, the **Default Application Catalog** dialog box opens, prompting you to open an Application Catalog.

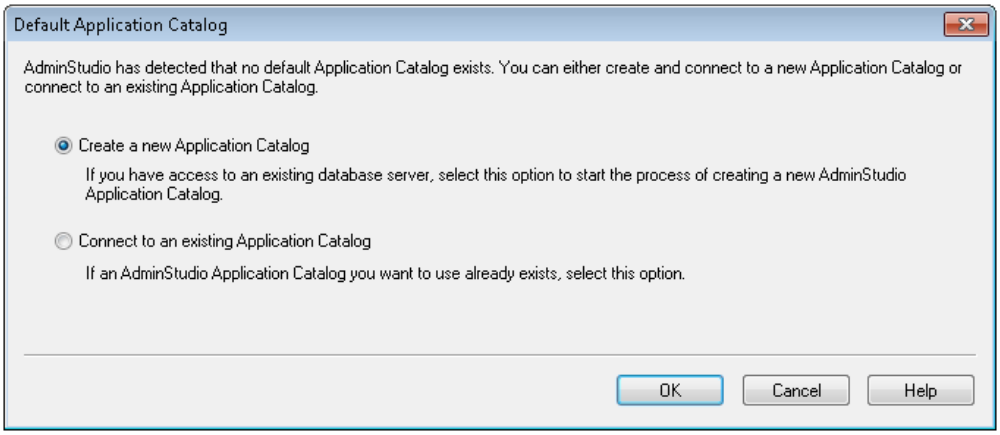

Figure 7-31: Default Application Catalog Dialog Box

You can select either of the following options:

Table 7-47 • Default Application Catalog Dialog Box Options

Option	Description
Create a new Application Catalog	Select this option to create a new, empty Application Catalog on an existing SQL Server database server that you have access to.
Connect to an existing Application Catalog	Select this option to connect to an existing Application Catalog on an SQL Server database server.

Edit Keywords Dialog Box

When App Portal performs a search on the **Browse Catalog** tab, it performs a search on not only the **Title**, **Brief Description**, and **Full Description** fields, but also on any **Keywords** that have been specified for that catalog item. On the **App Portal Information** tab of the **Application View**, you can specify keywords for an application's App Portal catalog item.

On the **Edit Keywords** dialog box, which is opened by clicking **Edit Keywords** on the **Keywords** dialog box, you can add new App Portal keywords and edit existing keywords.

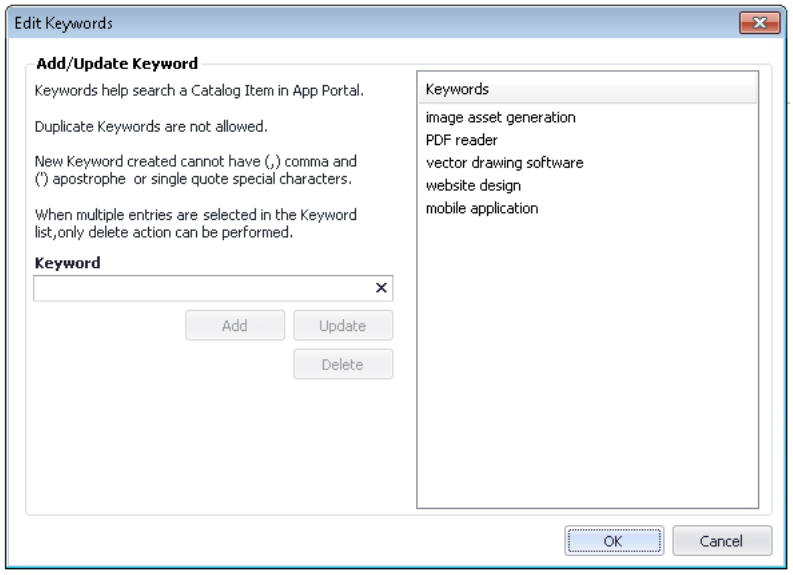

Figure 7-32: Edit Keywords Dialog Box

Note • *After you add a keyword on the **Edit Keywords** dialog box, it will be available to assign to any application in this Application Catalog.*

The **Edit Keywords** dialog box includes the following properties:

Table 7-48 • Edit Keywords Dialog Box

Property	Description
Keyword	Enter a keyword in this field and then click **Add** to add it to the **Keywords** list. ***Important*** • *Keywords must be single words only. If you enter a multiple-word keyword, all words of the phrase will be ignored when a search is performed.*
Keywords list	List of all defined keywords in this Application Catalog.
Add	Click to add the word in the **Keyword** field to the **Keywords** list.
Update	If you select an existing keyword in the **Keywords** list, it will be listed in the **Keyword** field. To change the keyword, edit it in the **Keywords** field and then click **Update**.
Delete	Click to delete the keyword selected in the **Keywords** list.

Extended Attribute Property Dialog Box

If you use extended attributes, and you click on a text extended attribute label, this dialog box opens.

Within it, you can provide the value for the extended attribute. When you click OK, the value is automatically displayed in the Extended Attributes View (Packages) next to the corresponding label.

Find Dialog Box

You can use the **Find** dialog box, which is accessed by clicking **Find** in the Application Manager ribbon, to search for data in Application Catalog tables.

Note • *This search is limited to string type columns.*

The tables that are searched depend upon what is selected when the **Find** dialog box is opened:

Table 7-49 • Search Options

If you select...	and specify these options...	this will be searched
Group	**All Tables and All Columns**	All tables and all columns in all of the Packages in the selected Group
Package	**All Tables and All Columns**	All tables and all columns in the selected Package
Package	**A Table and All Columns**	All columns of a specific table in the selected Package

Table 7-49 • Search Options

If you select...	and specify these options...	this will be searched
Package	**A Table and a Column**	A specific column in a specific table in the selected Package

Also, if you want to search for a partial match rather than an exact match, you can use the Partial Match option on the Find dialog box.

The Find dialog box can be accessed in several ways:

- Click **Find** in the Application Manager ribbon.
- Press **Ctrl** + **F**.
- Right-click on the node in the tree (Group, Application, MSI Package, App-V Package, etc.) that you want to search, and select **Find** on the shortcut menu.

The **Find** dialog box contains the following fields and buttons:

Table 7-50 • Find Dialog Box Properties

Properties	Description
Find What	Enter the text that you want to search for.
Look In Table	• If a package was selected when the **Find** dialog box was opened, all of the tables in that package are listed. Select the table that you would like to search, or select **<All Tables>**. When you select a table from this list, the **Look In Columns** list is populated with all of the columns in that table. • If a group is selected when you opened the **Find** dialog box, **<All Tables>** is the only option listed.
Look In Columns	• If you selected a table from the **Look in Table** list, all of the columns in that table are listed. Select the column that you would like to search, or select **<All Columns>**. • If a group was selected when you opened the **Find** dialog box, **<All Columns>** is the only option listed.
Partial Match	• If this option is not selected, Application Manager will search for an exact match of the text you entered in the **Find What** text box. The search will be case sensitive. • If this option is selected, then Application Manager will use appropriate wild card characters so that a partial data match is performed. The search will be case insensitive.

Table 7-50 • Find Dialog Box Properties

Properties	Description
Find Button	Click to initiate the search. The **Find** dialog box will close, and the data that is found is displayed in the **Search Results** tab of the Output Window, in the following format:  If you double click on this data, Application Manager will navigate to the appropriate record in the Tables View, and that record will be highlighted in red.

Flexera Identifier Dialog Box

A Flexera Identifier is a unique code assigned to applications by FlexNet Manager Suite that is used to link application information from Application Manager with application information in App Portal and FlexNet Manager Suite.

If both Application Manager and FlexNet Manager Suite are connected to the same Flexera Service Gateway, each time you import an application into the Application Catalog, a search for the application's Flexera Identifier is performed, and if it is found, it is listed on the **General Information** tab of the **Application View**.

Sometimes, an application's Flexera Identifier is not found, such as when the value of the information in the application's **Product Name**, **Version**, **Edition**, or **Publisher** fields is either incorrect or too specific. If a Flexera Identifier is not found, you can use the **Flexera Identifier** dialog box to perform a search.

To open the **Flexera Identifier** dialog box, click the browse button in the **Flexera Identifier** field on the **General Information** tab of the **Application View**. You can also open it by clicking **Assign Flexera ID** on the **Application Search Results** dialog box (which is opened by clicking the **Unrecognized Applications** in the toolbar).

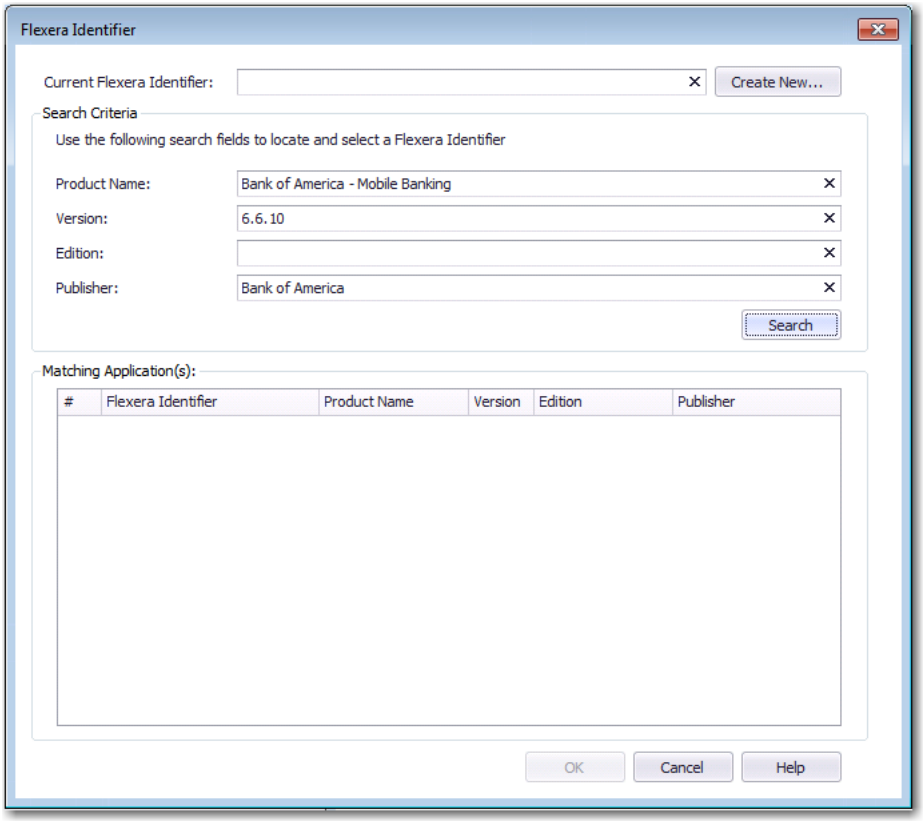

Figure 7-33: Flexera Identifier Dialog Box / Before Search

After a search has been performed, a list of possible matching applications is generated and displayed in the **Matching Application(s)** list.

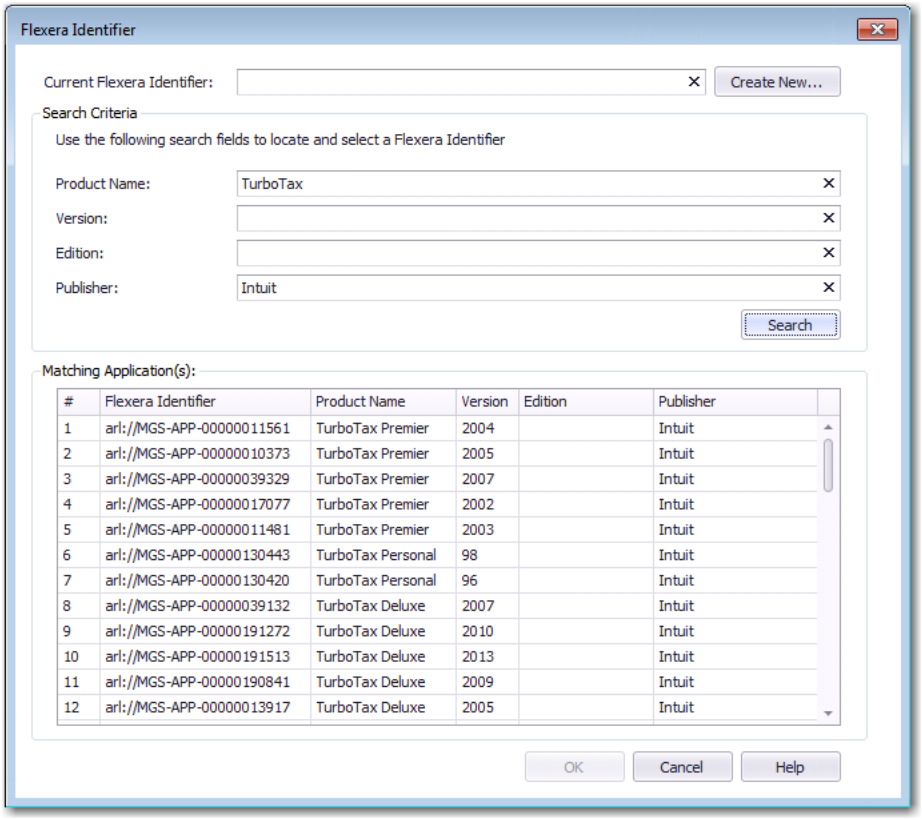

Figure 7-34: Flexera Identifier Dialog Box / After Search

The **Flexera Identifier** dialog box includes the following options:

Table 7-51 • Flexera Identifier Dialog Box

Option	Description
Current Flexera Identifier	If a Flexera Identifier has been found for this application, it will be listed in this field.
Create New	Click to open the Flexera Local Identifier Dialog Box where you can create a new, local Flexera Identifier.
Search Criteria	Sometimes, if value of the information in the application's **Product Name**, **Version**, **Edition**, or **Publisher** fields is either incorrect or too specific, a Flexera Identifier will not be found. Therefore, edit the text in these fields to either correct the information or make it less specific, and then click **Search**.
Search	Click to initiate a search of the FlexNet Manager Suite database to generate a list of possible matching applications, based upon the entered criteria.
Matching Application(s)	After a search is performed, possible matching applications are listed in this list. Select the matching application and click **OK** to select it.

Flexera Local Identifier Dialog Box

When an application is imported into the Application Catalog, AdminStudio automatically queries the FlexNet Manager Suite ARL and attempts to obtain the application's Flexera Identifier. If an application still does not have an assigned Flexera Identifier, you can perform a manual search of the FlexNet Manager Suite Application Recognition Library, as described in Performing a Manual Search for a Flexera Identifier to attempt to identify an existing entry.

However, if you cannot locate an existing entry, you can create a new local Flexera Identifier entry for the FlexNet Manager Suite Application Recognition Library by clicking the **Create New** button on the **Flexera Identifier** dialog box to open the **Flexera Local Identifier** dialog box.

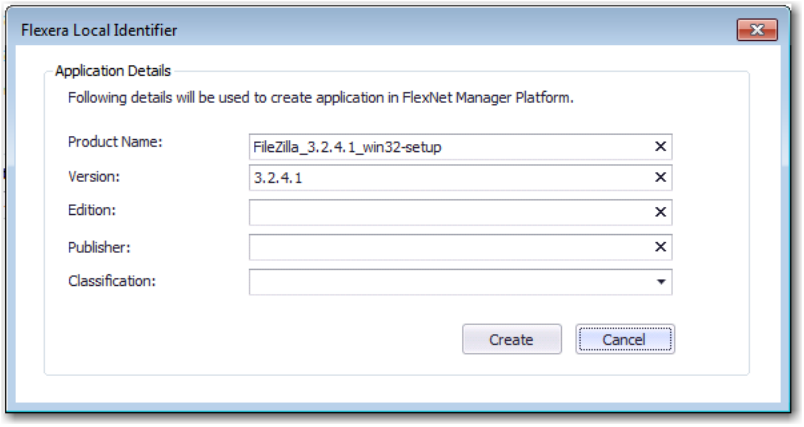

Figure 7-35: Flexera Local Identifier Dialog Box

The **Flexera Local Identifie**r dialog box includes the following properties:

Table 7-52 • Flexera Local Identifier Dialog Box

Property	Description
Product Name	The basic name of the application, excluding references to versions or editions, and without mentioning the publisher.
Version	The release number (or release identifier) of an application.
Edition	Enter the edition of this application.
Publisher	The name of the publisher of this software, responsible for its development and distribution.

Table 7-52 • Flexera Local Identifier Dialog Box

Property	Description
Classification	To indicate how this application is classified, select one of the following options: • **Beta**—A pre-release application (covers such items as beta releases, alpha releases, or release candidates) that you have under some special arrangement. • **Commercial**—The application requires a license to be purchased for use in a commercial setting. • **Freeware**—Licensed for use in a commercial environment free-of-charge. • **Malware**—A potentially harmful application (a virus, Trojan, and the like), and should be treated as malware. If installations of this application are identified, you need to address the corresponding incidents or security issues. • **Shareware**—The application is available for downloading from web sites, and typically uses a "try-before-you-buy" licensing model that might include reminder messages, functional limitations, or other restrictions until a full license is purchased. • **X Rated**—The application contains potentially objectionable or sexually explicit material. You might want to consider whether corporate policies require any action. • **Update**—The application represents an update, for example, a service pack, to another application, and is issued for free to all customers regardless of purchasing agreements or support contracts (a "minor" update).

When you click **Create**. A confirmation message appears stating that a new local Flexera Identifier has been created.

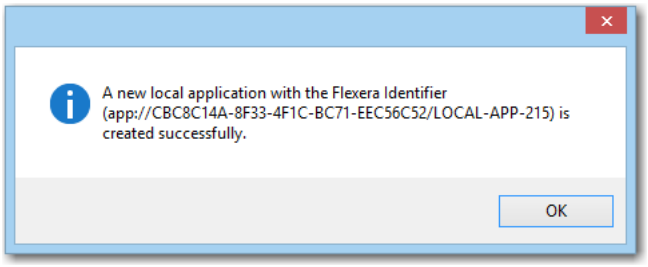

Figure 7-36: Confirmation of Creation of New Flexera Identifier

Global Conditions Dialog Box

In addition to using the **Requirements Wizard** to create global conditions, you can create new global conditions and edit existing global conditions on the **Global Conditions** dialog box, which can be opened by clicking the **Global Conditions** button on the **Catalog** tab of the Application Manager ribbon.

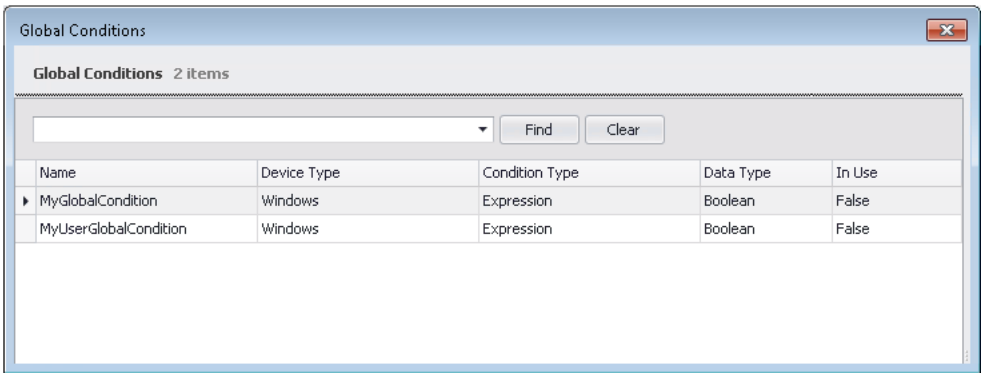

Figure 7-37: Global Conditions Dialog Box

The **Global Conditions** dialog box lists all of the global conditions present in the current Application Catalog. On the **Global Conditions** dialog box, you can edit or delete an existing global condition or create a new global condition:

- **Editing an existing global condition**—Right-click on the condition and then select **Edit Condition** from the shortcut menu. The **Create Global Condition** dialog box opens, where you can edit the condition.
- **Deleting an existing global condition**—Right-click on the condition and then select **Delete Condition** from the shortcut menu.
- **Adding a new global condition**—Right-click anywhere on the list of conditions and select **Create New Condition** from the shortcut menu. The **Create Global Condition** dialog box opens, where you can define a new condition.
- **View references**—If a condition is in use, right-click on the condition and select **References** from the shortcut menu to open the **References** dialog box, which lists the referring applications and the referring global conditions of the selected global condition.

The **Global Conditions** dialog box includes the following properties:

Table 7-53 • Global Conditions Dialog Box

Property	Description
Name	Name of global condition.
Device Type	Identifies the device type of the global condition.
Condition Type	Indicates whether the global condition is of the **Setting** or **Expression** type.
Data Type	Indicates the data type of the global condition, such as **Boolean** or **String**.
In Use	Indicates whether the condition is in use.
Search Box	Use this box along with the **Find** button to filter a large list of global conditions.

Keywords Dialog Box

When App Portal performs a search on the **Browse Catalog** tab, it performs a search on not only the **Title**, **Brief Description**, and **Full Description** fields, but also on any **Keywords** that have been specified for that catalog item. On the **App Portal Information** tab of the **Application View**, you can specify keywords for an application's App Portal catalog item.

On the **Keywords** dialog box, which is opened by clicking the browse button in the **Keywords** field on the **App Portal Information** tab of the **Application View**, you can add App Portal keywords to an application.

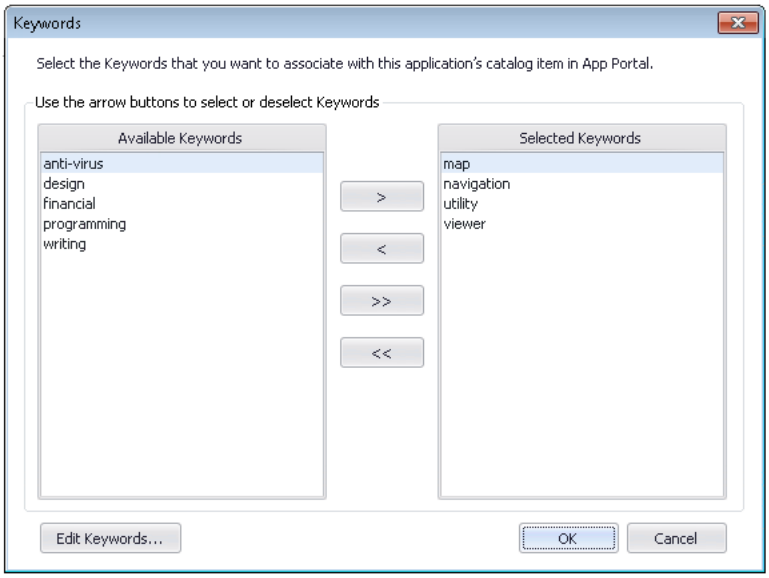

Figure 7-38: Keywords Dialog Box

The Keywords dialog box includes the following properties:

Table 7-54 • Keywords Dialog Box

Property	Description
Available Keywords List	Lists all of the existing keywords that are not currently assigned to this application.
Selected Keywords List	Lists all of the keywords that have been assigned to this application.
Arrow Keys	Click the **>** and **<** keys to move a selected keyword between the two lists. Click the **>>** and **<<** keys to move all of the keywords from one list to the other.
Edit Keywords	Click to open the Edit Keywords Dialog Box, where you can add additional keywords to this Application Catalog.

Login Required Dialog Box

If you chose to open an existing Application Catalog that was listed on the **Recent** tab of the Connect Application Catalog Dialog Box, and you are not currently logged in to that database, this dialog box opens prompting you to log in.

Properties Dialog Box

Edition • *Application Manager is included with AdminStudio Professional and Enterprise Editions.*

The **Properties** dialog box opens when you right-click on a group or application in the Application Manager tree and then, with the **Catalog** tab selected in the Application Manager ribbon, select **Properties** from the shortcut menu.

You can provide both a name and description for applications and groups, as well as any comments. The name entered on this dialog box appears in the Application Manager tree to identify the application or group.

Table 7-55 • Group Properties Dialog Box Properties

Property	Description
Name	Provide a name for the group or application. This name will appear in the Application Manager tree.  ***Note*** • *Name cannot exceed 70 characters in length.*
Description	Enter descriptive information about the group or application.  ***Note*** • *The description will be displayed in the* ***Properties*** *area of the Group View when an application is selected in the Group View.*  ***Note*** • *Description cannot exceed 126 characters in length.*
Comments	Provide comments about the group or application.  ***Note*** • *Comments cannot exceed 253 characters in length.*

Options Dialog Box

On the **Options** dialog box, which you open by selecting **Options** from the **Application Manager** tab, you can specify options relating to package import, package testing, conflict identification, server connection information, connection to the Flexera Service Gateway, as well as some general settings. This dialog box is divided into the following tabs:

General Tab

On the **General** tab of the **Options** dialog box, you can configure the following options:

Table 7-56 • General Tab Properties

Property	Description
Confirm All Drag-Drop Operations	Select this option if you want Application Manager to prompt you for confirmation whenever you drag and drop items.
Display Broken MSI/MST Package Links	When selected, any broken package links will be indicated by an icon change in the Application Manager tree and with a message in the Catalog Deployment Type View, which allows you to attempt to locate the package.
Only Display View Nodes With Data	When this option is selected, packages containing views without data will not display those views. For example, if a package has no shortcuts, then the **Shortcuts** view is not displayed for that package.

Table 7-56 • General Tab Properties (cont.)

Property	Description
Extended Attribute Description File	Specify the name and location of the extended attribute description file (**.xml**) which specifies the extended attributes available for each package in the Application Catalog. AdminStudio includes a default XML file for extended attributes, which is stored in the AdminStudio shared location. You can also construct your own Package Extended Attribute Description File. Each new Application Catalog automatically points to this file, and displays the name and location of the file in this tab.  ***Tip*** • *If you overwrite the default XML file with your extended attributes data, all subsequent Application Catalogs created include your attributes by default.*
Integrate with Workflow Manager	Select this option to integrate extended attributes with Workflow Manager. When this option is selected, you can associate extended attribute data for packages in Application Manager with workflow requests in Workflow Manager. This is accomplished by right-clicking on the package name in the Application Manager tree and selecting **Associate with Workflow Manager Workflow Request** from the shortcut menu.

Import Options / General Tab

On the **Import Options / General** tab of the **Options** dialog box, you can configure several options that affect how packages are imported into the Application Catalog.

You can configure the following options:

Table 7-57 • Import Options / General Tab Properties

Property	Description
Automatically Execute Tests After Import	If this option is selected, Application Manager will automatically test packages against all selected compatibility, best practices, and risk assessment tests as part of the import process. All of the tests selected on the **Select Tests to Execute** dialog box (other than those in the **Application Conflicts** category) will be run. By default, this option is selected. While having this option selected will mean longer import times for each application, packages will have all testing details populated immediately after import. However, if you are concerned with the length of import time, you may want to clear the selection of this option.  ***Note*** *• If this option is not selected, no tests will be performed on a package immediately following import. To manually run the tests, select the package (or select the group that contains the package) and then click the* ***Execute Tests*** *button in the ribbon on the* ***Test Center*** *tab.*  ***Note*** *• In previous releases of AdminStudio, the* ***Automatically Execute Tests After Import*** *option was not selected by default; in AdminStudio 2016, this option is selected by default. Therefore, for users upgrading from previous releases of AdminStudio, they will inherit the new default selection, which means that, by default, this option will be selected and tests will be run immediately after import. To have the same user experience as you did in previous versions, you need to clear the selection of this option.*
Integrate InstallScript Headers into Application Model Data	Extract the data in the imported package's InstallScript header files. The InstallScript header data is used to help populate the basic application and package metadata (such as product code, product name, etc.).
Ignore Tables list	The **Ignore Tables** list displays all of the tables that will be ignored during import (not imported into the Application Catalog). You can select tables and delete them from the list, or you can add new tables to the list by clicking **Add**, which opens the **Add Ignore Table** dialog box.

Import Options / Duplicate Package Tab

When you import a package into the Application Catalog, Application Manager checks specific identifiers that are selected on the **Duplicate Package** tab to determine if that package has already been imported.

If Application Manager determines that you are attempting to import a duplicate package (based upon the selected identifiers), the package is renamed using the specified **Duplicate Package Naming Syntax**.

The identifiers you can select on the **Duplicate Package** tab are as follows:

Table 7-58 • Import Options / Duplicate Package Tab Properties

Property	Description
Duplicate Package Identification Options	Select one or more of the following options to specify the identifiers that Application Manager will check to determine if a Windows Installer package has already been imported: • **Package Code property**—Identifier of package product was installed from. No two non-identical **.msi** files should ever have the same package code. • **Product Code property**—Unique identifier for the particular product release, represented as a string GUID, for example {12345678-1234-1234-1234-123456789012}. • **Product Language property**—The language the installer should use for any strings in the user interface that are not authored into the database. • **Product Version property**—Version of the product in string format. The format of the string is: `major.minor.build`. • **List of Transform Files**—A list of the transformations associated with this package import operation. • **[None Selected]**—If you do not select any of these five identifiers, Application Manager checks the ProductName Property identifier to determine if a package is a duplicate.
Duplicate Virtual Package Identification Options	Select one or more of the following options to specify the identifiers that Application Manager will check to determine if an App-V package has already been imported: • **PackageGUID property**—Unique identifier of App-V package. • **VersionGUID property**—Unique identifier of App-V package version. • **[None Selected]**—If you do not select either of these identifiers, Application Manager checks the Product Name identifier to determine if a package is a duplicate.

Table 7-58 • Import Options / Duplicate Package Tab Properties

Property	Description
Duplicate Package Naming Syntax	When it identifies a duplicate package, Application Manager generates a new name for that package using the syntax specified in this field. The default syntax is: `[Manufacturer]_[ProductName]` This means that if Application Manager encountered a duplicate package, it would pre-pend the duplicate's Product Name with the Manufacturer's name and, if necessary, append the Product Name with numbers. For example, the second time that PowerPoint is imported, its name would be changed to: `Microsoft Corporation_PowerPoint` To change the default naming syntax, edit this field. This generated name will be displayed in the Application Manager tree view.  ***Note*** • *Changing this "display" name does not change the ProductName Property that appears in the title bar of the Catalog Deployment Type View.*

Example of Importing a "Duplicate" Package

One common reason why you might want to import the same package into your Application Catalog database more than once would be if you wanted to use InstallShield Editor to create custom installation SKUs of a common MSI package to distribute to different departments in your organization, each installation including certain features that are appropriate for the department and excluding certain features that are not appropriate. For example, if you were distributing a copy of Microsoft Office, you could add transforms to the Microsoft Office MSI package so that:

- Accounting's installation would include only Word and Excel
- Marketing's installation would include only Word and PowerPoint, and
- Development's installation would include only Word and Access.

Therefore, you might want to import the same package into your database more than once, each time with a different set of transformations. What happens when you import the package the second time depends upon the identifiers you selected on the **Duplicate Package** tab. In this example:

- If you select the **List of Transform Files** and **ProductCode** identifiers on the **Import Options / Duplicate Package** tab of the **Options** dialog box, Application Manager will not identify these two packages as duplicate, even though they have the same ProductCode, because they have a different set of transformations. Therefore, the package will be imported with the same display name as the first package.
- If you only select the **ProductCode** identifier on the **Import Options / Duplicate Package** tab of the Application Manager **Options** dialog box, Application Manager will identify the second package as a duplicate because the two packages have the same ProductCode, and the package will be renamed.

Note • *The options that you select on the **Import Options / Duplicate Package** tab of the Application Manager **Options** dialog box apply globally to all packages that you attempt to import; you cannot apply different identifiers to*

different packages. Also, since these options are saved in the AdminStudio Shared Directory, everyone using AdminStudio at your organization who shares the same directory will share the same Duplicate Package options.

Import Options / Application Model Defaults Tab

On the **Import Options / Application Model Defaults** tab of the **Options** dialog box, you can specify the default values for Microsoft System Center 2012 Configuration Manager application model properties. These default values will be assigned to new applications being imported into the Application Catalog, if they do not already have a value specified.

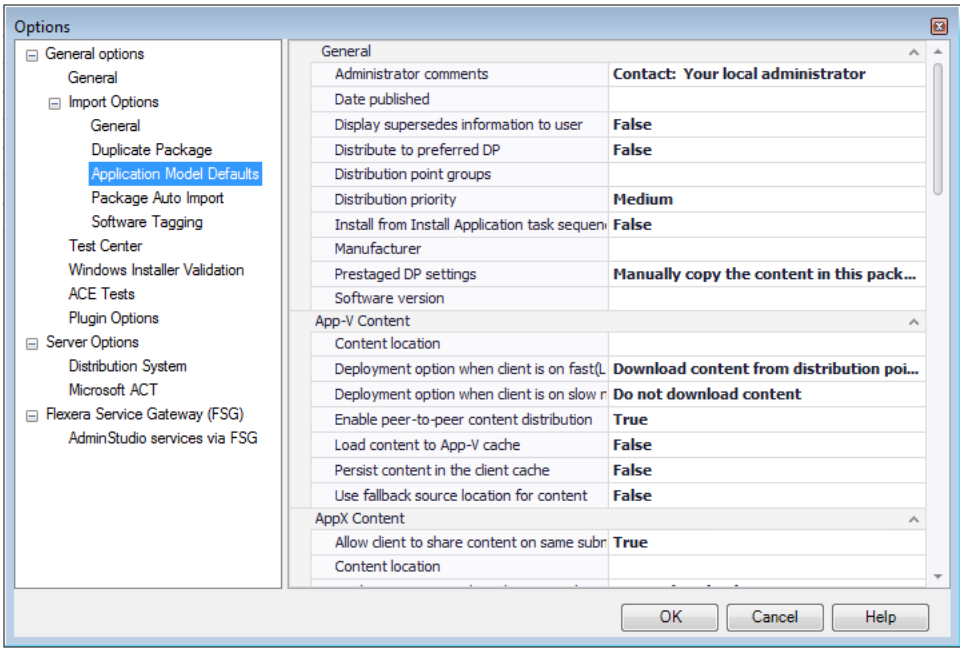

Figure 7-39: Options Dialog Box / Application Model Defaults Tab

The **Application Model Defaults** tab of the **Options** dialog box includes the following properties:

Table 7-59 • Import Options / Application Model Defaults Tab Properties

Category	Option	Description
General	**Administrator comments**	Description of the application.
	Date published	The purpose of this field is to display the date the application was published to System Center 2012 Configuration Manager. When you create an application in Application Manager (usually by importing a package), this field is left blank. • If you do not enter a value in this field, when you publish the application to System Center 2012 Configuration Manager, this field will be automatically updated to display the published date. • If you enter a value in this field, and then publish the application to System Center 2012 Configuration Manager, the date that you entered will be listed as the published date in Configuration Manager.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
General (Continued)	**Display supersedes information to user**	Set this option to **True** to allow users to see deployments for this application and all applications that it supersedes in the Application Catalog. This may result in the user installing multiple applications on the same device, if the requirements for these applications are met.
	Distribute to preferred DP	To enable on-demand content distribution to preferred distribution points, select **True**. When enabled, the content is distributed to all preferred distribution points in the list when a client requests the content for the package and the content is not available on any preferred distribution points.
	Distribution point groups	Specify the default System Center 2012 Configuration Manager distribution point groups to which application content will be distributed. ***Note*** • *If AdminStudio is integrated with App Portal, this is a required field. If no distribution point group is entered, the App Portal administrator will be required to manually enter this information in System Center Configuration Manager before App Portal will be able to distribute applications.*
	Distribution priority	When you are sending multiple packages to a distribution point, those packages are sent in priority order, with higher priority packages being sent first. Use this property to specify a package's priority. The following options are available: • **High** • **Medium** • **Low**
	Install from Install Application task sequence	Select **True** to deploy this application when deploying an operating system, as part of an Install Application task sequence. Select **False** to install this application manually.
	Manufacturer	Manufacturer of the application, as discovered from its deployment types.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
General (Continued)	**Prestaged DP settings**	Select one of the following options to specify how you want to distribute content to prestaged distribution points: • **Automatically download content when packages are assigned to DP**—Select to ignore the prestage settings and distribute content to the distribution point. • **Download only content changes to the DP**—Select to prestage the initial content to the distribution point, and then distribute content changes to the distribution point. • **Manually copy the content in this package to the DP**—Select to always prestage content on the distribution point. (Default)
	Software version	Version of the application, as discovered from its deployment types.
APK Content	**Content location**	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options** > **Distribution System** tab of the **Options** dialog box, and published from there.
APK Link Content	**Content location**	N/A
App Portal	**Brief Description**	Default entry for App Portal Brief Description property.
	Keywords	Default App Portal keywords.
	Long Description	Default entry for App Portal Long Description property.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
App-V Content	**Content location**	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options > Distribution System** tab of the **Options** dialog box, and published from there.
	Deployment option when client is on fast (LAN) network	Select one of the following options to specify how the client should download content when on a fast network: • **Download content from distribution point and run locally**—Select this option to download the content from the distribution point and run it locally. • **Stream content from distribution point**—Select this option for App-V packages to stream content from the distribution point.
	Deployment option when client is on slow network	Select one of the following options to specify whether the client should download content when on a slow network: • **Do not download content**—When the client is connected within a slow or unreliable network boundary, do not download content. Select this option to save network bandwidth. (Default) • **Download content from distribution point and run locally**—Select this option if, when the client is connected within a slow or unreliable network boundary, you want it to download the content from the distribution point and run it locally.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
App-V Content (continued)	**Enable peer-to-peer content distribution**	Select this option to reduce load on the network by allowing clients to download content from other clients on the network that have already downloaded and cached the content. This option utilizes Windows BrancheCache and can be used on computers running Windows Vista SP2 and later.
	Load content to App-V cache	Entire package (instead of just Feature Block 1) is loaded completely into the App-V cache prior to launch.
	Persist content in the client cache	To retain content in the cache on the client computer indefinitely even if it has already been run, select **True**. ***Note*** • *Setting this property to **True** will reduce the available cache space. This might cause a large deployment to fail at a later point if there is insufficient space available in the cache.*
	Use fallback source location for content	To enable clients to "fall back" to using an unprotected distribution point if the package is not available on a protected (preferred) distribution point, set this option to **True**. By default, this option is set to **False**.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
AppX Content	**Allow client to share content on same subnet**	To reduce the load on the network by allowing clients to download content from other local clients on the network that have already downloaded and cached the content, select **True**. ***Note*** • *Applies to Windows Installer and Legacy Installer (.exe) packages only.*
	Content location	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options > Distribution System** tab of the **Options** dialog box, and published from there.
	Deployment option when client is on slow network	Select one of the following options to specify whether the client should download content when on a slow network: • **Do not download content**—When the client is connected within a slow or unreliable network boundary, do not download content. Select this option to save network bandwidth. (Default) • **Download content from distribution point and run locally**—Select this option if, when the client is connected within a slow or unreliable network boundary, you want it to download the content from the distribution point and run it locally.
	Persist content in the client cache	To retain content in the cache on the client computer indefinitely even if it has already been run, select **True**. ***Note*** • *Setting this property to **True** will reduce the available cache space. This might cause a large deployment to fail at a later point if there is insufficient space available in the cache.*
	Use fallback source location for content	To enable clients to "fall back" to using an unprotected distribution point if the package is not available on a protected (preferred) distribution point, set this option to **True**. By default, this option is set to **False**.
AppX Link Content	**Content location**	N/A

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
AppX User Experience	**Maximum allowed run time (minutes)**	Specifies the maximum time (in minutes) that the program is expected to run on the client computer. This setting can be specified as a whole number greater than zero. The default setting is 120 minutes. This value is used for two purposes: • To monitor results from the deployment type. • To determine if a deployment type will be installed when maintenance windows have been defined on client devices.
Catalog	**Classification**	Identifies whether this is a **Client** or **Server** application, or whether the application classification is **Unknown**. By default, this property is set to **Client** for all applications.
	Localized description	Localized version of application description.
	Localized display name	Localized version of the application's display name.
	User documentation	Location of documentation provided with this application.
IPA Content	**Content location**	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options > Distribution System** tab of the **Options** dialog box, and published from there.
IPA Link Content	**Content location**	N/A
Misc	**Content location**	N/A

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
MSI Content	**Allow client to share content on same subnet**	To reduce the load on the network by allowing clients to download content from other local clients on the network that have already downloaded and cached the content, select **True**. ***Note*** • *Applies to Windows Installer and Legacy Installer (.exe) packages only.*
	Content location	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options** > **Distribution System** tab of the **Options** dialog box, and published from there.
	Deployment option when client is on slow network	Select one of the following options to specify whether the client should download content when on a slow network: • **Do not download content**—When the client is connected within a slow or unreliable network boundary, do not download content. Select this option to save network bandwidth. (Default) • **Download content from distribution point and run locally**—Select this option if, when the client is connected within a slow or unreliable network boundary, you want it to download the content from the distribution point and run it locally.
	Persist content in the client cache	To retain content in the cache on the client computer indefinitely even if it has already been run, select **True**. ***Note*** • *Setting this property to **True** will reduce the available cache space. This might cause a large deployment to fail at a later point if there is insufficient space available in the cache.*
	Use fallback source location for content	To enable clients to "fall back" to using an unprotected distribution point if the package is not available on a protected (preferred) distribution point, set this option to **True**. By default, this option is set to **False**.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
MSI Installer	**Install command line**	Specify the command line that Configuration Manager will use to install this package on a client machine, including any required installation parameters.
	Install folder	Specify the folder that contains the installation program for the deployment type. This folder can be an absolute path on the client or a path to the distribution point folder that contains the installation files. This field is optional.
	Installation source management product code	To enable installation source management, enter the Windows Installer product code.  ***Note*** • *In System Center Configuration Manager, installation source management enables a Windows Installer file to automatically be updated or repaired from content source files on an available distribution point.*
	Run installation as 32-bit process on 64-bit client	Select **True** to run the installation of this deployment type as a 32-bit process on a 64-bit client. To run it as a 64-bit process on a 64-bit client, select **False**.
	Uninstall command line	Specify the command line that Configuration Manager will use to uninstall this package from a client machine, including any required parameters.
	Uninstall folder	Specify the folder that contains the uninstall program for the deployment type. This folder can be an absolute path on the client or a path relative to the distribution point folder that contains the package. This field is optional.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
MSI User Experience	**Allow user to view and interact with the program installation**	Set this property to **True** to enable the user to view and interact with the program installation in order to configure installation options. If it is set to **False**, the program installation is hidden from the user. ***Note*** • *This property can be set to* ***True*** *only when the* ***Login requirement*** *property is set to* ***Only when a user is logged on****.*
	Enforce specific behavior	Select one of the following options to enable Configuration Manager to enforce specific OS reboot behavior regardless of the application's intended behavior: • **Determine behavior based on return codes**—Handle reboots based on the codes configured on the Return Codes tab. • **No specific action**—No reboot required after installation. • **The software installation program might force a device restart**—Configuration Manager will not control reboot; the actual installation might force a reboot without warning. • **Configuration Manager client will force a mandatory device restart**—Configuration Manager will force a device reboot—either by notifying the user or without notification.
	Estimated installation time (min)	Specify the estimated time that the deployment type will take to install.
	Installation behavior	Select one of the following options: • **User**—The application installs for only the user who it is deployed to. • **System**—The application installs only once and is available to all users. • **Any**—If the application is deployed to a device, then it will install for all users. If the application is deployed to a user, then it will install for only that user.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
MSI User Experience (Continued)	**Installation program visibility**	Select one of the following options to specify the mode in which the deployment type will run on client devices: • **Maximized**—The deployment type runs maximized on client devices. Users will see all installation activity. • **Normal**—The deployment type runs in the normal mode based on system and program defaults. This is the default mode. • **Minimized**—The deployment type runs minimized on client devices. Users might see installation activity in the notification area or task bar. • **Hidden**—The deployment type runs hidden on client devices and users will see no installation activity.
	Logon requirement	Select one of the following options to specify the login requirements for installing this application: • **Only when a user is logged on** • **Whether or not a user is logged on** • **Only when no user is logged on**  ***Note*** • *If you have set the* ***Installation behavior*** *property to* ***User****, this option will default to* ***Only when a user is logged on*** *and cannot be changed.*
	Maximum allowed run time (min)	Specifies the maximum time (in minutes) that the program is expected to run on the client computer. This setting can be specified as a whole number greater than zero. The default setting is 120 minutes. This value is used for two purposes: • To monitor results from the deployment type. • To determine if a deployment type will be installed when maintenance windows have been defined on client devices.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
Script Content	**Allow client to share content on same subnet**	To reduce the load on the network by allowing clients to download content from other local clients on the network that have already downloaded and cached the content, select **True**. ***Note*** • *Applies to Windows Installer and Legacy Installer (.exe) packages only.*
	Content location	In System Center Configuration Manager, the **Content location** is the location where a deployment type's files are located. In Application Manager, this field usually remains blank. However, if you enter an application-specific location for publishing in this field, Distribution Wizard will not create a GUID folder and will, instead, publish the application from this location **only if** the source files already exist in this location. Otherwise, the source files are copied to the location specified in the **Location to Publish Packages** field on the **Server Options > Distribution System** tab of the **Options** dialog box, and published from there.
	Deployment option when client is on slow network	Select one of the following options to specify whether the client should download content when on a slow network: • **Do not download content**—When the client is connected within a slow or unreliable network boundary, do not download content. Select this option to save network bandwidth. (Default) • **Download content from distribution point and run locally**—Select this option if, when the client is connected within a slow or unreliable network boundary, you want it to download the content from the distribution point and run it locally.
	Persist content in the client cache	To retain content in the cache on the client computer indefinitely even if it has already been run, select **True**. ***Note*** • *Setting this property to **True** will reduce the available cache space. This might cause a large deployment to fail at a later point if there is insufficient space available in the cache.*
	Use fallback source location for content	To enable clients to "fall back" to using an unprotected distribution point if the package is not available on a protected (preferred) distribution point, set this option to **True**. By default, this option is set to **False**.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
Script Installer	**Install Command Line**	Specify the command line that Configuration Manager will use to install this package on a client machine, including any required installation parameters.
	Install Folder	Specify the folder that contains the installation program for the deployment type. This folder can be an absolute path on the client or a path to the distribution point folder that contains the installation files. This field is optional.
	Installation source management product code	To enable installation source management, enter the Windows Installer product code. ***Note*** • *In System Center Configuration Manager, installation source management enables a Windows Installer file to automatically be updated or repaired from content source files on an available distribution point.*
	Run installation as 32-bit process on 64-bit client	Select **True** to run the installation of this deployment type as a 32-bit process on a 64-bit client. To run it as a 64-bit process on a 64-bit client, select **False**.
	Uninstall Command Line	Specify the command line that Configuration Manager will use to uninstall this package from a client machine, including any required parameters.
	Uninstall Folder	Specify the folder that contains the uninstall program for the deployment type. This folder can be an absolute path on the client or a path relative to the distribution point folder that contains the package. This field is optional.

Table 7-59 • Import Options / Application Model Defaults Tab Properties (cont.)

Category	Option	Description
Script User Experience	**Allow user to view and interact with the program installation**	Set this property to **True** to enable the user to view and interact with the program installation in order to configure installation options. If it is set to **False**, the program installation is hidden from the user. ***Note*** • *This property can be set to* ***True*** *only when the* ***Login requirement*** *property is set to* ***Only when a user is logged on****.*
	Enforce specific behavior	Select one of the following options to enable Configuration Manager to enforce specific OS reboot behavior regardless of the application's intended behavior: • **Determine behavior based on return codes**—Handle reboots based on the codes configured on the Return Codes tab. • **No specific action**—No reboot required after installation. • **The software installation program might force a device restart**—Configuration Manager will not control reboot; the actual installation might force a reboot without warning. • **Configuration Manager client will force a mandatory device restart**—Configuration Manager will force a device reboot—either by notifying the user or without notification.
	Estimated installation time (min)	Specify the estimated time that the deployment type will take to install.
	Installation behavior	Select one of the following options: • **User**—The application installs for only the user who it is deployed to. • **System**—The application installs only once and is available to all users. • **Any**—If the application is deployed to a device, then it will install for all users. If the application is deployed to a user, then it will install for only that user.

Category	Option	Description
Script User Experience (Continued)	**Installation program visibility**	Select one of the following options to specify the mode in which the deployment type will run on client devices: • **Maximized**—The deployment type runs maximized on client devices. Users will see all installation activity. • **Normal**—The deployment type runs in the normal mode based on system and program defaults. This is the default mode. • **Minimized**—The deployment type runs minimized on client devices. Users might see installation activity in the notification area or task bar. • **Hidden**—The deployment type runs hidden on client devices and users will see no installation activity.
	Login requirement	Select one of the following options to specify the login requirements for installing this application: • **Only when a user is logged on** • **Whether or not a user is logged on** • **Only when no user is logged on**  ***Note*** • *If you have set the **Installation behavior** property to **User**, this option will default to **Only when a user is logged on** and cannot be changed.*
	Maximum allowed run time (min)	Specifies the maximum time (in minutes) that the program is expected to run on the client computer. This setting can be specified as a whole number greater than zero. The default setting is 120 minutes. This value is used for two purposes: • To monitor results from the deployment type. • To determine if a deployment type will be installed when maintenance windows have been defined on client devices.

Import Options / Package Auto Import Tab

The **Package Auto Import** feature enables you to automatically import or re-import packages, of the specified package type, in one or more shared network directories into your Application Catalog. Application Manager periodically checks these directories and imports all new packages it finds, and reimports all updated packages. The Package Auto Import feature is configured on the **Import Options / Package Auto Import** tab of the **Options** dialog box.

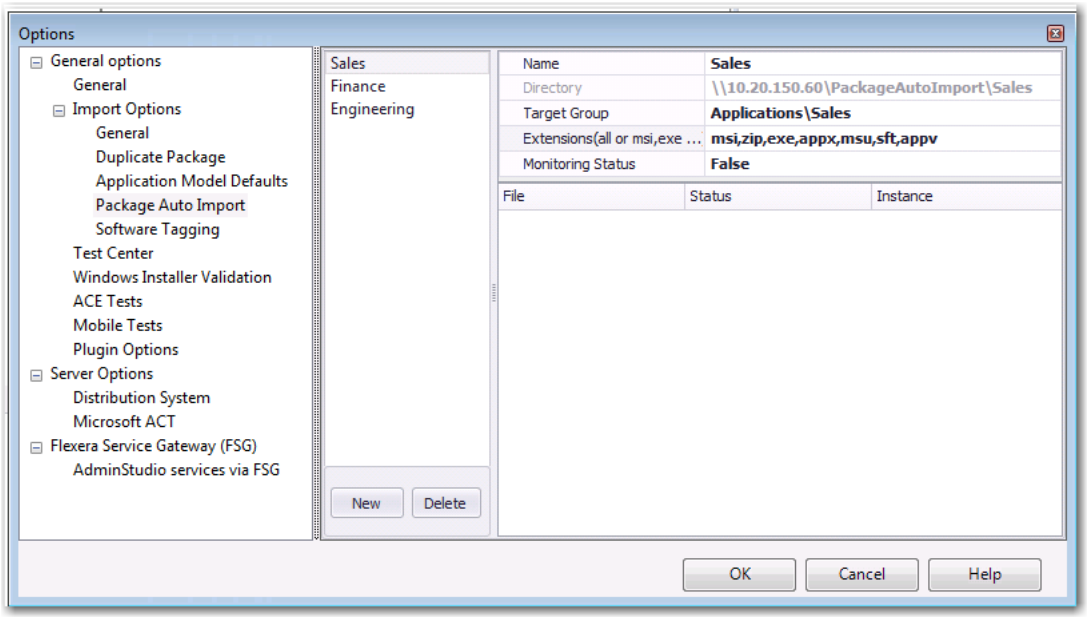

Figure 7-40: Import Options / Package Auto Import Tab of Options Dialog Box

The Package Auto Import feature supports all package types, including:

- Apple disk image package (.dmg)
- Apple installer package (.pkg)
- Apple iOS mobile app (.ipa)
- Citrix XenApp virtual package (.profile)
- Google Android mobile app (.apk)
- Installer package (.exe)
- Microsoft App-V virtual package (.sft, .appv)
- Microsoft Web Deploy package (.zip)
- Microsoft Windows Installer package (.msi)
- Microsoft Windows Store mobile app (.appx)
- Symantec Workspace virtual package (.xpf)
- VMware ThinApp virtual package (.exe)
- Web application (.htm, .html)

In addition to being able to batch import these package types using the Package Auto Import feature, you can also use it to batch import the following additional types of files:

- Microsoft Windows Security Patch files (.msu)
- iOS Enterprise Policy Configuration files (.mobileconfig or .plist)

When these packages are automatically imported into Application Manager, a group structure that mimics the directory structure of the selected network directory is created in the Application Manager tree:

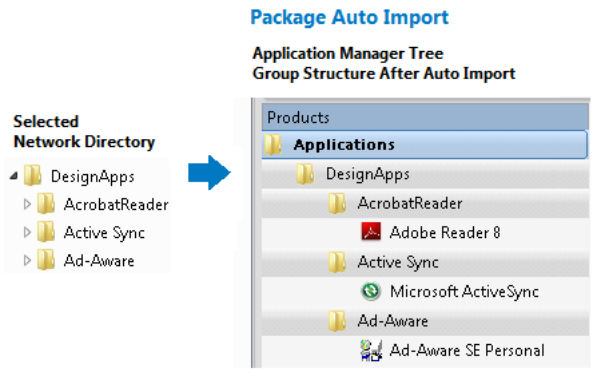

Figure 7-41: Group Structure Created by Package Auto Import

On the **Import Options / Package Auto Import** tab of the **Options** dialog box, you specify the information necessary to set up automatic package import from one or more network directories. The **Package Auto Import** tab includes the following properties.

Table 7-60 • Package Auto Import Tab

Property	Description
Name	Enter a name to identify the monitored directory.
Directory	Either enter a directory path or click the browse button and select a directory. ***Important*** • *The directory must be in UNC format and it must be a shared directory.*
Target Group	Specify the group in the Application Manager tree into which the packages will be imported.
Extensions	Click the browse button to open the Select Watcher Extensions dialog box. Select the package types that you want to monitor and then click **OK** to close the dialog box. The selected extensions will be listed in this field.
Monitoring Status	To begin monitoring this directory for new and updated packages, set the **Monitoring Status** field to **True**. ***Note*** • *To stop monitoring this directory, set the **Monitoring Status** field to **False**.*
New / Delete Buttons	Click **New** to add a new directory to monitor. Click **Delete** to remove a selected directory.

After you define a directory to monitor on the **Import Options > Package Auto Import** tab and click **OK**, the import of packages in the specified directories will begin after 30 minutes.

Viewing the Status of a Monitored Directory

After a directory's **Monitoring Status** has been set to **True**, the packages (of the selected package type) in that directory are listed on the **Package Auto Import** tab.

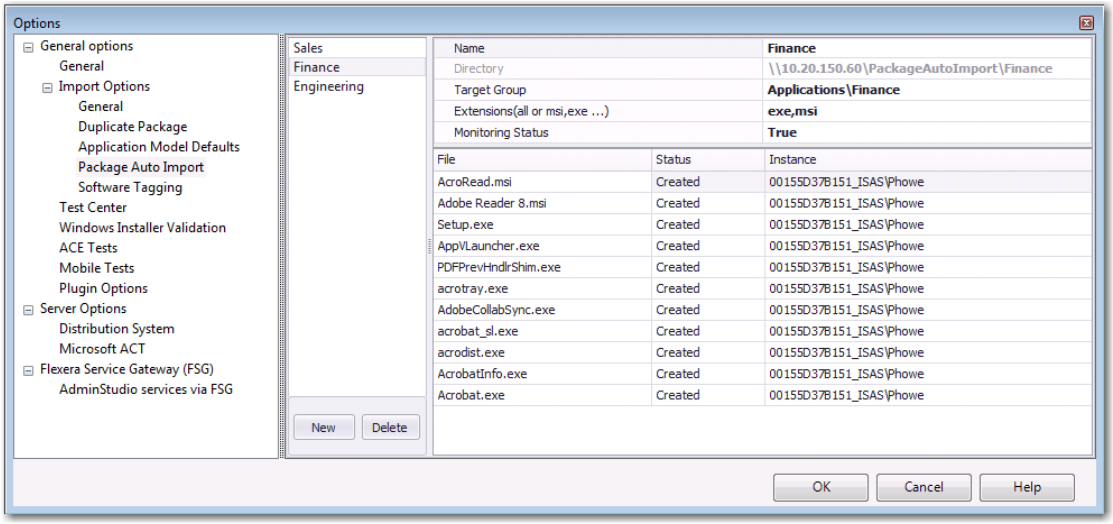

Figure 7-42: Monitoring the Import of Packages in a Directory on the Package Auto Import Tab

In the **Status** column, packages will have one of the following statuses:

- **Created**—Package will be imported as soon as one of the AdminStudio Host processes connected to this Application Catalog is running but is not currently being used.
- **Imported**—Package has been imported into the Application Catalog.
- **Canceled**—User canceled the import of the package into the Application Catalog.
- **Error**—There was an error during import of the package into the Application Catalog.
- **Fatal**—Something is wrong with the package and import failed.
- **FileNotExists**—File does not exist in the specified location.
- **AccessDenied**—Access to the file being imported was denied.

Import Options / Software Tagging Tab

On the **Software Tagging** subtab of the **Import Options > Software Tagging** tab of the Application Manager **Options** dialog box, you can enable or disable automatic software tag file creation and can set the default values for **Tag Creator Name** and **Tag Creator RegID**.

Important *• Any changes that you make to the software tagging options on the* ***Software Tagging*** *tab of the Application Manager* ***Options*** *dialog box will also automatically be made to the options on the* ***Build Options*** *tab of the Repackager* ***Options*** *dialog box.*

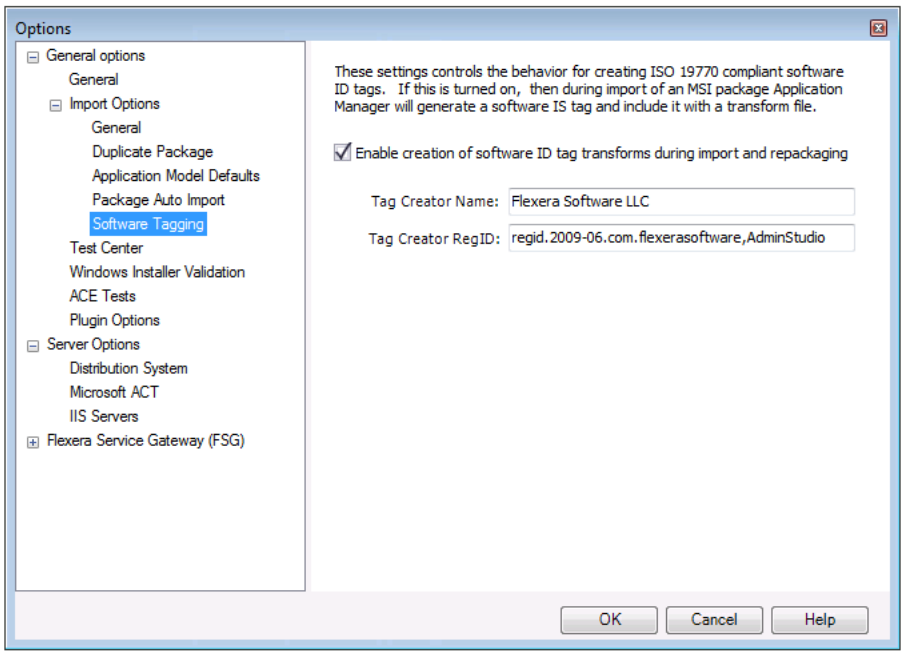

Figure 7-43: Options Dialog Box / Software Tagging Tab

On the **Software Tagging** tab of the **Options** dialog box, you can configure the following properties:

Table 7-61 • Import Options / Software Tagging Tab Properties

Option	Description
Enable creation of software ID tag transforms during import and repackaging	Select to instruct AdminStudio to automatically create a transform file containing software tag file(s) for Windows Installer packages that are imported into the Application Catalog or built using Repackager. By default, this option is selected. ***Note*** *• Whenever a Windows Installer package is imported into the Application Catalog or built using Repackager, AdminStudio creates a software ID tag file (which is stored in the Application Catalog), but if the* ***Enable creation of software ID tag transforms during import and repackaging*** *option it not selected, AdminStudio does not create the transform.*
Tag Creator Name	Enter a name to identify the creator of the software ID tag files that will be created by AdminStudio. By default, the value is `Flexera Software LLC`.

Table 7-61 • Import Options / Software Tagging Tab Properties (cont.)

Option	Description
Tag Creator RegID	Enter an ID to uniquely identify the creator of the software ID tag files that will be created by AdminStudio, using the following format: `regid.YYYY-MM.ReversedDomainName,optional_division` For example: `regid.2009-06.com.yourcompany,GlobalProductDivision` By default, the value is AdminStudio's RegID: `regid.2009-06.com.flexerasoftware,AdminStudio`

Test Center Tab

On the **Test Center** tab of the **Options** dialog box, you can configure several options that affect how packages and web applications are tested and how issues are resolved.

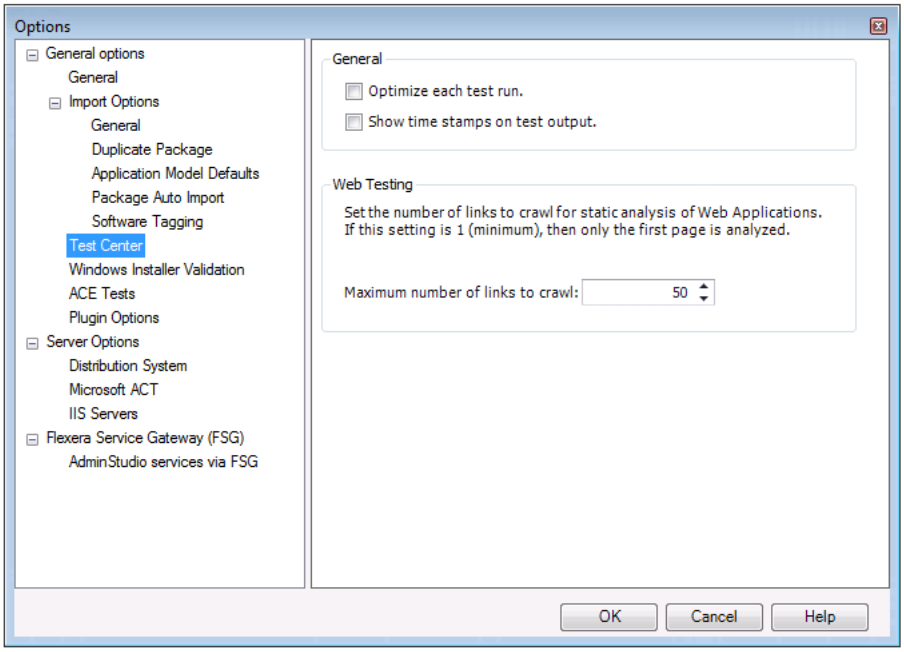

Figure 7-44: Options Dialog Box / Test Center Tab

On the **Test Center** tab of the **Options** dialog box, you can configure the following properties:

Table 7-62 • Test Center Tab Properties

Option	Description
Optimize each test run	This option determines whether Application Manager executes all tests or only tests that were not previously run: • **Selected**—If this option is selected, before beginning testing, Application Manager will check the selected packages to see which tests have been run on each package and which have not been run. It also checks to see if the Windows Installer file (or its transform file) or App-V package has changed since the last time that testing was performed. If the packages have not changed, Application Manager will then only execute those selected tests which have not yet been run. • **Not selected**—If this option is not selected, Application Manager will execute all selected tests on all selected packages each time testing is initiated, even if the test has already been run on a package and neither the package nor its transform file has changed. If you have a large number of applications in your Application Catalog, selecting this option enables you to start testing, then click **Stop** to pause testing when you want to access Application Manager to perform other tasks. When you click **Stop**, Application Manager would finish executing the current test. When you were ready to resume testing, you could then click **Execute Tests** and Application Manager would immediately begin testing where it left off the last time testing was performed.
Show time stamps on test output	Select this option to include date and time indications in the test output, such as: `06-21-2012 17:16:54 :: Determining Microsoft ICE tests to run.` and `06-21-2012 17:17:06 :: Microsoft ICE - ICE 58`
Maximum number of links to crawl	Specify the number of hyperlinked levels deep that will be tested when performing static (non-interactive) testing of web applications. For example if this number is set to 1, only the first page of the web application would be tested. But if this number was set to 3, then the first page would be tested, as would its child pages, and its child pages.

Windows Installer Validation Tab

On the **Windows Installer Validation** tab of the **Options** dialog box, you specify the files containing the ICE rules that will be used in validation testing.

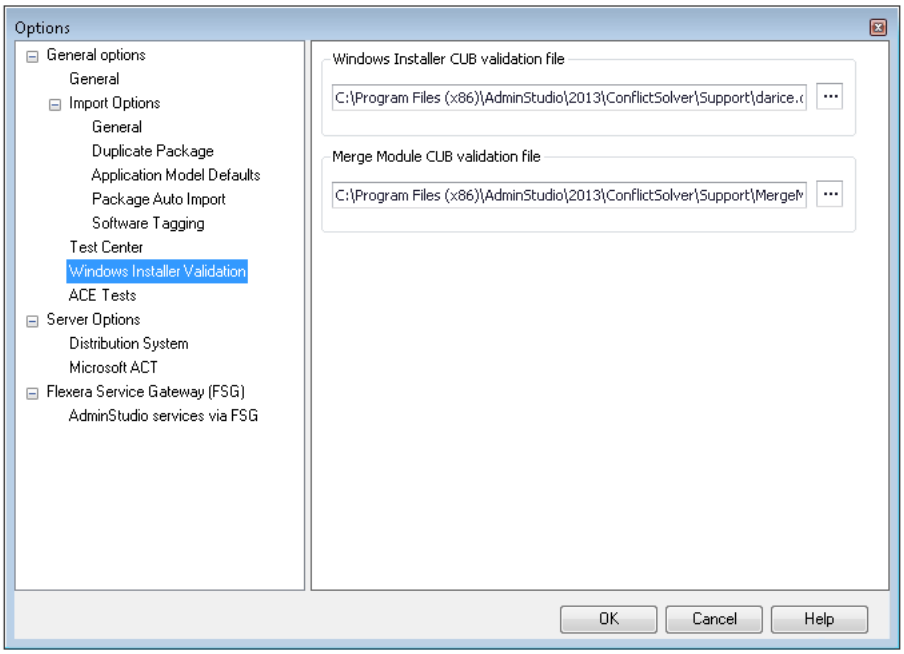

Figure 7-45: Options Dialog Box / Windows Installer Validation Tab

On the **Windows Installer Validation** tab of the **Options** dialog box, you can configure the following properties:

Table 7-63 • Windows Installer Validation Tab Properties

Property	Description
Windows Installer CUB validation file	The file specified in this field contains the Internal Consistency Evaluators (ICEs) that will be used for validation of Windows Installer packages. Either enter the location of this file directly, or use the Browse button (...) to locate it.
Merge Module CUB validation file	The file specified in this field contains the Internal Consistency Evaluators (ICEs) that will be used for validation of merge modules. Either enter the location of this file directly, or use the Browse button (...) to locate it.

ACE Tests Tab

On the **ACE Tests** tab of the **Options** dialog box, you specify the default ACE and ICE rules that you want to use in testing. You can also access the Rules Viewer, which can be used to add user defined ACEs, and you can specify a custom ACE rule file.

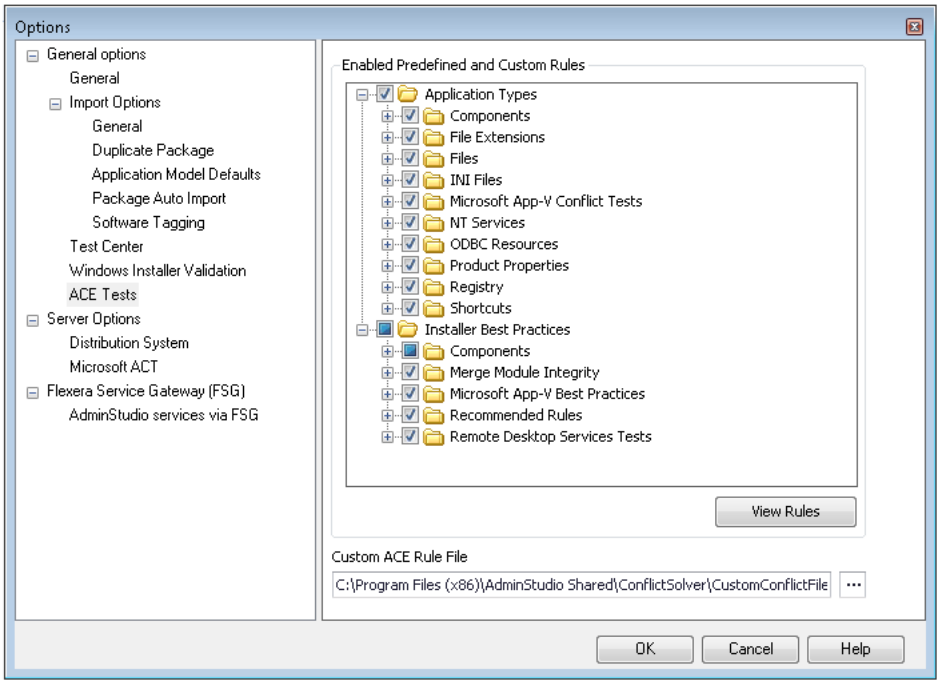

Figure 7-46: Options Dialog Box / ACE Tests Tab

On the **ACE Tests** tab of the Application Manager **Options** dialog box, you can configure the following options:

Table 7-64 • ACE Tests Tab Properties

Property	Description
Enabled Predefined and Custom Rules	There are two types of ACE rules: • **Application Types**—Detect conflicts between two packages. These tests are run when you use the Conflict Wizard. • **Installer Best Practices**—Internally perform checks against the structure of a Windows Installer or App-V package. (Similar to Microsoft's ICE validation rules.) These tests are run when you click the **Execute Tests** button in the ribbon (or immediately after import if the **Automatically Execute Tests After Import** option is selected on the **Import Options** tab of the **Options** dialog box, which is selected by default). In both of these trees, if you want a specific type of test run by default, select the appropriate check box. Tests associated with unselected boxes will not be performed by default during testing. ***Important*** • *These selection lists are equivalent to the **Application Conflicts** and **Best Practices and Risk Assessment** test lists (Windows Installer and App-V only) on the **Select Tests to Execute** dialog box. Changes made in one location are automatically replicated to the other location.*

Table 7-64 • ACE Tests Tab Properties (cont.)

Property	Description
View Rules	Click to open the **Rules Viewer** dialog box. On the **Rules Viewer** dialog box, you can click **Add** to open the Rules Wizard, which you can use to add user-defined ACEs to Application Manager.
Custom ACE Rule File	The user-defined ACE file specified here is run after the pre-defined ACE rules are run. The selection of this user-defined ACE file will affect the default Conflict Types displayed on this dialog (described above), as well as those displayed on the Rules Viewer. By default, a file path to an initially empty user-defined ACE file is provided for you. If you have already created a user-defined ACE, specify the location of that user-defined ACE file to activate it. Only one user-defined ACE file can be active at one time. You use user-defined ACEs to extend the functionality of pre-defined ACEs with company-specific functionality. By selecting different user-defined ACE files, you can organize rules appropriate for individual users in your organization. See Creating Your Own Custom ACE Tests for more information.

Mobile Tests Tab

AdminStudio's mobile risk assessment tests enable you to find out which features a specific mobile app uses, such as telephone, location services, camera, microphone, etc. You can enhance this testing by creating custom tests that combine risk assessment checks with AND or OR operators.

For example, you could create a custom test to see if a mobile application uses a gyroscope OR accelerometer. Or you could create a test that determines whether a mobile application uses location services AND allows location tracking.

On the **Mobile Tests** tab of the **Options** dialog box, you can view or edit existing custom mobile tests. You can also click **New** to open the **Mobile Test Wizard**, which you can use to add new custom mobile tests.

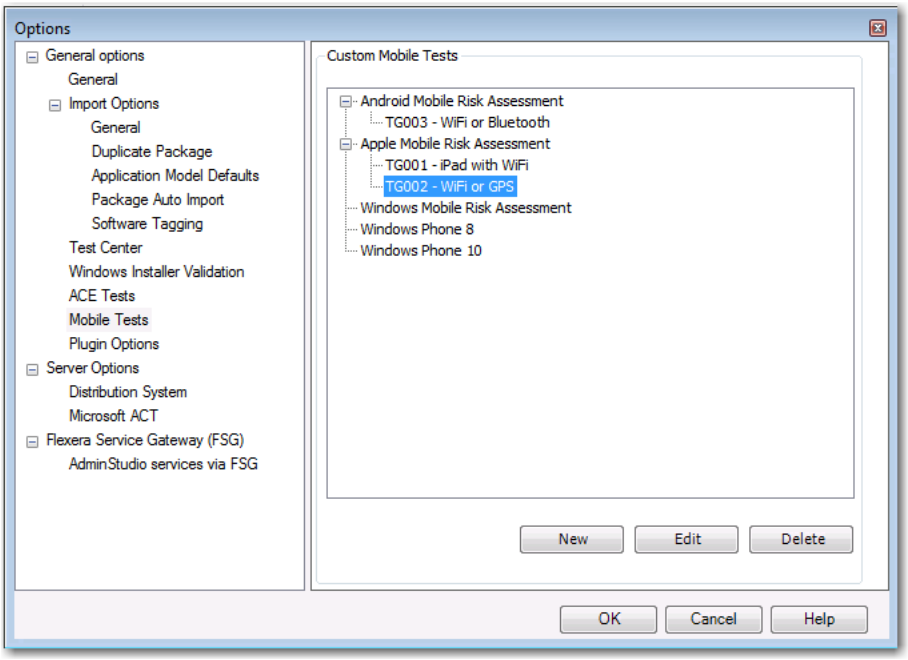

Figure 7-47: Mobile Tests Tab / Options Dialog Box

The **Mobile Tests Tab** includes the following properties.

Table 7-65 • Mobile Tests Tab Properties

Property	Description
Custom Mobile Tests List	List of all custom mobile tests, listed by mobile application test category. The following categories are listed: • Android Mobile Risk Assessment • Apple Mobile Risk Assessment • Windows Mobile Risk Assessment • Windows Phone 8 • Windows Phone 10
New	Click to open the **Mobile Test Wizard**, which you can use to create a custom mobile test.
Edit	Click to edit the selected custom mobile test in the Mobile Test Wizard.
Delete	Click to delete the selected custom mobile test.

Plugin Options Tab

On the **Plugin Options** tab of the Application Manager **Options** dialog box, you can specify options for AdminStudio plug-ins including the import of Google Android and Apple iOS public store apps, Automated Application Converter, and App-V 5 conversion. The **Plugin Options** tab includes the following subtabs:

- Google Android Link Import Plugin
- Apple iOS Link Import Plugin
- Automated Application Converter Plugin
- App-V 5.x Conversion Plugin

Google Android Link Import Plugin

On the **Google Android Link Import Plugin** subtab, you can specify the location in your network of Google Android apps that you have already downloaded from the Google Play Store.

If you import deep link to a Google Play Store app that has also already been downloaded to this specified location, AdminStudio will analyze the downloaded binary's data so that additional Test Center tests can be executed for that app. This will result in more accurate test results, and a more successful deployment of the deep link to AirWatch or System Center 2012 Configuration Manager.

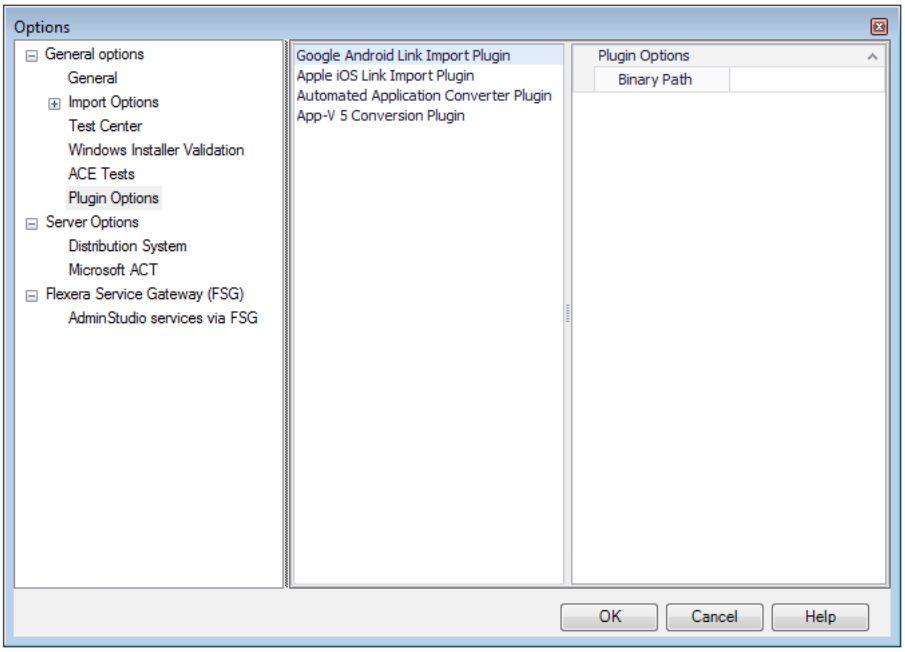

Figure 7-48: Options Dialog Box / Plugin Options Tab / Google Android Link Import Plugin

Apple iOS Link Import Plugin

On the **Apple iOS Link Import Plugin** subtab, you can specify the location in your network of your iTunes Library.

If you import a deep link to an Apple iOS app that has also already been downloaded to this specified iTunes Library, AdminStudio will analyze the downloaded binary's data so that additional Test Center tests can be executed for that app. This will result in more accurate test results, and a more successful deployment of the deep link to AirWatch or System Center 2012 Configuration Manager.

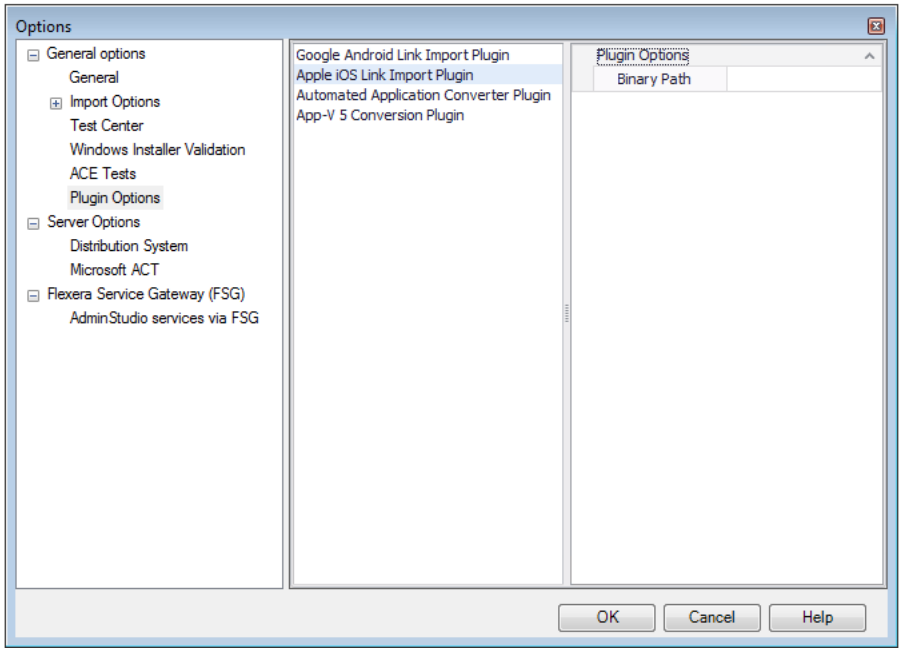

Figure 7-49: Options Dialog Box / Plugin Options Tab / Apple iOS Link Import Plugin

Automated Application Converter Plugin

You can use the Conversion Wizard to convert a Windows Installer package, or multiple packages, to a virtual package in Microsoft App-V (version 4 or 5), Citrix XenApp, Symantec Workspace, or VMware ThinApp format, or to perform repackaging on a virtual machine. Before performing this type of conversion, you need to enter Automatic Application Converter settings on the **Plugins Options > Automated Application Converter Plugin** tab of the **Options** dialog box.

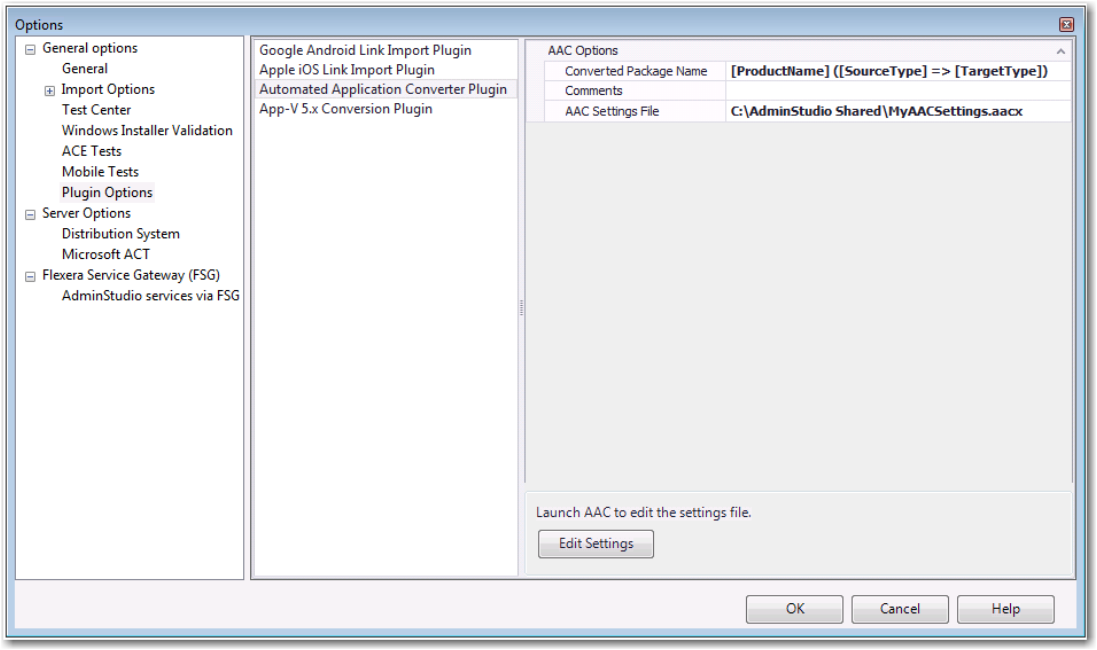

Figure 7-50: Options Dialog Box / Plugin Options Tab / Automated Application Converter Plugin

The **Plugin Options / Automated Application Converter Plugin** tab of the **Options** dialog box includes the following properties:

Table 7-66 • Plugin Options / Automated Application Converter Plugin Properties

Property	Description
Converted Package Name	Enter a name to differentiate the converted version of the package from the original version. By default, this field will be populated with the original package name `[ProductName]`. For example: • `[ProductName]` • `[Manufacturer]_[ProductName]` • `[ProductName]_v5`
Comments	Enter metadata that you would like to add to each converted package. This text will be displayed in the **Administrator Comments** field on the **Package Information** tab of the **Catalog Deployment Type View** for each package.
AAC Settings File	Select a Automated Application Converter project file (**.aacx**) that contains connection settings to at least one virtual machine.  ***Note*** • *For more information, see Creating an Automated Application Converter Settings File.*
Edit Settings	Click to edit the specified Automated Application Converter project file. See Editing the Default Automated Application Converter Settings File From Application Manager.

App-V 5.x Conversion Plugin

You can use the Conversion Wizard to upgrade an App-V 4.x package (**.sft**) to App-V 5.0 format (**.appv**). Before performing this type of conversion, you need to enter App-V 5.x conversion plug-in settings on the **Plugins Options** tab of the **Options** dialog box.

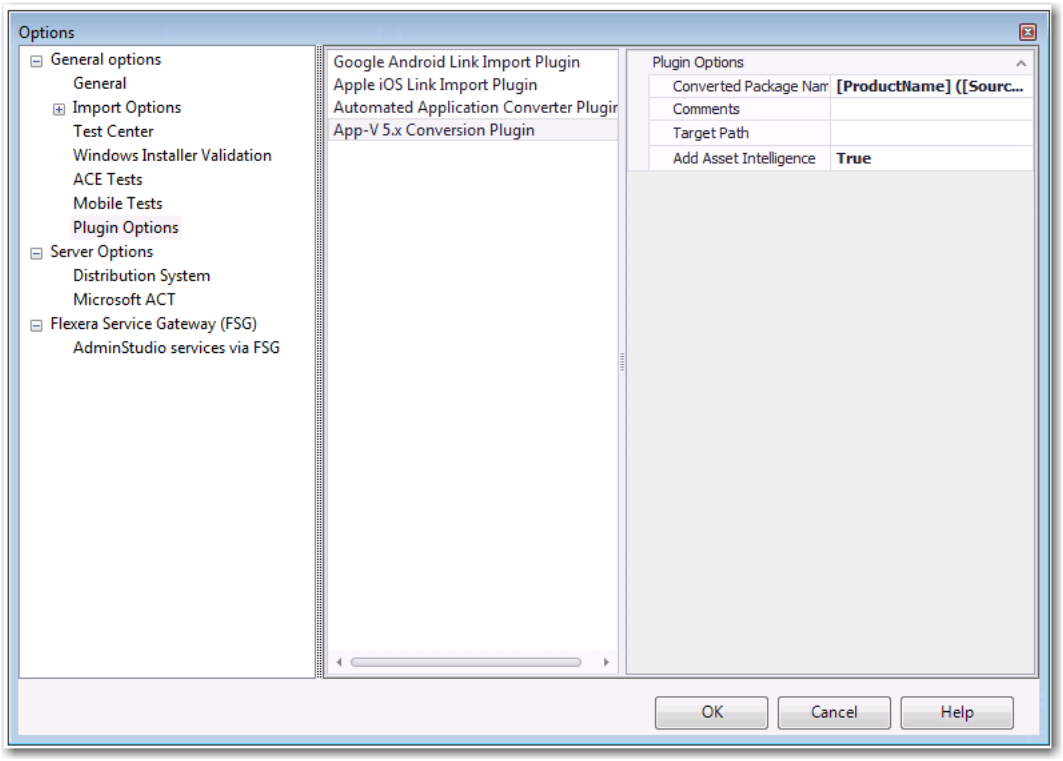

Figure 7-51: Options Dialog Box / Plugin Options Tab / App-V 5.x Conversion Plugin

The **Plugin Options / App-V 5.x Conversion Plugin** tab of the **Options** dialog box includes the following properties:

Table 7-67 • Plugin Options / App-V 5.x Conversion Plugin Properties

Property	Description
New Package Name	Enter a name to differentiate the converted version of the package from the original version. By default, this field will be populated with the original package name `[ProductName]`. For example: • `[ProductName]` • `[ProductName]_v5` • `[Manufacturer]_[ProductName]_v5`
Comments	Enter metadata that you would like to add to each converted package. This text will be displayed in the **Administrator Comments** field on the **Package Information** tab of the **Catalog Deployment Type View** for each package.
Target Path	Specify the output folder where you want the converted packages to be located.

Table 7-67 • Plugin Options / App-V 5.x Conversion Plugin Properties

Property	Description
Asset Intelligence	Asset intelligence is used to enhance the inventory capabilities of Microsoft System Center 2012 Configuration Manager by extending hardware inventory and adding license management functionality. The asset intelligence features can report application data such as digital PID, MSI product codes, and publisher names for each virtual application registered on a client computer. To add asset intelligence information to a converted App-V 5.x package, set this option to **True**.

Server Options / Distribution System Tab

On the **Distribution System** tab of the Application Manager **Options** dialog box, you can define multiple named connections to System Center Configuration Manager, Citrix XenApp Server, Microsoft App-V Server, Symantec Altiris Server, and AirWatch Server distribution systems. This enables you to both have multiple connections easily available during import and distribution, and to refer to those connection settings by name in Platform API commands.

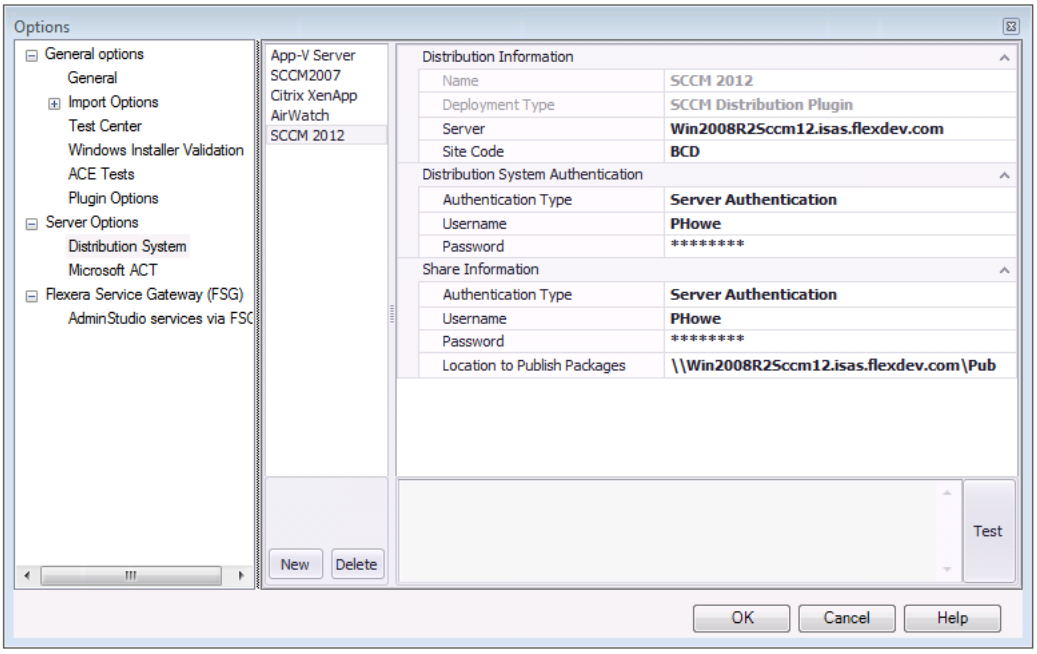

Figure 7-52: Options Dialog Box / Distribution System Tab

The **Server Options / Distribution System** tab of the **Options** dialog box includes the following properties:

Table 7-68 • Server Options / Distribution System Tab Properties

Property	Description
Name	Enter a name to identify this named connection to a distribution system.

Table 7-68 • Server Options / Distribution System Tab Properties

Property	Description
Deployment Type	Select one of the following to identify the distribution system technology of this named connection: • **AirWatch Distribution Plugin** • **Altiris Distribution Plugin** • **App-V Distribution Plugin** • **Casper Distribution Plugin** • **SCCM Deployment Plugin** • **XenApp Deployment Plugin**
Server	Enter the name of your distribution system server.
Site Code	Enter the code that identifies your distribution system site.  ***Note*** • *If you are creating a named connection to a Microsoft App-V, Citrix XenApp or Altiris server, leave the* ***Site Code*** *field blank. This field is not displayed when creating a named connection to a Casper Server.*
Distribution System Authentication / Authentication Type	Choose one of the following options to identify the authentication type you are going to use to access the specified distribution system: • **Server Authentication**—Choose this option if you want to use server login identification to log into this server. Then enter the appropriate **Username** and **Password**. • **Windows Authentication**—Choose this option if you want to use Windows network authentication (your network login ID) to log into this server.
Distribution Point	(Casper only) Enter the Casper distribution point you want to distribute packages to.  ***Note*** • *Casper supports multiple server infrastructures, but AdminStudio only supports the File Share Distribution Points infrastructure, and copies packages to a UNC File Share Distribution Point in Casper. AdminStudio currently does not support copying packages to JDS Instances, Cloud Distribution Points, Software Update Servers, or NetBoot Servers.*

Table 7-68 • Server Options / Distribution System Tab Properties

Property	Description
Share Information / Authentication Type	Choose one of the following options to identify the authentication type you are going to use to access the shared location where you will be publishing packages during distribution: • **Server Authentication**—Choose this option if you want to use server login identification to log into this server. Then enter the appropriate **User name** and **Password**. • **Windows Authentication**—Choose this option if you want to use Windows network authentication (your network login ID) to log into this server. ***Note*** • *The fields in the **Share Information** section are not required when setting up a connection to AirWatch Server. Applications are published directly to the AirWatch Server, not to a shared location.*
Location to Publish Package	Enter or browse to the shared location where you will be publishing packages during distribution. ***Note*** • *The fields in the **Share Information** section are not required when setting up a connection to AirWatch Server. Applications are published directly to the AirWatch Server, not to a shared location.* ***Note*** • *When publishing to a Casper server, AdminStudio publishes packages to a directory named **Packages**.*
New	Click to create a new named connection. A set of empty connection setting fields are displayed.
Delete	Click to delete the selected named connection.
Test	Click to test the connection settings of the selected named connection. Messages will be displayed in the Test area to confirm the connection.

Microsoft App-V Server Distribution Requirements

In order for you to distribute packages to a Microsoft App-V Server, the WinRM service must be running, and the App-V Server must be in the list of trusted hosts. Both of these can be accomplished from PowerShell by running the following command:

```
set-item wsman:\localhost\Client\TrustedHosts –value <Machine Name>
```

The following image is an example of starting the WinRM service in PowerShell.

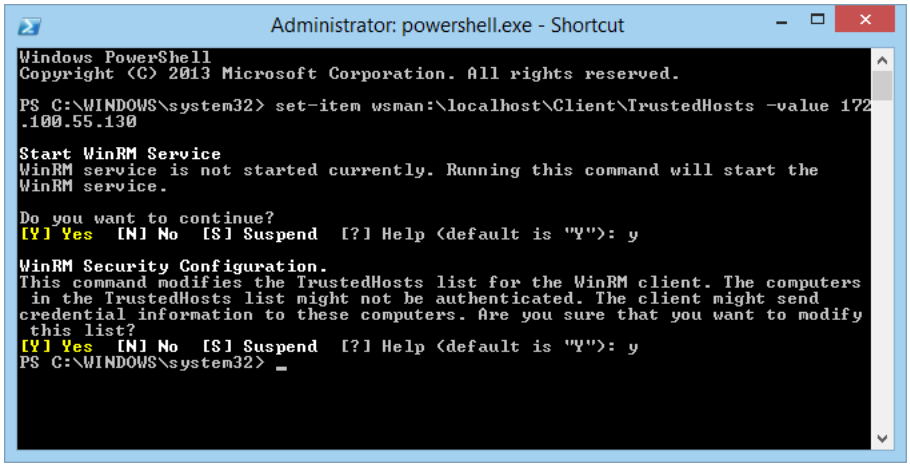

Figure 7-53: Starting the WinRM Service in PowerShell

Server Options / Microsoft ACT Tab

On the **Server Options / Microsoft ACT** tab of the Application Manager **Options** dialog box, enter connection settings for your Microsoft ACT (Application Compatibility Toolkit) database. This will enable AdminStudio to display data from the ACT database in Application Manager Test Center views and reports.

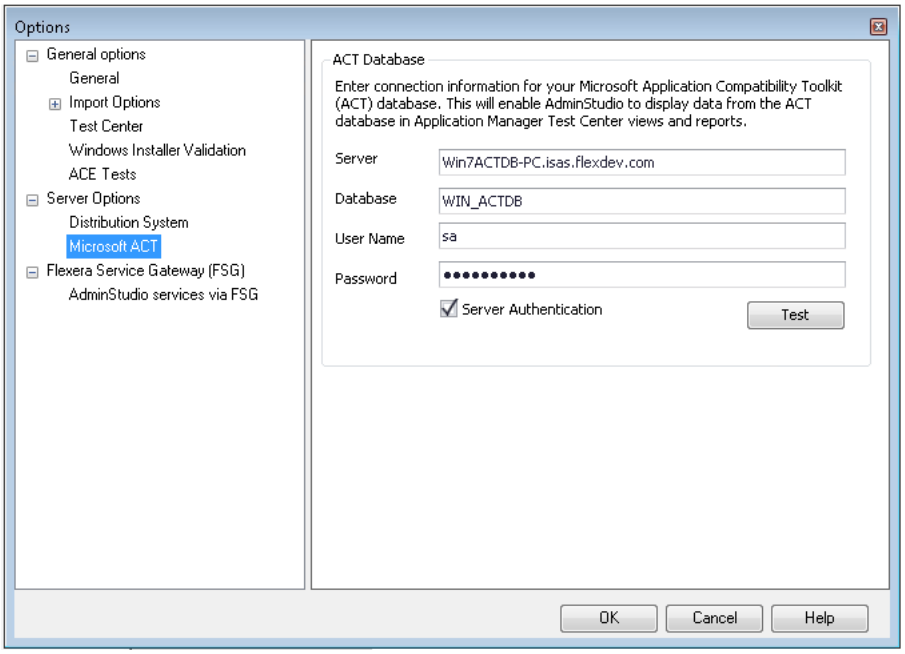

Figure 7-54: Options Dialog Box / Microsoft ACT Tab

The **Server Options / Microsoft ACT** tab includes the following properties:

Table 7-69 • Server Options / Microsoft ACT Tab Properties

Property	Description
Server	Enter the name of the server that contains your ACT database.
Database	Enter the name of your ACT database.
Server Authentication	Do one of the following: • **Server Authentication**—Select this option if you want to use database server login identification to log into this server. Then enter the appropriate **User Name** and **Password**. • **Windows Authentication**—If you want to use Windows network authentication (your network login ID) to log into this database server, leave the **Server Authentication** field unselected and leave the **User Name** and **Password** fields blank.

Note • *If you create a new Application Catalog, you will need to reenter this connection information.*

Software Repository Tab

On the **Software Repository** tab of the Application Manager **Options** dialog box, you can view and edit the **Software Repository Location** for the connected Application Catalog and the **Proxy Account** to access that location.

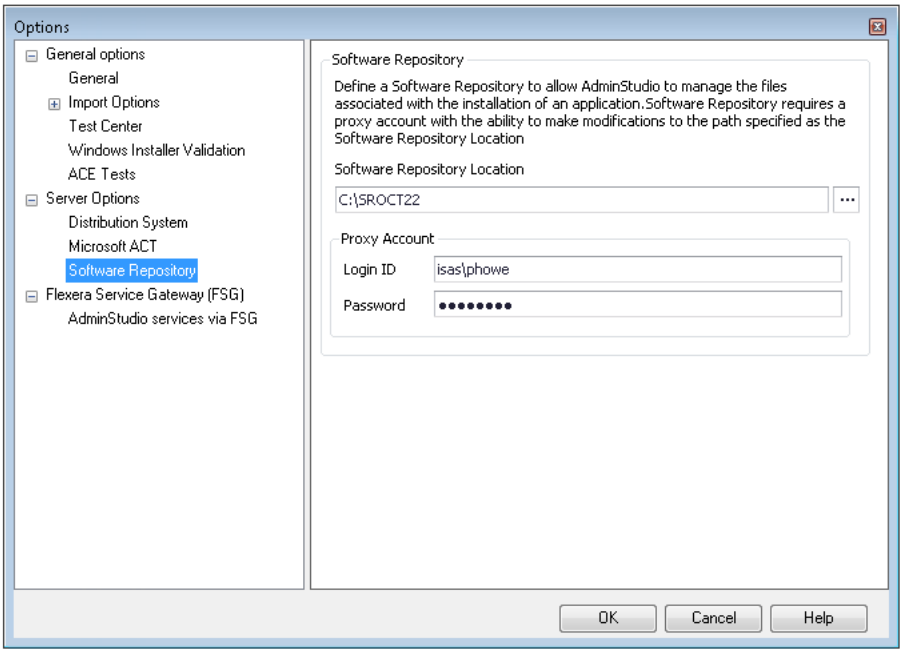

Figure 7-55: Options Dialog Box / Software Repository Tab

***Note** • This tab is only displayed if you enabled the Software Repository when creating the connected Application Catalog (by selecting the **Enable Software Repository** option on the **Select Software Repository Location** panel of the Application Catalog Wizard).*

The **Software Repository** tab includes the following options:

Table 7-70 • Software Repository Tab Properties

Option	Description
Software Repository Location	Enter or select the directory location of the Software Repository for this Application Catalog. All of the files associated with a package that is imported into the Application Catalog are copied to this location. This allows you to manage those files, preventing them from getting modified or lost.
Proxy Account	Specify the **Login ID** and **Password** for a **Proxy Account** that AdminStudio can use to access and modify the specified **Software Repository Location** folder. ***Note** • You cannot use Windows Authentication for this Proxy Account.* ***Important** • The Proxy Account needs full control on the **Software Repository Location** folder at the directory level as well as at the sharing level. Only such accounts can be used as a Proxy Account to access the **Software Repository Location** directory.*

Flexera Service Gateway (FSG) Tab

If you have also purchased FlexNet Manager Suite, App Portal, and/or Workflow Manager, you can connect to the Flexera Service Gateway and communicate with those applications. You enter the login credentials for your Flexera Service Gateway server on the **Flexera Service Gateway (FSG)** tab of the Application Manager **Options** dialog box.

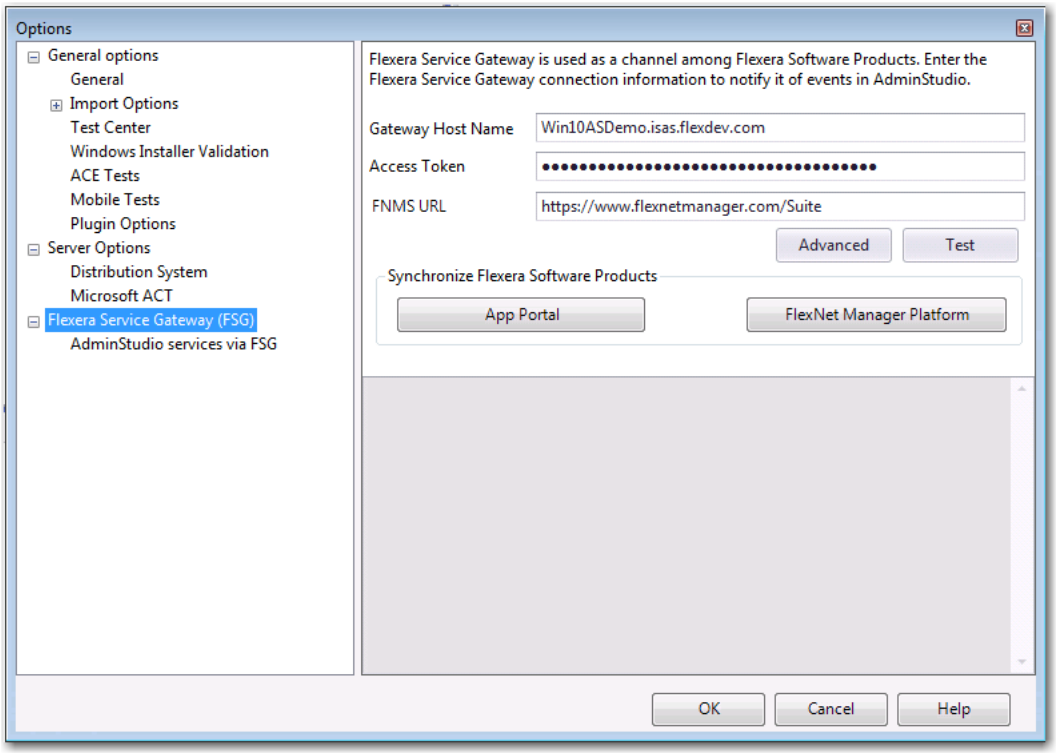

Figure 7-56: Options Dialog Box / Flexera Service Gateway (FSG) Tab

Note • *For a detailed description of the benefits of communicating with FlexNet Manager Suite and App Portal, see Integrating with Other Flexera Software Applications via the Flexera Service Gateway.*

The **Flexera Service Gateway (FSG)** tab of the **Options** dialog box includes the following properties:

Table 7-71 • Flexera Service Gateway (FSG) Tab Properties

Property	Description
Gateway Host Name	Enter the name or URL of your Flexera Service Gateway server. If your System Administrator has installed Flexera Service Gateway using a different port than the default port, enter the appropriate port number at the end of the URL, preceded by a colon, such as: `172.300.40.501`**:8484** ***Note*** • *The Flexera Service Gateway installer is downloaded from the Flexera Software Product & License Center.*

Table 7-71 • Flexera Service Gateway (FSG) Tab Properties

Property	Description
Access Token	If you are connecting to an installation of FlexNet Manager Suite Cloud, enter the access token that was provided by your system administrator. If you are connecting to an installation of FlexNet Manager Suite On Premises, leave this field blank.
FNMS URL	To easily configure your connection to FlexNet Manager Suite, entering the FlexNet Manager Suite URL.
Advanced	Click to open the **Credentials** dialog box, where you can enter the Flexera Service Gateway login credentials: • **User Name**—Unless your System Administrator has provided you with a specific **User Name** to use, enter the default value of **admin**. • **Password**—Unless your System Administrator has provided you with a specific **Password** to use, enter the default value of **admin**.  ***Note*** • *By default, the default credentials are already entered. Unless your system administrator has informed you that these credentials have been changed, you do not need to open the **Credentials** dialog box.*
Test	Click to validate the Flexera Service Gateway connection information.
App Portal	Click to create a catalog item in App Portal for all of the applications in the Application Catalog that were published to System Center Configuration Manager before the Flexera Service Gateway connection information was entered. • If, when you click this button, valid System Center 2012 Configuration Manager connection information is not entered on the **Distribution System** tab of the **Options** dialog box, a message will appear prompting you to enter connection information. • If you are not connected to the Flexera Service Gateway or if the Flexera Service Gateway is not available, an error message will be displayed stating that the sync has failed.  ***Note*** • *After valid Flexera Service Gateway connection information is entered, each time you publish an application to System Center 2012 Configuration Manager, a catalog item for that application will automatically be created in App Portal.*

Table 7-71 • Flexera Service Gateway (FSG) Tab Properties

Property	Description
FlexNet Manager Platform	Click to search the FlexNet Manager Suite Application Recognition Library (ARL) to locate and obtain the **Flexera Identifier** for the Application Catalog's existing applications. ***Note*** • *After valid Flexera Service Gateway connection information is entered, each time you import an application into the Application Catalog, the* ***Flexera Identifier*** *for that application will be obtained from FlexNet Manager Suite.*

AdminStudio Services via FSG Tab

In order for AdminStudio to communicate and share package data with another application, you need to identify a shared Application Catalog database that both products can access.

You identify the shared Application Catalog on the **AdminStudio Services via FSG** tab of the Application Manager **Options** dialog box:

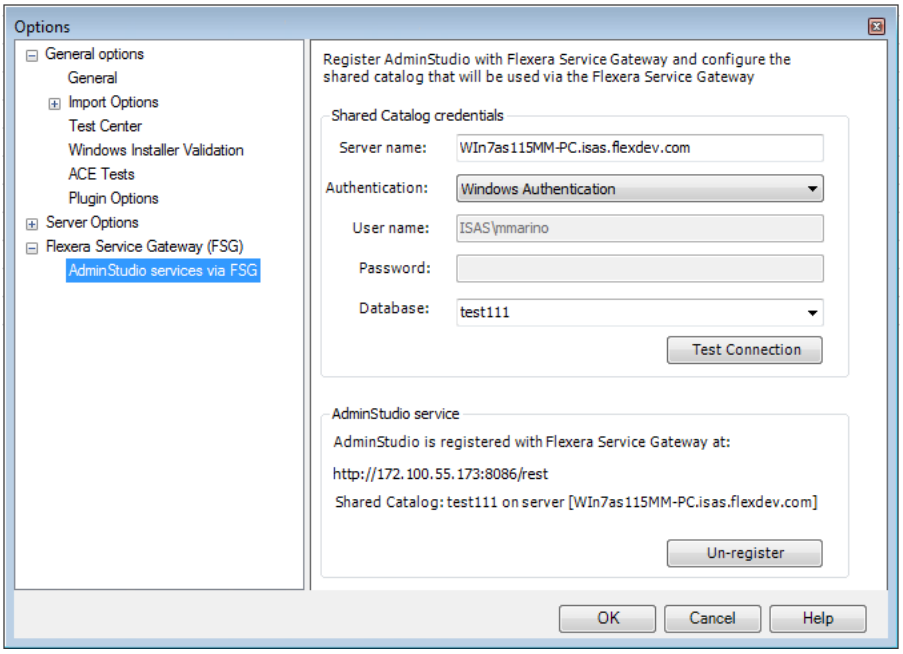

Figure 7-57: AdminStudio Services via FSG Tab of Options Dialog Box

The **AdminStudio Services via FSG** tab includes the following properties:

Table 7-72 • AdminStudio Services via FSG Tab

Property	Description
Server name	Lists the name of the server that contains the shared Application Catalog database that has been registered with the Flexera Service Gateway.

Table 7-72 • AdminStudio Services via FSG Tab

Property	Description
Authentication	Specifies the type of authentication to access the shared Application Catalog database as either **Windows Authentication** or **SQL Server Authentication**. If **SQL Server Authentication** is selected, the **User name** and **Password** credentials must also be entered.
Database	Name of the shared Application Catalog database that has been registered with the Flexera Service Gateway.
Test Connection	Click to test the connection to the shared Application Catalog.
Un-register	Click to unregister the specified Application Catalog with the Flexera Service Gateway.

References Dialog Box

The **References** dialog box, which opens when you right-click on a condition on the **Global Conditions** dialog box and select **References** from the shortcut menu, lists any applications or other global conditions that reference the selected global condition.

The **References** dialog box includes the following properties:

Table 7-73 • References Dialog Box

Property	Description
Referring Applications list	List of all applications that have been assigned a requirement that uses the selected global condition.
Referring Global Conditions list	List of all other global conditions which use the selected global condition.

SCCM Server Environment Dialog Box

The SCCM Server Environment dialog box, which is opened by clicking **App-V Virtual Environments** in the Application Manager ribbon and then selecting **SCCM Server Environment**, lists all existing defined SCCM server environments.

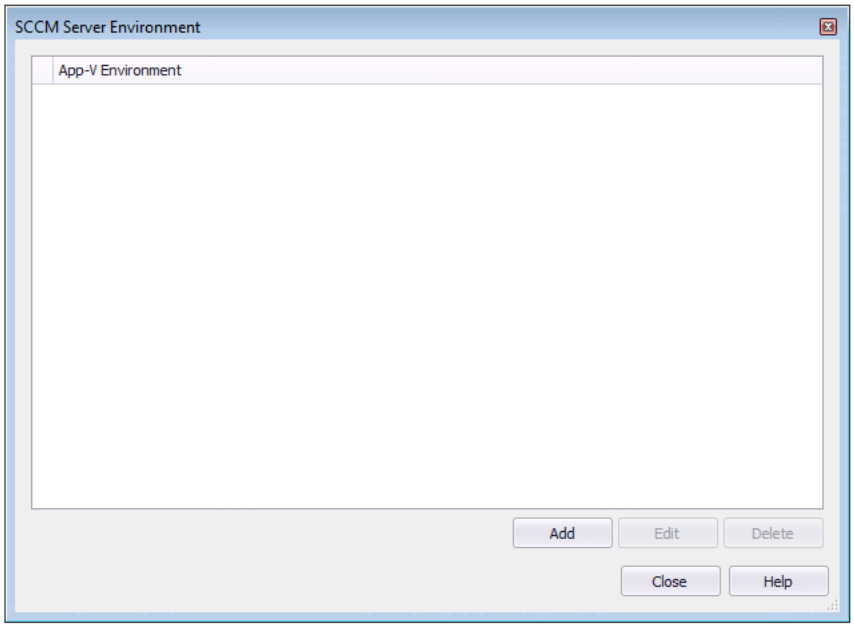

Figure 7-58: SCCM Server Environment Dialog Box

On the **SCCM Server Environment** dialog box, you can perform the following tasks:

- **Adding a new virtual environment**—Click **Add** to open the **Create Virtual Environment** dialog box and create a new virtual environment.
- **Editing an existing virtual environment**—Select a virtual environment and click **Edit** to edit an existing virtual environment.
- **Deleting a virtual environment**—Select a virtual environment and click **Delete** to delete an existing virtual environment.

Select Application Catalog Dialog Box

The **Select Application Catalog** dialog box opens when you are attempting to connect to an existing Standalone Application Catalog that requires database authentication by selecting it from a list of recently used Application Catalogs.

- **Enterprise Server**—Select this tab to open the AdminStudio Enterprise Server Application Catalog database. See Enterprise Server Tab.
- **Standalone**—Select this tab to open an Application Catalog other than the AdminStudio Enterprise Server database. See Standalone Tab / Specify Database Information.
- **Recent**—Provides a list of recently opened Application Catalogs. When you select an Application Catalog and click **OK**, either the Application Catalog opens or you are prompted for login information (if you need authentication to the Application Catalog). See Recent Tab.

Select AdminStudio Enterprise Server URL Dialog Box

If you click the HTTP link on an AdminStudio Enterprise Server Login dialog, this dialog box opens prompting you to identify the AdminStudio Enterprise Server URL that you would like to connect to.

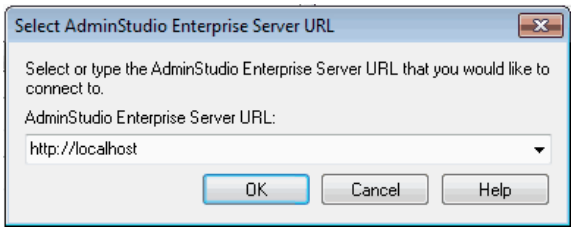

Figure 7-59: Select AdminStudio Enterprise Server URL Dialog Box

Select Substitute Package Dialog Box

The **Substitute Package** field on the **Casper Deployment Data > Limitations** subtab of the **Catalog Deployment Type View** specifies the package to deploy to computers that do not have the required architecture type.

If you click on the **Substitute Package** field (which, by default, is set to **None**), the **Select Substitute Package** dialog box opens, prompting you to select a substitute package from either the Casper Server or the Application Catalog.

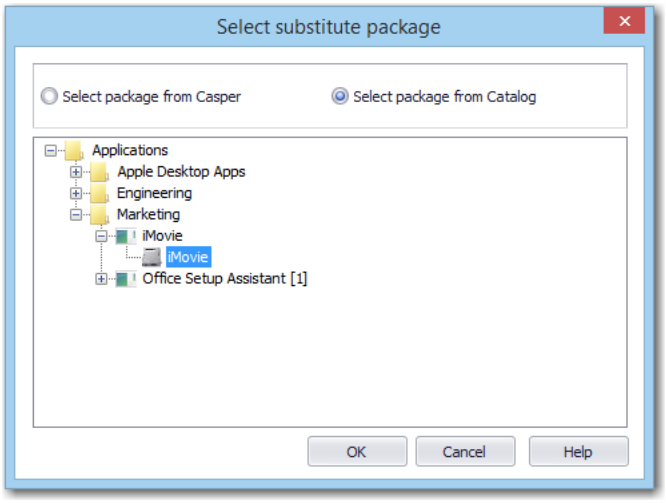

Figure 7-60: Select Substitute Package Dialog Box

Select Watcher Extensions Dialog Box

The **Select Watcher Extensions** dialog box opens when you click in the **Extensions** field on the P**ackage Auto Import** tab of the **Options** dialog box when you are defining a directory to monitor.

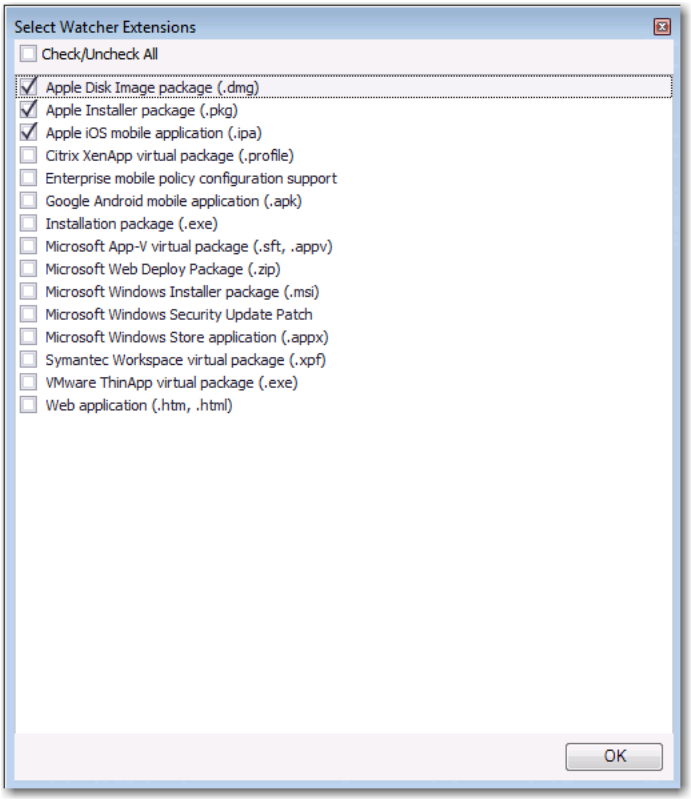

Figure 7-61: Select Watcher Extensions Dialog Box

Select the desired package types to import and then click **OK**.

Servers Dialog Box

The **Servers** dialog box opens when you click the browse link in the **Server names** field on the **XenApp Information** subtab of the **XenApp Deployment Data** tab of the **Catalog Deployment Type View** for a Citrix XenApp profile.

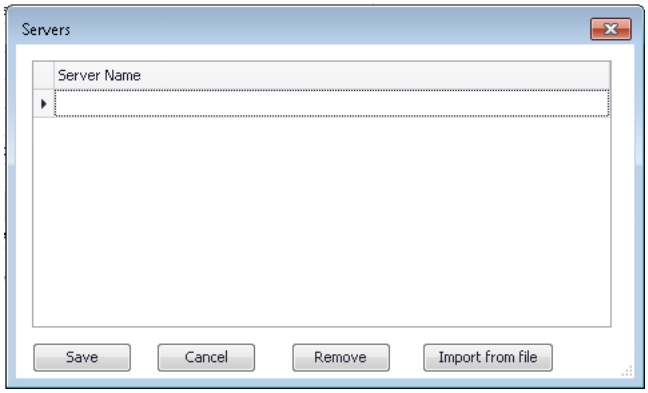

Figure 7-62: Servers Dialog Box

Enter server names in the list; click **Enter** to create a new row in the list. You also have the option to click **Import from file** to import a list of servers from an application server list file (***.asl**).

Specify Applications Dialog Box

On the **Specify Applications** dialog box, which is opened when you click **Add** on the **Add Applications** dialog box, you can use a tree structure to select an App-V 5.0 application to add to an App-V 5.0 SCCM Server virtual environment.

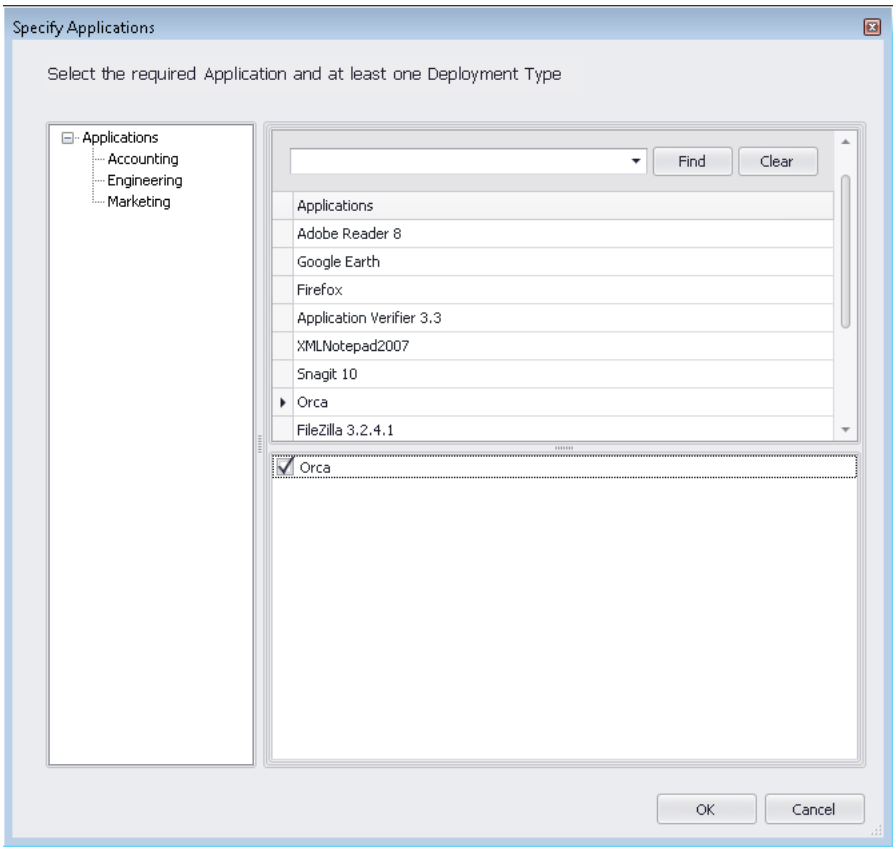

Figure 7-63: Specify Applications Dialog Box

The **Specify Applications** dialog box includes the following properties:

Table 7-74 • Specify Applications Dialog Box

Property	Description
Group tree list	Select the group that contains the App-V 5.0 package that you want to add.
Applications list	When a group is selected in the group tree list, the names of the applications in that group are listed in the Applications pane. Select the application in the list that contains the App-V 5.0 package that you want to add to the virtual environment.

Table 7-74 • Specify Applications Dialog Box

Property	Description
Deployment type list	When an application is selected in the **Applications** list, that application's App-V 5.0 deployment type is listed in the lower pane. Select the App-V 5.0 deployment type that you want to add to the virtual environment and click OK. ***Note*** • *If the selected application does not contain any App-V 5.0 packages, nothing is listed in the Deployment type list.*

Users Dialog Box

The **Users** dialog box opens when you click the browse link in the **Accounts** field on the **XenApp Information** subtab of the **XenApp Deployment Data** tab of the **Catalog Deployment Type View** for a Citrix XenApp profile.

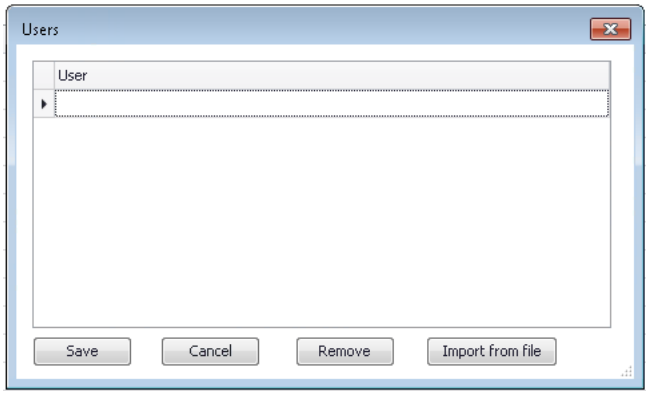

Figure 7-64: Users Dialog Box

Enter the user accounts that you want to have access to this XenApp profile to the list; click **Enter** to create a new row in the list. You also have the option to click **Import from file** to import a list of user accounts from an application user list file (***.aul**).

Virtual Package Association Dialog Box

You can choose to use the **Associate Package** function in Application Manager to manually associate a virtual package with its source Windows Installer package after both packages have been imported into the Application Catalog.

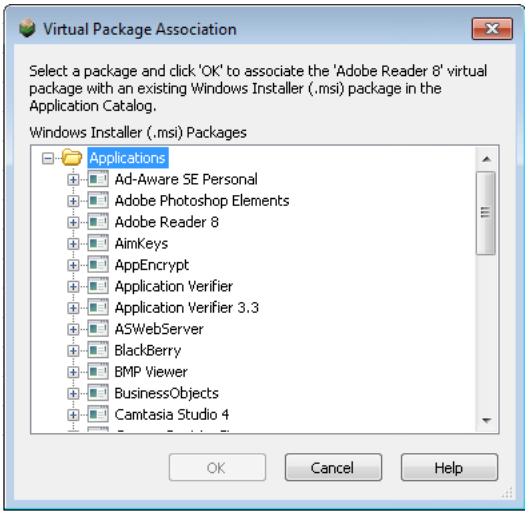

Figure 7-65: Virtual Package Association Dialog Box

If you right-click on a virtual package in the Application Manager tree and then select **Associate Package** from the shortcut menu, the **Virtual Package Association** dialog box opens, listing all of the Windows Installer packages in the Application Catalog. Select the virtual package's source Windows Installer package and click **OK**. The Windows Installer package will now be listed in the **Associations** field on the **Package Information** tab of the **Catalog Deployment Type View** for the virtual package.

Important • *After you have imported a virtual package into the Application Catalog, you can use the* ***Associate Package*** *function to associate it with any Windows Installer package in the Application Catalog, even one that is not its source package. Therefore, it is preferable to use the Import Wizard to import both the Windows Installer and virtual packages at the same time so that AdminStudio can create the proper associations.*

XML Namespaces Dialog Box

On the **XML Namespaces** dialog box, which is opened by clicking **Namespace** on the Create Global Condition Dialog Box when defining a condition with the **Setting Type** of **XPath query**, you specify the XML namespaces and prefixes that you want to use when this XPath query runs.

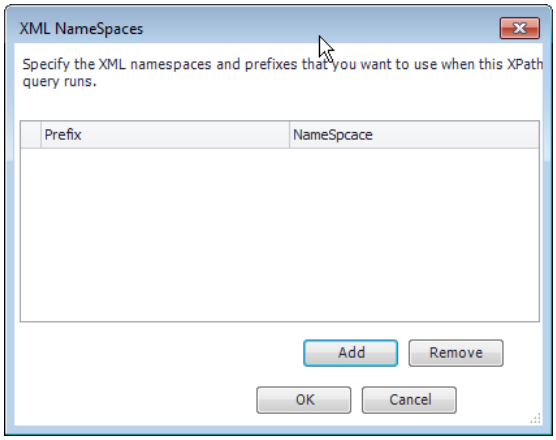

Figure 7-66: XML Namespaces Dialog Box

The **XML Namespaces** dialog box includes the following properties:

Table 7-75 • XML Namespaces Dialog Box Properties

Property	Description
Prefix	Lists the prefix portion of the defined XML namespaces.
Namespace	Lists the namespace portion of the defined XML namespaces.
Add	Click to open the **Add XML Namespace** dialog box, where you are prompted to enter a **Prefix** and **Namespace** for an XML namespace.
Remove	Click to remove a namespace from the list.

Wizards

Application Manager includes the following wizards:

- Application Catalog Wizard
- Conversion Wizard
- Detection Method Wizard
- Dependency Wizard
- Import Wizard
- OS Snapshot Wizard
- Requirement Wizard
- Supersedence Wizard
- Upgrade Wizard

Application Catalog Wizard

You use the Application Catalog Wizard to create a new SQL Server Application Catalog database. This Wizard includes the following panels:

- Welcome Panel
- Specify Database Information Panel
- Select Software Repository Location Panel
- Creating Application Catalog Panel

Welcome Panel

You use the Application Catalog Wizard to create a new SQL Server Application Catalog database. On the **Welcome** panel, click **Next** to continue.

Specify Database Information Panel

On the **Specify Database Information** panel of the Application Catalog Wizard and the **Standalone** tab of the Connect Application Catalog Dialog Box, enter the information required to login to the specified Application Catalog.

Table 7-76 • Application Catalog Wizard / Specify Database Information Panel Options

Option	Description
Server	The list of available SQL Servers on the network. You can also manually enter the name of the SQL Server to which you want to connect.
Authentication	Select one of the following options: • **Windows Authentication**—Choose to use Windows network authentication (your network login ID) to log into this Application Catalog. • **Server Authentication**—Choose to use SQL Server login identification for authentication. • **Login ID and Password**—If you chose Server Authentication, enter the appropriate Login ID and Password.
Catalog	Select the catalog from those available on the Server.
Test	Click this button to test whether a connection can be made to the database.

Select Software Repository Location Panel

A Windows Installer package is made up of many files that are executed when the setup is run. You only import the **.msi** file into the Application Catalog, not all of the files necessary for installation. With the Software Repository, when you import an installation package into the Application Catalog, all of the files associated with that package are copied into the Software Repository location, a directory that you specify. This allows you to manage those files, preventing them from getting modified or lost.

On the **Select Software Repository Location** panel, you can choose to **Enable the Software Repository** for the new Application Catalog, and specify a **Proxy Account** for AdminStudio to use to make modifications to the directory path selected as the **Software Repository Location**.

Important • *You are only permitted to enable the Software Repository when creating an Application Catalog, not after it has already been created.*

The **Select Software Repository Location** panel includes the following options:

Table 7-77 • Select Software Repository Location Panel Options

Option	Description
Enable Software Repository	Select this option to enable the Software Repository feature for this new Application Catalog.
Software Repository Location	Enter or select the directory location of the Software Repository for this Application Catalog. All of the files associated with a package that is imported into the Application Catalog are copied to this location. This allows you to manage those files, preventing them from getting modified or lost.
Proxy Account	Specify the **Login ID** and **Password** for a **Proxy Account** that AdminStudio can use to access and modify the specified **Software Repository Location** folder.  ***Note*** • *You cannot use Windows Authentication for this Proxy Account.*  ***Important*** • *The Proxy Account needs full control on the **Software Repository Location** folder at the directory level as well as at the sharing level. Only such accounts can be used as a Proxy Account to access the **Software Repository Location** directory.*

Creating Application Catalog Panel

This panel displays the progress while your new Application Catalog is being created. If the Application Catalog cannot be created, an error message will be displayed.

Conversion Wizard

You can use the Application Manager **Conversion Wizard** to perform the following tasks from within Application Manager:

- **Convert an App-V 4.x package to App-V 5.0 format**—See Converting App-V 4.x Packages to App-V 5.0 Format.

***Important** • If AdminStudio is installed on a Windows 7 (x64) machine, you will need to first set the PowerShell execution policy to "unrestricted" before attempting to use the Conversion Wizard to upgrade an App-V 4.x package to App-V 5.0 format. To do this, execute the following command on an elevated Windows PowerShell (x86) utility:*

```
Set-ExecutionPolicy Unrestricted
```

***Note** • To perform this upgrade, the Microsoft Application Virtualization Sequencer Version 5.0 must be installed on the same machine as AdminStudio.*

- **Convert one or multiple Windows Installer packages or legacy installers to virtual packages** using default Automated Application Converter settings— See Using the Conversion Wizard to Perform Express Conversion to Virtual Packages or Automated Repackaging.

You open the Conversion Wizard by right-clicking on an application or group of applications in the Application Manager tree and then selecting **Launch Conversion Wizard** from the shortcut menu.

The Conversion Wizard consists of the following panels:

- Target Type Selection Panel
- Select the Package(s) to Convert Panel
- Summary Panel
- Converting the Packages Panel

Target Type Selection Panel

On the **Target Type Selection** panel of the Conversion Wizard, you specify the type of conversion that you want to perform.

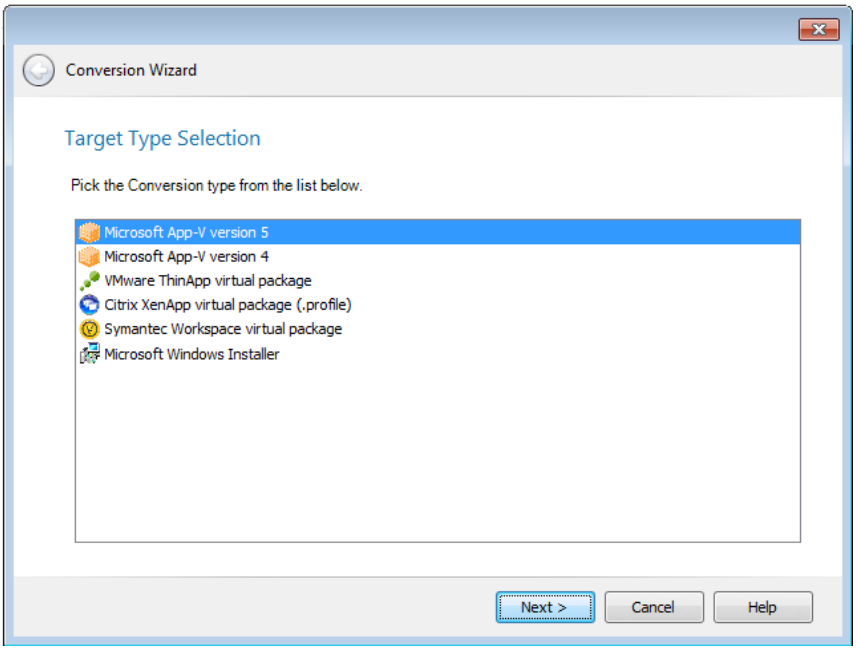

Figure 7-67: Conversion Wizard / Target Type Selection Panel

The following conversion types are available:

Table 7-78 • Conversion Wizard / Target Type Selection Panel

Option	Description
Microsoft App-V version 5	One of the following: • Convert the selected Microsoft App-V 4.x virtual package to App-V 5 format. • Convert the selected Windows Installer or legacy package to a virtual package in Microsoft App-V 5 format.
Microsoft App-V version 4	Convert the selected Windows Installer or legacy package to a virtual package in Microsoft App-V 4 format.
VMware ThinApp virtual package	Convert the selected Windows Installer or legacy package to a virtual package in VMware ThinApp format.
Citrix XenApp virtual package (.profile)	Convert the selected Windows Installer or legacy package to a virtual package in Citrix XenApp format.
Symantec Workspace virtual package	Convert the selected Windows Installer or legacy package to a virtual package in Symantec Workspace format.
Microsoft Windows Installer	Convert the selected legacy package to a Windows Installer package.

Select the Package(s) to Convert Panel

When using the Conversion Wizard to perform a conversion to a virtual package or to upgrade an App-V 4.x virtual package to App-V 5.0 format, the **Select the Package(s) to Convert** panel opens and prompts you to select the packages you want to convert. By default, the package(s) that were selected when you launched the Conversion Wizard are already selected.

Select or clear the selection of applications that you want to convert and then click **Next** to continue.

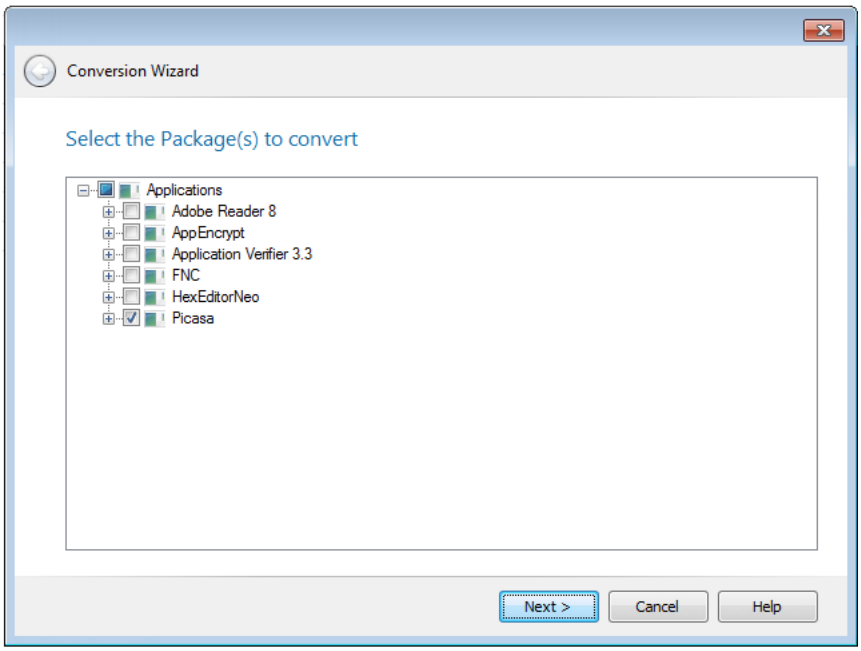

Figure 7-68: Conversion Wizard / Select the Package(s) to Convert Panel

Automated Application Converter Settings Panel

On the Automated Application Converter Settings panel of the Conversion Wizard you can specify the virtual machine platform to use during this conversion run, and can also choose to customize the default Automated Application Converter Settings for this run of the Conversion Wizard.

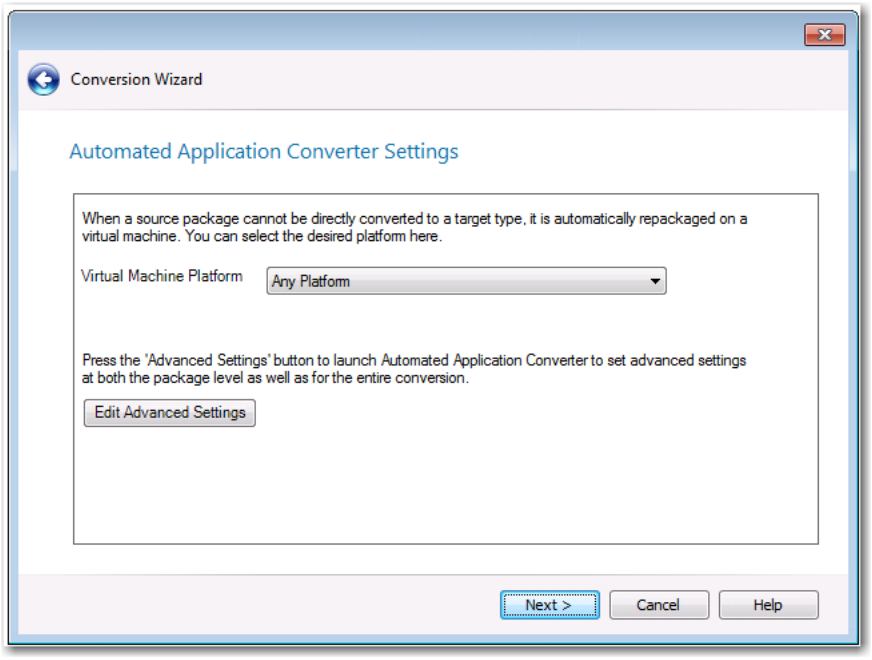

Figure 7-69: Automated Application Converter Settings Panel of Conversion Wizard

The virtual machine platforms defined in the settings file (that is specified on the **Plugin Options > Automated Application Converter Plugin** tab of the **Options** dialog box) are listed in the **Virtual Machine Platform** list. Select the platform to use for this run of the Conversion Wizard.

If you want to edit additional advanced settings, click the **Edit Advanced Settings** button. A copy of the default conversion settings file is opened, displaying the **Packages** tab of Automated Application Converter. For more information, see Using the Conversion Wizard to Perform Express Conversion to Virtual Packages or Automated Repackaging.

Important • *Changes that you make to settings by clicking the **Edit Advanced Settings** button on this panel are only used for this run of the Conversion Wizard. To change the default settings, you need to edit the settings file that is specified on the **Plugin Options > Automated Application Converter Plugin** tab of the **Options** dialog box.*

Summary Panel

The **Summary** panel of the Conversion Wizard lists the selections you have made in the wizard. Click **Next** to begin conversion.

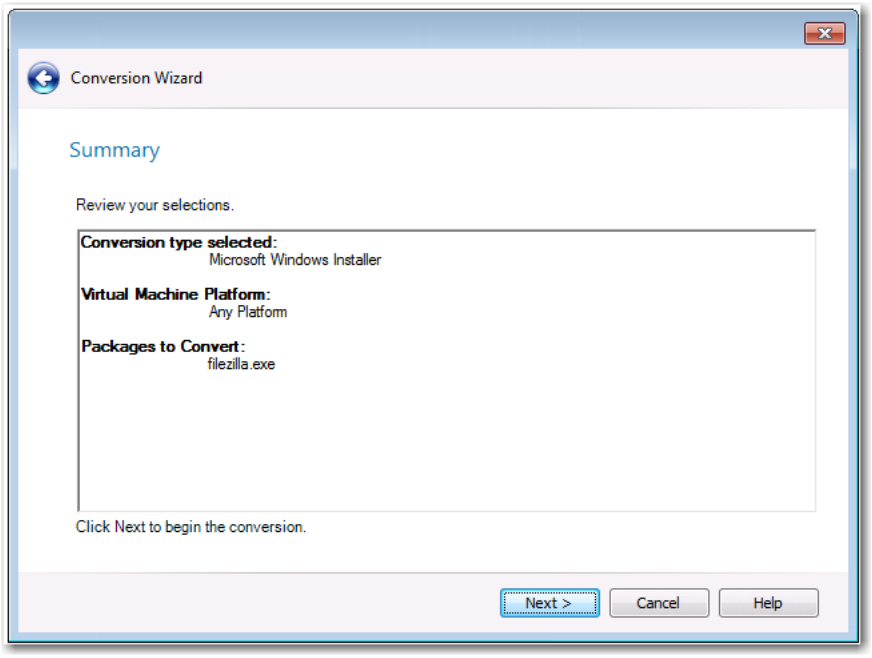

Figure 7-70: Conversion Wizard / Summary Panel

Converting the Packages Panel

During conversion using the Conversion, status messages are displayed on the Converting the Packages panel. When conversion is complete, the results of the conversion are listed.

Click **Finish** to close the wizard.

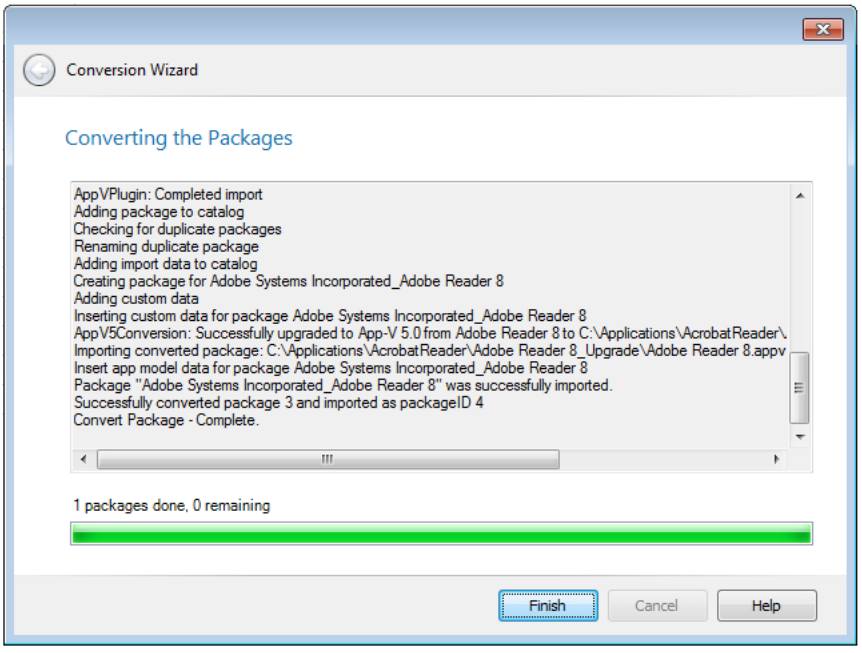

Figure 7-71: Conversion Wizard / Converting the Packages

Detection Method Wizard

The **Detection Method** subtab of the **Deployment Data** tab of the **Catalog Deployment Type View** lists methods to detect whether this package is already installed on the target system. You can use the Detection Method Wizard to add detection methods to this list and to edit existing detection methods.

The **Detection Method Wizard** is opened by clicking the **Add Detection Method** or **Edit Detection Method** buttons in the ribbon of the **Detection Method** subtab.

The **Detection Method Wizard** consists of the following panels:

- Welcome Panel
- File System Detection Panel
- Registry Detection Panel
- Windows Installer Detection Panel
- Script Detection Panel
- Summary Panel

Welcome Panel

On the **Welcome** panel, you select the type of the detection method that you are adding: file system, registry, Windows Installer, or script.

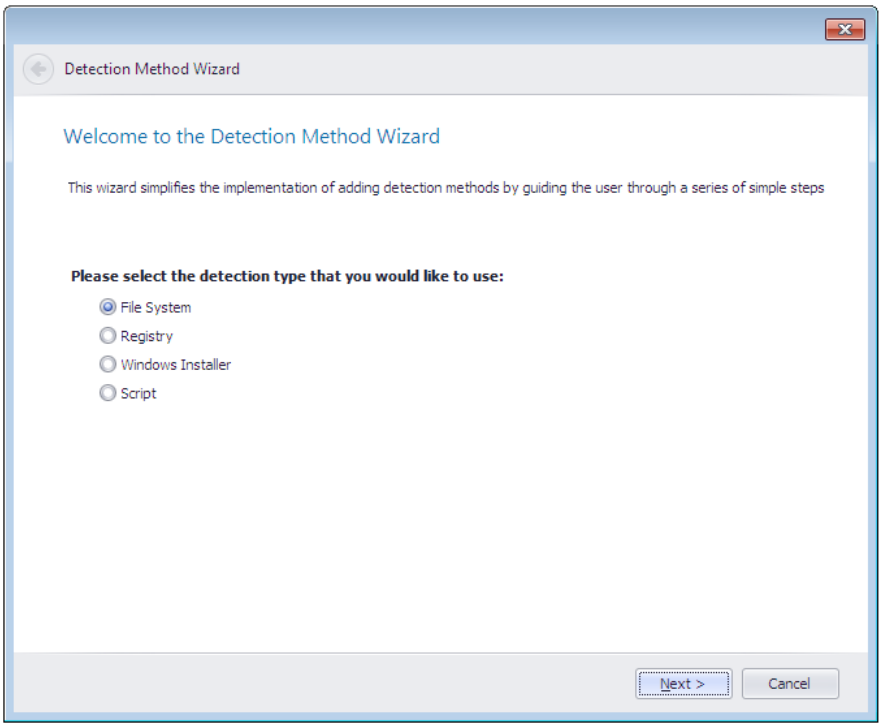

Figure 7-72: Detection Method Wizard / Welcome Panel

The **Welcome** panel includes the following properties:

Property	Description
File System	Determine whether an application is installed on a client device by detecting whether a specified file or folder exists on that client device.
Registry	Determine whether an application is installed on a client device by detecting whether a specified registry key or registry value exists on that client device.
Windows Installer	Determine whether an application is installed on a client device by detecting whether a specified Windows Installer file exists on that client device.
Script	Use a script to determine whether an application is installed on a client device.

File System Detection Panel

On the **File System Detection** panel, which opens if you selected **File System** on the **Welcome** panel, you enter the file or folder path information and the conditions to be applied on the selected file.

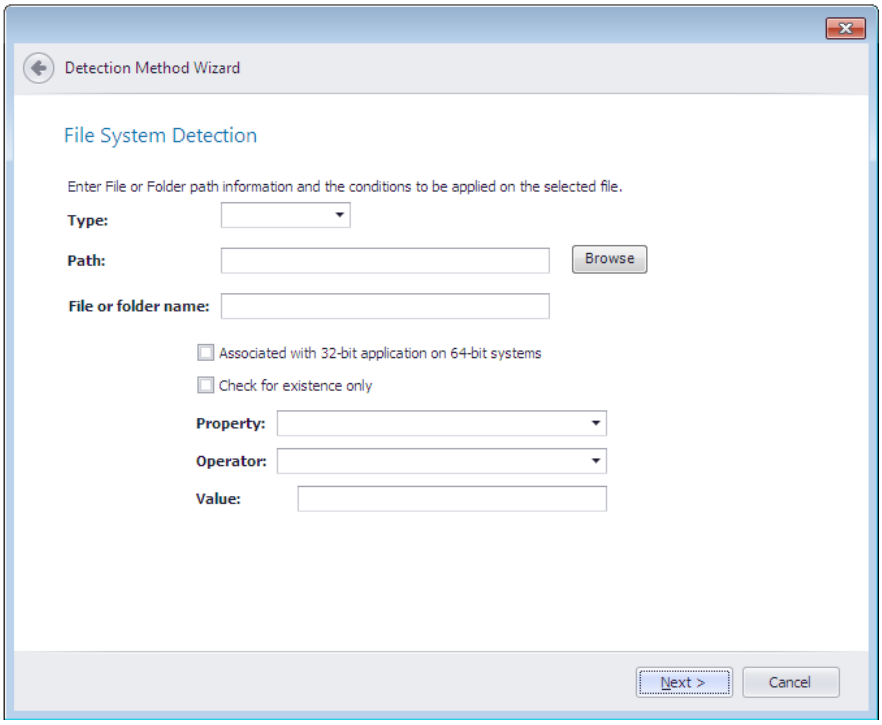

Figure 7-73: Detection Method Wizard / File System Detection Panel

The **File System Detection** panel includes the following properties:

Table 7-79 • Detection Method Wizard / File System Detection Panel

Property	Description
Type	Select either **File** or **Folder**.
Path	Click **Browse** and select the path the location of the file or folder.
File or folder name	Enter the name of the file or folder that you are using in this detection method.
Associated with 32-bit application on 64-bit systems	Select this option if you want to restrict this detection method to a file or folder that is associated with a 32-bit application on a 64-bit system.
Check for existence only	Select this option if you want to just check for the existence of the specified file or folder on the client system, without requiring that it meet any **Date Modified** or **Date Created** condition. If you select this option, the **Property**, **Operator**, and **Value** fields are disabled.
Property **Operator** **Value**	Use these fields to define a condition, using the **Date Modified** or **Date Created** property, that the selected file or folder has to meet in order to be successfully detected. Available operators are: **Equals**, **Not equal to**, **Greater than or equal to**, **Greater than**, **Less than**, **Less than or equal to**, or **Between**. In the **Value** field, enter a date in the following format: 4/17/2012 4:47:50 PM

Registry Detection Panel

On the **Registry Detection** panel, which opens if you selected **Registry** on the **Welcome** panel, you enter the Windows Registry information and the conditions to be applied on those values.

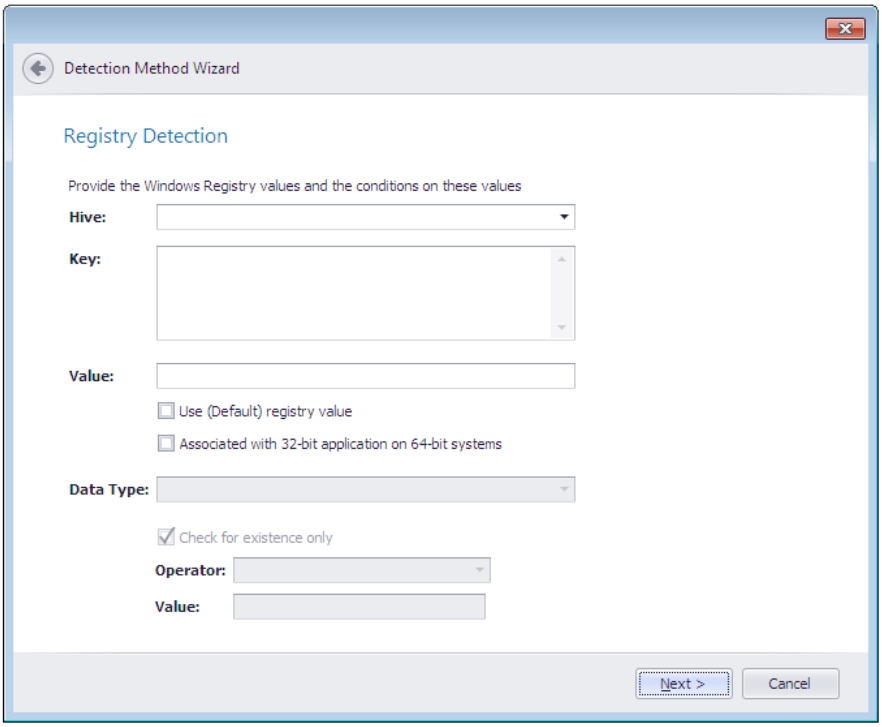

Figure 7-74: Detection Method Wizard / Registry Detection Panel

The **Registry Detection** panel includes the following properties:

Table 7-80 • Detection Method Wizard / Registry Detection Panel

Property	Description
Hive	Select the registry hive of the registry key or value that you are using in this detection method.
Key	Enter the registry key that you are using in this detection method.
Value	Enter the registry value that you are using in this detection method. This field is disabled if the **Use (Default) registry value** option is selected.
Use (Default) registry value	Select this option to search for a default registry value. If you select this option, the **Value** field is disabled and the **Data Type** field is enabled.
Associated with 32-bit application on 64-bit systems	Select this option if you want to restrict this detection method to a registry key or value that is associated with a 32-bit application on a 64-bit system.

Table 7-80 • Detection Method Wizard / Registry Detection Panel

Property	Description
Data Type	Select the data type of the default registry value that you are using in this detection method. Available data types are: **String**, **Integer**, or **Version**. This field is only enabled when the **Use (Default) registry value** option is selected.
Check for existence only	Select this option if you want to just check for the existence of the specified registry key or value on the client system, without requiring that it meet any conditions. If you select this option, the **Operator** and **Value** fields are disabled.
Operator **Value**	Use these fields to define a condition that the specified registry key or value has to meet in order to be successfully detected. Available operators are: **Equals**, **Not equal to**, **Greater than or equal to**, **Greater than**, **Less than**, **Less than or equal to**, or **Between**. In the **Value** field, enter a value for the registry key or value to define the condition.

Windows Installer Detection Panel

On the **Windows Installer Detection** panel, which opens if you selected **Windows Installer** on the **Welcome** panel, you provide the Windows Installer file information and the conditions that need to be applied on that file.

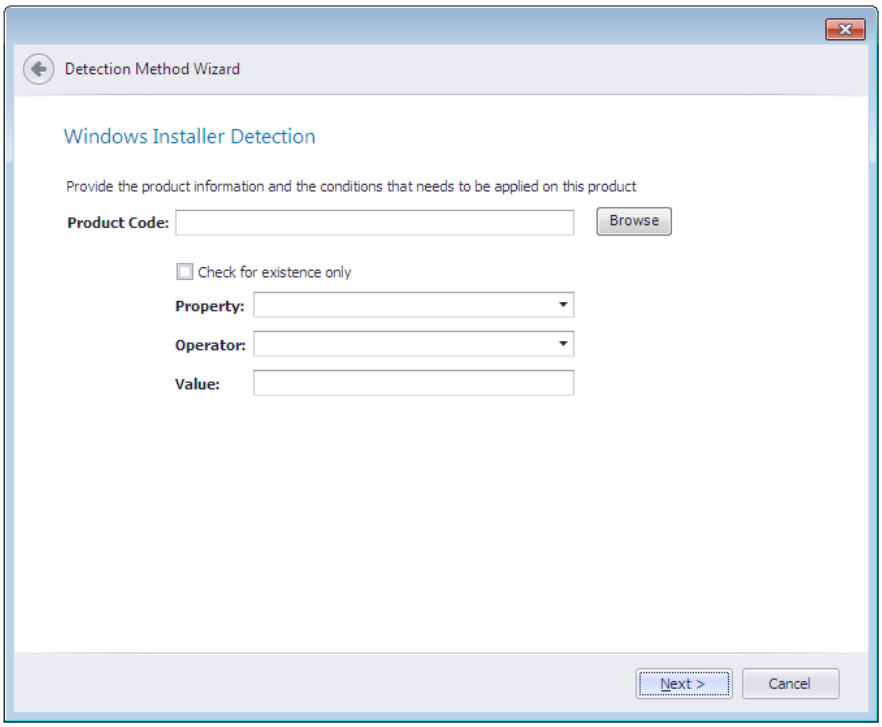

Figure 7-75: Detection Method Wizard / Windows Installer Detection Panel

The **Windows Installer Detection** panel includes the following properties:

Table 7-81 • Detection Method Wizard / Windows Installer Detection Panel

Property	Description
Product Code	Click **Browse** and select the Windows Installer **.msi** file that you want to use in this detection method. The Windows Installer file's **Product Code** will then be listed this field. ***Note*** • *You also have the option of entering the product code.*
Check for existence only	Select this option if you want to just check for the existence of the specified Windows Installer file on the client system, without requiring that it meet any conditions. If you select this option, the **Property**, **Operator** and **Value** fields are disabled.
Property **Operator** **Value**	Use these fields to define a condition, using the **Version** or **Upgrade Code** property, that the specified Windows Installer file has to meet in order to be successfully detected. After you select a **Property**, the **Value** field is populated with a **Version** or **Upgrade Code** value from the selected Windows Installer file. Available operators are: **Equals**, **Not equal to**, **Greater than or equal to**, **Greater than**, **Less than**, or **Less than or equal to**. ***Note*** • *If you attempt to edit a Windows Installer Detection detection method, and you attempt to change the detection method property (from **Upgrade Code** to **Version** or vice versa), you may be required to required to browse to the Windows Installer file again to retrieve the new property value.*

Script Detection Panel

On the **Script Detection** panel, which opens if you selected **Script** on the **Welcome** panel, you specify the script information that you want to use to determine whether an application is installed on a client device.

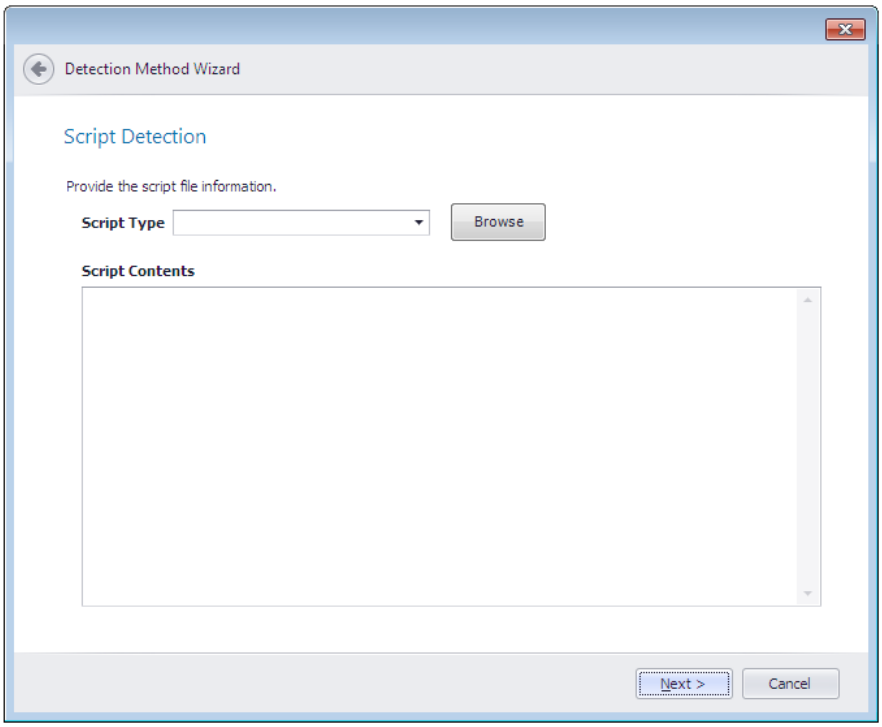

Figure 7-76: Detection Method Wizard / Script Detection Panel

Important • *If you already have some non-script rules defined for this deployment type, if you then add a script rule, the non-script rule(s) will not be pushed to System Center Configuration Manager when you publish this application.*

The **Script** panel includes the following properties:

Table 7-82 • Detection Method Wizard / Script Panel

Property	Description
Script Type	First, select one of the following options: **PowerShell**, **VBScript**, or **JScript**. Next, click the **Browse** button and select the script that you want to use for this detection method. You also have the option of entering or pasting the script code directly into the **Script Contents** box.
Script Contents	Displays the contents of the specified script file. You are permitted edit the script in this text box.

Summary Panel

On the **Summary** panel, a summary of your selections is listed. Click **Finish** to add the Detection Method to the list.

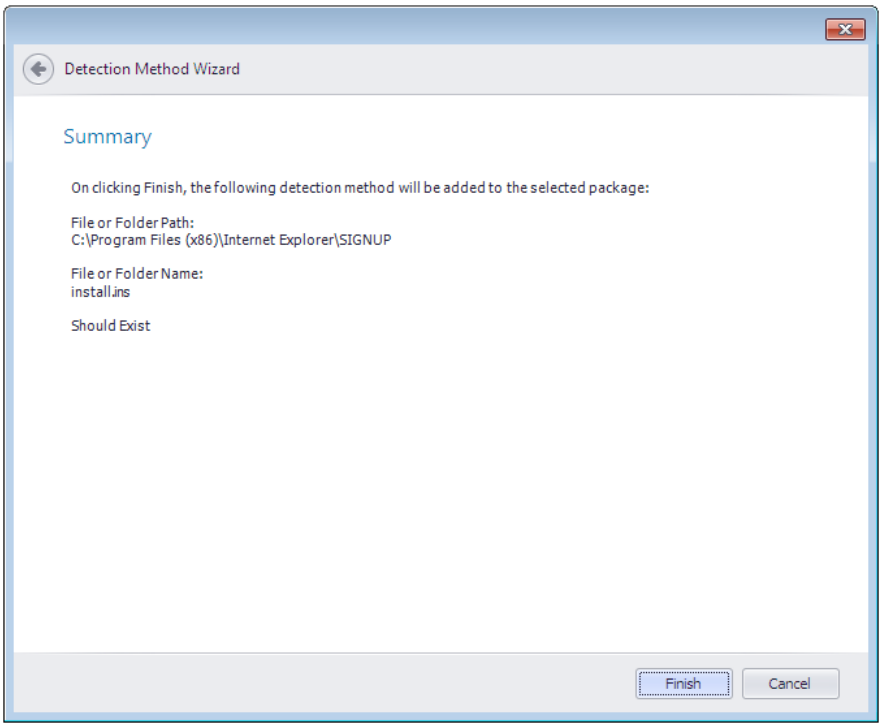

Figure 7-77: Detection Method Wizard / Summary Panel

Dependency Wizard

You can use the **Dependencies** subtab to view or edit a list of other packages in the Application Catalog that must also be deployed by Microsoft System Center Configuration Manager with this package onto the target machine in order for this package to successfully operate. You can use the Dependency Wizard to add dependencies to this list and to edit existing dependencies.

The **Dependency Wizard** is opened by clicking the **Add Dependency** or **Edit Dependency** buttons in the ribbon of the **Dependencies** subtab.

The **Dependency Wizard** consists of the following panels:

- Welcome Panel
- Deployment Types in Application Catalog Panel
- Configuration Manager Credentials Panel
- Deployment Types in Configuration Manager 2012 Panel
- Auto Detect Dependencies Panel
- Scanning Progress Panel
- Auto Scan Results Panel
- System Requirements Panel

- Summary Panel

Welcome Panel

On the **Welcome** panel, choose the method that you would like to use to add dependencies:

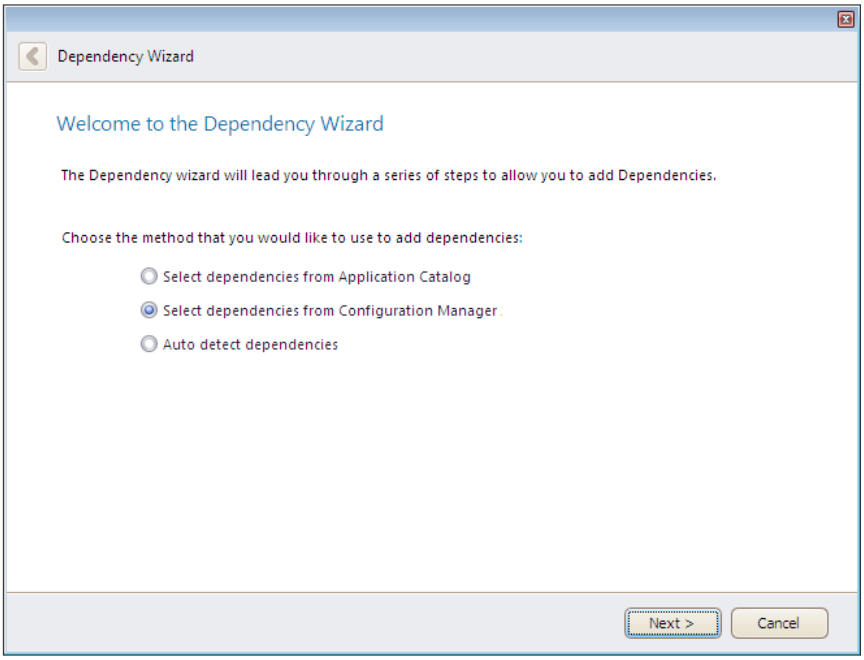

Figure 7-78: Dependency Wizard / Welcome Panel

The **Welcome** panel includes the following options:

Table 7-83 • Dependency Wizard / Welcome Panel

Option	Description
Select dependencies from Application Catalog	Select this option if you want to select a dependent application from those in the Application Catalog.
Select dependencies from Configuration Manager	Select this option if you want to select a dependent application from those in System Center Configuration Manager.
Auto-detect dependencies	Select this option if you want Application Manager to automatically detect dependent packages. To do this, Application Manager will automatically scan the file headers of Windows Installer packages to determine if any dependencies exist.

Deployment Types in Application Catalog Panel

On the **Deployment Types in Application Catalog** panel, you select dependent applications from the Application Catalog.

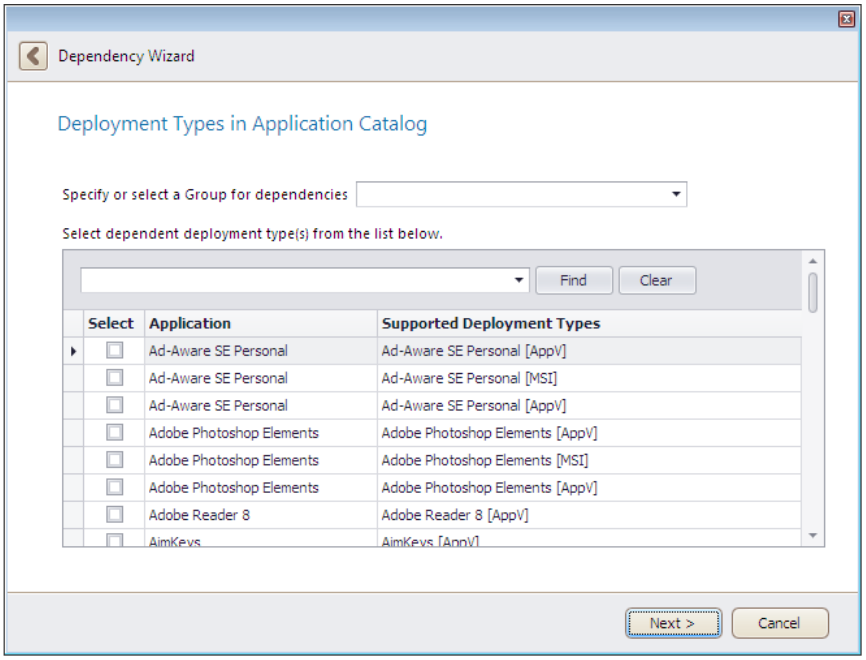

Figure 7-79: Dependency Wizard / Deployment Types in Application Catalog Panel

The Deployment Types in Application Catalog panel includes the following options:

Table 7-84 • Dependency Wizard / Deployment Types in Application Catalog Panel

Option	Description
Specify or select a Group for dependencies	Select a group name from the list or enter the name of a new group.
Search box	Use to filter the list of packages.
Application	Name of available applications.
Supported Deployment Types	Deployment type of available applications.

Configuration Manager Credentials Panel

On the **Configuration Manager Credentials** panel, you enter connection information for System Center Configuration Manager.

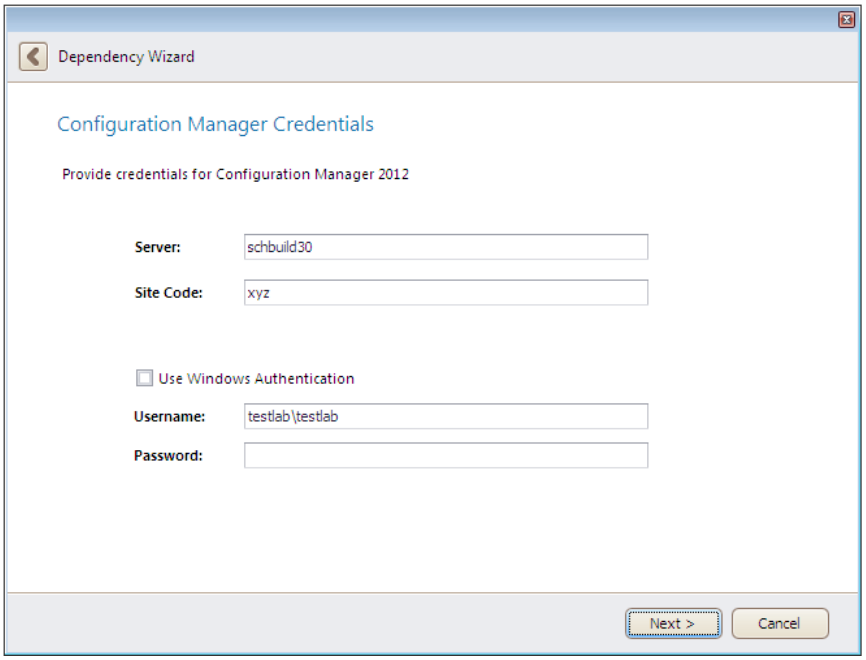

Figure 7-80: Dependency Wizard / Configuration Manager Credentials Panel

The **Configuration Manager Credentials** panel includes the following properties:

Table 7-85 • Dependency Wizard / Configuration Manager Credentials Panel

Property	Description
Server	Enter the name of the Configuration Manager Server you want to connect to.
Site Code	Enter the code that identifies the Configuration Manager site you want to connect to.
Use Windows Authentication	Select this option if you want to use Windows network authentication (your network login ID) to log into this Microsoft Configuration Manager Server.
Username and Password	If using server authentication, enter the **Username** and **Password** of that server.

Deployment Types in Configuration Manager 2012 Panel

On the **Deployment Types in Configuration Manager 2012** panel, you select dependent deployment types from the list.

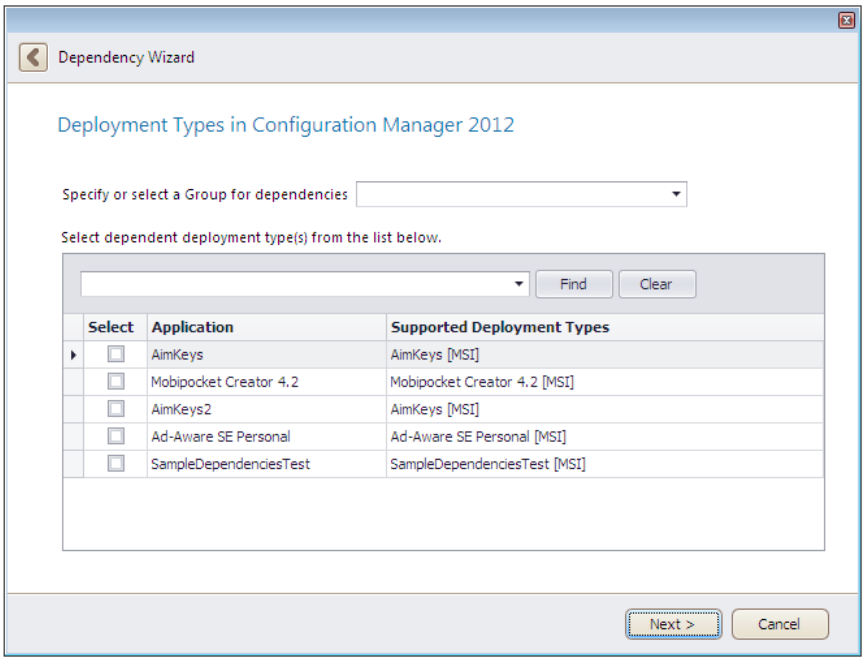

Figure 7-81: Dependency Wizard / Deployment Types in Configuration Manager 2012 Panel

The **Deployment Types in Configuration Manager 2012** panel includes the following properties:

Table 7-86 • Dependency Wizard / Deployment Types in Configuration Manager 2012 Panel

Property	Description
Specify or select a Group for dependencies	Either select an existing group from the list or enter the name for a new group.
Search box	Use to filter the list of packages.
Application	Name of available applications
Supported Deployment Types	Deployment types of available applications.

Auto Detect Dependencies Panel

The **Auto Detect Dependencies** panel opens when you select **Auto-detect dependencies** from the **Welcome** panel of the Dependency Wizard.

Click **Next** to begin scanning. Application Manager will begin to automatically scan the file headers of Windows Installer packages to determine if any dependencies exist.

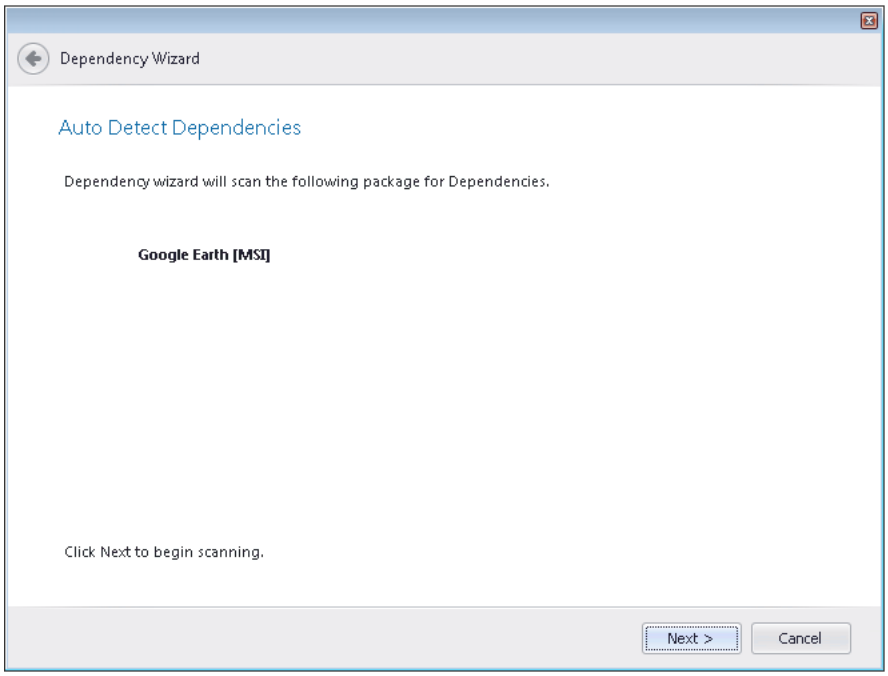

Figure 7-82: Dependency Wizard / Auto Detect Dependencies Panel

When you scan a Windows Installer package for dependencies, using the **Auto detect dependencies** option of the **Dependency Wizard**, two types of dependencies are detected:

- **Package-level dependencies**—The **Auto detect dependencies** option of the **Dependency Wizard** detects other packages that the current package is dependent upon. You can then choose to add them to the package's **Dependencies** subtab of the **Deployment Data** tab on the **Catalog Deployment Type View**.
- **File-level dependencies**—The **Auto detect dependencies** option of the **Dependency Wizard** populates the a Windows Installer package's file-level Dependencies View.

Scanning Progress Panel

The **Scanning Progress** panel opens when you begin a dependency scan and shows the progress. When scanning is complete, you are prompted to click **Next** to see the results of the dependency scan.

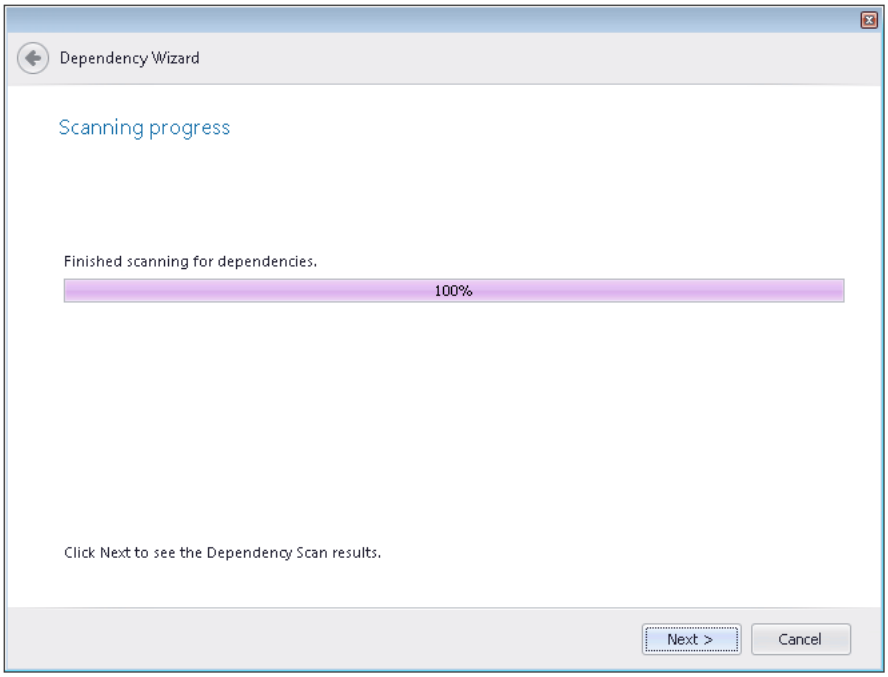

Figure 7-83: Dependency Wizard / Scanning Progress Panel

Auto Scan Results Panel

If the Dependency Wizard detected some dependencies during the dependency scan, the dependencies are listed.

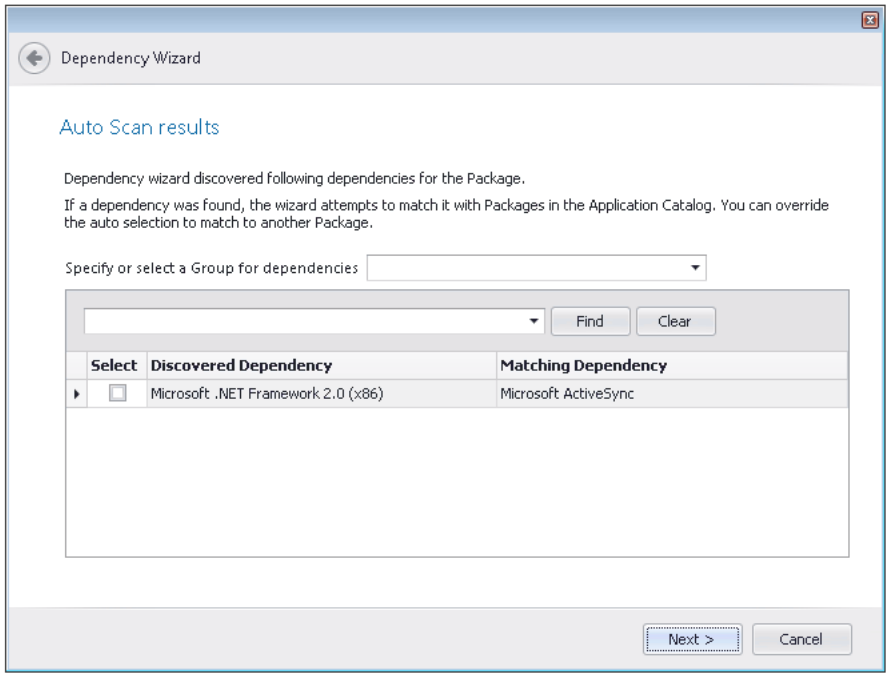

Figure 7-84: Dependency Wizard / Auto Scan Results Panel

The **Auto Scan Results** panel includes the following properties when dependencies are detected:

Table 7-87 • Auto Scan Results Panel (Dependencies Found) / Dependence Wizard

Property	Description
Specify or select a Group for dependencies	Either select an existing group from the list or enter the name for a new group.
Search box	Use to filter the list of packages.
Discovered Dependency	List of discovered dependencies. Select the dependencies you want to add to the **Dependencies** tab.
Matching Dependency	Identifies other packages that are also dependent upon the listed dependency.

Below is an example of the Auto Scan Results panel when no dependencies are found:

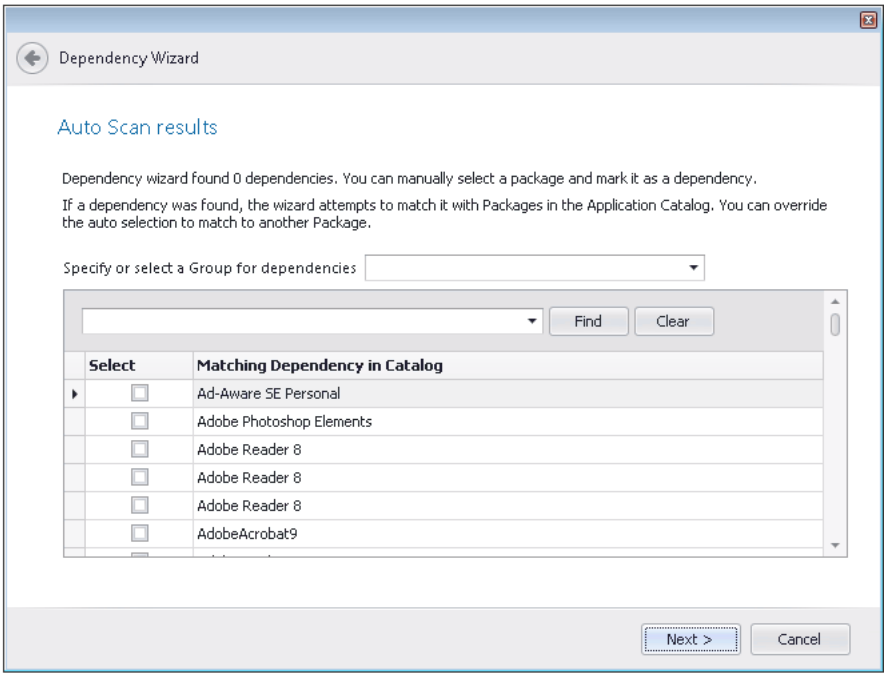

Figure 7-85: Dependency Wizard / Auto Scan Results Panel / No Dependencies Found

The **Auto Scan Results** panel includes the following properties when no dependencies are detected:

Table 7-88 • Auto Scan Results Panel (Dependencies Found) / Dependence Wizard

Property	Description
Specify or select a Group for dependencies	Either select an existing group from the list or enter the name for a new group.

Table 7-88 • Auto Scan Results Panel (Dependencies Found) / Dependence Wizard

Property	Description
Search box	Use to filter the list of packages.
Matching Dependency in Catalog	Select the packages that you want to add to the **Dependency** tab for the selected package.

System Requirements Panel

If you are performing a dependency scan, the **System Requirements** panel opens and lists any system requirements that were detected for the selected package.

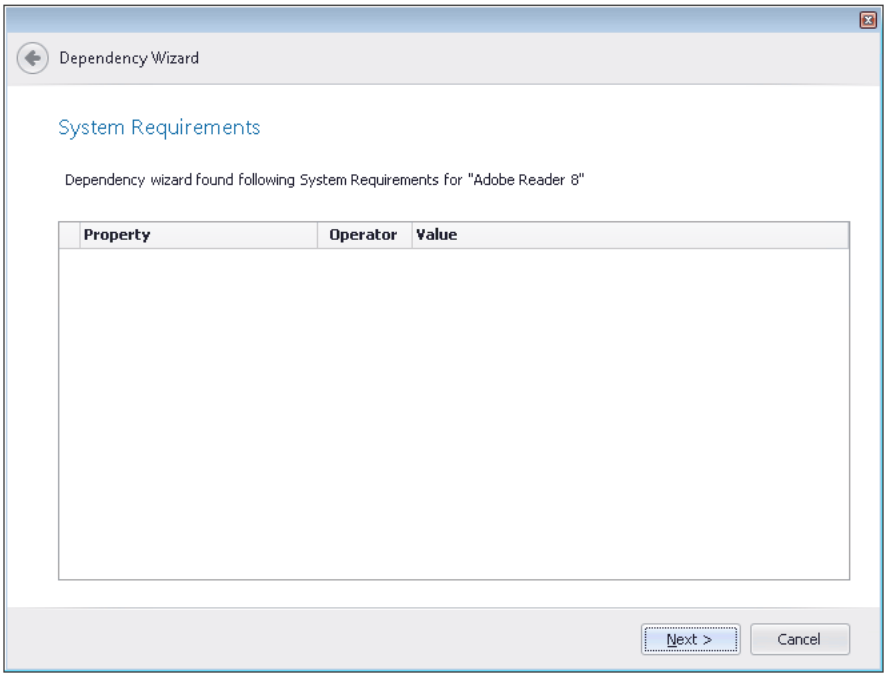

Figure 7-86: Dependency Wizard / System Requirements Panel

Summary Panel

On the **Summary** panel, a summary of your selections is listed. Click **Finish** to add the dependencies to the list.

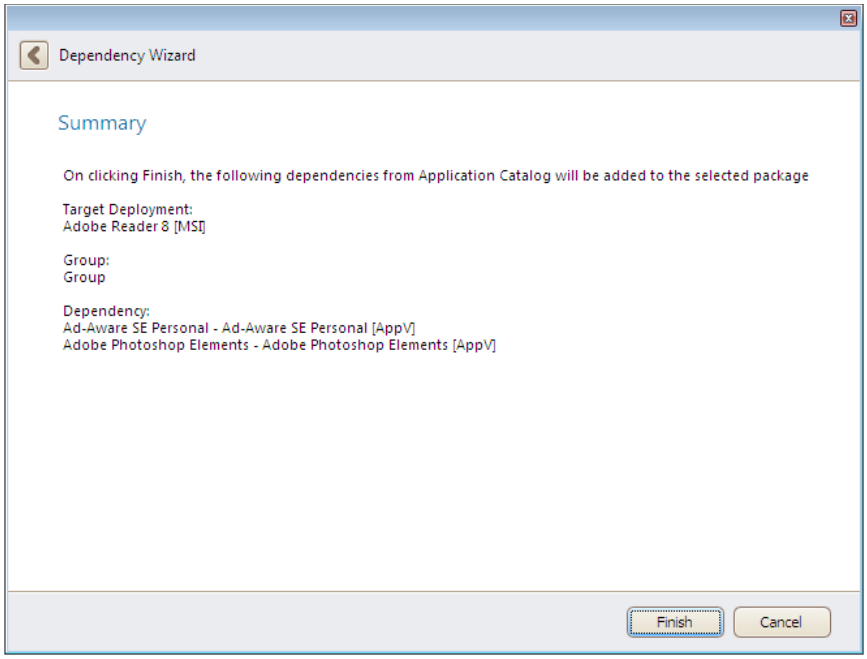

Figure 7-87: Dependency Wizard / Summary Panel

Import Wizard

The Import Wizard allows you to import the following installation package types into the Application Catalog: Windows Installer packages and associated transform and patch files, virtual packages (Microsoft App-V, VMware ThinApp, and Citrix), mobile apps (Apple iOS, Google Android, and Windows Store), merge modules, OS snapshots, and other non-MSI setup formats (such as InstallShield Professional or ISMP installations).

The Import Wizard consists of the following panels:

- Source Panel
- Package Type Selection Panel (Single Application)
- Package Type Selection Panel (Folder of Multiple Applications)
- Enterprise Policy File Selection Panel
- Security Patch File Selection Panel
- OS Snapshot Selection Panel
- Public Store Selection Panel
- Store Application Selection Panel
- Source Server Details Panel
- Package File Selection Panel
- Package Folder Selection Panel
- Web Site Details Panel
- Select Applications (Folder of Multiple Applications) Panel

- Select Applications/Packages Panel
- Package Support Files Panel
- Destination Group Panel
- Summary Panel
- Running the Import Panel

When an import is being performed, Application Manager displays its progress messages in the **Import** tab of the **Output Window**.

Source Panel

On the **Source** panel of the Import Wizard, which is opened by clicking the **Import** button on the **Catalog** tab of the Application Manager ribbon, specify the type of import that you want to perform.

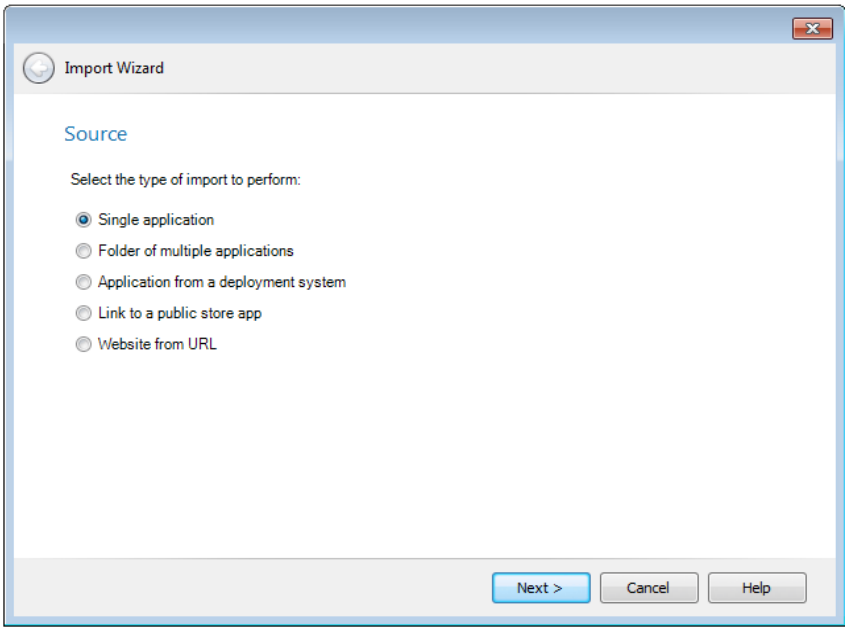

Figure 7-88: Import Wizard / Source Panel

On the **Source** panel, select one of the following options:

Table 7-89 • Source Panel

Option	Description
Single application	Select this option to import a single application into the Application Catalog.

Table 7-89 • Source Panel

Option	Description
Folder of multiple applications	Select this option to import a directory of applications into the Application Catalog. You can import packages of multiple deployment types using this option. You will be prompted to select which deployment types you wish to import. All of the installer packages of the selected deployment types that are located in the selected folder or its subfolders will be imported. You will also be given the option to mimic the directory structure of the selected directory.
Application from a deployment system	Select this option to import applications or packages from the following deployment systems: • Microsoft System Center 2012 Configuration Manager • Microsoft System Center 2007 Configuration Manager  ***Note*** • *Prior to being able to import packages from one of these deployment systems, you first need to set up a connection, as described in Creating Multiple Named Connections to Distribution Systems.*
Link to a public store app	Select this option to import a deep link to a mobile app in a public store: Apple Store, Google Play Store, or Microsoft Windows Store.
Website from URL	Select this option to import a web application into the Application Catalog by specifying a URL to a web application.  ***Note*** • *If you want to instead import a web application that is in a directory on a network server, you need to select the* ***Folder of multiple applications*** *option on the* ***Source*** *panel, and then select the* ***Web application (.htm, .html)*** *option on the* ***Package Type Selection*** *panel. See Importing a Local Web Application from a Virtual Directory.*

Package Type Selection Panel (Single Application)

On the **Package Type Selection** panel, which opens when you select **Single application** on the **Source** panel, you are prompted to select the type of package that you want to import.

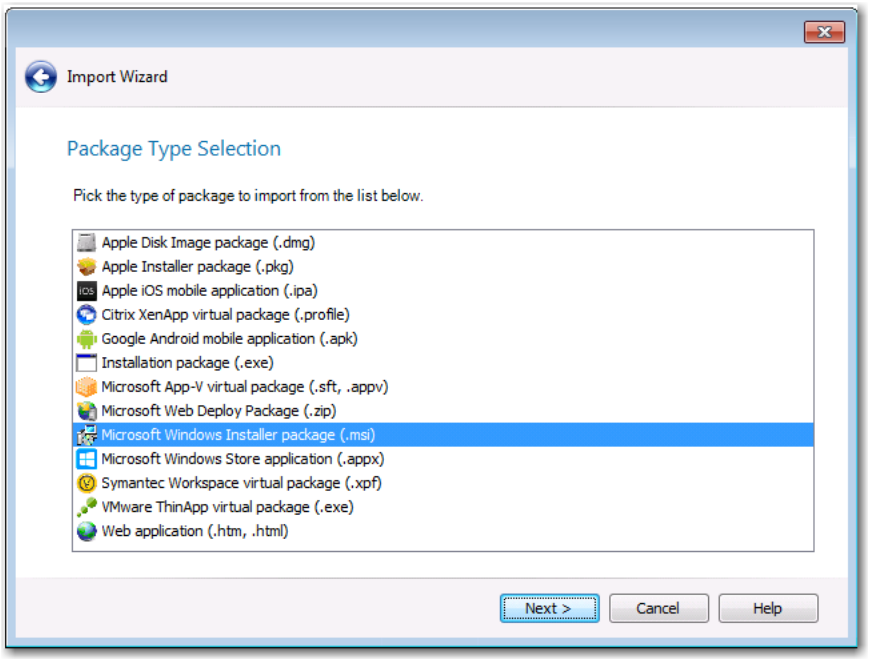

Figure 7-89: Import Wizard / Package Type Selection Panel (Single Application)

Select one of the following package types and then click **Next**:

Table 7-90 • Package Types Listed on Package Type Selection Panel

Package Type	Description
Apple Disk Image package (.dmg)	When you double-click a **.dmg** file, an Apple disk image is "mounted" as a volume within the Finder. To install the application, you usually drag the application icon from the disk image into the Applications folder.
Apple Installer package (.pkg)	Double-clicking a **.pkg** file launches the Apple installer application, where the package is installed by proceeding through an installation wizard.
Apple iOS mobile app (.ipa)	File used to distribute and install an app on devices (iPhones and iPads) running the Apple iOS operating system.
Citrix XenApp virtual package (.profile)	Virtual package for deployment on Citrix XenApp, an application delivery system for Windows applications.
Google Android mobile app (.apk)	File used to distribute and install an app on devices (phones and tablets) running the Google Android operating system.

Table 7-90 • Package Types Listed on Package Type Selection Panel

Package Type	Description
Installation package (.exe)	Non-MSI legacy setup types (such as InstallShield Professional or ISMP installations). Also, complex installer executable files (.exe) that contain bundled Windows Installer packages, including: • InstallShield InstallScript .exe files • InstallShield Basic MSI installers that are compressed into a setup.exe file • InstallShield Suite Installer .exe files • Wise Package Studio .exe files • Other executable file types that can be uncompressed by 7-ZIP
Microsoft App-V virtual package (.sft, .appv)	Virtual application designed to run on the Microsoft Application Virtualization platform. An App-V 4.5 or 4.6 package has an **.sft** extension, while an App-V 5.0 package has an **.appx** extension.
Microsoft Web Deploy package (.zip)	You can use the web deploy package format to streamline the deployment of web applications to Microsoft IIS web servers or to Microsoft Azure websites. In a web deploy package, the content, configuration, databases and other artifacts of a web application are packaged in a .zip file.
Microsoft Windows Installer package (.msi)	File that contains all of the information that the Windows Installer requires to install or uninstall an application or product and to run the setup user interface. The **.msi** file can also contain one or more transform files (**.mst**) and one or more patches (**.msp**).
Microsoft Windows Store application (.appx)	File used to distribute and install a mobile app on Windows mobile devices.
Symantec Workspace virtual package (.xpf)	Virtual package in Symantec Workspace format that is activated using the Symantec Workspace Virtualization Agent (which is installed on the client computer).
VMware ThinApp virtual package (.exe)	Self-contained virtual package in VMware ThinApp format that requires no client-side agents or supporting server infrastructure.
Web application (.htm, .html)	Default "home" page of a local web application. Importing this file will enable you to perform browser compatibility testing and interactive web testing. See *Importing a Local Web Application from a Virtual Directory*.  ***Note*** • *To import a deployed web application by entering its URL, see Importing a Deployed Web Application.*

Package Type Selection Panel (Folder of Multiple Applications)

On the **Package Type Selection** panel, which opens when you select **Folder of multiple applications** on the **Source** panel, you are prompted to select the types of packages that you want to import.

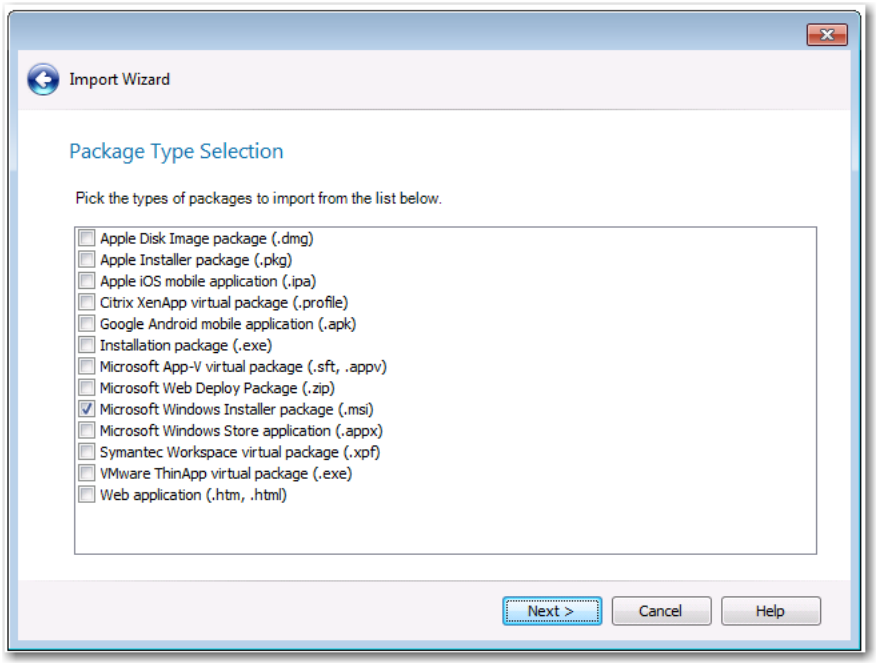

Figure 7-90: Import Wizard / Package Type Selection (Folder of Multiple Applications)

Select one or more of the following package types and then click **Next**:

Table 7-91 • Package Types Listed on Package Type Selection Panel

Package Type	Description
Apple Disk Image package (.dmg)	When you double-click a **.dmg** file, an Apple disk image is "mounted" as a volume within the Finder. To install the application, you usually drag the application icon from the disk image into the Applications folder.
Apple Installer package (.pkg)	Double-clicking a **.pkg** file launches the Apple installer application, where the package is installed by proceeding through an installation wizard.
Apple iOS mobile app (.ipa)	File used to distribute and install an app on devices (iPhones and iPads) running the Apple iOS operating system.
Citrix XenApp virtual package (.profile)	Virtual package for deployment on Citrix XenApp, an application delivery system for Windows applications.
Google Android mobile app (.apk)	File used to distribute and install an app on devices (phones and tablets) running the Google Android operating system.

Table 7-91 • Package Types Listed on Package Type Selection Panel

Package Type	Description
Installation package (.exe)	Non-MSI legacy setup types (such as InstallShield Professional or ISMP installations). Also, complex installer executable files (.exe) that contain bundled Windows Installer packages, including: • InstallShield InstallScript .exe files • InstallShield Basic MSI installers that are compressed into a setup.exe file • InstallShield Suite Installer .exe files • Wise Package Studio .exe files • Other executable file types that can be uncompressed by 7-ZIP
Microsoft App-V virtual package (.sft, .appv)	Virtual application designed to run on the Microsoft Application Virtualization platform. An App-V 4.5 or 4.6 package has an **.sft** extension, while an App-V 5.0 package has an **.appx** extension.
Microsoft Web Deploy Package (.zip)	You can use the web deploy package format to streamline the deployment of web applications to Microsoft IIS web servers or to Microsoft Azure websites. In a web deploy package, the content, configuration, databases and other artifacts of a web application are packaged in a .zip file.
Microsoft Windows Installer package (.msi)	File that contains all of the information that the Windows Installer requires to install or uninstall an application or product and to run the setup user interface. The **.msi** file can also contain one or more transform files (**.mst**) and one or more patches (**.msp**).
Microsoft Windows Store application (.appx)	File used to distribute and install a mobile app on Windows mobile devices.
Symantec Workspace virtual package (.xpf)	Virtual package in Symantec Workspace format that is activated using the Symantec Workspace Virtualization Agent (which is installed on the client computer).
VMware ThinApp virtual package (.exe)	Self-contained virtual package in VMware ThinApp format that requires no client-side agents or supporting server infrastructure.
Web application (.htm, .html)	Default "home" page of web application.  ***Note*** • *To import a deployed web application by entering its URL, see Importing a Deployed Web Application.*

Enterprise Policy File Selection Panel

On the **Enterprise Policy File Selection** panel, which opens when you select the **Enterprise Policy Configurations** group on the **Environment** tab of the Application Manager tree and then click **Import** in the toolbar, you are prompted to select the enterprise policy file that you want to import.

For information on enterprise policy files, see Managing iOS Enterprise Policy Configuration Files.

Browse to an enterprise policy file and then click **Next** to continue.

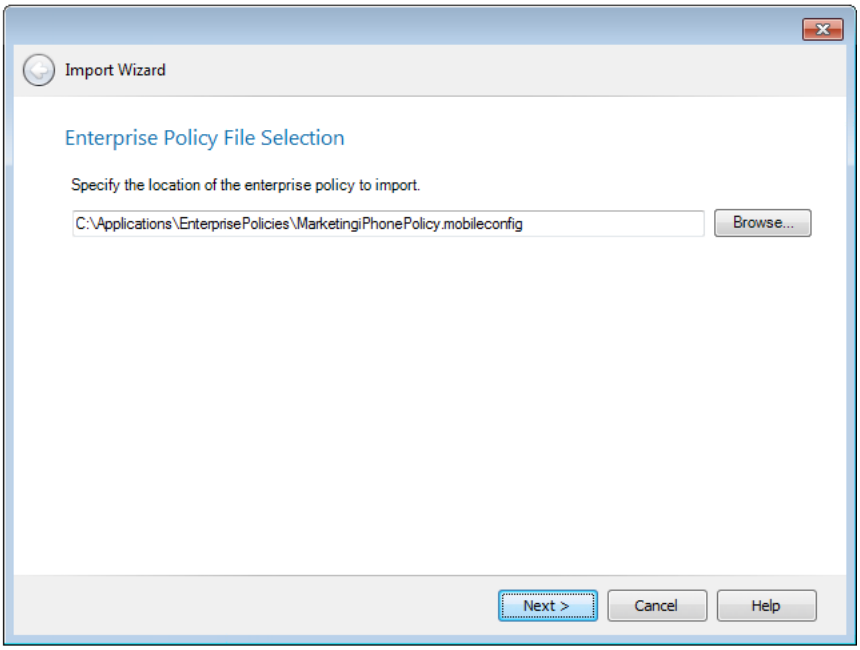

Figure 7-91: Import Wizard / Enterprise Policy File Selection

Security Patch File Selection Panel

On the **Security Patch File Selection** panel, which opens when you select the **Security Patches** group on the **Environment** tab of the Application Manager tree and then click **Import** in the toolbar, you are prompted to select the security patch file that you want to import.

Browse to a security patch file and then click **Next** to continue.

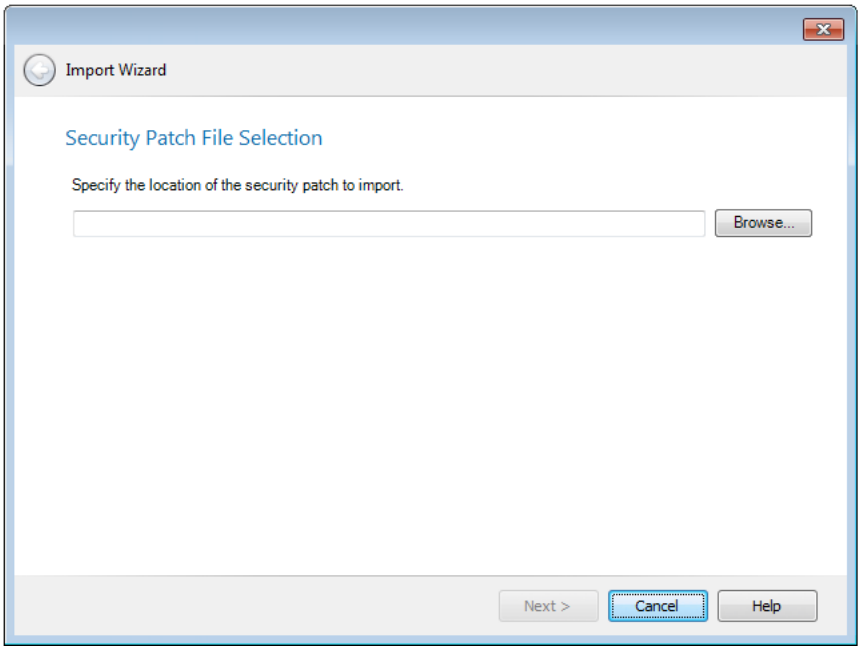

Figure 7-92: Import Wizard / Security Patch File Selection

For information on importing Microsoft Security Patch files and performing Patch Impact Analysis, see Analyzing the Impact of Installing Microsoft Operating System Security Patches.

OS Snapshot Selection Panel

On the **OS Snapshot File Selection** panel, which opens when you select the **Snapshots** group on the **Environment** tab of the Application Manager tree and then click **Import** in the toolbar, you are prompted to select the OS snapshot file that you want to import.

Browse to OS snapshot file and then click **Next** to continue.

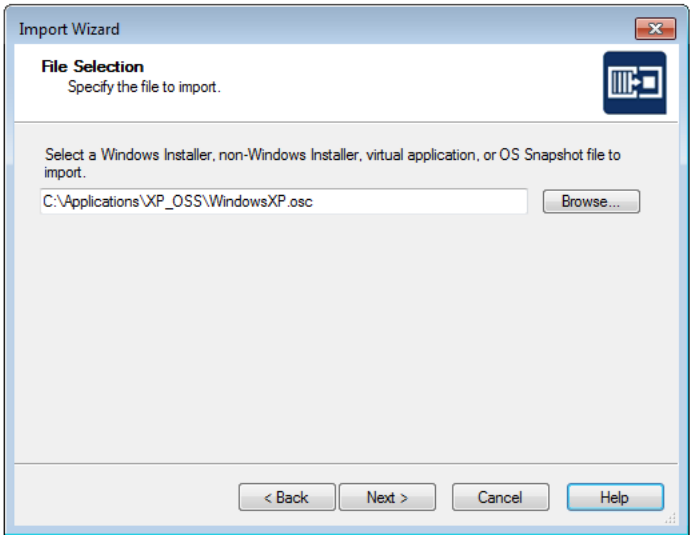

Figure 7-93: Import Wizard / File Selection

Public Store Selection Panel

On the **Public Store Selection** panel, which opens when you select **Link to a public store app** on the **Source** panel, you are prompted to select the public store from which you want to import a deep link to a mobile app,

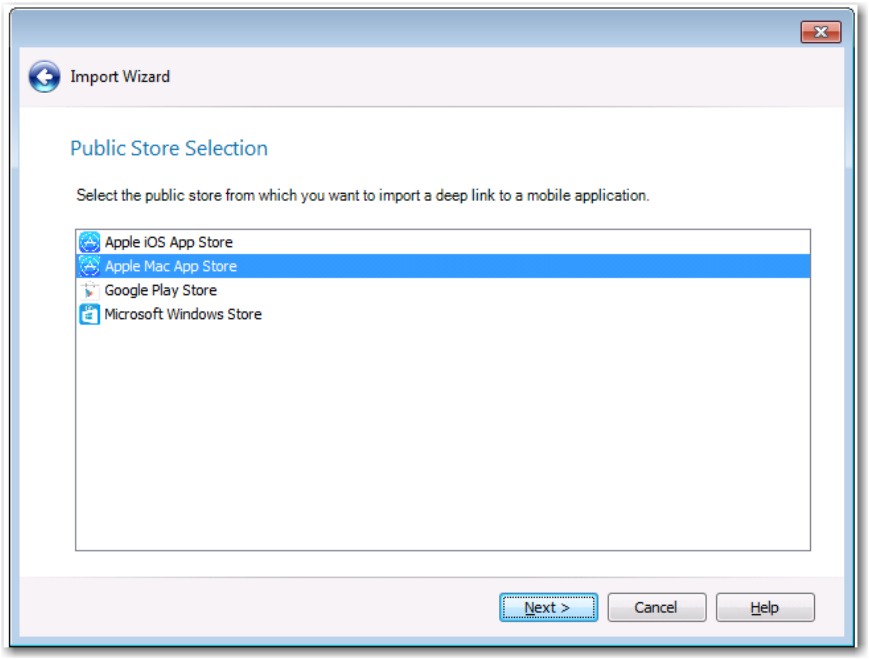

Figure 7-94: Import Wizard / Public Store Selection

You can import links to mobile apps in the Apple iOS App Store, Google Play Store, or Microsoft Windows Store into the Application Catalog. You can also import links to desktop applications in the Apple Mac App Store. This enables you to prepare and manage public store applications in conformance with your standard application readiness processes.

For more information on importing public store mobile apps, see Importing Links to Public Store Applications and Managing Mobile App Metadata.

Store Application Selection Panel

On the **Store Application Selection** panel, which opens when you select **Link to a public store app** on the **Source** panel and select a public store type on the **Public Store Selection** panel, you are prompted to browse to the public store app that you want to insert a link to.

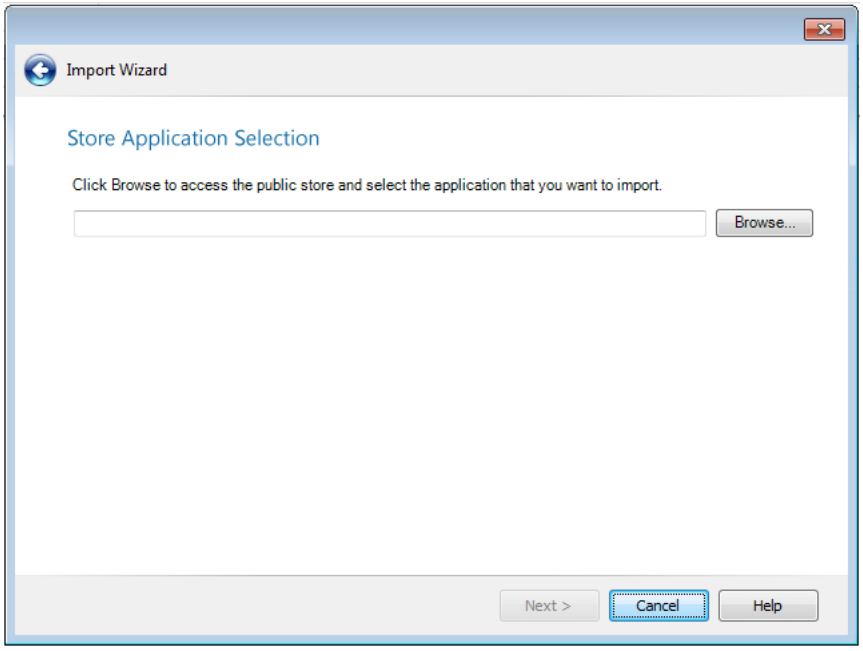

Figure 7-95: Import Wizard / Store Application Selection

Click **Browse** to open the **Browse Application from Store** dialog box, which displays the browser window of the selected public store, such as the Apple App Store or Google Play Store.

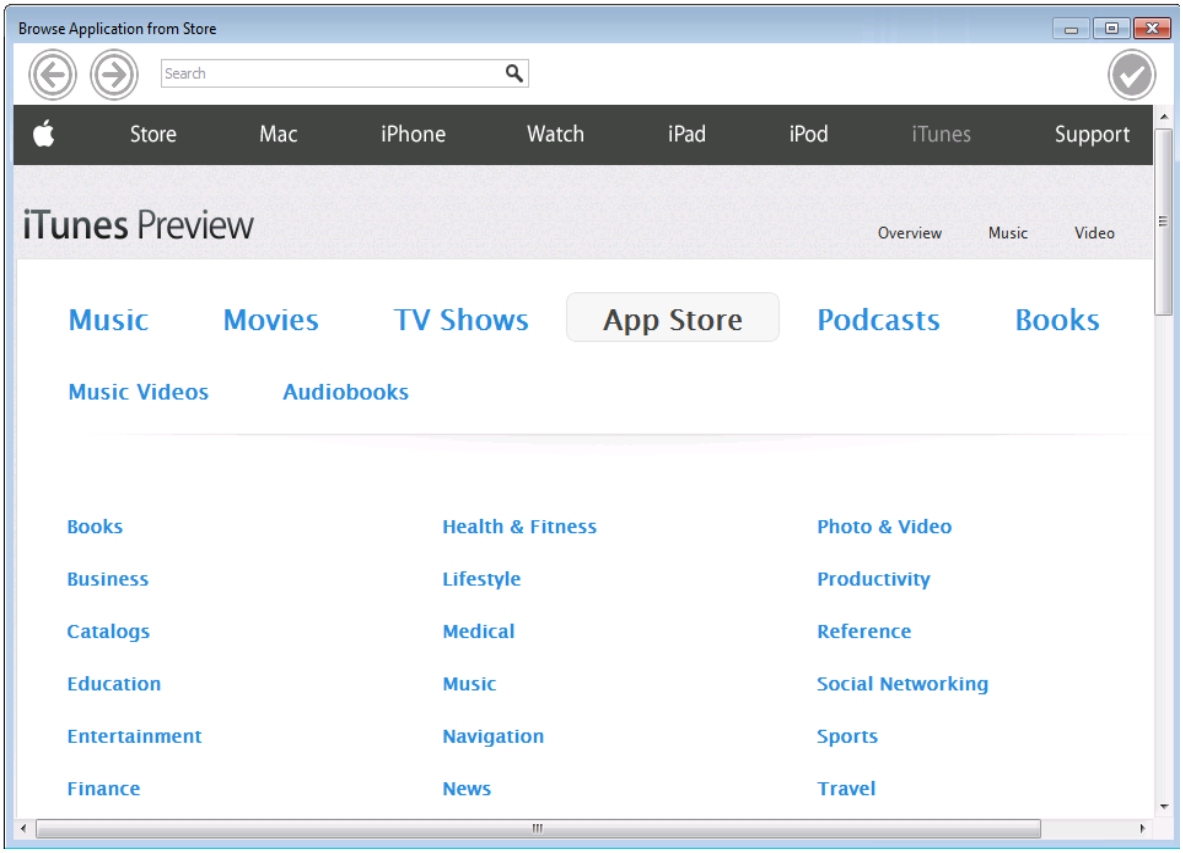

Figure 7-96: Apple App Store

On the **Browse Application from Store** dialog box, use the links in to locate the desired mobile app and open its informational page.

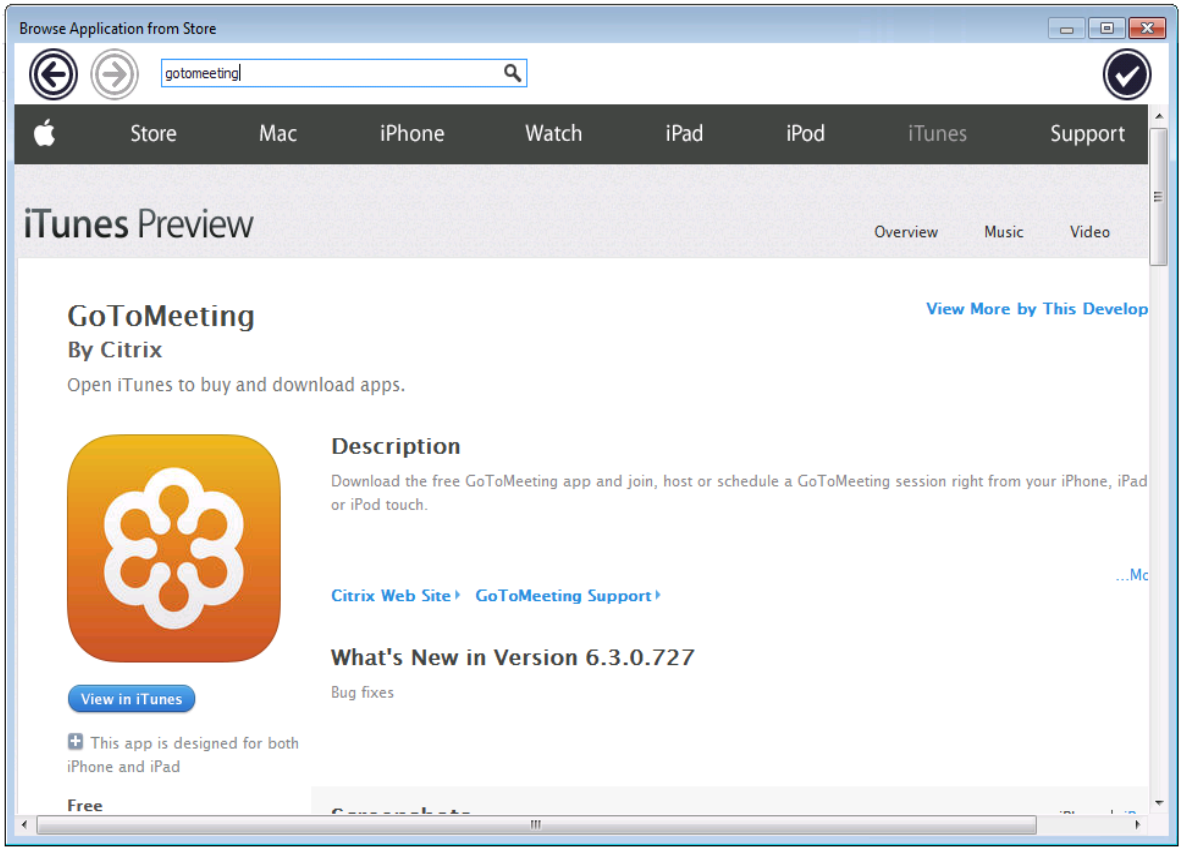

Figure 7-97: Mobile App Informational Page on Apple App Store

Note • *You can also use the arrow keys at the top left of the dialog box to navigate through the public store.*

When you have opened the informational page of the mobile app that you would like to import, click the checkmark button at the top right of the dialog box.

The link to the selected mobile app is now listed on the **Store Application Selection** panel, such as:

```
https://itunes.apple.com/us/app/gotomeeting/id424104128?mt=8
```

Click **Next** to continue.

Source Server Details Panel

If you select the **Packages from a deployment system** option on the **Source** panel, the **Source Server Details** panel opens and prompts you to select a named connection to a Microsoft System Center Configuration Manager server.

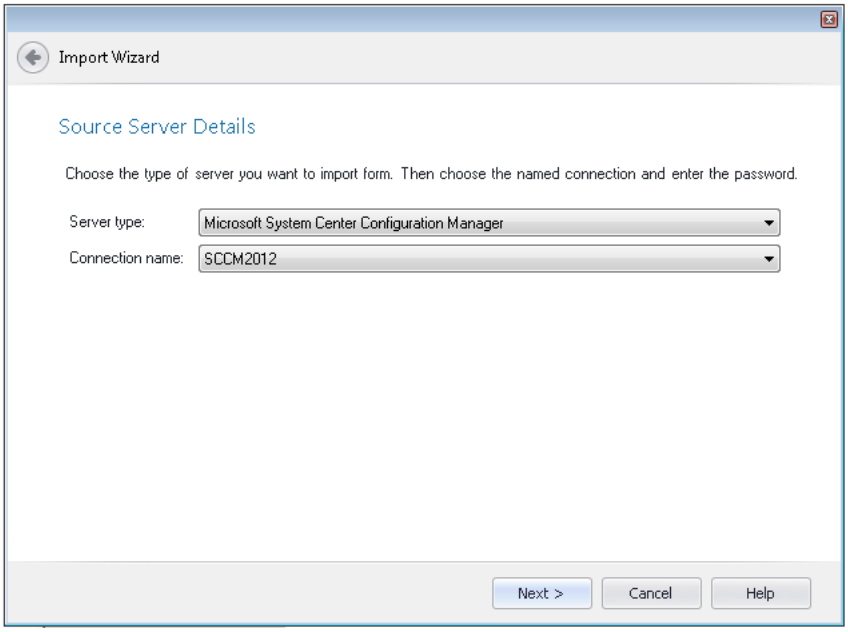

Figure 7-98: Import Wizard / Source Server Details Panel

In order to import packages from Microsoft System Center Configuration Manager, you must first set up a named connection, as described in Creating Multiple Named Connections to Distribution Systems.

After you create a connection, it will be available for selection on the **Source Server Details** panel.

Package File Selection Panel

When you select **Single application** on the **Source** panel of the Import Wizard, the **Package File Selection** panel opens, prompting you to select the package that you want to import.

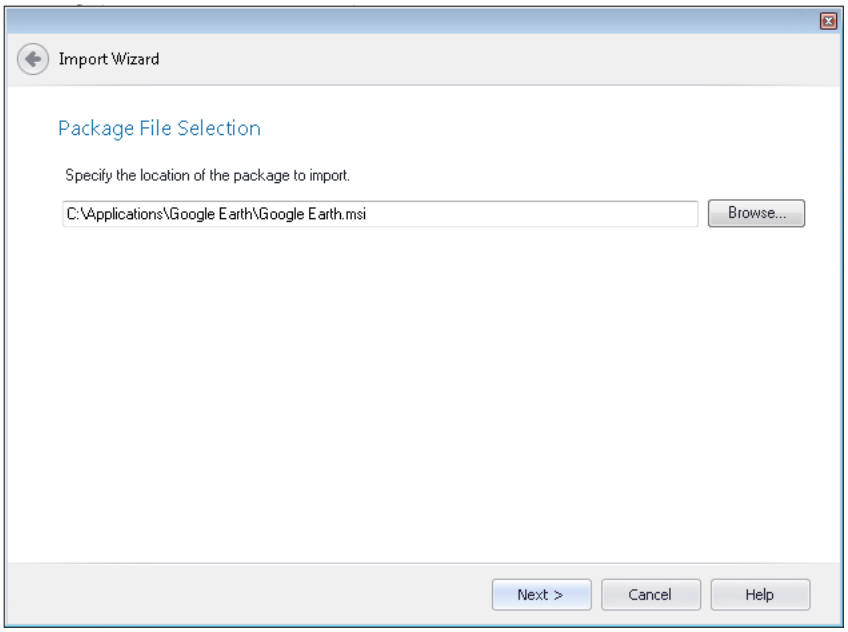

Figure 7-99: Import Wizard / Package File Selection Panel

Browse to the package that you want to import and click **Next**.

Note • *The package that you select must be of the type that you selected on the* ***Package Type Selection*** *panel.*

Package Folder Selection Panel

On the **Package Folder Selection** panel of the Import Wizard, which opens if you select **Folder of multiple applications** on the **Source** panel, you are prompted to select the directory that contains the packages that you want to import into the Application Catalog.

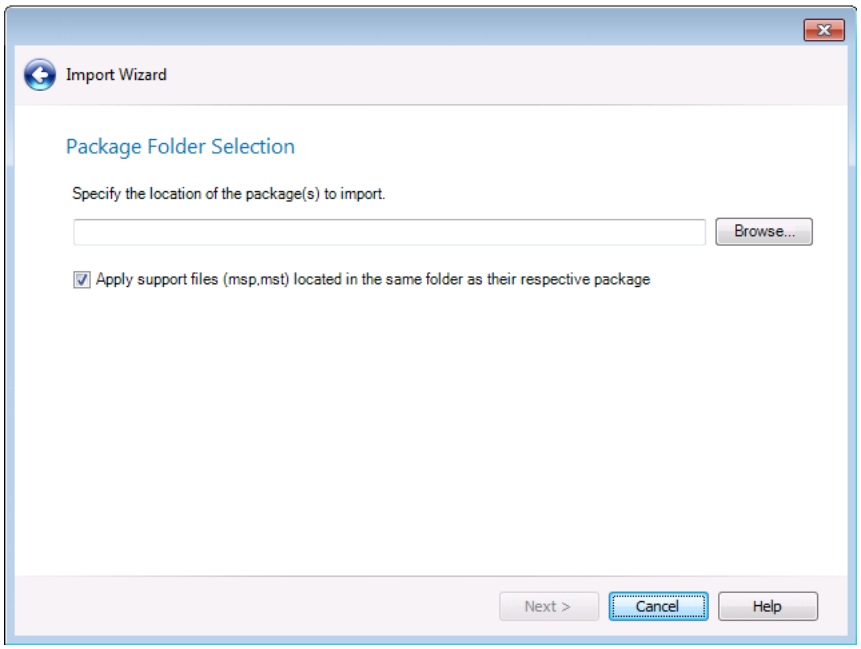

Figure 7-100: Import Wizard / Package Folder Selection Panel

In the **Specify the location of the package(s) to import** field, enter or browse to the directory that contains the packages that you want to import, and then click **Next**.

Optionally, if you also want to import package support files (such as transforms or patch files), select the **Apply support files (.msp, .mst) located the same folder as their respective package** option.

The Import Wizard will search the selected directory and its subdirectories to locate the packages of the types you selected on the Package Type Selection Panel (Folder of Multiple Applications).

Import Wizard's Selection Rules When Importing Packages from a Directory

When importing packages from a directory, the Import Wizard will scan the selected directory and all of its subdirectories for the package types you selected on the Package Type Selection Panel (Folder of Multiple Applications) panel, and will import all packages that are found.

On the **Destination Group** panel of the Import Wizard, you have the option to create subgroups in the Application Catalog based on the subdirectory structure of the selected directory to contain the imported packages, or to import all of the packages into the root of the specified group.

Web Site Details Panel

If you select **Website from URL** on the **Source** panel of the Import Wizard, the **Web Site Details** page opens, prompting you to enter the URL and credentials to the web application you want to import.

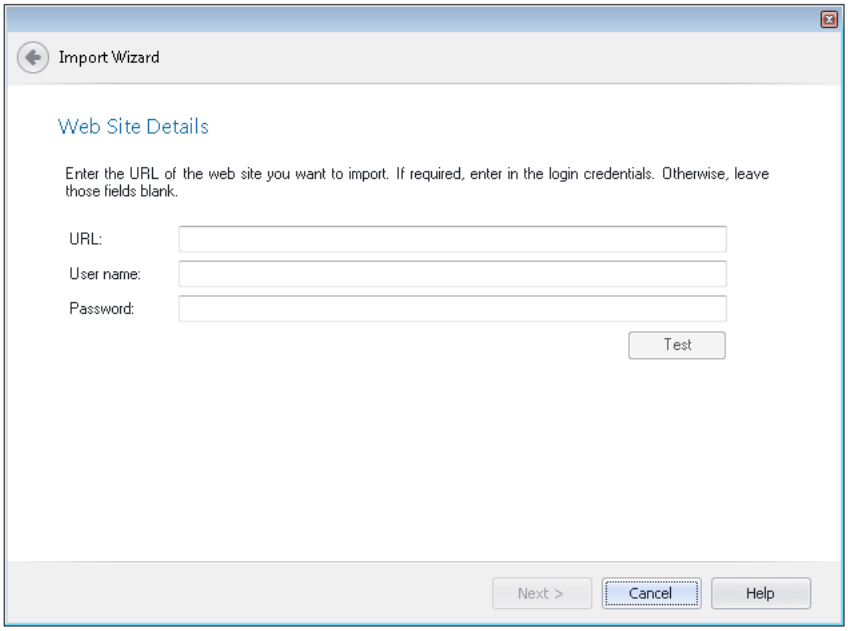

Figure 7-101: Import Wizard / Web Site Details Panel

The **Web Site Details** panel includes the following properties:

Table 7-92 • Web Site Details Panel Properties

Property	Description
URL	Enter the URL to the web application you want to import, such as: **http://www.corporatetravel.com**
User name	Enter the login credentials for the specified web application.
Password	If you are not required to login to this web application, leave these fields blank.
Test	Click to test the entered credentials.

Select Applications (Folder of Multiple Applications) Panel

When you choose **Folder of multiple applications** on the **Source** panel of the Import Wizard, after you specify the directory location of the packages to import, the **Select Applications** panel opens, listing all of the packages of the selected package type in the specified directory.

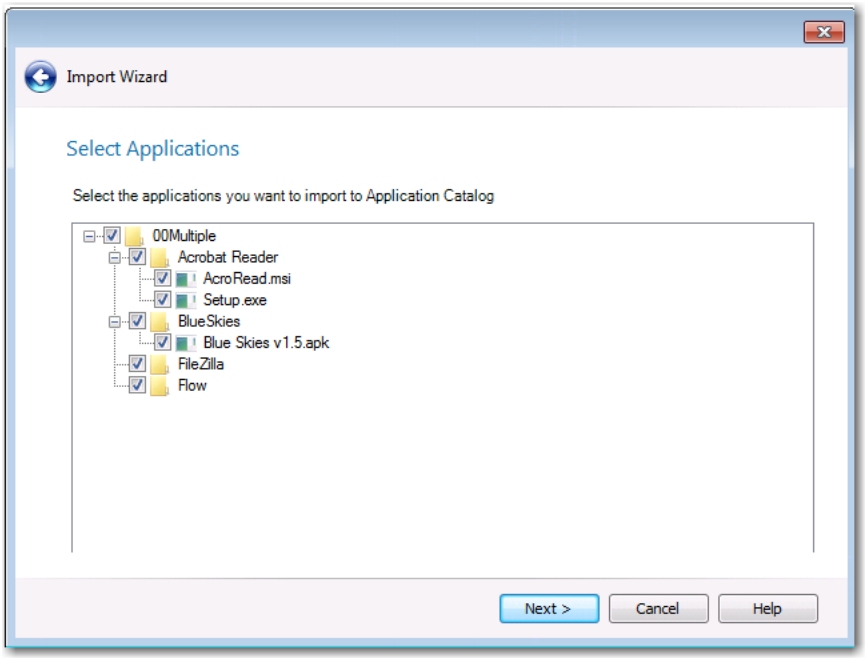

Figure 7-102: Select Applications Panel of Import Wizard (When Importing Folder of Multiple Applications)

By default, all applications containing the selected package type are selected. You can clear the selection of any packages you do not want to import.

Select Applications/Packages Panel

The name and functionality of this panel, which opens after you successfully connect to a Microsoft System Center Configuration Manager server, depends upon whether you are connected to a System Center 2012 Configuration Manager server or a System Center 2007 Configuration Manager Server.

Select Applications Panel

If you are connected to a System Center 2012 Configuration Manager server, the **Select Applications** panel opens, listing all of the applications in the connected server and prompting you to select the applications you want to import.

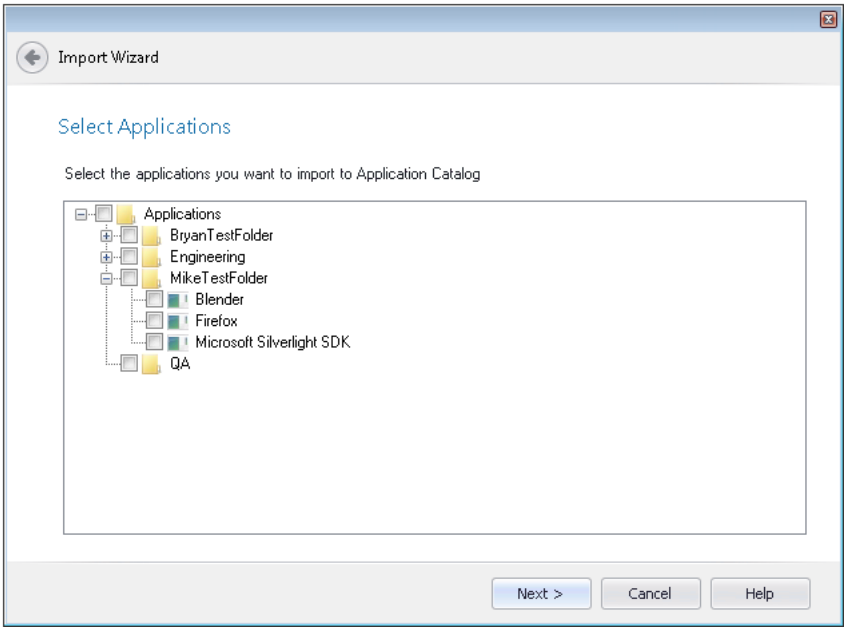

Figure 7-103: Import Wizard / Select Applications Panel

Select the applications that you want to import and click **Next**.

Select Packages Panel

If you are connected to a System Center 2007 Configuration Manager server, the **Select Packages** panel opens, listing all of the packages in the connected server and prompting you to select the packages you want to import.

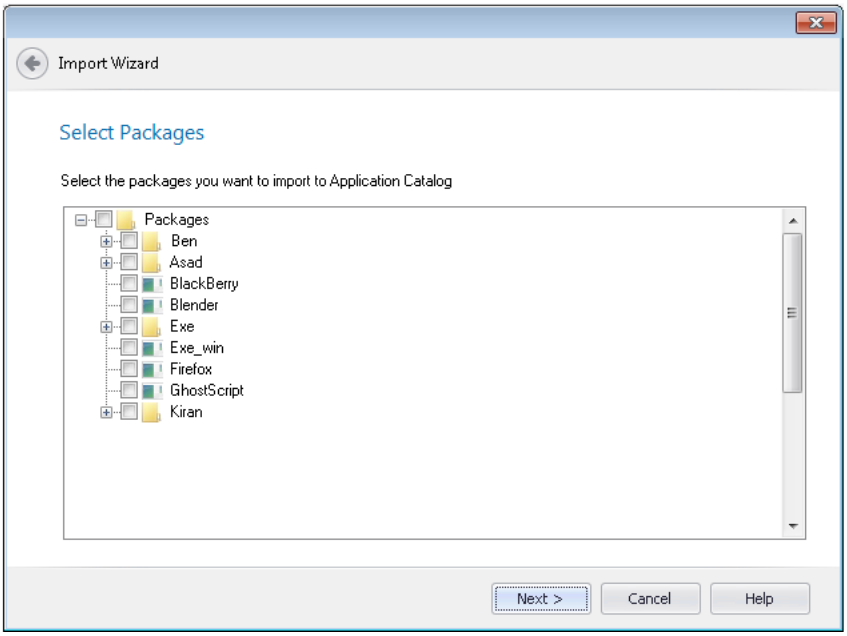

Figure 7-104: Import Wizard / Select Packages Panel

Select the packages that you want to import and click **Next**.

Package Support Files Panel

On the **Package Support Files** panel, you are prompted to optionally import additional support files along with the selected package.

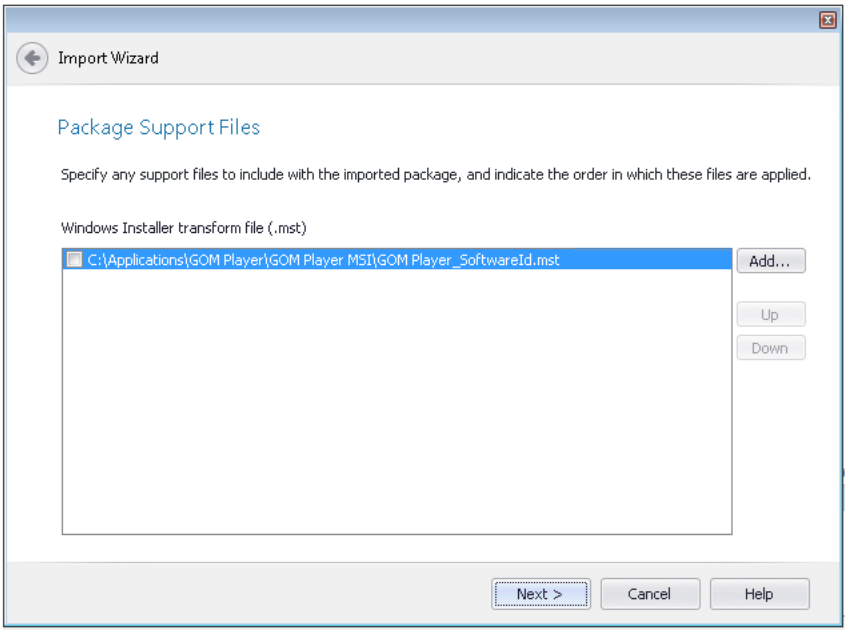

Figure 7-105: Import Wizard / Package Support Files Panel

The following types of support files can be imported:

Table 7-93 • Package Support Files by Package Type

Package Type	Support File	Description
Windows Installer (.msi)	Transform files (.mst)	All of the **.mst** files that are in the same directory as the Windows Installer file you are importing are automatically listed, but only those **.mst** files that AdminStudio determines are probably applicable to this Windows Installer package are selected to be included in the import. If you do not want to import a selected **.mst** file, clear the selection.  ***Note*** • *You an add additional transform files and specify the order that they will be applied, as described in Adding Additional Package Support Files and Ordering List.*
	Patch files (.msp)	If a patch file is in the same directory as the Windows Installer file you are importing, that patch file will automatically be listed. If you do not want to import it, clear the selection.  ***Note*** • *You an add additional patch files and specify the order that they will be applied, as described in Adding Additional Package Support Files and Ordering List.*  ***Note*** • *If you specify an update.exe patch file that was created by Developer/DevStudio/InstallShield Editor, Application Manager will extract the .msp file in the Temp folder and then perform the import.*  ***Note*** • *See About the Administrative Installation of Patches.*
Legacy packages (.exe)	Setup configuration files (.ini)	Contains setup and configuration information for a legacy installation package.

Adding Additional Package Support Files and Ordering List

You can import more than one package support file, and specify the order in which the files are applied:

- **To add an additional support file**—Click **Add** and select a file to add to the list.
- **To specify the order of listed support files**—Select a support file in the list and click the **Up** or **Down** button move the file up or down in the list.

About the Administrative Installation of Patches

For patches to be applied to a Windows Installer package, it is necessary to perform an administrative install of the Windows Installer package and then perform an administrative install of each patch package one by one. This way, the content of each patch package is appended to the Windows Installer package at the administrative install location.

In previous releases, when you imported a patch into the Application Catalog, you were prompted to specify a location for an administrative install. However, starting with AdminStudio 2013, you no longer have to specify a location for an administrative install if your Windows Installer package includes patches. Instead, the administrative install operation is automatically performed in a TEMP folder.

Destination Group Panel

On the **Destination Group** panel, select the group into which you want to import the selected package(s).

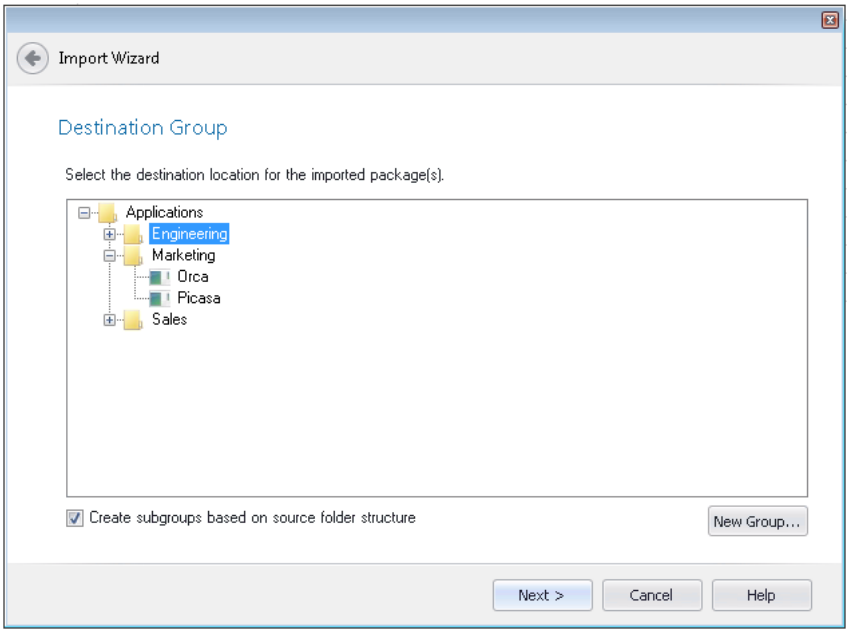

Figure 7-106: Import Wizard / Destination Group Panel

If a group you want to import the package(s) into does not exist, click the **New Group** button to create a new group.

Note *• If you launched the Import Wizard by right-clicking on a group in the tree and then selecting* ***Import*** *from the shortcut menu, that group will be selected by default on the* ***Destination Group*** *panel.*

Reproducing the Subdirectory Structure of Selected Directory

If you selected the **Folder of multiple applications** option on the **Source** panel, the **Destination Group** panel will have an additional option: **Create subgroups based on source folder structure**. The location of the imported packages in the Application Manager tree depends upon whether this option is selected:

- **Selected**—Subgroups of the selected group will be created in the Application Manager tree that mimic the directory structure of the selected directory, and the packages will be imported into those subgroups.

- **Not selected**—All of the packages in the selected directory (and its subdirectories) will be imported into the root of the selected group.

Selecting an Application Node as a Destination

Application nodes are created in the Application Manager tree using the package's associated Package Code. If multiple packages of different deployment types (such as Windows Installer, App-V, and ThinApp) of the same software product are all imported into the same Group and all have the same Package Code, all of the deployment types will be automatically listed under the same application node.

However, consider the scenario where you are importing a single package file that already has an existing application node in the Application Catalog (because a package of a different deployment type has already been imported). If you are not sure whether the Package Code of the package you are importing matches that of that application's already imported package, you can choose the desired application node on the **Destination Group** panel to ensure that both packages will be associated with the same application.

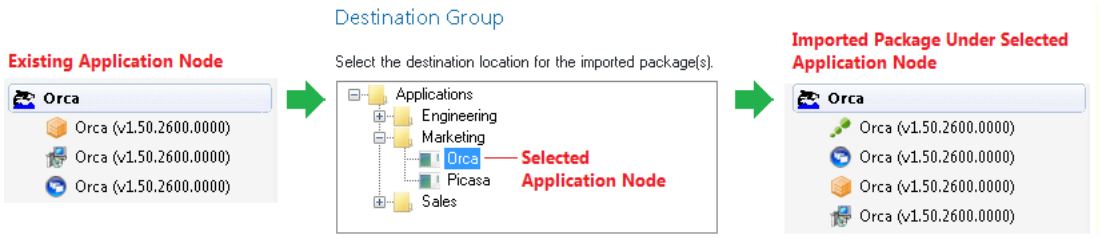

Figure 7-107: Selecting an Application Node as a Destination

Summary Panel

Before executing the import, review the information in the Summary panel about the options selected in the previous panels.

Depending on the import type and how the Import Wizard was invoked, clicking Back returns you to the **Destination Group** panel, **MSM Source Information** panel, **OS Snapshot Information** panel, or **Other Setup Installation Files** panel. Click **Finish** to begin import.

Running the Import Panel

The **Running the Import** panel displays a progress bar and status messages during import. When the import is complete, click **Finish** to close the wizard.

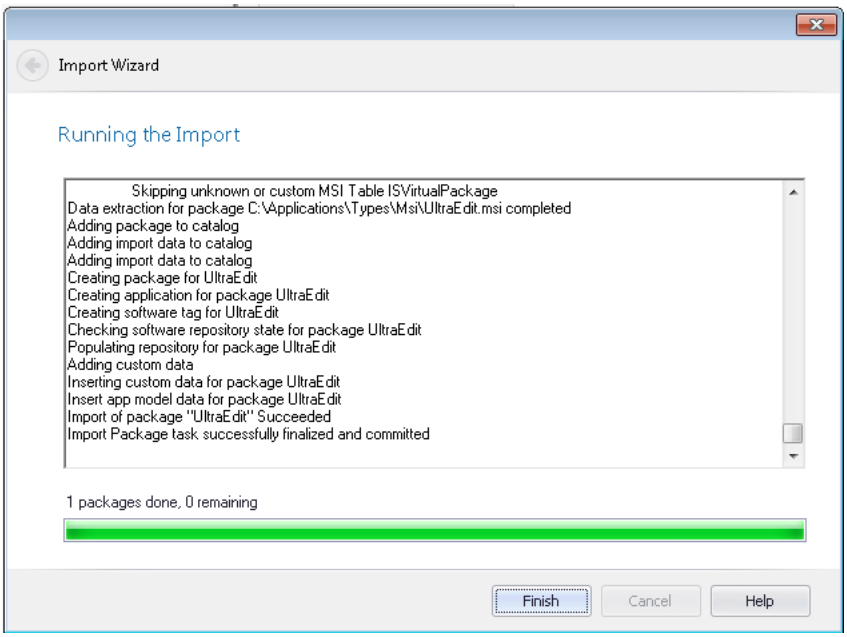

Figure 7-108: Import Wizard / Running the Import Panel

Merge Module Import Wizard

You can use the Merge Module Import Wizard to import multiple merge modules into the Application Catalog at the same time. You can open the Merge Module Import Wizard by first opening the **Merge Modules** tab, and then doing either of the following:

- Click the **Import** button on the ribbon the **Merge Modules** tab.
- Right-click on the **Merge Modules** root group or a merge module in the tree and then select **Import Merge Modules** from the shortcut menu.

The Merge Module Import Wizard consists of the following panels:

- MSM Source Information Panel
- Summary Panel

MSM Source Information Panel

If you are importing a Merge Module, this panel opens, allowing you to import multiple Merge Modules into the Application Catalog at one time.

Click the Browse ( ) button in the **Merge Modules** area and select the merge module file that you want to import. To import multiple patches, you can repeat the procedure as necessary.

The order in which merge modules are applied can be changed by selecting a merge module in the list and clicking the Move Up and Move Down arrows.

If you need to delete a merge module you have added, clear its check box.

Click **Next** to proceed with the import.

Summary Panel

Before executing the import, review the information in the **Summary** panel about the options selected in the previous panels.

Click **Finish** to begin the import of the merge module.

OS Snapshot Wizard

You can use the OS Snapshot Wizard to create a snapshot of your current operating system configuration. You launch the OS Snapshot Wizard from the AdminStudio Tools Gallery or by selecting **OS Snapshot Wizard** from the **AdminStudio Tools** group of the Windows Start menu.

The following topics contain information about each Wizard panel and dialog box available through the OS Snapshot Wizard. The help topics in this reference are the same detailed documentation that is displayed when you press the F1 key or click the Help button while working in a Wizard or dialog box.

Select one of the following links for OS Snapshot reference information:

- Welcome Panel
- Project Information Panel
- Analyzing Panel
- OS Snapshot Summary Panel
- Analysis Options Dialog Box
- ISSnapshot.ini File

Welcome Panel

You can use the OS Snapshot Wizard to create a snapshot of your current operating system configuration. You launch the OS Snapshot Wizard from the AdminStudio Tools Gallery or by selecting **OS Snapshot Wizard** from the **AdminStudio Tools** group of the Windows Start menu.

The **Welcome** panel appears when you first launch the OS Snapshot Wizard, providing some introductory information about the use of the OS Snapshot Wizard.

The **Next** button advances you to the **Project Information** panel.

Project Information Panel

The Project Information panel gathers information necessary for taking the OS Snapshot.

You must provide the following information before the Start button is enabled, allowing you to take the snapshot.

Table 7-94 • Project Information Panel Options

Option	Description
OS Snapshot project name	Provide a name for the snapshot file (.osc).

Table 7-94 • Project Information Panel Options (cont.)

Option	Description
OS Snapshot project folder	Provide the directory in which snapshot data will be stored. Either enter the path in the field, or click the Browse (...) button to navigate to it. If the directory already exists, a confirmation dialog box opens when you click the Next button.

If you want to review or change current capture settings, click Edit to display the Analysis Options dialog box.

Analyzing Panel

The **Analyzing** panel appears while the OS Snapshot Wizard analyzes your system.

Following the snapshot, the **Summary** panel appears.

OS Snapshot Summary Panel

At the end of the OS Snapshot process, the Summary panel is displayed, containing information about the OS Snapshot that was just performed.

Prior to clicking Finish, review the information to ensure the snapshot contains the data you expected.

Following the OS Snapshot process, you can import the snapshot into the Application Catalog and use it as a baseline to which setups can be compared.

Caution • *OS Snapshots should only be used by Application Manager for comparison purposes. You should never attempt to convert an OS Snapshot into an MSI package.*

Analysis Options Dialog Box

The **Analysis Options** dialog box, accessible by clicking **Edit** from the **Project Information** panel, allows you to specify capture types for the OS snapshots.

You can select the following:

- Files
- INI files
- Shortcuts
- Registry data

Additionally, you can restrict directory analysis to specific directories, which can significantly improve OS Snapshot Wizard performance. Click New to add a directory restriction, edit to modify an existing restriction, or delete to remove a restriction.

Options set in this dialog box apply to the current and subsequent snapshot sessions.

ISSnapshot.ini File

The ISSnapshot.ini file is the default exclusion file for the OS Snapshot Wizard. It contains exclusions to be applied when capturing an OS snapshot, and mainly focuses on specific items that should not be included in applications, such as InstallShield Professional-specific COM settings and OS Snapshot–specific registry entries.

The file is located in the Windows folder, and can be edited using the Exclusions Editor, or using a text editor. See Exclusions Editor Interface.

***Note** • It is strongly recommended that you not modify this file, as it increases the likelihood of either inadvertently omitting necessary pieces of the OS snapshot, or including registry entries or files that should not be part of the snapshot.*

Requirement Wizard

The **Requirements** subtab of the **Deployment Data** tab lists user or device requirements that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package. You use the **Requirement Wizard** to add items to this list.

The **Requirement Wizard** is opened by clicking the **Add Requirement** or **Edit Requirement** buttons in the ribbon of the **Requirements** subtab.

The **Requirement Wizard** includes the following panels:

- Welcome Panel
- Create Custom Requirements Panel
- Create User Requirements Panel
- Select the Device Requirements Type Panel
- Configuration Manager Credentials Panel
- Device Requirements from Configuration Manager Panel
- Create Device Requirements Panel
- Summary Panel

Welcome Panel

On the **Welcome** panel, select the requirement type that you would like to use.

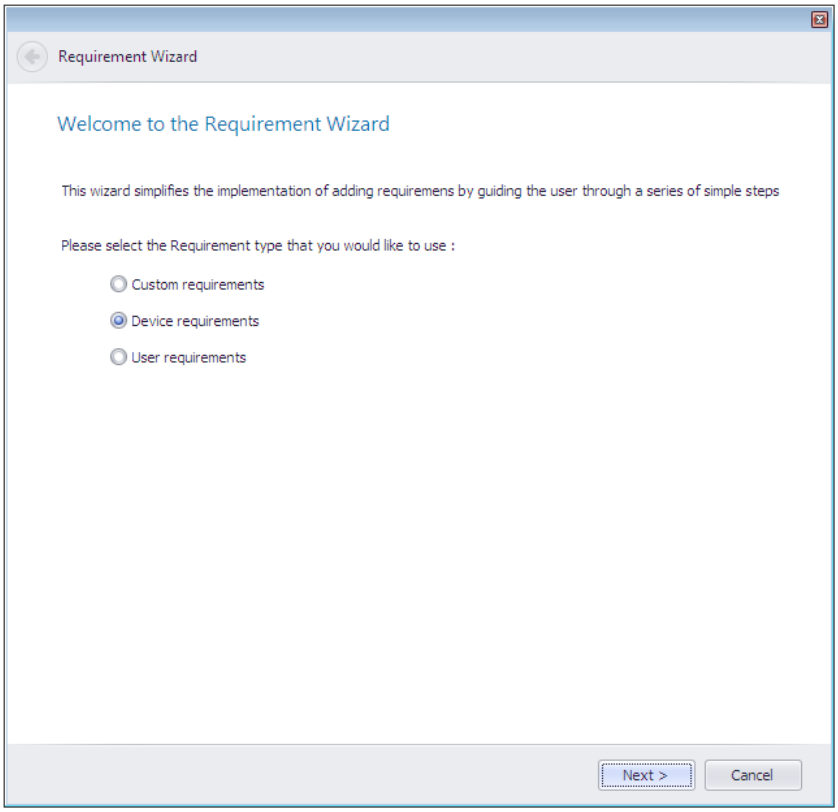

Figure 7-109: Requirement Wizard / Welcome Panel

The **Welcome** panel includes the following properties:

Table 7-95 • Requirement Wizard / Welcome Panel

Property	Description
Custom requirements	Select this option if you want to define a custom requirement that the target system needs to be meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package.
Device requirements	Select this option if you want to define a device requirement (such as CPU speed, free disk space, operating system, etc.) that the target system needs to be meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package.
User requirements	Select this option if you want to select a System Center Configuration Manager-defined user global condition that the target system needs to meet in order for Microsoft System Center Configuration Manager to be able to successfully deploy this package.

Create Custom Requirements Panel

On the **Create Custom Requirements** panel, which appears if you select **Custom requirements** on the **Welcome** panel, you specify the custom conditions for the requirement.

When you initially view the **Create Custom Requirements** panel, you are prompted to either select an existing condition and click **Create** to open the Create Global Condition Dialog Box and create a new condition. Once you create a condition, it is available for selection when creating other **Requirements**.

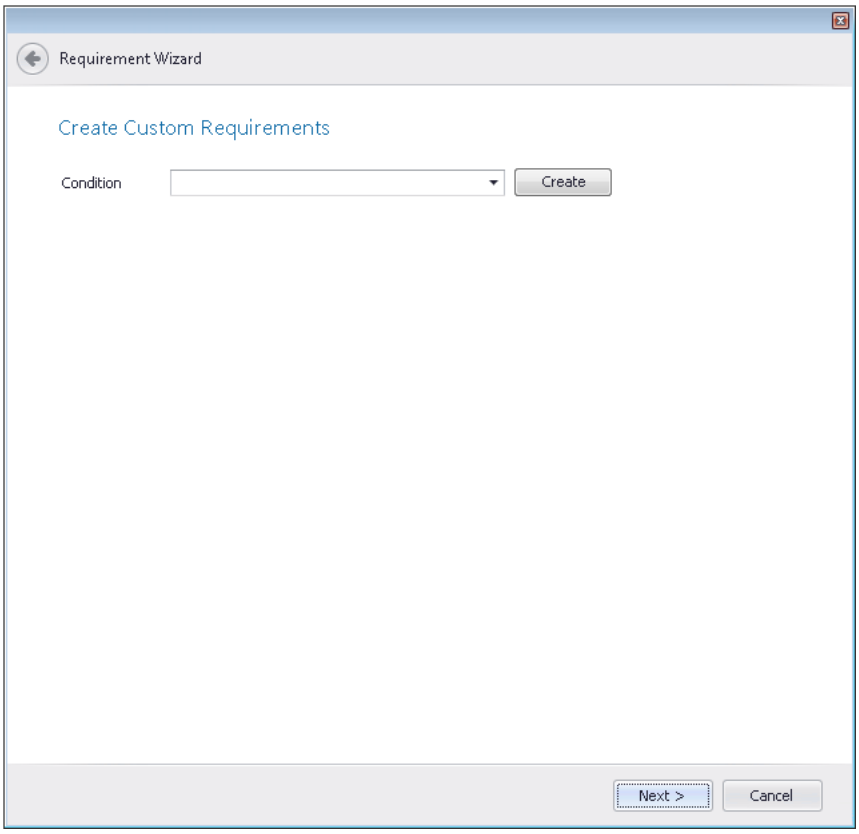

Figure 7-110: Create Custom Requirements Panel / Initial View

The fields displayed on the **Create Custom Requirements** panel depend upon the **Setting Type** of the selected global condition.

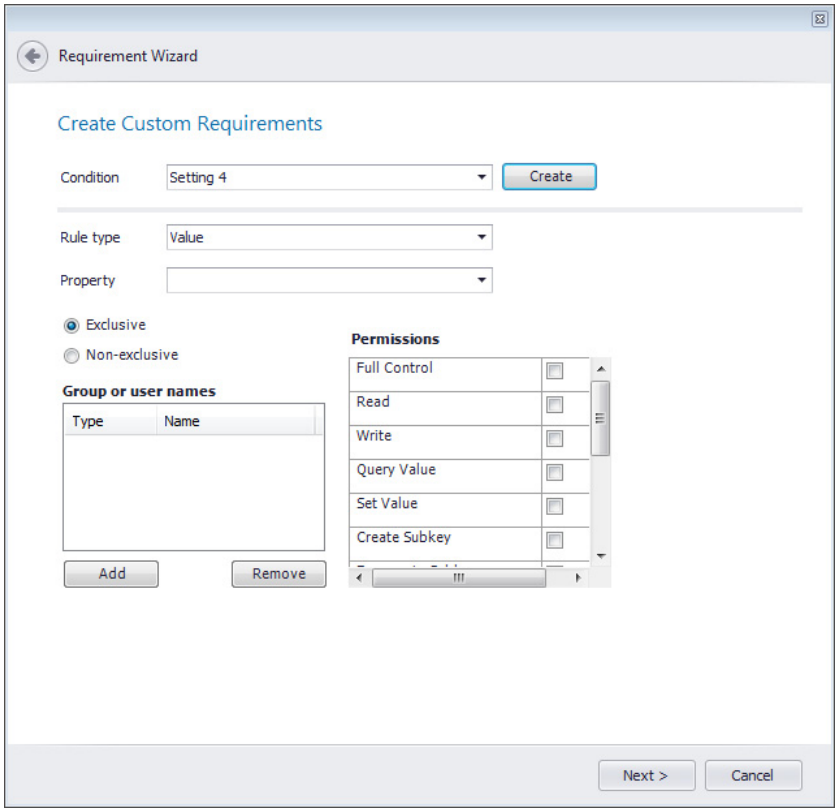

Figure 7-111: Requirement Wizard / Create Custom Requirements Panel - Setting Type of Registry Key

The **Create Custom Requirements** panel includes the following properties:

Table 7-96 • Requirement Wizard / Create Custom Requirements Panel

Property	Description
Condition	Select a condition from the list or click the **Create** button to open the Create Global Condition Dialog Box and create a condition. ***Note*** • *See Create Global Condition Dialog Box for information on using this dialog box to create a global condition.*
Rule Type	Select one of the following options: • **Value**—Select to create a condition that searches for a defined condition meeting a specific value. If you select this option, additional fields are displayed on the **Create Custom Requirements** panel that you can use to identify the specific value. • **Existential**—Select to create a condition that searches for the existence of a defined condition. If you select this option, the **The selected global condition must exist on client devices** option appears.

Table 7-96 • Requirement Wizard / Create Custom Requirements Panel

Property	Description
Property	Select the **Property** of the **File system** or **Registry key** condition that you want to use to create the requirement. ***Note*** • *Only displayed when the selected global condition's* ***Setting Type*** *is set to either* ***File system*** *or* ***Registry key****.*
Operator	Select an operator to use in this custom requirement. Available options are: **Between**, **Greater than or equal to**, **Greater than**, **Equals**, **Less equals**, **Less than**, **None of**, **Not equal to**, or **One of**. ***Note*** • *Only displayed when selected global condition's* ***Setting Type*** *is set to* ***File system***, ***IIS metabase***, ***Registry value***, ***Script***, *or* ***SQL query***, ***Wql query***, *or* ***Xpath query****.*
Value	Select the value of the selected **Property** that you want to use in this requirement. ***Note*** • *Displayed for global conditions of all* ***Setting Types*** *except for* ***Registry*** *key, but only when* ***Rule type*** *is set to* ***Value*** *(not* ***Existential****).*
Exclusive / Non-exclusive	Specify exclusivity option. ***Note*** • *Only displayed for global conditions with a* ***Setting Type*** *of* ***Registry key*** *that also have a* ***Rule type*** *of* ***Value****.*
Group or user names	Click **Add** to add users or groups to this list. On the **Enter User** or **Group Name** dialog box, you enter the name of the user or group using the format **Domain\User** or **Domain\Group**, and specify whether you want to **Allow** or **Deny** access to this user or group. ***Note*** • *Only displayed for global conditions with a* ***Setting Type*** *of* ***Registry key*** *that also have a* ***Rule type*** *of* ***Value****.*
Permissions	Select the permissions in this list to **Allow** or **Deny** that permission to the selected user or group. ***Note*** • *Only displayed for global conditions with a* ***Setting Type*** *of* ***Registry key*** *that also have a* ***Rule type*** *of* ***Value****.*

Create User Requirements Panel

On the **Create User Requirements** panel, you use the **Condition**, **Rule Type**, **Operator**, and **Value** fields to build a user requirement.

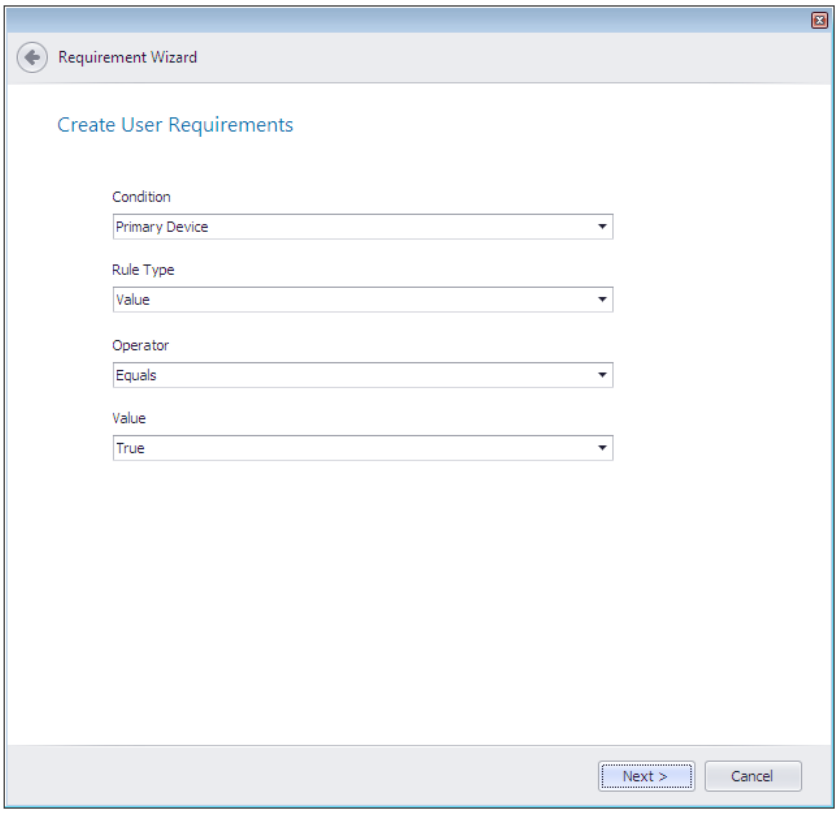

Figure 7-112: Requirement Wizard / Create User Requirements Panel

The **Create User Requirements** panel includes the following properties:

Property	Description
Condition	Select a condition type from the list. For user requirements, **Primary Device** is the only condition type listed.
Rule Type	Select a rule type from the list. For custom device requirements, **Value** is the only type listed.
Operator	Select a rule type from the list. For user requirements, **Equals** is the only operator listed.
Value	Select either **True** or **False** to define this user requirement.

Select the Device Requirements Type Panel

On the **Select the Device Requirements Type** panel, specify whether you want to create a custom device requirement or select a device requirement from Configuration Manager.

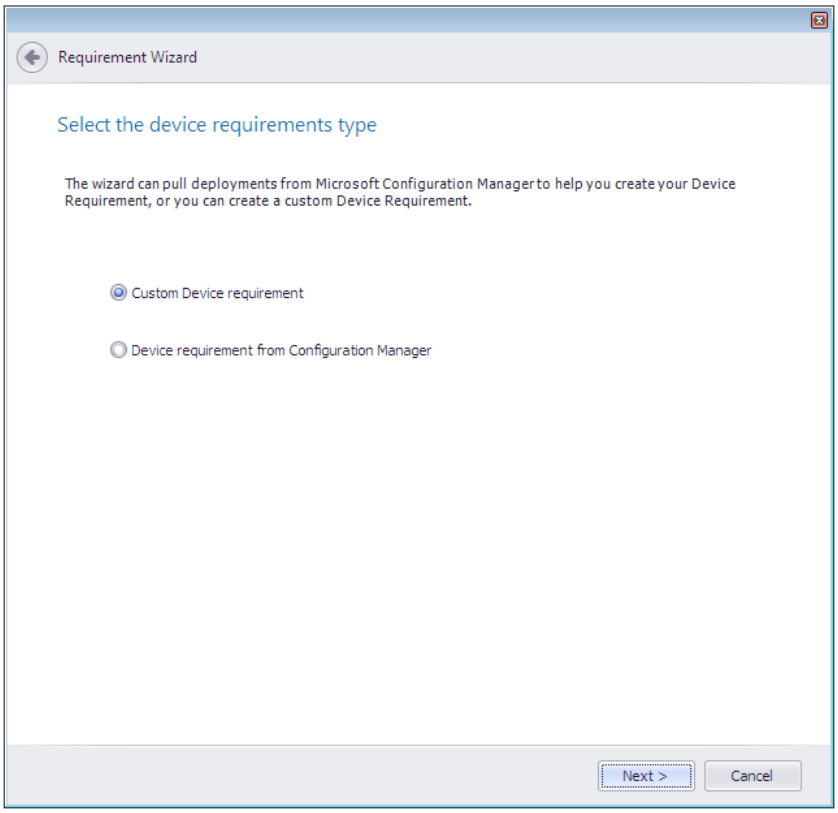

Figure 7-113: Requirement Wizard / Select the Device Requirements Type Panel

The **Select the Device Requirements Type** panel includes the following properties:

Table 7-97 • Requirement Wizard / Select the Device Requirements Type Panel

Property	Description
Custom Device requirement	Select to create your own device requirement.
Device requirement from Configuration Manager	Select to use a device requirement that was defined in System Center Configuration Manager.

Configuration Manager Credentials Panel

On the **Configuration Manager Credentials** panel, you enter connection information for System Center Configuration Manager.

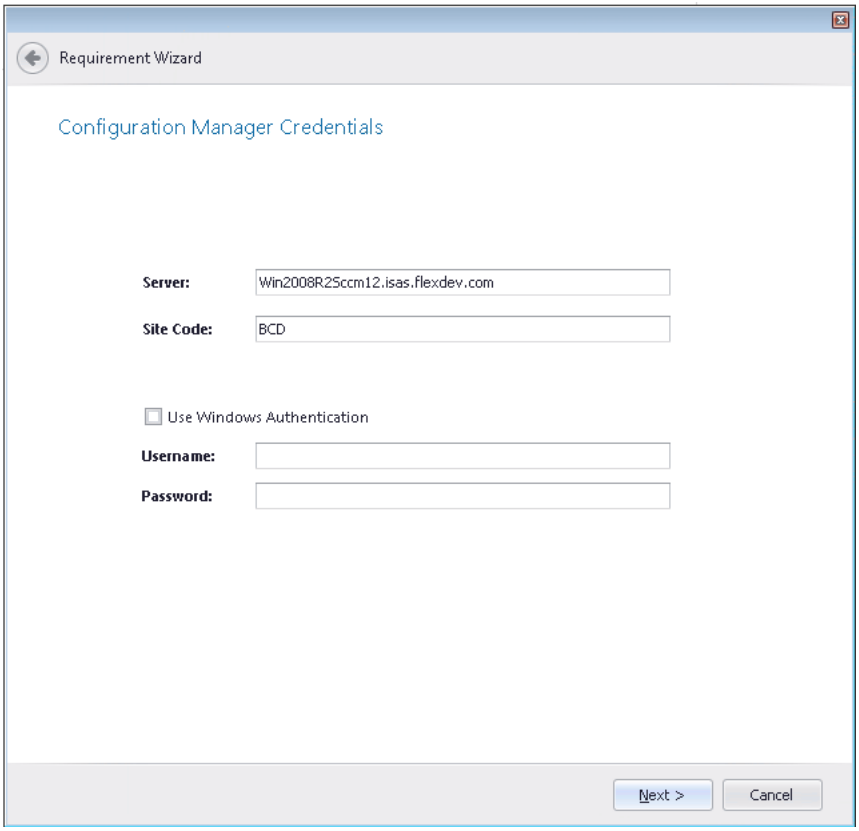

Figure 7-114: Requirement Wizard / Configuration Manager Credentials Panel

The **Configuration Manager Credentials** panel includes the following properties:

Table 7-98 • Requirement Wizard / Configuration Manager Credentials Panel

Property	Description
Server	Enter the name of the Configuration Manager 2012 Server you want to connect to. This field is pre-populated with the name of the Configuration Manager System Center server that you have entered on the Distribution System tab of the Options dialog box.
Site Code	Enter the code that identifies the Configuration Manager site you want to connect to.
Use Windows Authentication	Select this option if you want to use Windows network authentication (your network login ID) to log into this System Center Configuration Manager Server.
Username and Password	If using server authentication, enter the **Username** and **Password** of that server.

Device Requirements from Configuration Manager Panel

The **Device Requirements from Configuration Manager** panel lists those applications in the System Center 2012 Configuration Manager server that have defined device requirements. Select the application in the list that matches the one that you are editing, and click **Next** to continue.

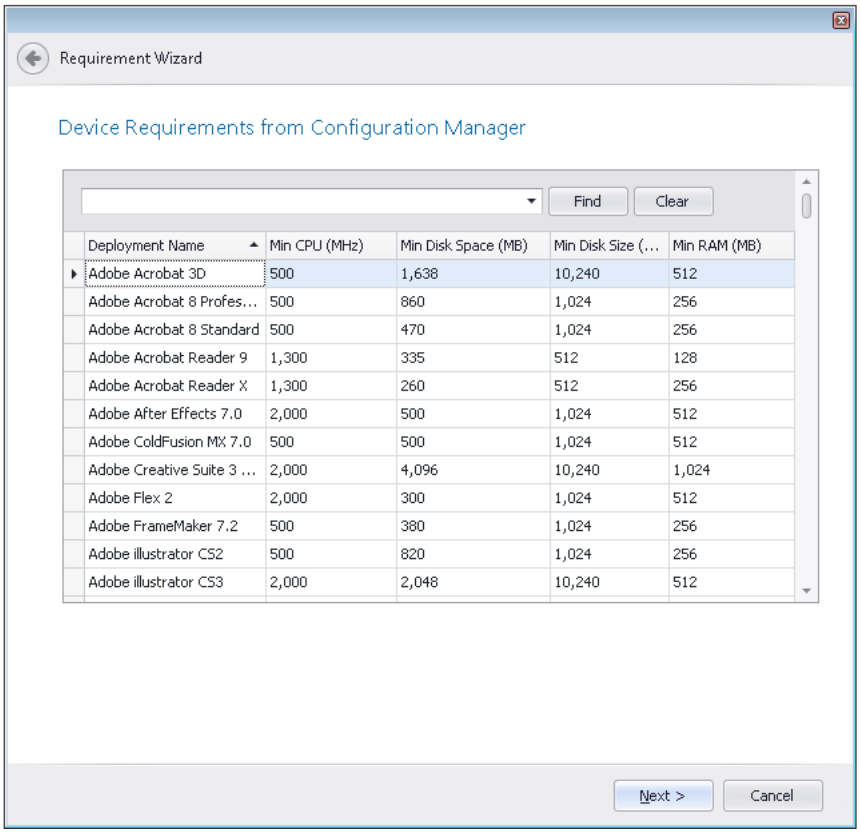

Figure 7-115: Requirement Wizard / Device Requirements from Configuration Manager Panel

The **Device Requirements from Configuration Manager** panel includes the following properties:

Table 7-99 • Requirement Wizard / Device Requirements from Configuration Manager Panel

Property	Description
Search box	Use to filter the list of device requirements.
Deployment Name	Name application associated with the device requirement.
Min CPU (MHz)	Defined minimum CPU speed requirement, in MHz.
Min Disk Space (MB)	Defined minimum disk space requirement, in MB.
Min Disk Size (MB)	Defined minimum disk size requirement, in MB.
Min RAM (MB)	Defined minimum RAM requirement, in MB.

Create Device Requirements Panel

On the **Create Device Requirements** panel, you specify a device requirement.

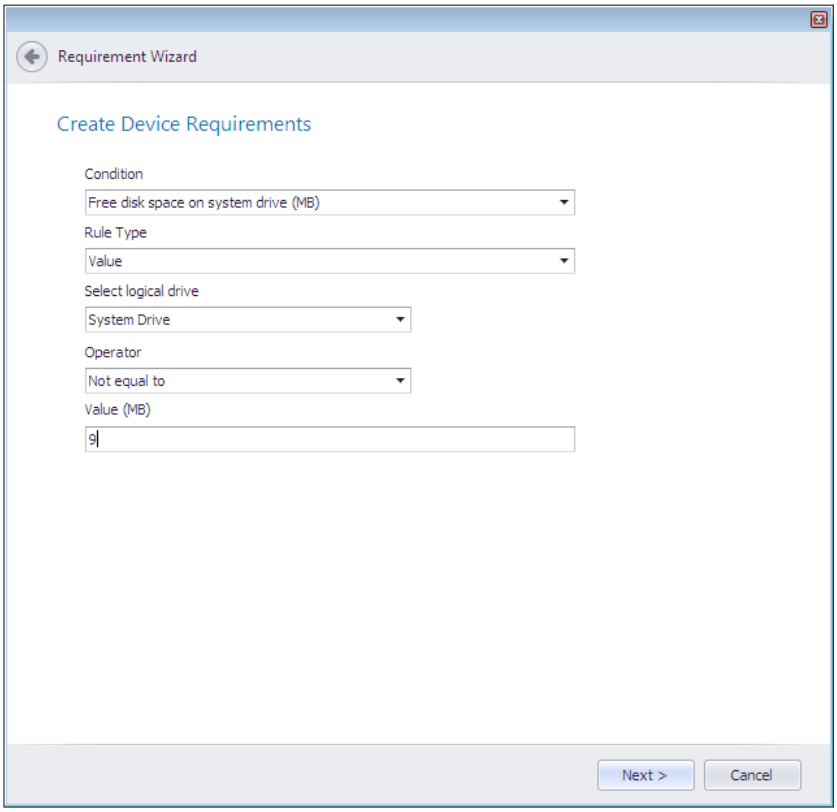

Figure 7-116: Requirement Wizard / Create Device Requirements Panel

The **Create Device Requirements** panel includes the following properties:

Table 7-100 • Requirement Wizard / Create Device Requirements Panel

Property	Description
Condition	Select one of the following conditions: • **Active Directory Site** • **Configuration Manager Site** • **CPU Speed (MHz)** • **Disk space** • **Number of processors** • **Operating system** • **Operating system language** • **Organizational unit (OU)** • **Total physical memory (MB)** • **Windows Store inactive**
Rule Type	Select a rule type from the list. For custom device requirements, **Value** is the only type listed.
Operator	Select an operator from the list. Possible sets of operators are: • **One of** or **None of** • **Equals**, **Not equal to**, **Greater than**, **Less than**, **Between**, **Greater than or Equal to**, or **Less than or equal to**

Table 7-100 • Requirement Wizard / Create Device Requirements Panel

Property	Description
[Additional Fields]	Additional fields are displayed depending upon the **Condition** selected. Use these fields to define the requirement for the selected **Condition**. • **Active Directory Site**—Click the **Add** button and add a site to the **Active Directory Sites** list. • **Configuration Manager Site**—Click the **Add** button and add a site to the **Configuration Manager Sites** list. • **CPU Speed (MHz)**—Enter a value, in MHz, in the **Value (MHz)** text field. • **Disk space**—Select a drive from the **Select logical drive** list and enter a value, in MBs, in the **Value (MB)** text box. • **Number of processors**—Enter a number in the **Value** text box. • **Operating system**—Select operating systems from the **Select Operating System** list. You can choose just a major category (such as **Windows 8** or **Windows Server 2012**) or you can identify a specific operating system / service pack / processor type combination, such as **All Windows 8 (32-bit)**. • **Operating system language**—Select languages from the **Select Operating System Language(s)** list. • **Organizational unit (OU)**—Click the **Add** button and add a OU to the list. • **Total physical memory (MB)**—Enter a value, in MBs in the **Value (MB)** text box. • **Windows Store inactive**—Enter a value in the **Value** text box.

Summary Panel

On the **Summary** panel, a summary of your selections is listed. Click **Finish** to add the requirement to the list.

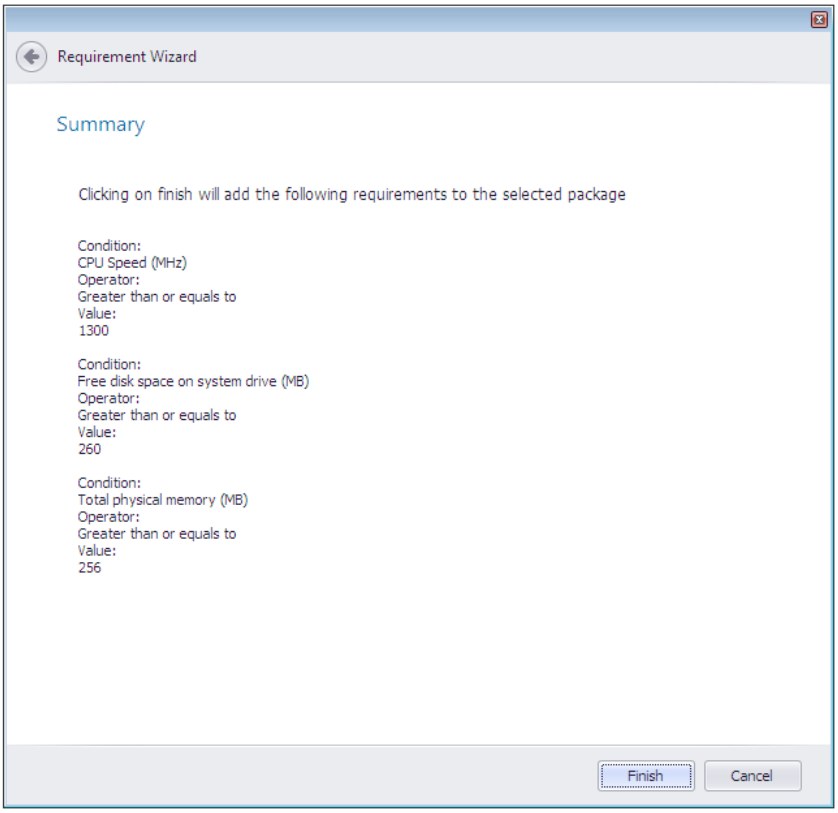

Figure 7-117: Requirement Wizard / Summary Panel

Supersedence Wizard

The **Supersedence** subtab of the **Deployment Data** tab lists other packages that this package would supersede if installed on the same target machine (meaning that the package on the target system would need to be uninstalled prior to installing this package). You use the **Supersedence Wizard** to add items to this list.

The **Supersedence Wizard** is opened by clicking the **Add Supersedence** or **Edit Supersedence** buttons in the ribbon of the **Supersedence** subtab.

The **Supersedence Wizard** includes the following panels:

- Welcome Panel
- Deployment Types in Application Catalog Panel
- Configuration Manager Credentials Panel
- Deployment Types in Configuration Manager 2012 Panel
- Summary Panel

Welcome Panel

On the **Welcome** panel, select the supersedence method you want to use.

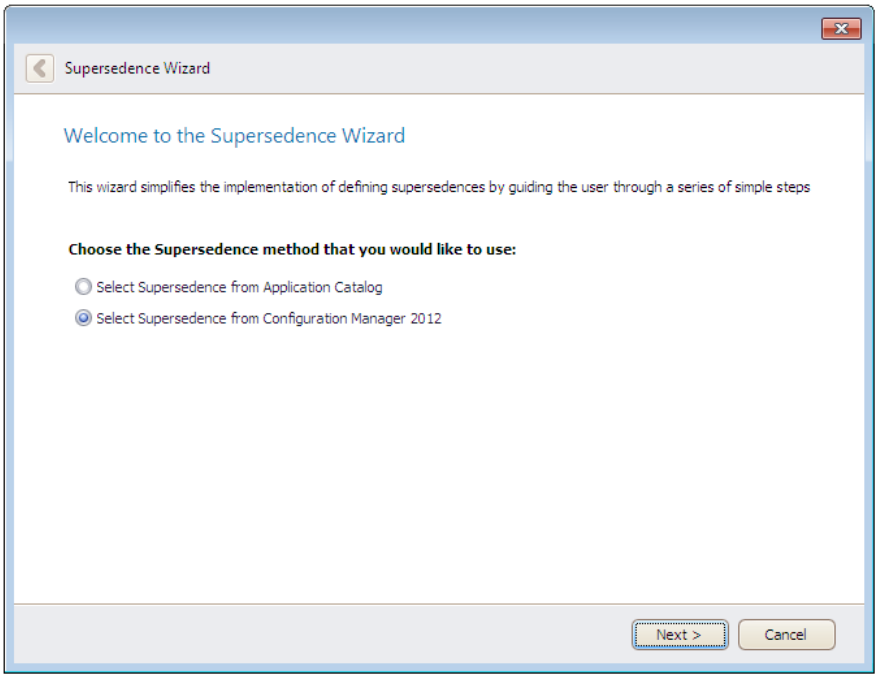

Figure 7-118: Supersedence Wizard / Welcome Panel

The **Welcome** panel includes the following properties:

Table 7-101 • Supersedence Wizard / Welcome Panel

Property	Description
Select Supersedence from Application Catalog	Select to select a supersedent application from the Application Catalog.
Select Supersedence from Configuration Manager 2012	Select to select a supersedent application from Configuration Manager 2012.

Deployment Types in Application Catalog Panel

On the **Deployment Types in Application Catalog** panel, select the dependent supersedence(s) from the list.

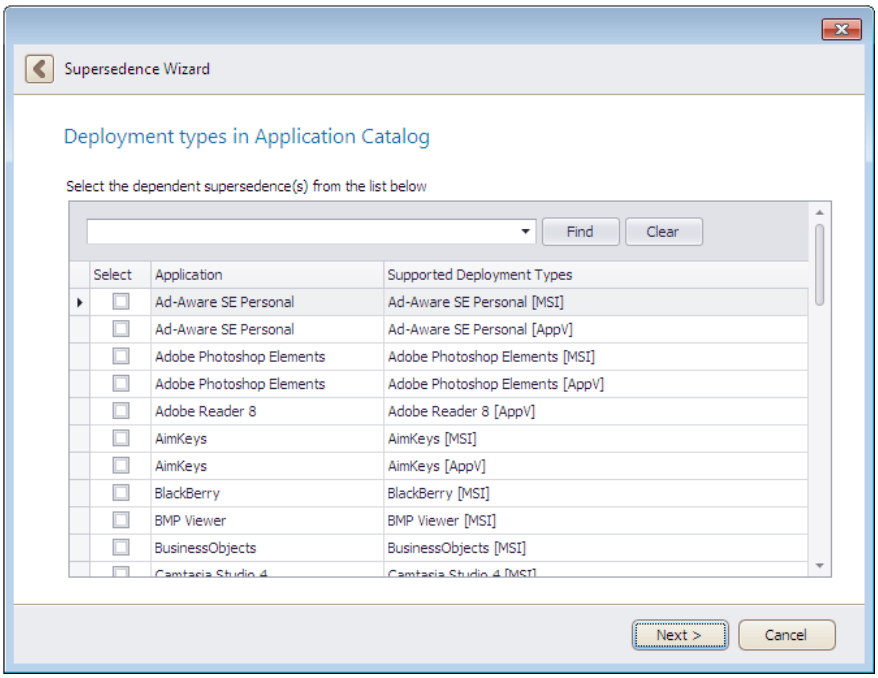

Figure 7-119: Supersedence Wizard / Deployment Types in Application Catalog Panel

The **Deployment Types in Application Catalog** panel includes the following properties:

Table 7-102 • Supersedence Wizard / Deployment Types in Application Catalog Panel

Property	Description
Find / Clear	Use to filter application list.
Application	Application name.
Supported Deployment Types	Lists all of the application's supported deployment types.

Configuration Manager Credentials Panel

On the **Configuration Manager Credentials** panel, specify Configuration Manager connection credentials.

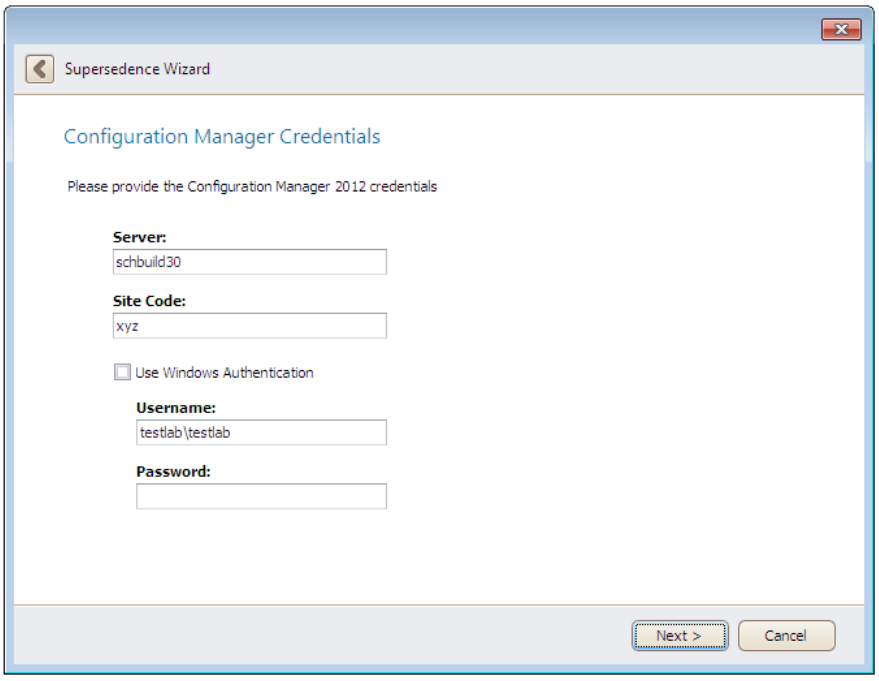

Figure 7-120: Supersedence Wizard / Configuration Manager Credentials

The **Configuration Manager Credentials** panel includes the following properties:

Table 7-103 • Supersedence Wizard / Configuration Manager Credentials Panel

Property	Description
Server	Enter the name of the Configuration Manager Server you want to connect to.
Site Code	Enter the code that identifies the Configuration Manager site you want to connect to.
Use Windows Authentication	Select this option if you want to use Windows network authentication (your network login ID) to log into this Microsoft Configuration Manager Server.
Username and Password	If using server authentication, enter the **Username** and **Password** of that server.

Deployment Types in Configuration Manager 2012 Panel

On the **Deployment Types in Configuration Manager 2012** panel, select dependent supersedences from the list of applications from Configuration Manager 2012.

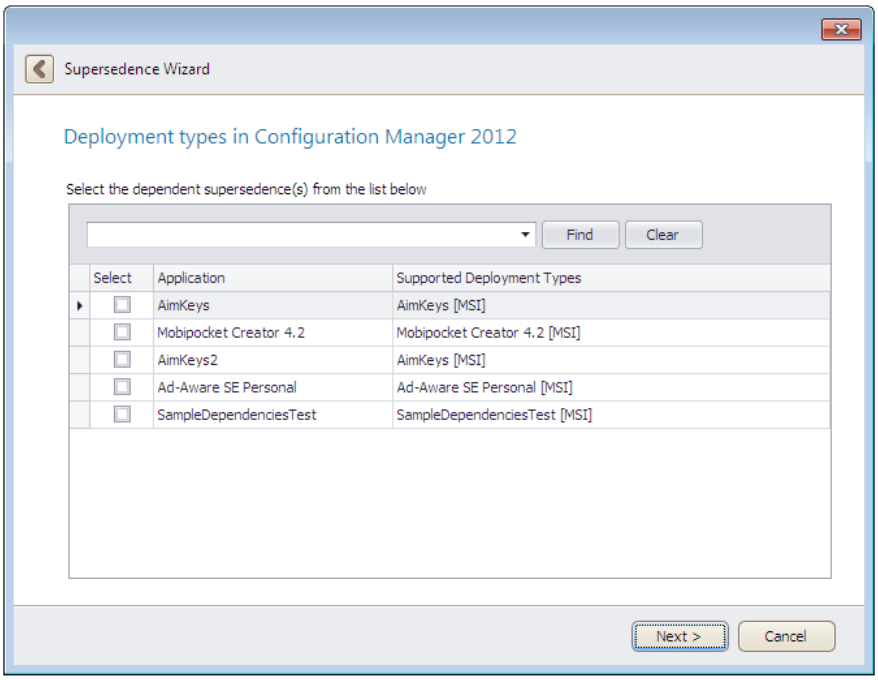

Figure 7-121: Supersedence Wizard / Deployment Types in Configuration Manager 2012 Panel

The **Deployment Types in Configuration Manager 2012** panel includes the following properties:

Table 7-104 • Supersedence Wizard / Deployment Types in Configuration Manager 2012 Panel

Property	Description
Find / Clear	Use to filter application list.
Application	Application name.
Supported Deployment Types	Lists all of the application's supported deployment types.

Summary Panel

On the **Summary** panel, a summary of your selections is listed. Click **Finish** to add the supersedences to the list.

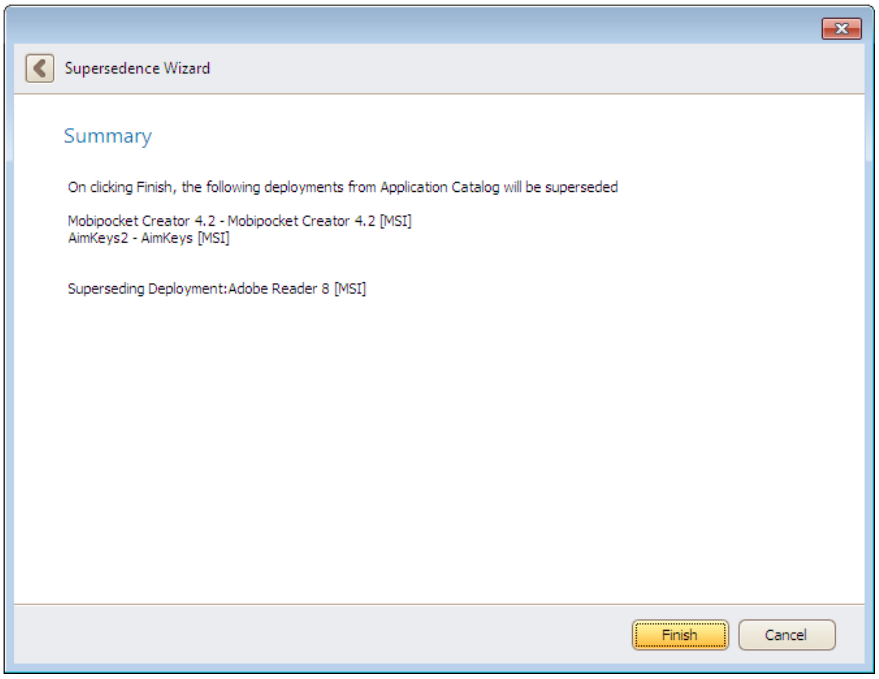

Figure 7-122: Supersedence Wizard / Summary Panel

Test on Virtual Machine Wizard

You can use the **Test on Virtual Machine Wizard** to quickly launch a specified virtual machine and install a selected Windows Installer (.msi) or installation executable (.exe) package (both legacy installers and complex installation executables) for testing. This wizard uses the capability of the Automated Application Converter tool to spin up the selected virtual machine and install the selected package.

Note • *Both legacy installers and complex installer executables (which contain bundled Windows Installer packages) can be tested using the Test on Virtual Machine Wizard.*

The Test on Virtual Machine Wizard is launched by right-clicking on a Windows Installer (**.msi**) or installer executable (**.exe**) package (or on an application containing an **.msi** or **.exe** package) and selecting **Test on Virtual Machine** from the shortcut menu.

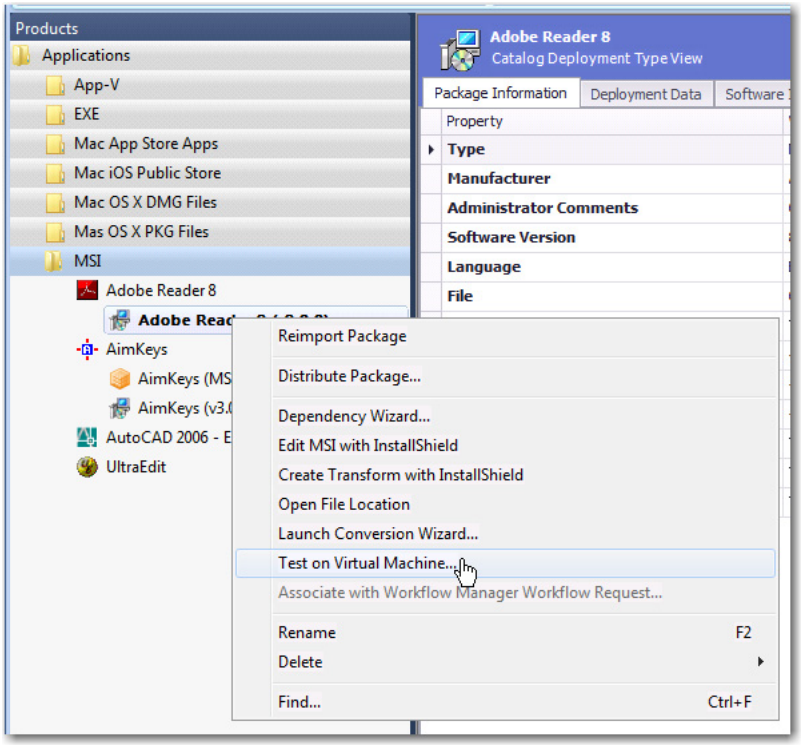

Figure 7-123: Test on Virtual Machine Option

Note • *The **Test on Virtual Machine** selection on the shortcut menu is available on both the **Catalog** and the **Test Center** tabs of Application Manager.*

The Test on Virtual Machine Wizard consists of the following panels:

- Select Package to Test Panel
- Automated Application Converter Test Settings Panel
- Summary Panel
- Performing the Test Process Panel

Select Package to Test Panel

On the **Select Package to Test** panel, the package that was selected when you opened the Test on Virtual Machine Wizard is automatically selected in the Application Manager tree.

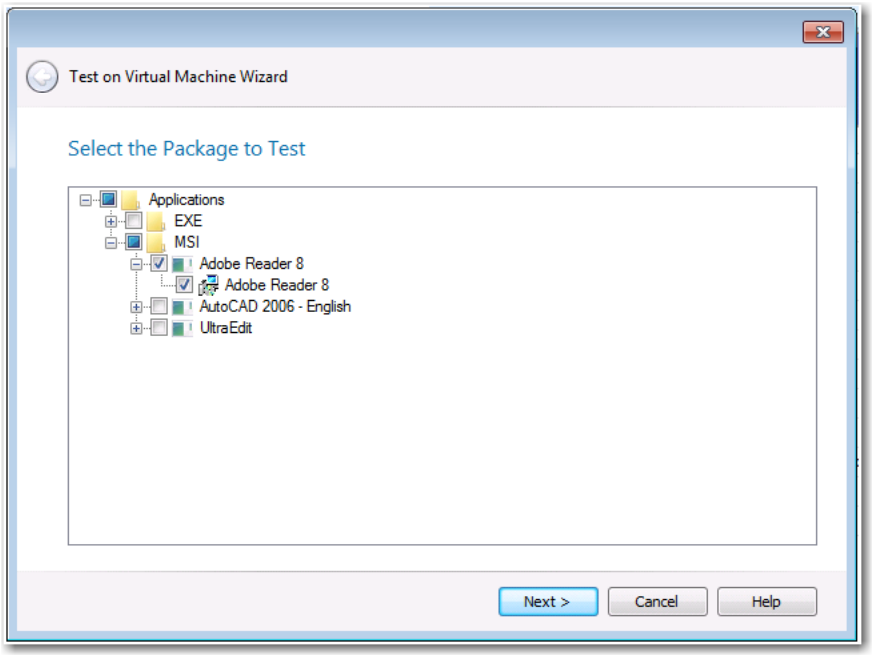

Figure 7-124: Select the Package to Test Panel / Test on Virtual Machine Wizard

Confirm the selection of the package that you want to test and click **Next**.

Note • *You can only select one package for testing.*

Automated Application Converter Test Settings Panel

The **Virtual Machine List** field on the **Automated Application Converter Test Settings** panel of the Test on Virtual Machine Wizard lists the virtual machines defined in the Automated Application Converter settings file that is selected on the **Plugin Options** > **Automated Application Converter Plugin** tab of the **Options** dialog box.

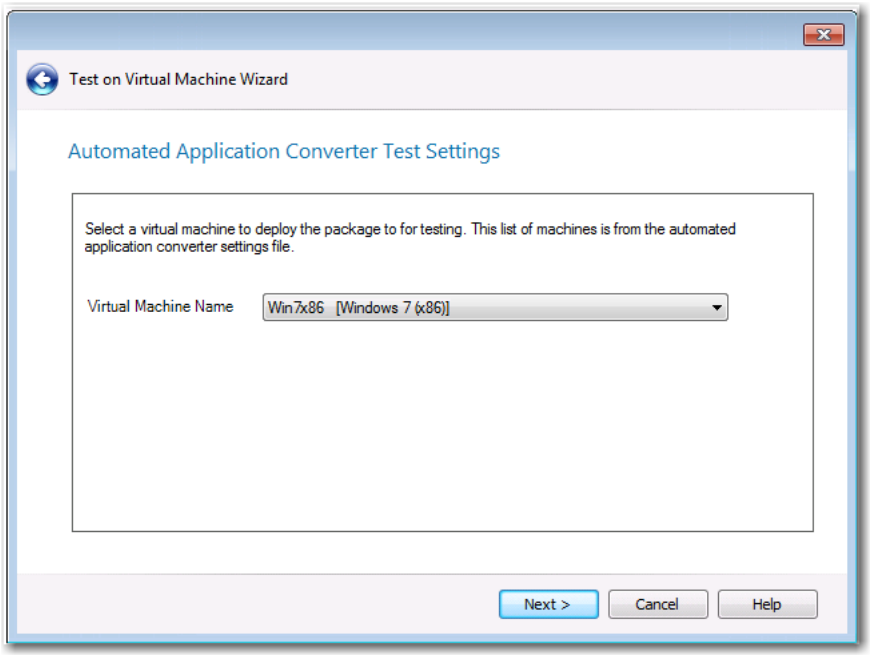

Figure 7-125: Automated Application Converter Test Settings Panel / Test on Virtual Machine Wizard

Select the name of the virtual machine that you want to use for testing and click **Next**.

Summary Panel

The **Summary** panel lists the selections you have made on the previous panels of the Test on Virtual Machine Wizard. Click **Next** to launch the package on the virtual machine for testing.

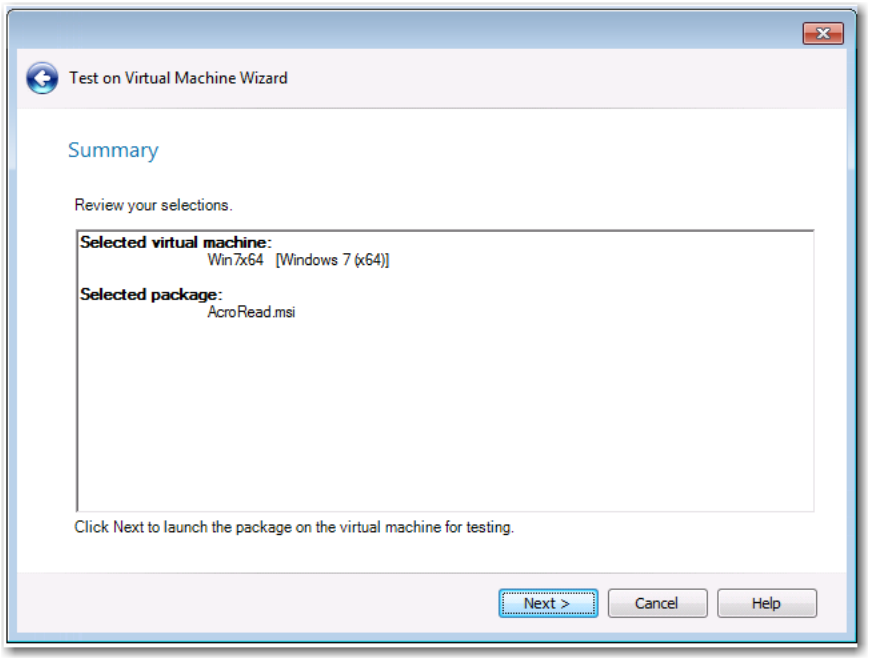

Figure 7-126: Summary Panel / Test on Virtual Machine Wizard

Performing the Test Process Panel

After you click **Next** on the Summary panel of the Test on Virtual Machine Wizard, the **Performing the Test Process** panel opens. The selected package is launched on the specified virtual machine for testing, and progress messages appear on this panel. When the package has been installed and launched on the virtual machine, the **Remote Desktop** button will become enabled.

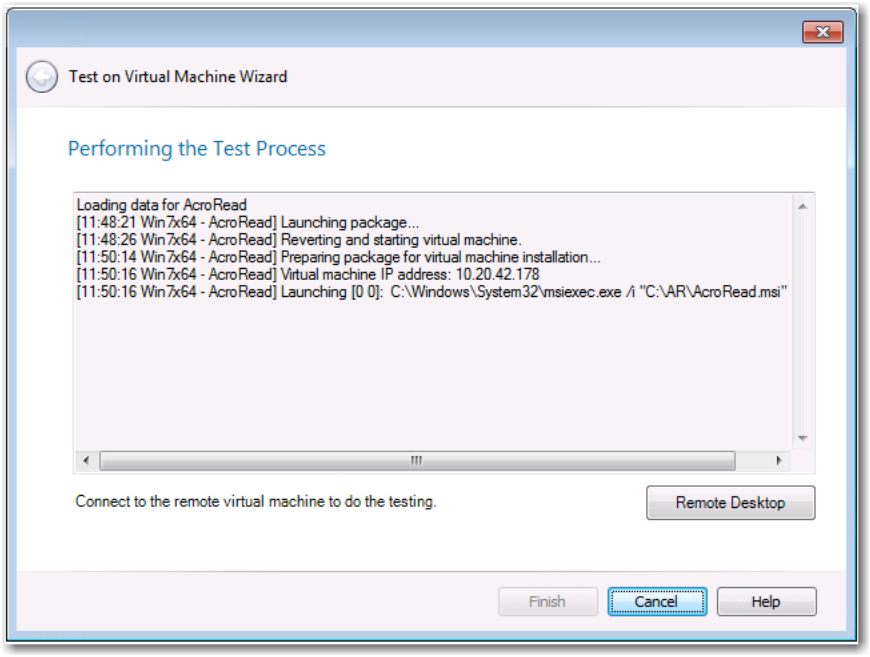

Figure 7-127: Performing the Test Process Panel / Test on Virtual Machine Wizard

Click the **Remote Desktop** button to connect to the specified virtual machine and perform testing. You may be prompted for login credentials to the virtual machine image. A Remote Desktop session opens displaying the virtual image where this package has been installed.

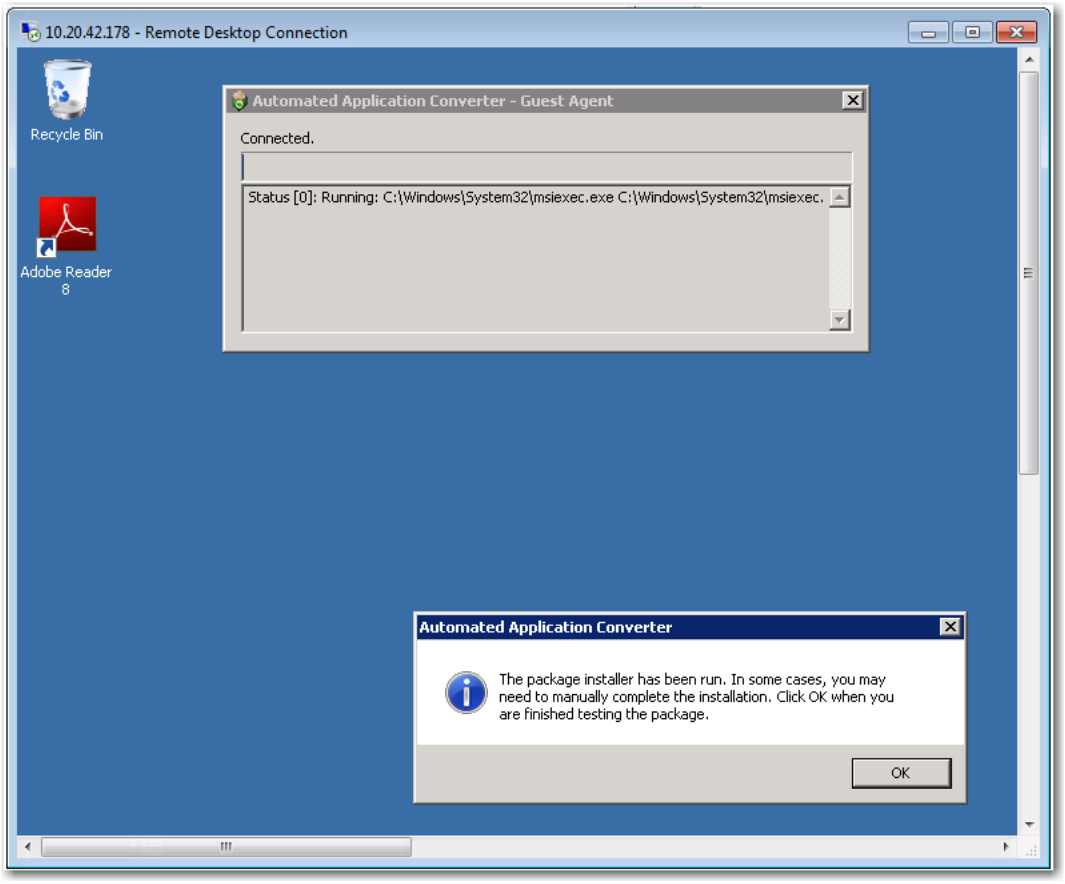

Figure 7-128: Test Session in Remote Desktop Connection Window

Use the installed shortcuts to launch the package and perform the desired testing. When you have finished testing the package, click **OK** to close the Remote Desktop session and shut down the virtual machine.

When you return to the **Test on Virtual Machine Wizard**, click **Finish** to close the wizard.

Upgrade Wizard

When you attempt to open an AdminStudio 5.0, 5.5, 6.0, 7.0, or 7.5 Application Catalog in AdminStudio 2016, you are prompted to upgrade it to use the AdminStudio 2016 schema.

Log files for the upgrade are created in the following directory:

*AdminStudio Shared Directory***ConflictSolver\Logs**

Note • *Note the following regarding upgrading an existing Application Catalog:*

- *The upgrade of AdminStudio 3.0, 3.01, and 3.5 databases is not supported by AdminStudio 7.0 or later.*
- *Starting with AdminStudio 8.0, Microsoft Access databases are not supported.*
- *Starting with AdminStudio 9.01, Oracle databases are not supported.*
- *When an SQL Server Application Catalog database is upgraded, the old tables are not dropped from the Application Catalog.*

The Upgrade Wizard consists of the following panels:

- **Welcome Panel**—Initial panel displayed when the Upgrade Wizard is launched. Click **Next** to proceed with the upgrade.
- **Progress Panel**—Displays the results of the upgrade. Click **Finish** to exit the Upgrade Wizard.

Upgrading Pre-AdminStudio 5.0 Application Catalogs

Pre-AdminStudio 5.0 Application Catalogs cannot be upgraded automatically by AdminStudio 7.0 or later. However, you can upgrade them using the Legacy Upgrade Wizard, a standalone utility that was included with AdminStudio 7.0 and 7.5. The Legacy Upgrade Wizard utility is installed in the following directory:

C:\Program Files\InstallShield\AdminStudio\7.x\Common\LegacyUpgradeWizard.exe

If you do not have a copy of AdminStudio 7.0 or 7.5 available to you, contact Technical Support.

User Permissions in Application Manager

Security and permissions can be assigned to Application Manager users to restrict the tasks that they can perform in Application Manager. Detailed information on these permissions and how to assign them can be found in AdminStudio Client Tools Permissions in the Managing Roles and Permissions section of the help library.

Note *• Typically only AdminStudio Administrators and a few select users will have access to create new Application Catalogs, upgrade Application Catalogs, or otherwise affect multiple users.*

Database Server Permissions

In order to operate some AdminStudio tools, AdminStudio users require specific database permissions. Depending upon the type of user, you may wish to be more selective in the permissions you assign to these users.

If you have AdminStudio Enterprise Edition, you can assign permissions to individual users using the Role functionality in AdminStudio Enterprise Server, as described in AdminStudio and Workflow Manager Roles and Permissions. Otherwise, you can provide more selective restrictions at the database server level using the information in the following table, AdminStudio Database Server Permissions.

Every AdminStudio user will need at a minimum read privilege to every table in the Application Catalog. The minimum permissions are described below, based upon the type of operation you want the user to perform.

Table 7-105 • AdminStudio Database Server Permissions

Type	Description
General User Administrative Process	General administrative processes cover a range of activities such as adding groups, moving packages around, adding comments, updating extending attributes, etc. For example, these tables include **cstblPackage**, **cstblGroups**, and **cstblGroupPackages** Any Application Catalog table which is not referenced explicitly in the discussion for the other AdminStudio processes should be considered a general user administrative table. Most AdminStudio users should have write access to these tables.
Import Process	The user importing MSI packages, merge modules, or just about anything will require write access to a significant set of Application Catalog tables depending on the type of import. For example: • **MSI package file**—For MSI package file import operations, those Application Catalog tables with a **csmsi** prefix are populated. • **Merge modules**—For merge module import operations, the **csmsm** prefixed tables are used. • **Patches**—For patch import operations, the **cspch** prefix tables are used. • **OS snapshots**—For OS snapshot import operations, the **osc** prefix tables are used.
Validation Process	For this process, the user will need to be able to write entries into the **cstblValidationResults** and **cstblValidationConfiguration** tables.
Dependency Scanning Process	For this process, the user will need to be able to write entries into the **cstblPackageExeDependencies** table.
Conflict Detection and Resolution Process	For this process, the user will need to be able to write entries into the **cstblConflict** prefixed table names.
Patch Impact Analysis Process	For this process, the user will need to be able to write entries into the **cstblPatchConflict** prefixed table names. This process will create and delete some temporary tables and, as such, the user performing this process should have the necessary server privileges to perform these operations.
Package Auto Import Process	The Package Auto Import process will ultimately generate a series of Import operations, and so the user performing these operations should have the Import process rights described above. If the user wants to edit these operations in the Wizard, then they will need write accession to the **cstblSubscribed** prefixed tables.
Workflow Operations Process	For this process, the user will need to be able to write entries into the **wftbl** prefixed table names.

Table 7-105 • AdminStudio Database Server Permissions (cont.)

Type	Description
Tools Properties Operations	For this process, the user will need to be able to write entries into the **wftblTools** table name.
Pre-Deployment Testing	For this process, the user will need to be able to write entries into the **pdt** prefixed table names.

Note • *A number of processes within AdminStudio generate data which can subsequently be deleted by the AdminStudio user. Any discussion of the minimum privileges required for a specific AdminStudio process will also imply the privileges to delete this same data.*

Application Manager Command-Line Functionality

Note • *If you invoke Application Manager using the command line* **iscmide.exe** *without passing any parameters, Application Manager will launch in UI mode.*

Tip • *By default, all packages are imported into the root group. If you want to import packages to specific groups, you must use a configuration file (*`-C` *parameter), and specify a group for each package.*

Application Manager supports the following command-line parameters. These parameters are case-insensitive, and must be preceded with either a dash symbol (-) or a forward slash (/).

Table 7-106 • Command Line Parameters

Command Line Parameter & Examples	Description
-? `iscmide.exe -?`	Displays version information and help text for command-line parameters.
-C"configuration_file_name" `iscmide.exe` `-I` `-C"C:\MyConfigs\myconfig.ini"`	The name and location of a configuration file (.ini) containing any required parameters for import. If you are using a configuration file, the only necessary parameters to pass at the command line are `-I` and `-C"configuration_file_name"`. You can include all other parameters inside the INI file.

Table 7-106 • Command Line Parameters

Command Line Parameter & Examples	Description
-D"application_catalog_name" `iscmide.exe` `-S"mysql\sql1"` `-U"admin"` `-P"admin"` `-D"mycatalog"` `-IF"c:\mypackages\mymsi.msi;` `c:\mypackages\mytrans.mst;"`	The name of the Application Catalog. This parameter is only used for SQL Server Application Catalogs, and is a required parameter when using a SQL Server–based Application Catalog.
-I `iscmide.exe` `-I` `-C"c:\mypackages\myconfig.ini"`	This option indicates that a bulk import operation is to be performed. If you are using -IF or -IMM, you do not need to specify this, as these parameters inform Application Manager to perform an import operation.
-IF"msi_file_name[; mst1; mst2...]" **-IF"msi_file_name[; msp1; msp2...]"** **-IF"msi_file_name[; mst1; msp1; msp2...]"** `iscmide.exe` `-F"c:\mycatalogs\conflict.mdb"` `-IF"c:\mypackages\mymsi.msi;` `c:\mypackages\mytrans.mst;"` `iscmide.exe` `-F"c:\mycatalogs\conflict.mdb"` `-IF"c:\mypackages\mymsi.msi;` `c:\mypackages\mypatch.msp;` `c:\mypackages\mytrans.mst;"` `iscmide.exe` `-F"c:\mycatalogs\conflict.mdb"` `-IF"c:\mypackages\mymsi.msi`	The name and full path of the MSI file to be imported, and optionally a semicolon-delimited list of transforms or patches to be applied before importing the package.
-IMM"merge_module_file_name" `iscmide.exe` `-F"c:\mycatalogs\conflict.mdb"` `-IMM"c:\mymodules\crystal.msm"`	The name and full path of the merge module to be imported.
-L"logfile_name" `iscmide.exe` `-I` `-C"c:\mypackages\myconfig.ini"` `-L"c:\mypackages\mylog.txt"`	The output log file name.

Table 7-106 • Command Line Parameters

Command Line Parameter & Examples	Description
-P"password" `iscmide.exe` `-S"mysql\sql1"` `-U"admin"` `-P"admin"` `-D"mycatalog"` `-IF"c:\mypackages\mymsi.msi;` `c:\mypackages\mytrans.mst;"`	The password for the SQL Server Application Catalog. This parameter is only used for SQL Server Application Catalogs, and is a required parameter when using a SQL Server–based Application Catalog. The only exception to this requirement is if you want to take advantage of SQL integrated security (Windows Authentication). In this case, do not use the -P parameter.
-Q `iscmide.exe -Q`	Starts Application Manager as a system tray icon application without showing the full Application Manager Interface. When this option is specified with bulk import options, Application Manager exits once import is complete.
-S"server_name[\instance_name]" `iscmide.exe` `-S"mysql\sql1"` `-U"admin"` `-P"admin"` `-D"mycatalog"` `-IF"c:\mypackages\mymsi.msi;` `c:\mypackages\mytrans.mst;"`	The SQL Server where the Application Catalog resides. If this parameter is passed, the -F parameter is ignored. This parameter is only used for SQL Server Application Catalogs, and is a required parameter when using a SQL Server–based Application Catalog.
-U"login_id" `iscmide.exe` `-S"mysql\sql1"` `-U"admin"` `-P"admin"` `-D"mycatalog"` `-IF"c:\mypackages\mymsi.msi;` `c:\mypackages\mytrans.mst;"`	The user name for the SQL Server Application Catalog This parameter is only used for SQL Server Application Catalogs, and is a required parameter when using a SQL Server–based Application Catalog. The only exception to this requirement is if you want to take advantage of SQL integrated security (Windows Authentication). In this case, do not use the -U parameter.

Using a Configuration File

This section explains how to define a configuration file to use during the import process and how to use a configuration file with command-line options. The following topics are included:

- Application Manager Configuration File
- Using a Configuration File with Command-Line Options

Application Manager Configuration File

In addition to supporting individual command-line parameters, Application Manager can also use a configuration file (when specified using the `-C"configuration_file_name"` parameter) to perform a bulk import of packages into the Application Catalog. This INI file can contain the values for all required parameters during the import process.

- Configuration File Examples
- Parameter Explanation
- Deprecated Parameters

Important • *To accommodate the bulk import of App-V virtual packages using the Application Manager configuration file, the parameters for specifying the files to import were updated starting in AdminStudio 10.0. While configuration files written for previous versions of AdminStudio are still valid in AdminStudio 2016 and its Service Packs, their use is deprecated because it is simpler to use the new parameters. For information on the deprecated parameters, see Deprecated Parameters.*

Configuration File Examples

The following configuration file examples are provided:

- Configuration File for Performing a Bulk Import
- Configuration File to Perform Bulk Import into an Application Catalog for a Named User
- Configuration File to Perform Bulk Import into an Application Catalog for a Trusted User
- Configuration File for Applying Transforms and/or Patches During Command-Line Import

Configuration File for Performing a Bulk Import

The following is an example of a configuration file for performing a bulk import:

```
[GENERAL]
DatabaseType=SQL
LogFile=D:\scratch\TestImport.txt
PackageFile=2

[SQL]
Server=ConflictSolverSQL2K
UserID=myAccountName
Password=myPassword
Database=myDBName

[PackageFile-1]
File=D:\scratch\xmlnotepad2007\XmlNotepad.msi
Group=RootGroup\SubGroup
Transform1=\\server\Data1.mst
EA1=Business Criticality;Business Critical
EA2=Installation Instructions;\\fileserver\docs\VirtualizationSuitabilityNotes.docx

[PackageFile-2]
File=D:\scratch\Test\Test.sft
Group=RootGroup\SubGroup
EA1=Business Criticality;Business Critical
EA2=Installation Instructions;\\fileserver\docs\AppVNotes.docx
```

Configuration File to Perform Bulk Import into an Application Catalog for a Named User

When writing a configuration file to perform bulk import into an Application Catalog for a named user, specify the `[SQL]` section as follows:

```
[SQL]
Server=ConflictSolverSQL2K
UserID=Admin
Password=mypassword
Database=AdminStudio
```

Configuration File to Perform Bulk Import into an Application Catalog for a Trusted User

When writing a configuration file to perform bulk import into an Application Catalog for a trusted user, specify the [SQL] section as follows:

```
[SQL]
Server=ConflictSolverSQL2K
Database=AdminStudio70
```

Configuration File for Applying Transforms and/or Patches During Command-Line Import

The following is an example of a configuration file that applies transforms and patches during a command-line import:

```
[General]
DatabaseType=SQL
LogFile=c:\temp\importlog.txt
PackageFile=4

[PackageFile-1]
File=\\server\Data1.MSI
Transform1=\\server\Data1a.MST
Transform2=\\server\Data1b.MST
Patch1=\\server\Data1p.MSP
Patch2=\\server\Data2p.MSP
AdminInstallLocation=\\Server\Shared\Data1

[PackageFile-2]
File=\\server\Data2.MSI
Patch1=\\server\Data1p.MSP
AdminInstallLocation=\\Server\Shared\Data2

[PackageFile-3]
File=\\server\Data3.MSI
Transform1=\\server\Data3a.MST
Patch1=\\server\Data1p.MSP
AdminInstallLocation=\\Server\Shared\Data3

[PackageFile-4]
SetupName=AdminStudio for Macintosh
SetupDirectory=C:\AdminStudio\MacFiles
FullDirectory=1
```

Note • *The [PackageFile-4] section of this example is specifying an other (non-MSI and non-SFT) setup type. See About Legacy Installer Packages.*

Parameter Explanation

This section provides a description of the parameters used in each section of the configuration file:

- [General] Section

[General] Section

The following table describes the parameters used in the `[General]` section of the configuration file.

Table 7-107 • Parameter Explanation: [General] Section

Parameter	Description
DatabaseType	Using this parameter, you can specify the Application Catalog database type. This value must be set to **SQL**. ***Note*** • *In previous releases, AdminStudio supported Microsoft Access and Oracle databases. However, these two database types are no longer supported.*
LogFile	Using this parameter, you can specify the name and location of the output log file. The LogFile parameter corresponds to the -L command-line parameter.
PackageFile	Use this parameter to indicate the total number of Windows Installer (**.msi**), merge module (**.msm**), App-V (**.sft**, **.appv**), and other setup type packages to be imported. Each package is denoted in subsequent INI file sections named `[PackageFile-n]`.

[SQL] Section

The following table describes the parameters used in the `[SQL]` section of the configuration file.

Table 7-108 • Parameter Explanation: [SQL] Section

Parameter	Description
Server	Using this required parameter, you can provide the name of the SQL Server. It corresponds to the -S command-line parameter.
UserID	Using this parameter, you can provide the login name for the SQL Server. It corresponds to the -U command-line parameter. This is required for non-trusted logins.
Password	Using this parameter, you can provide the password for the SQL Server. It corresponds to the -P command-line parameter. This is required for non-trusted logins.
Database	Use the Database parameter to provide the catalog name for the SQL Server. It corresponds to the -D command-line parameter. If a value is not specified, the default SQL Server Application Catalog for the specified login will be used.

[PackageFile-n] Section

Each Windows Installer, merge module, App-V, or other setup type package to be imported into the Application Catalog must be described in its own section, numbered sequentially (`[PackageFile-1]`, `[PackageFile-2]`, etc.). Each section must contain the name and location of the file, and any transforms or patches to apply to the file prior to import.

Table 7-109 • Parameter Explanation: [PackageFile-n] Section

Parameter	Description
File	Use this parameter to specify the name and location of the file (**.msi**, **.msm**, **.sft**, **.appv**) you are importing. This parameter is required.
Group	You can use the Group parameter to specify the group into which the package should be imported. Use a "\" to indicate a group hierarchy. If no group is specified, the package is imported into the root group. It is possible to specify multiple groups by separating each group with a semicolon, such as: `Group=RootGroup\SubGroup;RootGroup\Subgroup2`
Transform*n*	Use this parameter to specify the name and location of a transform to apply to the Windows Installer package prior to import. Each subsequent transform increases the value of *n* (`Transform1`, `Transform2`, `Transform3`, etc.).  ***Note*** • *This parameter is only applicable when importing Windows Installer packages.*
EAn	Use this parameter to specify extended attributes and values for the file. Each subsequent attribute increases the value of *n* (`EA1`, `EA2`, `EA3`, etc.). Specify extended attributes using the following syntax: `EA`*`n`*`=`*`AttributeName`*`;`*`AttributeValue`* For example: `EA1=Business Criticality;Business Critical` `EA2=Installation Instructions;\\schfiler\doc\VirtualizationNotes.docx` The attribute names should already be specified in the `EA_Default.xml file.` The `EAn` parameter is supported for Windows Installer (**.msi**) and App-V (**.sft**, **.appv**) packages.
Patch*n*	Use this parameter to specify the name and location of a patch to apply to the Windows Installer package prior to import. Each subsequent patch increases the value of *n* (`Patch1`, `Patch2`, `Patch3`, etc.).  ***Note*** • *This parameter is only applicable when importing Windows Installer packages.*

Table 7-109 • Parameter Explanation: [PackageFile-n] Section

Parameter	Description
AdminInstallLocation	When applying a patch to an MSI package, it is necessary to perform an Administrative install of the MSI package and then perform an Administrative install of each patch package one by one. Use this parameter to specify the location where the Administrative install will be performed.  ***Note*** • *This parameter is required if patches are specified.*
SetupName	Identifies the name of the imported setup package (an other setup type).  ***Note*** • *Only valid when importing a file with an unsupported file extension.*
SetupDirectory	Identifies the location of the other setup type files.  ***Note*** • *Only valid when importing a file with an unsupported file extension.*
FullDirectory	Specifies whether to import files in the selected directory and all subdirectories (1) or just the files in the selected directory (0).  ***Note*** • *Only valid when importing a file with an unsupported file extension.*

Deprecated Parameters

To accommodate the bulk import of App-V virtual packages using the Application Manager configuration file, the parameters for specifying the files to import were updated starting in AdminStudio 10.0.

In versions of AdminStudio prior to version 10.0, you had to individually specify the number of MSI, MSM, and Other Setup Type files that you were going to import in the `[General]` section of the configuration file (using the `MSIFile=n`, `MSMFile=n` and `OtherSetupFile=n` parameters), and then specify the parameters for each package to import in its own section that started with `[MSIFile-n]`, `[MSMFile-n]` or `[OtherSetupFile-n]`.

Starting with AdminStudio 10.0, the total number of packages (of any deployment type) to import can now be specified using one parameter in the `[General]` section: `PackageFile=n`. And the parameters for each package (of any deployment type) to import are specified in a separate section entitled `[PackageFile-n]`. For example, the following configuration file would import two files: one Windows Installer package and one App-V package:

```
[GENERAL]
DatabaseType=SQL
LogFile=D:\server10\ImportLog.txt
PackageFile=2
.
.
.
[PackageFile-1]
File=D:\server10\xmlnotepad2007\XmlNotepad.msi
```

```
Group=RootGroup\SubGroup1
Transform1=\\server\Data1.mst
EA1=Business Criticality;Business Critical
EA2=Installation Instructions;\\fileserver\docs\VirtualizationNotes.docx

[PackageFile-2]
File=D:\server10\packages\app2000.sft
```

Group=RootGroup\SubGroup2

While configuration files written for previous versions of AdminStudio are still valid in AdminStudio 2016 and its Service Packs, their use is deprecated because it is simpler to use the new parameters. This section lists those deprecated parameters.

- Deprecated Parameters in the [General] Section
- [MSIFile-n] Section (Deprecated)
- [MSMFile-n] Section (Deprecated)
- [OtherSetupFile-n] Section (Deprecated)

Deprecated Parameters in the [General] Section

The `MSIFile=n`, `MSMFile=n`, and `OtherSetupFile=n` parameters in the `[General]` section of the Application Manager Configuration file were deprecated starting in AdminStudio 10.0; they have been replaced with the `PackageFile=n` parameter. The following is an example of how these deprecated parameters were used:

```
[General]
DatabaseType=SQL
LogFile=c:\temp\importlog.txt
MSIFile=3
MSMFile=1
OtherSetupFile=1
```

The following table describes these parameters.

Table 7-110 • Deprecated Parameter Explanation: [General] Section

Parameter	Description
MSIFile	Use this parameter to indicate the number of MSI files to be imported. Each MSI file is denoted in subsequent INI file sections named `[MSIFile-n]`. See [MSIFile-n] Section (Deprecated).
MSMFile	Use this parameter to indicate the number of merge modules to be imported. Each merge module file is denoted in subsequent INI file sections named `[MSMFile-n]`. See [MSMFile-n] Section (Deprecated).
OtherSetupFile	Use this parameter to indicate the number of other setup type files to be imported. Each other setup type file is denoted in subsequent INI file sections named `[OtherSetupFile-n]`. See [OtherSetupFile-n] Section (Deprecated). ***Note*** • *See About Legacy Installer Packages.*

[MSIFile-n] Section (Deprecated)

Each Windows Installer package to be imported into the Application Catalog must be described in its own section, numbered sequentially ([MSIFile-1], [MSIFile-2], etc.). Each section must contain the name and location of the file, and any transforms or patches to apply to the file prior to import.

Table 7-111 • Parameter Explanation: [MSIFile-n] Section

Parameter	Description
File	Using the File parameter, you can specify name and location of the Windows Installer package (.msi) you are importing. This parameter is required.
Transform*n*	Use this parameter to specify the name and location of a transform to apply to the Windows Installer package prior to import. Each subsequent transform increases the value of *n* (Transform1, Transform2, Transform3, etc.).
Patch*n*	Use this parameter to specify the name and location of a patch to apply to the Windows Installer package prior to import. Each subsequent patch increases the value of *n* (Patch1, Patch2, Patch3, etc.).
AdminInstallLocation	When applying a patch to an MSI package, it is necessary to perform an Administrative install of the MSI package and then perform an Administrative install of each patch package one by one. Use this parameter to specify the location where the Administrative install will be performed. ***Note*** • *This parameter is required if patches are specified.*
Group	You can use the Group parameter to specify the group into which the package should be imported. Use a "\" to indicate a group hierarchy. If no group is specified, the package is imported into the root group. It is possible to specify multiple groups by separating each group with a semicolon, such as: `Group=RootGroup\SubGroup;RootGroup\Subgroup2`

[MSMFile-n] Section (Deprecated)

Each merge module to be imported into the Application Catalog must be described in its own section, numbered sequentially ([MSMFile-1], [MSMFile-2], etc.). Each section must contain the name and location of the file.

Table 7-112 • Parameter Explanation: [MSMFile-n] Section

Parameter	Description
File	Use this parameter to specify the name and location of the merge module (.msm) you are importing.

[OtherSetupFile-n] Section (Deprecated)

Each other setup type file to be imported into the Application Catalog must be described in its own section, numbered sequentially ([OtherSetupFile-1], [OtherSetupFile-2], etc.). Each section must contain the name and location of the file.

Table 7-113 • Parameter Explanation: [OtherSetupFile-n] Section

Parameter	Description
File	Use this parameter to specify the name and location of the other setup type file you are importing.
SetupName	Identifies the name of the imported setup package (an other setup type). ***Note*** • *Only valid when importing a file with an unsupported file extension.*
SetupDirectory	Identifies the location of the other setup type files. ***Note*** • *Only valid when importing a file with an unsupported file extension.*
FullDirectory	Specifies whether to import files in the selected directory and all subdirectories (1) or just the files in the selected directory (0). ***Note*** • *Only valid when importing a file with an unsupported file extension.*

Using a Configuration File with Command-Line Options

Application Manager supports use of a configuration file to pass parameters during command-line import. This is extremely useful if you are importing multiple packages and/or merge modules simultaneously. Use the following command line to use a configuration file:

```
iscmide.exe -C"configuration_file_name"
```

Replace **configuration_file_name** with the name and location of the configuration file to use.

Importing

This section includes topics on how to perform import operations from the command line. The following topics are included:

- Applying Transforms and Patches During Command-Line Import
- Importing Multiple Windows Installer Packages Simultaneously
- Importing Multiple Merge Modules Simultaneously
- Simultaneously Importing Windows Installer Packages and Merge Modules

- Using the Command Line to Import All Packages in a Directory
- Running Import Silently
- Creating a Log File During Command-Line Import

Applying Transforms and Patches During Command-Line Import

Application Manager provides two mechanisms for applying transforms or patches to a Windows Installer package during import. First, if you are only importing a single package into Application Manager from the command line, you can pass transforms or patches after the file name, as in the following command lines:

Table 7-114 • Applying Transforms and Patches During Import

Function	Command
Transform	`iscmide.exe -IF"msi_file;[mst1;mst2;]"`
Patch	`iscmide.exe -IF"msi_file;[msp1;msp2;]"`
Both	`iscmide.exe -IF"msi_file;[mst1;msp1;]"`

Replace **msi_file** with the name and location of the Windows Installer package, and **mst1** and **mst2** or msp1 and **msp2** with the names and locations of the transforms or patches to apply. For example, if your MSI file was named **data1.msi** and your two MST files were named **alpha.mst** and **gamma.mst**, your command line would look like the following:

```
iscmide.exe -IF"data1.msi;alpha.mst;gamma.mst;
```

Note • *Depending on the situation, it may be necessary to pass additional command-line parameters.*

If you are importing multiple Windows Installer packages, and applying transforms or patches to them, use a configuration file in which you can specify the names and locations of the packages and associated transforms or patches. Use the following command line to use a configuration file:

```
iscmide.exe -C"configuration_file_name"
```

Replace **configuration_file_name** with the name and location of the configuration file to use.

Importing Multiple Windows Installer Packages Simultaneously

The best way of importing multiple Windows Installer packages simultaneously into an Application Catalog is via a configuration file. Use the following command line to call your configuration file, in which you can specify multiple Windows Installer packages to import.

```
iscmide.exe -C"configuration_file"
```

Replace **configuration_file** with the name and location of the configuration file containing the names and locations of the packages you want to import.

Importing Multiple Merge Modules Simultaneously

The best way of importing multiple merge modules simultaneously into an Application Catalog is via a configuration file. Use the following command line to call your configuration file, in which you can specify multiple merge modules to import.

```
iscmide.exe -C"configuration_file"
```

Replace **configuration_file** with the name and location of the configuration file containing the names and locations of the merge modules you want to import.

Simultaneously Importing Windows Installer Packages and Merge Modules

To simultaneously import both Windows Installer packages and merge modules into an Application Catalog, use a configuration file from the command line. In this configuration file, you can specify the names and locations of both merge modules and Windows Installer packages you want to import.

Use the following command-line to specify your configuration file:

```
iscmide.exe -C"configuration_file_name"
```

Replace **configuration_file_name** with the name and location of the configuration file to use.

Using the Command Line to Import All Packages in a Directory

It is possible from the command line to import all packages in a directory. This can be done by placing the following line in a batch file (modifying it as necessary for your specific environment):

```
for %%a in (*.msi) do ISCMIDE
   -S"server_name"
   -U"userid"
   -P"password"
   -D"Application_Catalog_Name"
   -IF"%%a"
   -Q
   -L"%%aLog.txt"
```

The above statement runs Application Manager, importing each MSI package in the Application Catalog, and creates a log file with the name of the **.msi** file prepended to the log file name.

However, the above command makes the following assumptions:

- **ISCMIDE.exe** is in the path; otherwise, include the full path to **ISCMIDE.exe**.
- All packages are being imported into the specified SQL Server Application Catalog (provide the server name, userid, password, and Application Catalog name with the appropriate parameters `-S`, `-U`, `-P`, and `-D`, respectively).
- The above command will start Application Manager, import a file, exit Application Manager, and then restart Application Manager for each MSI file. If this is not acceptable, use a configuration file instead.
- No transforms are applied to the imported packages. If you need to apply transforms, use a configuration file instead.
- Application Manager starts in quiet mode. If it is switched to full mode, it is your responsibility to end the Application Manager process so the next file can be imported.

Running Import Silently

Application Manager can be run silently in system tray mode by using the following command line:

```
iscmide.exe -Q
```

An icon for Application Manager, with a corresponding shortcut menu available by right-clicking on the icon, appears in the system tray. If you pass the -Q parameter in addition to other parameters, progress is displayed in the tool tip available when you mouse over the icon. This is beneficial if you are importing a sizable amount of packages, yet want to monitor the progress periodically.

In quiet mode, when import from the command line ceases, Application Manager automatically exits.

Creating a Log File During Command-Line Import

It may be necessary or beneficial to create a log file during package/merge module import from the command line. You may want to see the results of the import, or determine why certain packages were not processed as expected. To create a log file, use the following command-line:

```
iscmide.exe -L"log_file_name"
```

Replace **log_file_name** with the name and location of the log file you want to create.

Note *• It may be necessary to pass additional command-line parameters, depending on the task you are performing from the command line.*

Connecting to Standalone Application Catalogs

This section includes the following topics:

- Connecting to a Specific Standalone Application Catalog Using Command-Line Options
- Creating Shortcuts to Specific Standalone Application Catalogs

Connecting to a Specific Standalone Application Catalog Using Command-Line Options

Using the following command line, you can connect to a specific SQL Server Application Catalog:

```
iscmide.exe -S"sql_server_name" -U"user_id" -P"password"
```

Replace **sql_server_name** with the specific SQL Server name (including path information). Replace **user_id** and **password** with the UserID and password for the server.

Note *• Depending on the Application Catalog configuration, it may be necessary to pass additional command-line parameters, such as the Application Catalog name.*

Creating Shortcuts to Specific Standalone Application Catalogs

For convenience, you may want to create a Windows shortcut to launch Application Manager and automatically connect to a specific Application Catalog.

Task ***To create the shortcut:***

1. On the Windows Desktop, right-click, point to New, and select Shortcut. The Create Shortcut Wizard appears.
2. Click the Browse button and navigate to the Application Manager executable (**ISCMIDE.exe**). Typically, it is in the `[AdminStudioInstallDirectory]\Common` directory. When you have located it, click OK and then click Next.
3. Type a name for the shortcut and click Finish. The new shortcut appears on the Desktop.
4. Right-click on the shortcut and select Properties.
5. In the **Properties** dialog box, append the necessary command-line parameters to the end of the target, such as:

   ```
   iscmide.exe -S"sql_server_name" -U"user_id" -P"password"
   ```

6. Click OK to dismiss the dialog box.

Note • *If you are creating a shortcut to a Microsoft SQL Server Application Catalog, you need to provide values for the SQL Server name, UserID, password, and Application Catalog name using the -S or -O, -U, -P, and -D parameters. See Application Manager Command-Line Functionality or Connecting to a Specific Standalone Application Catalog Using Command-Line Options.*

8

Repackaging Legacy Installations Using the Repackaging Wizard

Installations created for the Windows Installer service dramatically differ from traditional installations, making reusing legacy installations impossible without using a repackaging tool. You can use Repackager's Repackaging Wizard to capture the data placed on your system during installation and convert it into a Windows Installer (**.msi**) package, which you can then customize and distribute according to your organization's needs.

Documentation regarding using the Repackaging Wizard is presented in the following sections:

Table 8-1 • Using the Repackaging Wizard

Section	Description
About Repackaging	Introduces you to repackaging, explains various repackaging methods, lists Repackaging Best Practices, explains how to include the InstallScript Engine with a Windows installer package, and reviews Repackager options.
Repackaging Methods	Describes the methods of repackaging that the Repackaging Wizard supports.
Configuring Repackager to Ensure Optimal Installation Capture	Describes how to configure Repackager in order to get optimal results when capturing an installation.
Repackaging Legacy Installations Using the Repackaging Wizard	Explains how to use the Repackaging Wizard to convert the following installations: • InstallShield Professional 1.x to 5.1.x • InstallShield Professional 5.5 to 7.x • InstallShield InstallScript MSI • InstallShield DevStudio 9.x InstallScript • InstallShield Editor InstallScript

Table 8-1 • Using the Repackaging Wizard (cont.)

Section	Description
Documenting Repackaging Steps Using the Microsoft Step Recorder Tool	Explains how to use the Microsoft Step Recorder documentation tool to document the steps taken during repackaging.
Repackaging Wizard Reference	Describes each of the dialog boxes and Wizard panels that you might encounter when using the Repackaging Wizard.

Note • *For information on other Repackager features, see Converting Legacy Installations Using the Repackager Interface.*

About Repackaging

This section introduces you to repackaging, lists Repackaging Best Practices, and explains how to set Repackager options.

- Purpose of Repackaging Applications
- Supported Legacy Installation Types
- Repackaging 64-Bit Applications
- Repackaging Options Comparison
- Repackaging Wizard Best Practices
- About Repackaging on Clean Systems
- Including the InstallScript Engine With a Windows Installer Package

Purpose of Repackaging Applications

Installations created for the Windows Installer service dramatically differ from traditional installations, making reusing legacy installations impossible without using a repackaging tool. Repackager assists you by capturing the data placed on your system during installation and converting it into a Windows Installer (**.msi**) package, which you can then customize and distribute according to your organization's needs.

Repackaging an installation into a Windows Installer package provides the following benefits:

- **Can customize it using InstallShield Editor or Tuner**—You can further configure or customize the Windows Installer package to meet your specific needs by editing the **.msi** file in InstallShield Editor or by creating transforms in InstallShield Editor or Tuner.
- **Can perform conflict analysis and resolution**—You can use Application Manager to check the Windows Installer package for conflicts that may exist between it and other known Windows Installer packages in an Application Catalog database, ensuring the proper installation and functioning of your installations.

- **Can implement application repair and feature advertising**—Finally, once converted to a Windows Installer package, the installation can take advantage of Windows Installer functionality such as application repair and feature advertisement.

Supported Legacy Installation Types

You can use both the Repackaging Wizard and the Repackager interface to create Repackager projects. The tool that you use depends upon the type of installation you are converting:

Table 8-2 • Methods of Creating Repackager Projects

Tool	Installation Source
Repackaging Wizard	You can use the Repackaging Wizard to convert the following installations: • InstallShield Professional 1.x to 5.1.x • InstallShield Professional 5.5 to 7.x • InstallShield InstallScript MSI • InstallShield DevStudio 9.x InstallScript • InstallShield Editor InstallScript See Repackaging Legacy Installations Using the Repackaging Wizard.
Repackager Interface	You can use the Repackager interface to convert the following installations: • Repackager 3.x output (.inc) • Microsoft SMS projects (.ipf) • Novell ZENworks project files (.axt/.aot) • WinINSTALL projects (.txt) (6.0, 6.5, 7.x) • Wise installation projects (.wse) • InstallShield Professional log files (.isl) See Converting Legacy Installations Using the Repackager Interface.  ***Edition*** • *The Repackager interface is included with AdminStudio Standard, Professional, and Enterprise Editions.*

Repackaging 64-Bit Applications

Edition • *The Repackager interface is included with AdminStudio Standard, Professional, and Enterprise Editions.*

Repackager has the capability to repackage both 32-bit and 64-bit applications, as well as hybrid applications (both 32-bit and 64-bit). The Repackaging Wizard remains a 32-bit application, but can be run on both 32-bit (x86) and 64-bit (x64) Windows operating systems. The following table lists the operating systems to use to repackage both 32-bit and 64-bit applications, and the operating systems those repackaged applications will run on.

Table 8-3 • Repackaging 32-Bit and 64-Bit Applications

Application Type	Repackage on ...	Will run on ...
64-bit application	Windows 64-bit OS ***Note*** • *You can use either the* ***Installation Monitoring*** *or* ***Snapshot*** *method to repackage a 64-bit application on a 64-bit operating system.*	Windows 64-bit OS
32-bit application	Windows 32-bit OS ***Important*** • *While it is possible to repackage a 32-bit application on a 64-bit OS, it is recommended that you use a 32-bit OS, to avoid inadvertently capturing any 64-bit data. If Repackager captures any 64-bit data, it will flag the package as a 64-bit application, meaning that it will only run on a 64-bit OS. See Excluding 64-Bit Data.*	Windows 64-bit OS or Windows 32-bit OS

Excluding 64-Bit Data

It is strongly recommended that you repackage 32-bit applications on a 32-bit OS. However, if you choose to repackage a 32-bit application on a 64-bit OS, you need to make sure that you exclude any unnecessary 64-bit data, such as data from a 64-bit Windows Service that could be running or 64-bit files (stored in the **System64Folder**, **ProgramFiles64Folder**, or **CommonFiles64Folder** directories) or 64-bit registry entries (any entries stored in a node other than `WOW6432Node`).

Repackaging Options Comparison

Edition • *The Repackager interface is included with AdminStudio Standard, Professional, and Enterprise Editions.*

The following table details the different options available to you when using Repackager, based upon source type, product and version:

Table 8-4 • Repackaging Options Comparison Chart

Source	Product / Version	Repackaging Method	Result
Media 	IS Professional 1.x to 5.1.x	**Repackaging Wizard** Installation Monitoring **or** Snapshot	Repackager project with no feature delineation
	IS Professional 5.5 to 7.x	**Repackaging Wizard** Installation Monitoring **or** Snapshot	Repackager project with feature delineation, including registry entries and shortcuts
	IS InstallScript MSI IS Editor InstallScript IS DevStudio 9.*x* InstallScript	**Repackaging Wizard** Installation Monitoring **or** Single Step Snapshot	Repackager project with feature delineation, including registry entries and shortcuts
Project 	Repackager 3.x output (**.inc**) Microsoft SMS projects (**.ipf**) Novell ZENworks projects (**.axt/ .aot**) WinINSTALL projects (**.txt**) (6.0, 6.5, 7.x) Wise installation projects (**.wse**)	**Repackager Interface** Select **Open** on the **File** menu to have Repackager automatically convert file to a Repackager project	Repackager project with no feature delineation
	InstallShield Editor Pro log files (**.isl**)	**Repackager Interface** Select **Open** on the **File** menu to have Repackager automatically convert file to a Repackager project	Repackager project with feature delineation

Once you have created a Repackager project, you can visually examine the files, **.ini** files, shortcuts, and registry data from the installation, and exclude any non-essential items. Then, you can build the Repackager project into an InstallShield Editor project (**.ism**) for further editing, or create a Windows Installer package (**.msi**).

Repackaging Wizard Best Practices

Edition • *The Repackager interface is included with AdminStudio Standard, Professional, and Enterprise Editions.*

To ensure optimal performance of the Repackaging Wizard during repackaging and when working with Repackager projects, the following best practices are recommended:

- Repackage on a Clean System
- Launch Repackager Remotely or Install Repackager on the Clean Machine

- Use the Repackager Interface to Exclude Unwanted Items
- Exit All Other Applications
- Only Repackage Non-Windows Installer Setups

Repackage on a Clean System

It is essential that you repackage applications on a "clean" system to ensure you capture all changes made by the installation. A clean system typically consists of a computer with only the operating system and necessary service packs installed on it. Repackaging on a clean system provides the following benefits:

- **Prevents you from capturing Repackager files**—By repackaging on a clean system, you are ensuring that you do not inadvertently capture Repackager files during repackaging.
- **Ensures that you capture all of the necessary setup files**—If you do not repackage on a clean system, you may not capture all of the necessary files for the setup because the files may already be installed on the system.

Note *• For more information, see About Repackaging on Clean Systems.*

Launch Repackager Remotely or Install Repackager on the Clean Machine

Because it is best to keep the number of packages installed on the clean machine to a minimum, you should launch Repackager remotely from the clean machine or install Repackager on the clean machine:

- **Launch Repackager Remotely**—You could install Repackager on a shared network drive and then launch Repackager remotely from the clean machine. See Launching Repackager Remotely.
- **Install Repackager on clean machine**—You could install a copy of Repackager onto the clean machine. While it is preferable to launch Repackager remotely from the clean machine, if you do not have network access to an installation of the AdminStudio client tools, this is your best option. See Installing Repackager on a Clean Machine.

Both of these options are explained in Configuring Repackager to Ensure Optimal Installation Capture.

Use the Repackager Interface to Exclude Unwanted Items

You should repackage using the provided exclusions and then use the Repackager interface to visually remove unwanted items from the capture.

Because this occurs post-capture, you do not need to recapture the legacy setup if you inadvertently exclude items from the Windows Installer package you are building.

Note *• Since Windows Installer does not support packaging device drivers, you would need to create Custom Actions to install device drivers. See Using Custom Actions in the Windows Installer help section for more information.*

Exit All Other Applications

Other applications may lock files or directories, and may hinder the performance of the setup and repackaging. Therefore, exit all applications prior to repackaging.

Only Repackage Non-Windows Installer Setups

Windows Installer setups should not be repackaged. They should either be edited in InstallShield Editor, or, as Microsoft recommends, by creating a transform. This can be done using InstallShield Editor or Tuner.

You should not repackage Windows Installer (**.msi**) packages for the following reasons:

- Repackaging a Windows Installer package is against Microsoft Best Practices.
- If you make changes to a Windows Installer package, vendors will no longer provide support for that product.
- If you repackage a Windows Installer package, the component codes within the package are not retained and hence future patching or upgrades will not work.
- Traditionally, repackaging tools will ignore the Windows Installer-specific data in the Registry. This will result in an incomplete package.

Also, Repackager is not intended for repackaging operating system installations or service packs, or deeply integrated operating system components such as Internet Explorer. Moreover, components such as MDAC or DCOM should be included in the clean image, or installed by a setup using the vendor's redistributable.

Exception to This Rule

In general, due to the reasons listed above, it is not recommended to repackage a vendor-created Windows Installer package to create a new Windows Installer package. However, some IT organizations may elect to repackage Windows Installer packages in order to simplify them, which should make them more reliable and less likely to violate the organization's and Microsoft's recommended best practices.

If you choose to repackage a Windows Installer package, you need to keep in mind that you may no longer be able to:

- Directly deploy vendor-provided patches for this package, OR
- Use any vendor-provided automatic updating service for this package.

Therefore, you should only consider repackaging a Windows Installer package if your IT staff is also willing to invest resources into periodically repackaging that application's vendor patches into an updated Windows Installer package.

Note • *Tightly-controlled organizations probably would not want to have automatically-updating software, so the inability to use an automatic updating service may not be of concern to them.*

About Repackaging on Clean Systems

For optimal results when using Repackager or OS Snapshot, you should perform these processes on a clean system. A clean system typically consists of a computer with only the operating system and necessary service packs installed on it. It is the baseline system that the computer requires to run.

Although it may be tempting to consider basic software, such as Microsoft Office, as part of the clean system, this can result in poor snapshots and repackaged setups. Each application you install on the baseline system adds to the DLLs, changes versions of files, makes new registry entries, etc. This may cause Repackager or the OS Snapshot Wizard to miss these during capture, which ultimately may lead to missing files or registry entries in repackaged setups, or unexpected conflicts between the operating system and Windows Installer packages.

Note • *For more information on setting up a clean system to repackage on, see Configuring Repackager to Ensure Optimal Installation Capture.*

Alternate-Language Repackaging on Clean Machines

The standalone Repackager setup for clean machines does not install any language resources other than US English. Therefore, if you are Repackaging a setup on a clean system in a language other than in US English, you need to ensure you point to the correct template in the Repackaged Output View.

This can be on a mapped network drive, or you can copy the language-populated template (for example, **ISProjBlankTpl.ism**) to your clean system from the [**AdminStudioInstallDirectory]\Editor\Support** directory.

Language-specific templates are available when you purchase InstallShield Editor Language Packs.

Including the InstallScript Engine With a Windows Installer Package

Should you need to include the InstallScript engine with your setup, all the major releases of the InstallScript engine are available in the **InstallScript_Engines** folder on the AdminStudio installation CD. For more information, see the *Update to the Latest InstallShield Installation Engines* Knowledge Base article at:

https://flexeracommunity.force.com/customer/articles/en_US/HOWTO/Q108322

Repackaging Methods

Repackager supports three methods of repackaging:

Table 8-5 • Repackaging Methods

Repackaging Method	Description
Installation Monitoring Method	Repackager monitors system changes as an application is installed, and that data can be converted into a Windows Installer package. Installation Monitoring is the default method. ***Edition*** • *The Repackaging Wizard Installation Monitoring method is included with AdminStudio Standard, Professional, and Enterprise Editions.*
Snapshot Method	Repackager compares a system snapshot before and after an installation, determines the changes that were made, and that data can be converted to a Windows Installer package.

Installation Monitoring Method

Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

When using the **Installation Monitoring** method, the Repackaging Wizard monitors a system for any processes that are created during an installation. The Installation Monitoring method determines the dynamic interdependencies between files.

By monitoring these processes in the background, the Repackaging Wizard can identify files, shell links, and registry entries that are added, modified, or removed by the installation. The resulting files and Repackager output file can be converted into a Windows Installer package.

Installation Monitoring Method Considerations

Consider the following about Installation Monitoring when selecting a repackaging method:

- **Faster than Snapshot**—Installation Monitoring is significantly faster than the Snapshot repackaging method.
- **Clean system not required**—Although it is still a good practice to repackage on a clean system, it is not as important when using Installation Monitoring technology as it is when you use the Snapshot method.
- **Can exclude processes from the project**—When using the Installation Monitoring method, you can specify the processes that you want to exclude from the Installation Monitoring.
- **Enhanced system reboot handling**—On Windows Vista and newer, system reboots are almost instantaneous and do not allow running applications to properly shut down, which may result in a loss of data. When using the Installation Monitoring method, Repackager successfully handles a system reboot and delays it until you click the Reboot button on the Repackaging Wizard.
- **Windows side-by-side support**—The Repackager Installation Monitoring method scans and detects changes made to the Windows SxS (Side-by-Side) store and automatically includes the proper merge modules.

Snapshot Method

When using the **Snapshot** method, the Repackaging Wizard takes a reference snapshot of a system as a baseline configuration, performs the installation, and then takes a second snapshot.

The difference between the two snapshots is stored in a directory you specify, along with the Repackager output file (**.inc**). This file can then be converted into a Windows Installer package (**.msi**) using Repackager.

Snapshot Method Considerations

Consider the following about Snapshot technology when selecting a repackaging method:

- **Slower than Installation Monitoring**—The Snapshot method is significantly slower than the Installation Monitoring repackaging method.
- **Clean system is required**—When repackaging using Snapshot technology, you should use a clean system, with a baseline configuration for your target environment. If you do not repackage on a clean system, you may not capture all of the necessary files for the setup because the files may already be installed on the system.

- **Exclude anti-virus software directories**—Any machine that you use to repackage most likely has anti-virus software installed on it, even a "clean" machine. While you are repackaging an application, the real-time virus detection feature of anti-virus software could automatically update various cached files in its directories. In order to avoid repackaging errors when using the **Snapshot** method, you should exclude these directories. See Excluding Directories and Subdirectories for more information.

Note • *Anti-virus software does not affect repackaging using the* ***Installation Monitoring*** *method.*

Configuring Repackager to Ensure Optimal Installation Capture

Both repackaging methods, **Installation Monitoring** and **Snapshot**, involve installing an application and recording the system changes made by that installation. To ensure that you capture *all* changes made by the installation, you should, ideally, install the application onto a "clean machine" (a computer with only the operating system installed), as described in About Repackaging on Clean Systems.

Depending upon your network connectivity, you should configure Repackager on a clean machine in one of the following ways:

Table 8-6 • Methods to Configure Repackager

Repackager Configuration	Description
Launching Repackager Remotely	If you have connectivity from a clean machine to a computer or network location that contains an installation of Repackager, you should launch Repackager remotely.
Installing Repackager on a Clean Machine	If you do not have any network connectivity on the clean machine, you should install Repackager on the clean machine.

Launching Repackager Remotely

Because you want to avoid installing applications on the clean machine, you should launch Repackager remotely from the clean machine.

To launch Repackager remotely, perform the following tasks:

- Sharing Directories on a Machine with an Installation of AdminStudio
- Creating a Shortcut to the Repackaging Wizard on the Clean Machine
- Remotely Launching Repackaging Wizard on the Clean Machine

Sharing Directories on a Machine with an Installation of AdminStudio

To share directories on a machine where AdminStudio is installed, perform the following steps:

Task ***To share the Repackager and AdminStudio Shared folders:***

1. Locate a production machine with network access that has AdminStudio installed on it.

   Tip • *Check to make sure that this installation of AdminStudio has already been activated before proceeding.*

2. Open Windows Explorer and locate the following directory:

   `[AdminStudioInstallDirectory]\Repackager`

3. Right-click the **Repackager** directory and then click **Properties**. The **Repackager Properties** dialog box opens.
4. Open the **Sharing** tab of the **Repackager Properties** dialog box.
5. Click the **Advanced Sharing** button to open the **Advanced Sharing** dialog box.
6. Select **Share this folder** and configure sharing rights as necessary.
7. Click **OK** to close the **Advanced Sharing** dialog box and click **Close** to close the **Repackager Properties** dialog box.
8. Repeat the steps above to also share the **AdminStudio Shared** directory used by that installation of AdminStudio.

Creating a Shortcut to the Repackaging Wizard on the Clean Machine

To create a shortcut to Repackaging Wizard on the clean machine, perform the following steps:

Task ***To create a shortcut to the Repackaging Wizard on the clean machine:***

1. On this clean machine with network access, right-click on the **Computer** icon in Windows Explorer and select **Map network drive...** from the shortcut menu. The **Map Network Drive** dialog box opens.
2. Specify the drive letter you want use to represent the shared location.
3. Click **Browse**. The **Browse for Folder** dialog box opens.
4. Select the shared **Repackager** directory on the production machine (that you configured in Sharing Directories on a Machine with an Installation of AdminStudio) and click OK.
5. Click **Finish** to exit the **Map Network Drive** dialog box.
6. From Windows Explorer, navigate to the drive mapped to the shared **Repackager** directory on the production machine.
7. Right-click on the **Repack.exe** file (the Repackaging Wizard executable file), point to **Send To**, and click **Desktop (create shortcut)**. A shortcut to Repackager in the shared directory is now on the Desktop.

Remotely Launching Repackaging Wizard on the Clean Machine

To remotely launch the Repackaging Wizard on the clean machine, perform the following steps:

Task ***To remotely launch the Repackaging Wizard on the clean machine:***

1. On the clean machine, double-click the **Repackaging Wizard** shortcut on the desktop (that you created in Creating a Shortcut to the Repackaging Wizard on the Clean Machine). The **Welcome** panel of the **Repackaging Wizard** opens.

   Important • *Because you are running the Repackaging Wizard remotely, the online help topics cannot be viewed. However, you can view a version of AdminStudio Help Library online at:*

   http://helpnet.flexerasoftware.com

2. Continue using the Repackaging Wizard to capture a legacy setup, following the instructions in Repackaging Legacy Installations Using the Repackaging Wizard.

   Caution • *On the* ***Set Target Project Information and Capture Settings*** *panel of the Repackaging Wizard, do not set the* ***Project path to store files*** *field to a location on the clean machine; instead choose a network location.*

Installing Repackager on a Clean Machine

It is essential that you repackage applications on a "clean" system to ensure you capture all changes made by the installation. A clean system typically consists of a computer with only the operating system and necessary service packs installed on it. It is the baseline system that the computer requires to run.

While you want to avoid installing applications on the clean machine, if the clean machine does not have network connectivity to an installation of Repackager (which is required in order to run Repackager remotely), you have to install Repackager locally on a clean machine by running the Repackager installation.

To install a standalone version of Repackager on a clean machine, perform the following steps.

Note • *You cannot install Repackager on a machine that already has a copy of Repackager installed.*

Task ***To install Repackager on a clean machine:***

1. Build a "clean machine"—a computer with only the operating system and necessary service packs installed on it.
2. Download **StandaloneRepackager.exe** from the Flexera Software Product and License Center using the same credentials you used when you downloaded the full installer.
3. Copy **StandaloneRepackager.exe** to the clean machine.
4. Launch the setup. The **Welcome Panel** opens.
5. Click **Next**. The **License Agreement** panel opens.
6. Select the **I accept the terms of the license agreement** option and click **Next**. The **Customer Information** panel opens.

7. Enter a **User Name** and **Organization** name to identify this installation of Repackager.
8. Enter the **Activation Code** you received for the edition of AdminStudio that you purchased.
9. Click **Next**. The **Destination Folder** panel opens.
10. If you want to install Repackager in the specified directory, click **Next**. If you want to select a different directory, click **Change**, select a new directory, and then click **Next**. The **AdminStudio Shared Location** panel opens.

    The **AdminStudio Shared** directory contains shared information for repackaging and conflict identification, and other AdminStudio functions. With regard to Repackager, the **AdminStudio Shared** directory contains the following:

    - Repackager **isrepackager.ini** exclusion list
11. Specify the location of your organization's **AdminStudio Shared** directory, and click **Next**. The **Ready to Install** panel opens.
12. Click **Install** to begin the installation process. The **Installing Repackager** panel opens. When installation is complete, the **InstallShield Wizard Completed** panel opens.
13. Click **Finish** to exit the Wizard. A Repackager shortcut will be added to the Windows **Start** menu under **AdminStudio**, **AdminStudio Tools**.

Repackaging Legacy Installations Using the Repackaging Wizard

One frequently used method of creating a Repackager project is to repackage a legacy setup. Fundamentally, this involves monitoring the execution of a non-Windows Installer setup and converting changes made by the setup into a Windows Installer file.

Repackager provides the Repackaging Wizard for accomplishing this task. Using this Wizard, you can select the repackaging method (either Snapshot or Installation Monitoring), specify the setup(s) you want to repackage, and run the setup(s). When the Repackaging Wizard has finished its analysis, Repackager automatically creates a Repackager project (**.irp**) file, which can be modified in Repackager. You can then convert this file to an InstallShield Editor project (**.ism**) for further editing, or convert it directly to a Windows Installer package (**.msi**).

Caution *• It is highly recommended that you repackage applications on a "clean" system. See Configuring Repackager to Ensure Optimal Installation Capture for more information.*

When using the Repackaging Wizard to repackage a legacy setup, you can use any of the following methods:

Table 8-7 • Repackaging Methods

Repackaging Method	Description
Installation Monitoring Method	Repackager monitors system changes as an application is installed, and that data can be converted into a Windows Installer package. Installation Monitoring is the default method. See Repackaging Using the Installation Monitoring Method.  ***Edition*** • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*
Snapshot Method	Repackager compares a system snapshot before and after an installation, determines the changes that were made, and that data can be converted to a Windows Installer package. This is the default method. See Repackaging Using the Snapshot Method.
Using InstallScript Scan	You can use the Repackaging Wizard and InstallScript Scan to convert an InstallScript MSI installation to a Basic MSI package with InstallScript support. InstallScript Scan preserves the original components and much of the InstallScript installation logic, architecture, and maintainability of the original installation package. See Repackaging an InstallScript MSI Setup to a Basic MSI Setup

Repackaging Using the Installation Monitoring Method

Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

When you choose the **Installation Monitoring** method of repackaging, Repackager monitors system changes as an application is installed, and then you can convert that data into a Windows Installer package. Installation Monitoring is the default method.

Caution • *It is highly recommended that you repackage applications on a "clean" system. See Configuring Repackager to Ensure Optimal Installation Capture for more information.*

To repackage an installation using the Installation Monitoring method, perform the following steps:

- Step 1: Selecting the Repackaging Method.
- Step 2: Excluding Processes (Optional)
- Step 3: Collecting Product Information
- Step 4: Adding Additional Setup Programs (Optional)

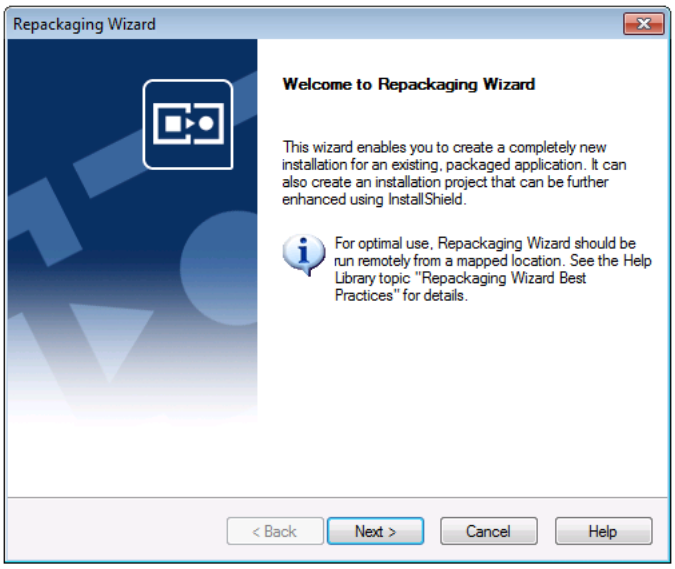
Step 1: Selecting the Repackaging Method

Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

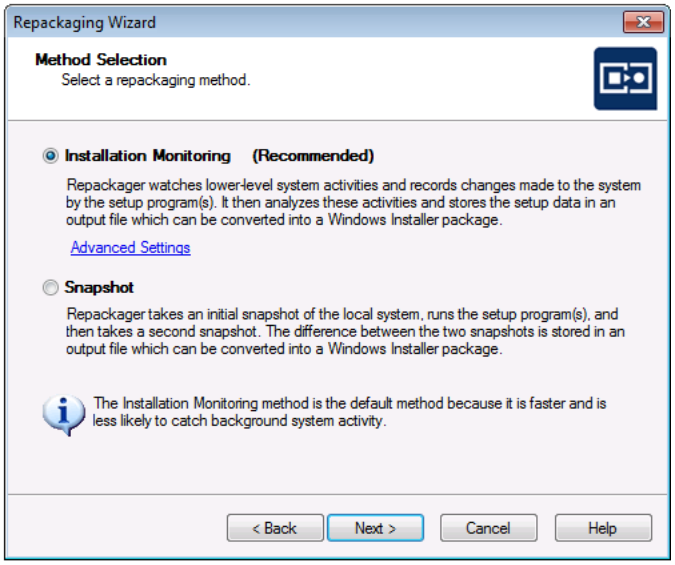
In this step, you launch the Repackaging Wizard and select the Installation Monitoring repackaging method.

Task ***To select a repackaging method:***

1. From the Repackager interface, launch the **Repackaging Wizard** by clicking on the link or by selecting **Repackaging Wizard** from the **Tools** menu. The Welcome Panel opens.



2. Click **Next**. The Method Selection Panel opens.



3. Select **Installation Monitoring**.
4. Continue with Step 2: Excluding Processes (Optional).

Step 2: Excluding Processes (Optional)

Edition *• The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

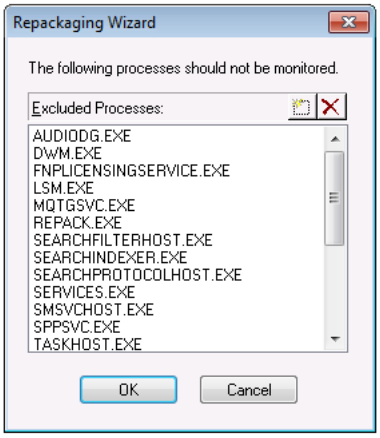
During Installation Monitoring, Repackager captures all of the activity of each service or process running on the machine, and then processes this collected data. However, many services running on a machine may have nothing to do with the installation being repackaged.

- **If you want to modify the default excluded processes list**, perform the following steps.
- **If you do not want to modify the default excluded processes list**, continue with Step 3: Collecting Product Information.

Tip *• If you know that the installation that you are capturing is from a self-extracting* ***.exe*** *file and if you want to use the* ***Installation Monitoring*** *method, you should add the name of that* ***.exe*** *file to the excluded processes list.*

Task ***To exclude processes from Installation Monitoring:***

1. On the **Method Selection** panel, click the **Advanced Settings** link. The **Excluded Processes** dialog box opens, listing a default set of processes.



2. To add a process to this list, click the New () button to add a new blank line to this list, and enter the name of the process that you want to exclude.

3. To delete a process from this list, select the process and click the Delete () button.

Note • *The changes you make to the excluded processes list are persisted for future Repackaging sessions. Therefore, once you have entered an appropriate set of processes to exclude for your machine, you can skip this optional step.*

4. Click **OK** to return to the Method Selection Panel.

5. Continue with Step 3: Collecting Product Information.

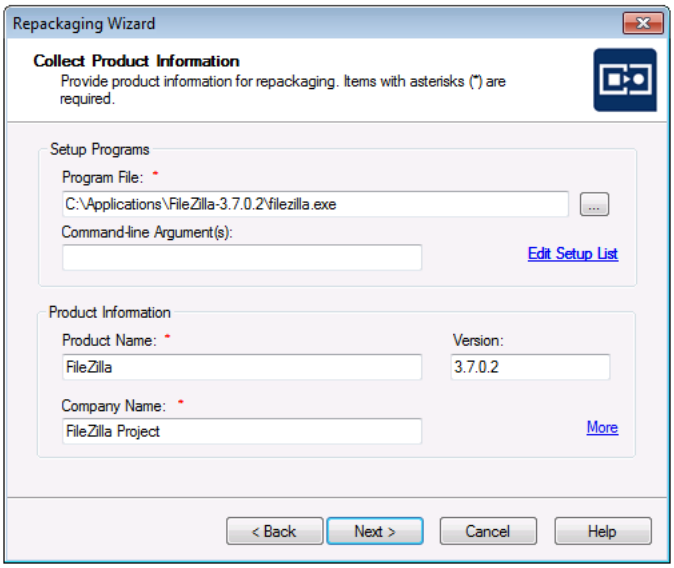
Step 3: Collecting Product Information

Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

In this step, you will specify the installation you want to repackage and enter any command-line arguments to be used when the installation is run.

Task ***To enter product information:***

1. On the Method Selection Panel, click **Next**. The **Collect Product Information** panel opens.



2. Click the Browse (...) button next to the **Program File** field and select the installation program that you are repackaging.
3. In the **Command-line Argument(s)** field, enter any command-line arguments to be used when the installation is run.
4. In the **Product Information** area, modify the **Product Name**, **Version**, and **Company Name**, as necessary.
5. If you want to associate websites with this installation, click the **More** link to open the Additional Product Information dialog box, enter the **Product URL** and **Support URL** for the application you are repackaging, and click OK.
6. Continue with Step 4: Adding Additional Setup Programs (Optional).

Step 4: Adding Additional Setup Programs (Optional)

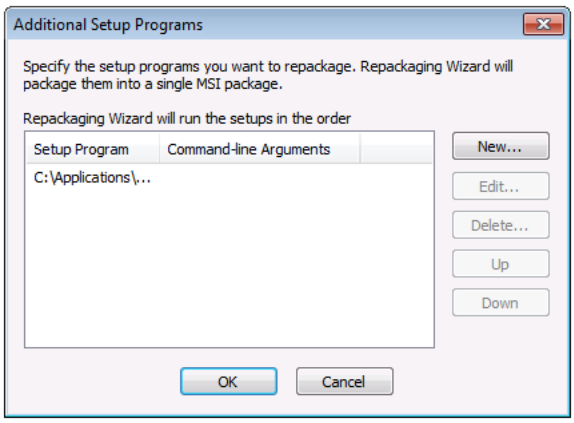
Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

You can specify additional setup programs to repackage together with this installation. Additional setup programs share the same product name, version number, and company name in the repackaged installation. However, as you locate each additional setup program to repackage, you can specify command-line parameters pertaining only to that setup. You can also specify the order in which the setups are run, should it be necessary.

- **If you want to add additional setup programs**, perform the following steps.
- **If you do not want to add additional setup programs**, continue with Step 5: Set Target Project Information.

Task ***To add additional setup programs, perform the following steps:***

1. On the Collect Product Information Panel, click the **Edit Setup List link**. The **Additional Setup Programs** dialog box opens.



2. If you want to **add** a setup program, perform the following steps:

   a. Click **New**. The **Setup Information** dialog box opens.

   b. Click the Browse (...) button next to the **Program File** field and select the setup program that you want to add.

   c. In the **Command-line Argument(s)** field, enter any command-line arguments to be used when this setup is run.

   d. Click **OK** to return to the **Additional Setup Programs** dialog box.

   e. If necessary, click the **Up** and **Down** buttons to change the order in which the setups are run.

3. If you want to **edit** an existing setup program, perform the following steps:

   a. On the Additional Setup Programs dialog box, select the program that you want to edit and click **Edit**. The Setup Information dialog box opens.

   b. Modify the **Program File** and **Command-line Argument(s)** fields.

   c. Click **OK** to return to the Additional Setup Programs dialog box.

4. If you want to **delete** a listed setup program, perform the following steps:

a. Select the program that you want to delete and click **Delete**. A dialog box opens prompting you to confirm the deletion.

b. Click **OK** to confirm the deletion and return to the Additional Setup Programs dialog box, where the deleted program is no longer listed.

5. Click **OK** to return to the **Collect Product Information** panel.

6. Continue with Step 5: Set Target Project Information.

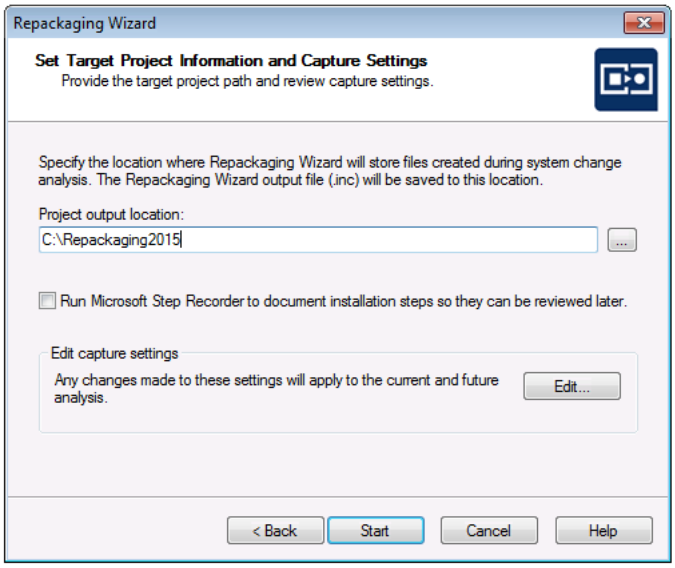
Step 5: Set Target Project Information

Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

In this step, you identify the location where you want files created by Repackager to be stored. For the Installation Monitoring repackaging method, it is recommended that this location not be located on your clean machine, but rather on the same machine as the Repackager executable (most likely on your administrator machine).

Task ***To set target project information and capture settings:***

1. On the Collect Product Information Panel, click **Next**. The Set Target Project Information and Capture Settings Panel opens.



2. Click the Browse (...) button next to the **Project path to store files** field and select the directory where you want the Repackaging Wizard to place its output, including the Repackager project file (**.irp**), the Repackaging Wizard output files, and source files.

   You can also enter the name of a new folder in the **Project path to store files** field, and you will be prompted to create it when you exit this panel.

3. Continue with Step 6: Set Capture Settings (Optional).

Step 6: Set Capture Settings (Optional)

Edition • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

From the **Set Target Project Information** and **Capture Settings Panel**, you can specify the following capture types for the repackaging session:

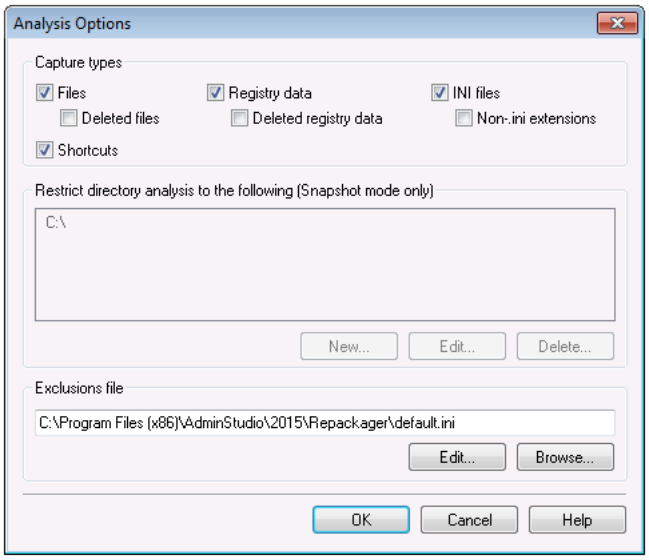
- Files and deleted files
- .ini files and .ini files with non-.ini extensions
- Shortcuts
- Registry data and deleted registry data

Options set in this dialog box apply to the current and subsequent repackaging sessions.

- **If you want to set capture settings**, perform the following steps.
- **If you do not want to set capture settings**, continue with Step 7: Beginning the Repackaging Process.

Task ***To set capture settings:***

1. On the **Set Target Project Information and Capture Settings** panel, click **Edit**. The **Analysis Options** dialog box opens.



Note • *Options set in this dialog box apply to the current and subsequent repackaging sessions.*

2. Select the capture types that you want to use for this repackaging session:

Type	Description
Files	Capture file names during repackaging.
Deleted files	Capture deleted file names during repackaging. ***Note*** *• If you select this option, deleted files will be displayed on the Deleted Files View of the Repackager interface.*
Registry data	Capture registry data during repackaging.
Deleted registry data	Capture deleted registry data during repackaging. ***Note*** *• If you select this option, deleted registry entries will be displayed on the Deleted Registry Entries View of the Repackager interface.*
INI files	Capture .ini files during repackaging.
Non-ini extensions	Capture .ini files with non-.ini extensions during repackaging.
Shortcuts	Capture shortcuts during repackaging.

3. Click **OK** to return to the **Set Target Project Information and Capture Settings** panel.
4. Continue with Step 7: Beginning the Repackaging Process.

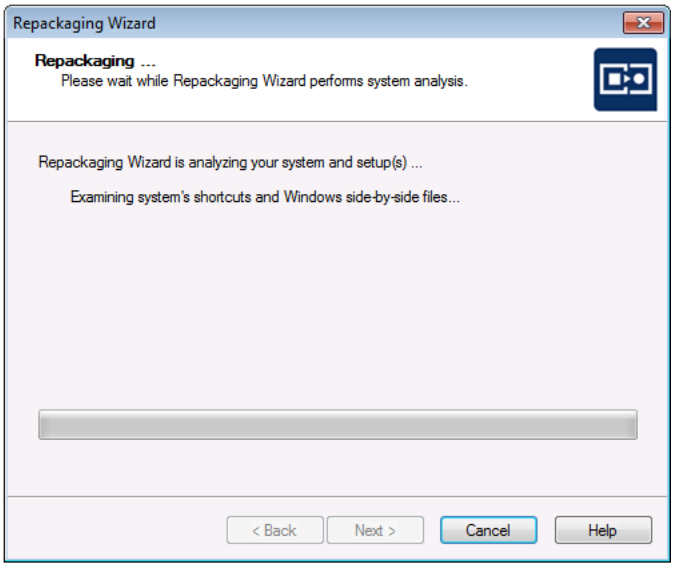
Step 7: Beginning the Repackaging Process

Edition *• The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*

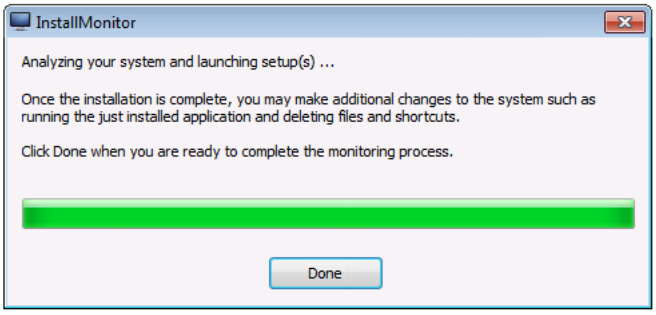
In this step you will begin the repackaging process.

Task ***To begin the repackaging process:***

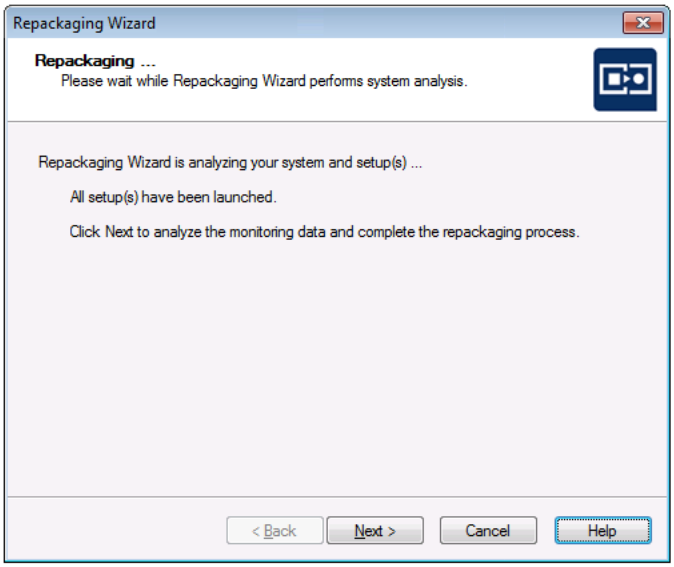
1. To begin the repackaging process, click **Start** on the Set Target Project Information and Capture Settings Panel. The **Repackaging Panel** opens and the Repackaging Wizard captures the initial system status. Then, the selected setup program will be launched.



2. Follow the prompts until the installation has completed. When the installation is complete, you are prompted to make any additional changes to the system (such as deleting files and shortcuts) that you want to be recorded in this repackaged installation.

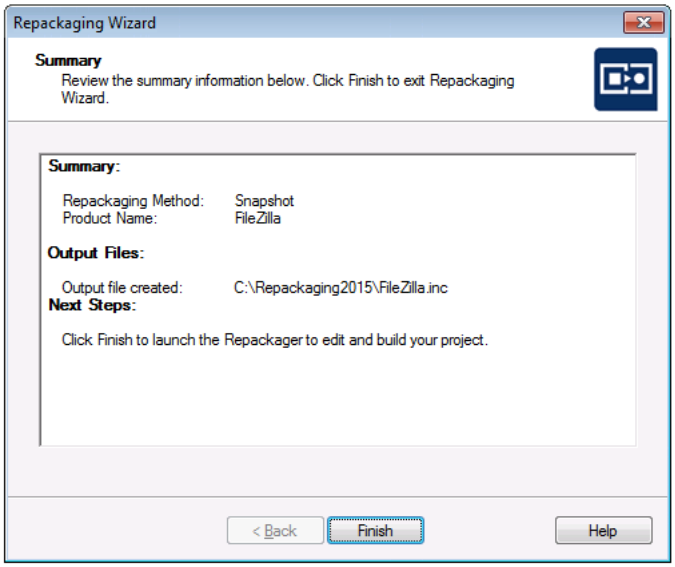


3. When you are ready to complete the monitoring process, click **Done**. You are then prompted to click **Next** to analyze the monitoring data and complete the repackaging process.



4. When you are ready to complete the repackaging process, click **Next**. The Repackaging Wizard then analyzes the system and setup data that it collected.

   Following repackaging, the **Summary Panel** is displayed, providing confirmation that the repackaging was successful.



5. Click **Finish**. Repackager launches and opens the Repackager project file (***.irp**) that you just created.
6. Continue with the instructions in Working With Repackager Projects.

Repackaging Using the Snapshot Method

When using the **Snapshot** method of repackaging, the Repackaging Wizard takes a reference snapshot of a system as a baseline configuration, performs the installation, and then takes a second snapshot.

The difference between the two snapshots is stored in a directory you specify, including the Repackager project file (**.irp**), the Repackaging Wizard output files, and the source files. The Repackager project file can then be converted into a Windows Installer package (**.msi**).

Caution *• It is highly recommended that you repackage applications on a "clean" system. See Configuring Repackager to Ensure Optimal Installation Capture for more information.*

Types of Snapshot Repackaging

There are two types of Snapshot repackaging:

Single Step

When Repackaging in a single step:

- You specify at least one setup program to repackage.
- Repackager first takes an initial system snapshot.
- Repackager then runs the setup program(s) you selected.
- Then Repackager takes a second snapshot to create the script file that can be converted into a Windows Installer package.

You also have the option of requiring the Repackager to prompt you before running the setup program(s), allowing you the opportunity to make changes to your system that you want included in the final package.

See Performing Single Step Snapshot Repackaging.

Multiple Step

When repackaging in multiple steps:

- You run the Repackager to obtain an initial system snapshot, after which the Repackager exits.
- You can then perform any modifications to the system, such as changing configurations, running installations, and so forth.
- After making the necessary modifications, you would then run the Repackager again to analyze system status changes.
- Repackager compares the final snapshot to the initial snapshot to determine the system changes that were made, and then records that information in a script file.

See Performing Multiple Step Snapshot Repackaging.

Performing Multiple Step Snapshot Repackaging

To repackage an installation using the **Multiple Step Snapshot** method, perform the following steps:

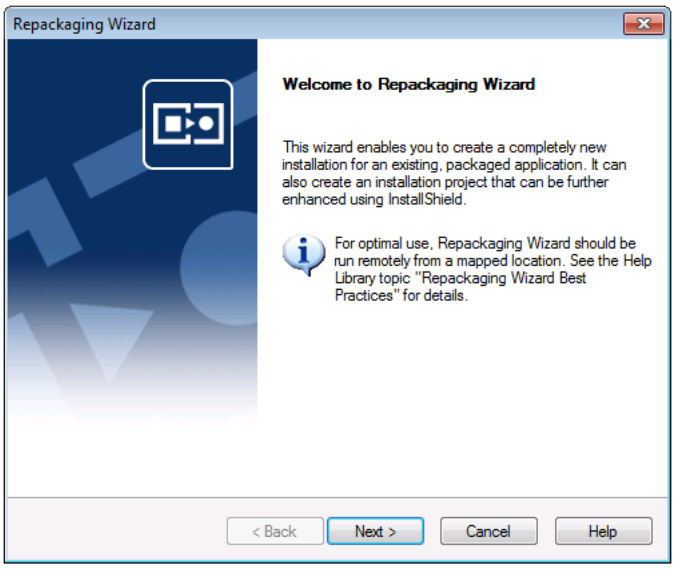
- Step 1: Selecting the Repackaging Method.
- Step 2: Initial Analysis
- Step 3: Install Setup and Make Manual System Changes

Step 1: Selecting the Repackaging Method

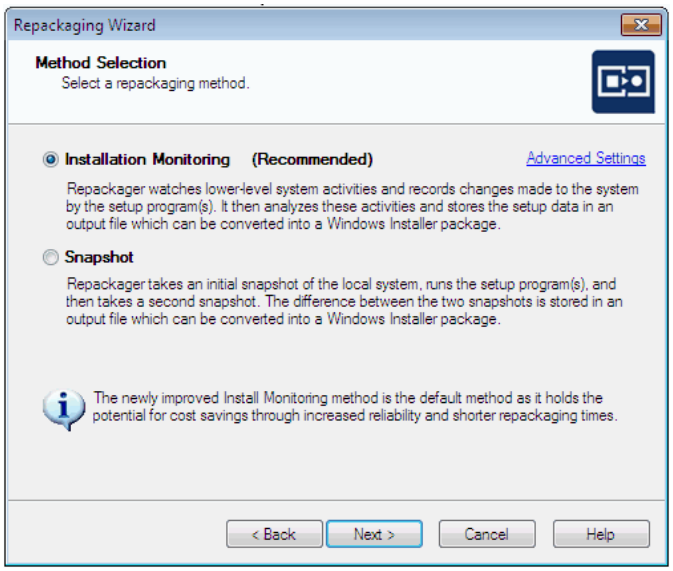
In this step, you launch the Repackaging Wizard and select the **Snapshot** repackaging method.

Task ***To select a repackaging method:***

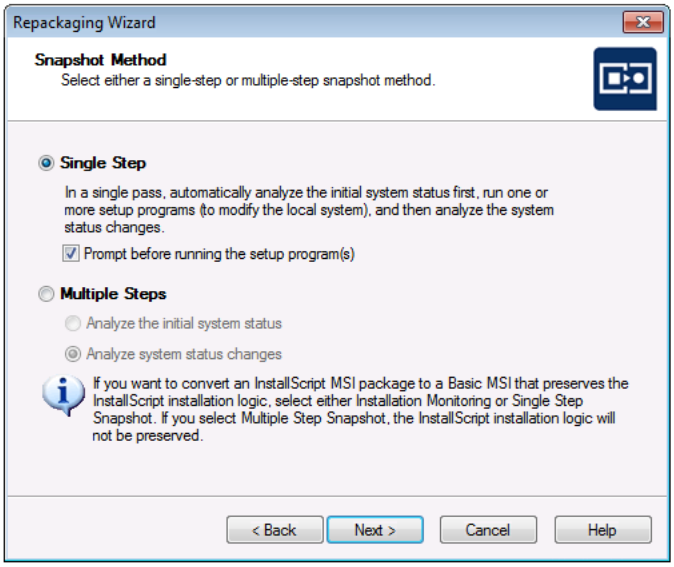
1. From the Repackager interface, launch the **Repackaging Wizard** by clicking on the link or by selecting **Repackaging Wizard** from the **Tools** menu. The Welcome Panel opens.



2. Click **Next**. The Method Selection Panel opens.



3. Select **Snapshot** and click Next. The Snapshot Method panel opens.



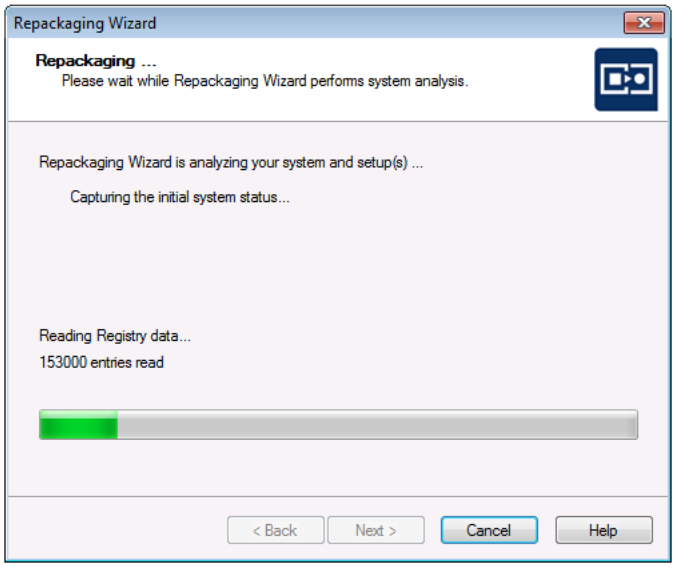
4. On the Snapshot Method panel, select **Multiple Steps**. The **Analyze the initial system status** option is enabled.
5. Select the **Analyze the initial system status** option.
6. Continue with Step 2: Initial Analysis.

Step 2: Initial Analysis

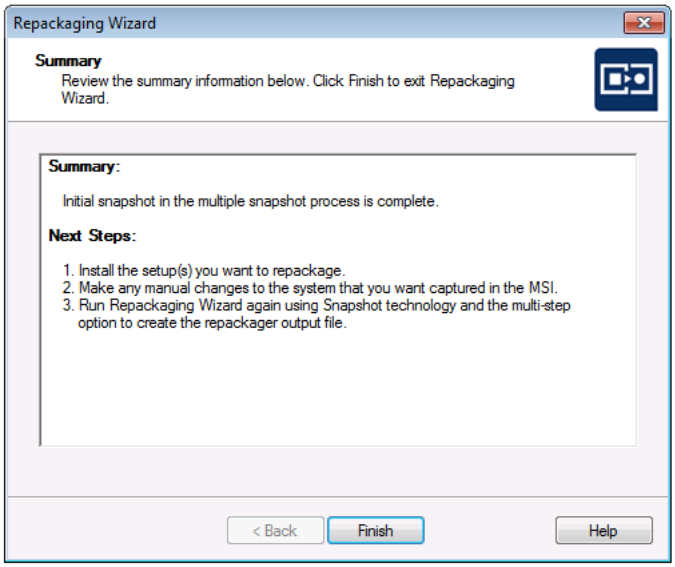
In this step, the Repackaging Wizard takes an initial snapshot of your system.

Task ***To perform initial analysis:***

1. On the Snapshot Method panel, click **Next**. The Repackaging Panel of the Repackaging Wizard opens, displaying the progress of the initial system status capture.



When Repackager finishes capturing the initial system status, the **Summary** panel opens, prompting you to install the application you are repackaging.



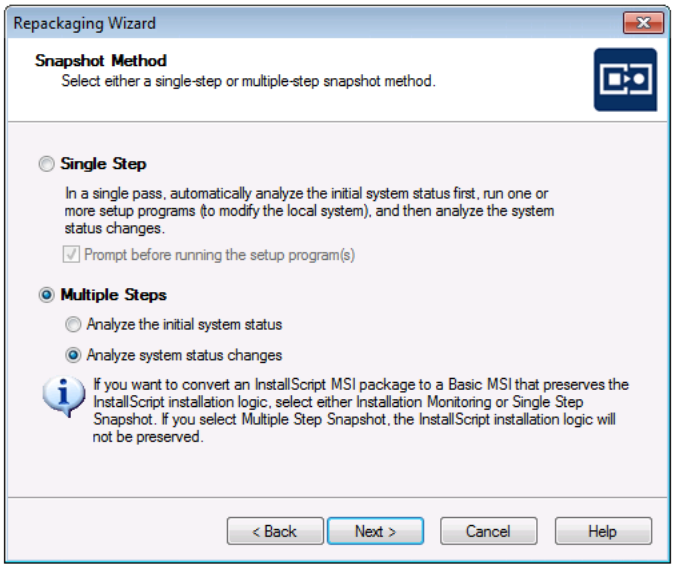
2. Click **Finish** to close the Repackaging Wizard.
3. Continue with Step 3: Install Setup and Make Manual System Changes.

Step 3: Install Setup and Make Manual System Changes

In this step, you will manually launch the installation of the application you are repackaging, and then you will make any manual changes to the system that you want captured in the Windows Installer package.

Task ***To install setup and make manual system changes:***

1. Launch the installation program of the application you are repackaging.
2. Follow the prompts until the installation has completed.
3. When the installation is complete, make any additional changes to the system (such as deleting files and shortcuts) that you want to be recorded in this repackaged installation.
4. Launch the Repackaging Wizard again. The **Welcome Panel** opens.
5. Click **Next**. The **Method Selection Panel** opens.
6. Select **Snapshot** and click **Next**. The **Snapshot Method Panel** opens with **Multiple Steps** already selected, and the **Analyze system status changes** option now enabled and selected.



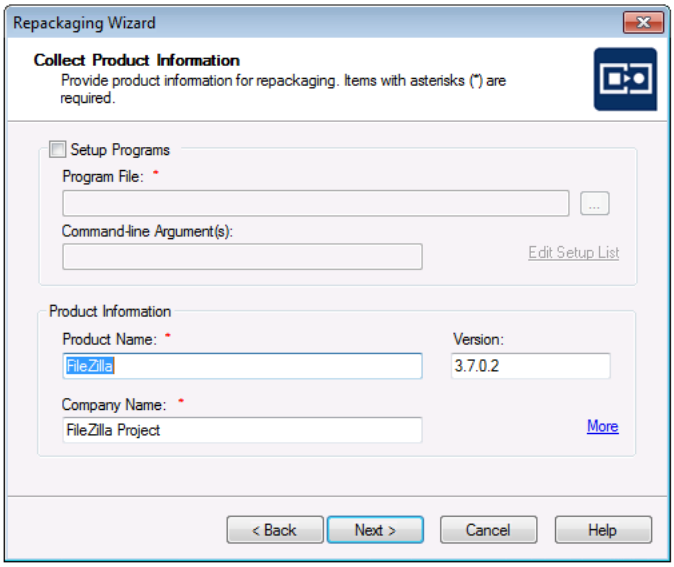
7. Continue with Step 4: Entering Product Information.

Step 4: Entering Product Information

In this step, you will enter product information for the application that you just installed.

Task ***To enter product information:***

1. On the **Snapshot Method Panel**, click **Next**. The **Collect Product Information Panel** opens. Because you are now performing the second step of a multiple-step Snapshot, the **Setup Programs** area is disabled (because you have already installed the application you are repackaging).



2. In the **Product Information** area, modify the **Product Name**, **Version**, and **Company Name**, as necessary.
3. If you want to associate websites with this installation package, perform the following steps:
   a. Click the **More** link. The **Additional Product Information** dialog box opens.

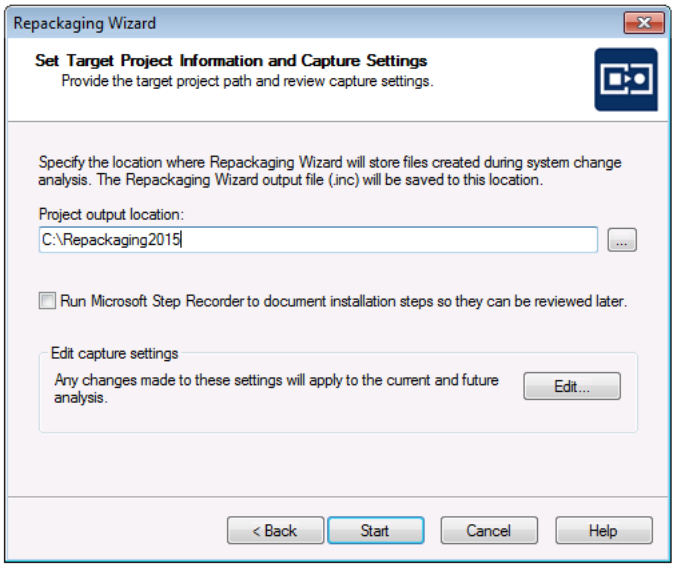
   b. Enter the **Product URL** and **Support URL** for the application you are repackaging.
   c. Click **OK**.
4. Continue with Step 5: Set Target Project Information.

Step 5: Set Target Project Information

In this step, you identify the location where you want files created by Repackager to be stored.

Task ***To set target project information and capture settings:***

1. On the **Collect Product Information Panel**, click **Next**. The **Set Target Project Information and Capture Settings Panel** opens.



2. Click the Browse (...) button next to the **Project path to store files** field and select the directory where you want the Repackaging Wizard to place its output, including the Repackager project file (**.irp**), the Repackaging Wizard output files, and source files.

   You can also enter the name of a new folder in the **Project path to store files** field, and you will be prompted to create it when you exit this panel.

3. Continue with Step 6: Set Capture Settings (Optional).

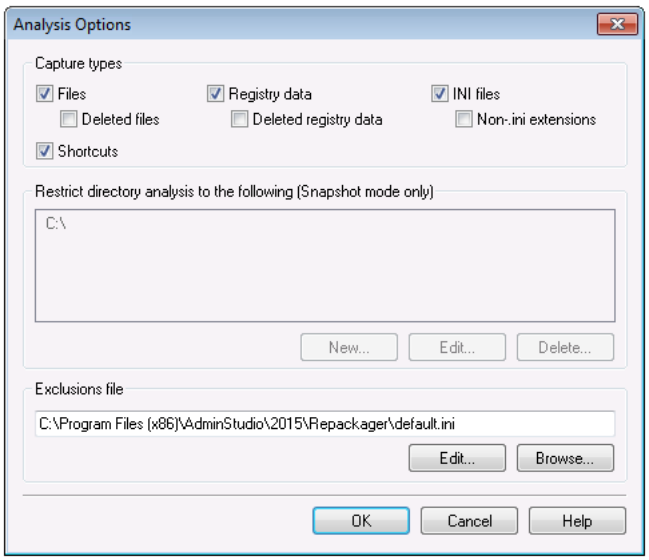
Step 6: Set Capture Settings (Optional)

From the **Set Target Project Information and Capture Settings Panel**, you can specify capture types for the repackaging session such as files, .ini files, shortcuts, and Registry data. You can also restrict directory analysis to specific directories, which can significantly improve repackaging performance.

- **If you want to modify the default capture settings**, perform the following steps.
- **If you do not want to modify the default capture settings**, click **Next** and continue with Step 7: Beginning the Repackaging Process.

Task ***To modify capture settings:***

1. On the **Set Target Project Information and Capture Settings Panel**, click **Edit**. The **Analysis Options** dialog box opens.



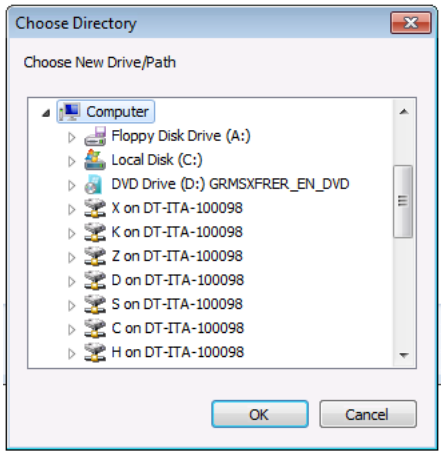
Note *• Options set in this dialog box apply to the current and subsequent repackaging sessions.*

2. Select the capture types that you want to use for this repackaging session:
   - **Files**
   - **Deleted files**

     Note *• If you select this option, deleted files will be displayed on the Deleted Files View of the Repackager interface.*
   - **INI files**
   - (INI files with) **Non-.ini extensions**
   - **Shortcuts**
   - **Registry data**
   - **Deleted registry data**

     Note *• If you select this option, deleted registry entries will be displayed on the Deleted Registry Entries View of the Repackager interface.*
3. If you want to restrict directory analysis to specific directories, first select the **C:** in the **Restrict directory analysis to the following** list and click **Delete**. You will be prompted to confirm the deletion.

4. Next, to indicate the specific directories, click **New**. The **Choose Directory** dialog box opens.



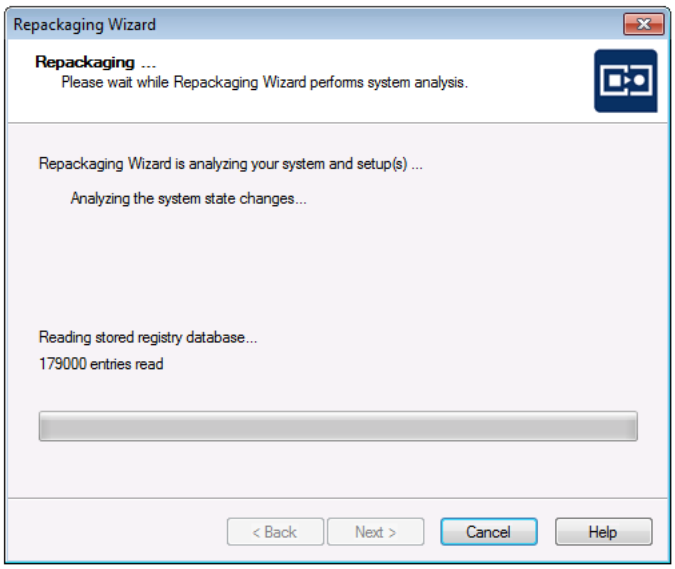
5. Select a directory to include and click **OK**. The selected directory is now listed on the **Analysis Options** dialog box. Repeat this process to add additional directories.
6. If you want to modify an existing restriction, or delete a restriction, select the listed directory and click **Edit** or **Delete**.
7. Click **OK** to return to the **Set Target Project Information and Capture Settings Panel**.
8. Continue with Step 7: Beginning the Repackaging Process.

Step 7: Beginning the Repackaging Process

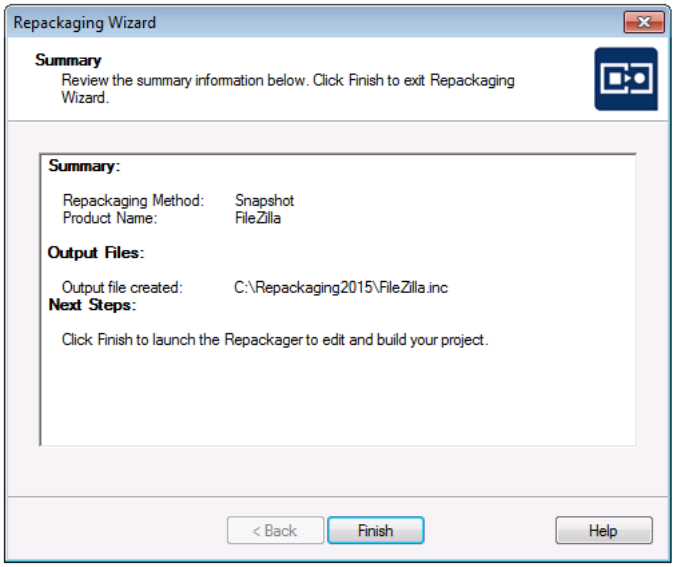
In this step you will begin the repackaging process.

Task ***To begin the repackaging process:***

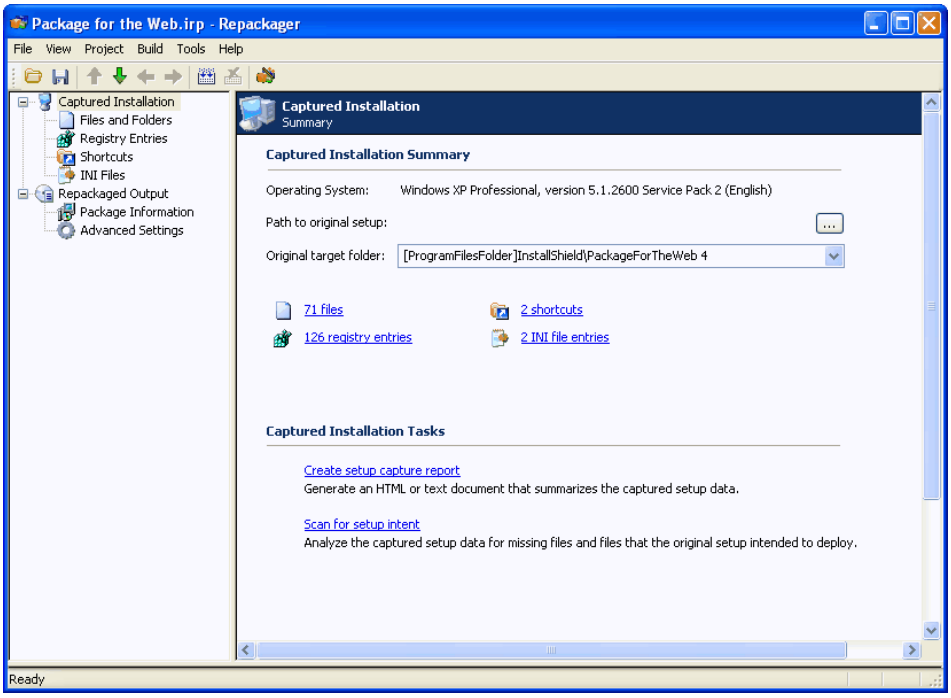
1. To begin the repackaging process, click **Start** on the Set Target Project Information and Capture Settings Panel. The **Repackaging Panel** opens and the Repackaging Wizard captures the system state changes.



When the Repackaging Wizard has finished analyzing the system state changes and creating the Repackager project, the Summary Panel opens, providing confirmation that the repackaging was successful and listing the location of your new Repackager project.



2. Click **Finish**. Repackager launches and opens the Repackager project file (***.irp**) that you just created.



3. Continue with the instructions in Working With Repackager Projects.

Performing Single Step Snapshot Repackaging

To repackage an installation using the **Single Step Snapshot** method, perform the following steps:

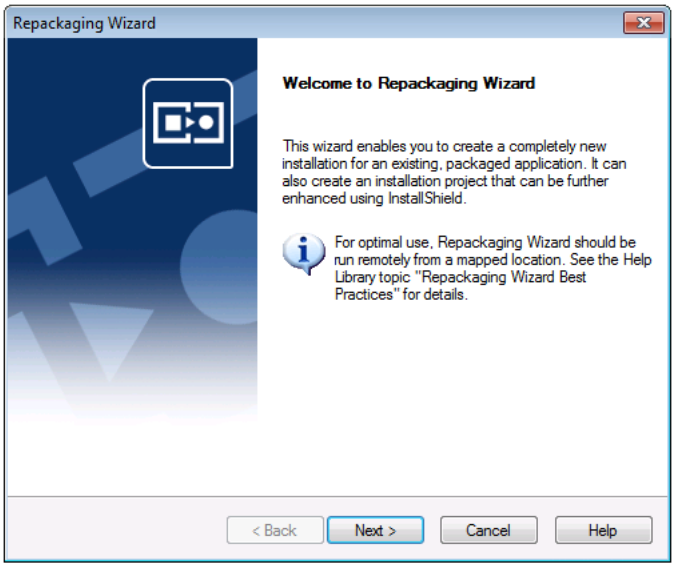
- Step 1: Selecting the Repackaging Method.
- Step 2: Collecting Product Information
- Step 3: Set Target Project Information
- Step 4: Set Capture Settings (Optional)
- Step 5: Beginning the Repackaging Process

Step 1: Selecting the Repackaging Method

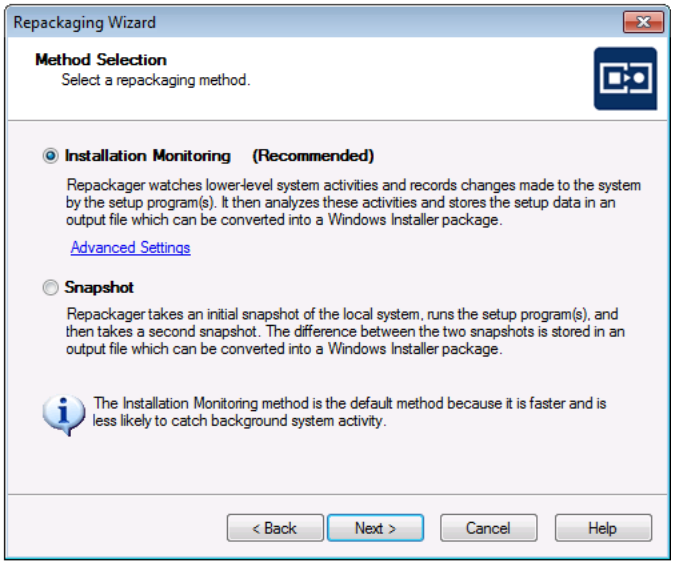
In this step, you launch the Repackaging Wizard and select the **Snapshot** repackaging method.

Task ***To select a repackaging method:***

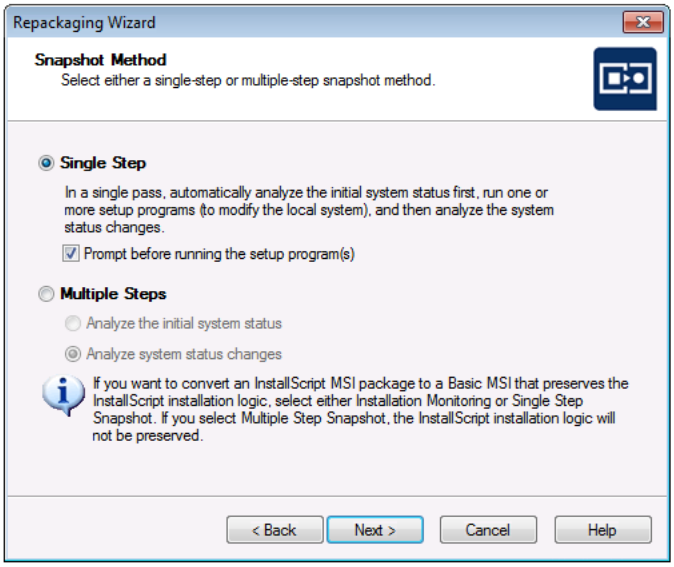
1. From the Repackager interface, launch the **Repackaging Wizard** by clicking on the link or by selecting **Repackaging Wizard** from the **Tools** menu. The Welcome Panel opens.



2. Click **Next**. The Method Selection Panel opens.



3. Select **Snapshot** and click **Next**. The **Snapshot Method** panel opens.



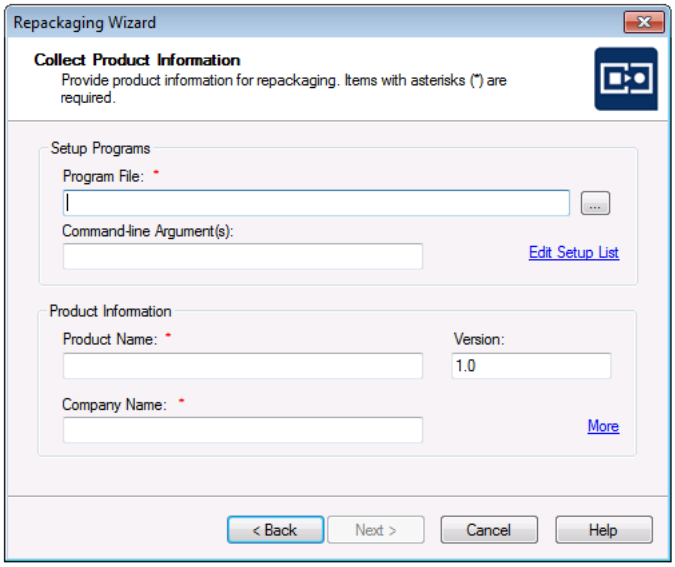
4. On the Snapshot Method panel, select **Single Step**.
5. If you want to be prompted before the selected setup program is launched, select the **Prompt before running the setup program(s) option**. If you do not select this option, the setup program will automatically be launched as soon as the Repackaging Wizard has finished analyzing the system status.
6. Continue with Step 2: Collecting Product Information.

Step 2: Collecting Product Information

In this step, you will specify the installation you want to repackage and enter any command-line arguments to be used when the installation is run.

Task ***To enter product information:***

1. On the Snapshot Method panel, click **Next**. The Collect Product Information Panel opens with the **Setup Programs** and **Product Information** areas enabled.



2. Click the Browse (...) button next to the **Program File** field and select the installation program that you are repackaging.
3. In the **Command-line Argument(s)** field, enter any command-line arguments to be used when the installation is run.
4. In the **Product Information** area, modify the **Product Name**, **Version**, and **Company Name**, as necessary.
5. If you want to associate websites with this installation package, perform the following steps:
   a. Click the **More** link. The **Additional Product Information** dialog box opens.

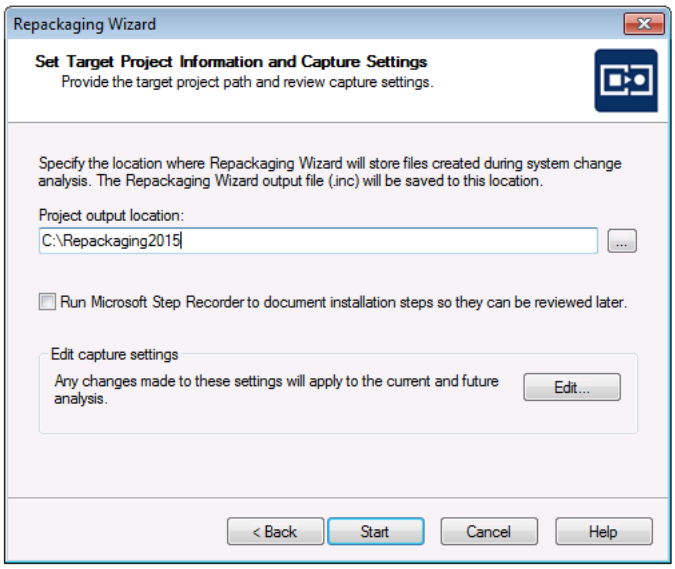
   b. Enter the **Product URL** and **Support URL** for the application you are repackaging.
   c. Click **OK**.
6. Continue with Step 3: Set Target Project Information.

Step 3: Set Target Project Information

In this step, you identify the location where you want files created by Repackager to be stored.

Task ***To set target project information:***

1. On the Collect Product Information Panel, click **Next**. The **Set Target Project Information and Capture Settings Panel** opens.



2. Click the Browse (...) button next to the **Project path to store files** field and select the directory where you want the Repackaging Wizard to place its output, including the Repackager project file (**.irp**), the Repackaging Wizard output files, and source files.

   You can also enter the name of a new folder in the **Project path to store files** field, and you will be prompted to create it when you exit this panel.

3. Continue with Step 4: Set Capture Settings (Optional).

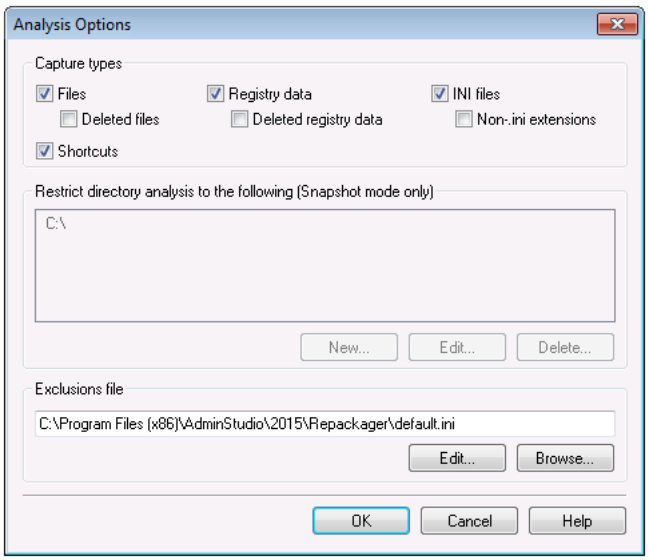
Step 4: Set Capture Settings (Optional)

From the **Set Target Project Information and Capture Settings Panel**, you can specify capture types for the repackaging session such as files, .ini files, shortcuts, and Registry data. You can also restrict directory analysis to specific directories, which can significantly improve repackaging performance.

- **If you want to modify the default capture settings**, perform the following steps.
- **If you do not want to modify the default capture settings**, click **Next** and continue with Step 7: Beginning the Repackaging Process.

Task ***To modify capture settings:***

1. On the **Set Target Project Information and Capture Settings Panel**, click **Edit**. The **Analysis Options** dialog box opens.



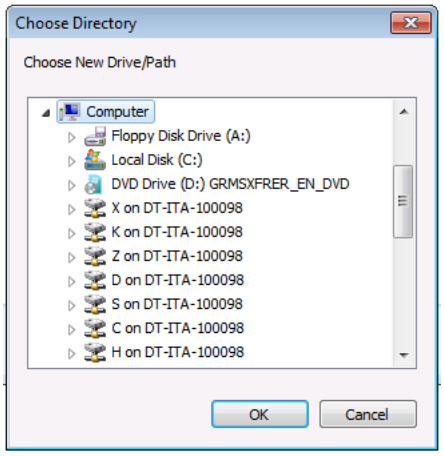
Note *• Options set in this dialog box apply to the current and subsequent repackaging sessions.*

2. Select the capture types that you want to use for this repackaging session:
   - **Files**
   - **Deleted files**

     Note *• If you select this option, deleted files will be displayed on the Deleted Files View of the Repackager interface.*
   - **INI files**
   - (INI files with) **Non-.ini extensions**
   - **Shortcuts**
   - **Registry data**
   - **Deleted registry data**

     Note *• If you select this option, deleted registry entries will be displayed on the Deleted Registry Entries View of the Repackager interface.*
3. If you want to restrict directory analysis to specific directories, first select the **C:** in the **Restrict directory analysis to the following** list and click **Delete**. You will be prompted to confirm the deletion.

4. Next, to indicate the specific directories, click **New**. The **Choose Directory** dialog box opens.



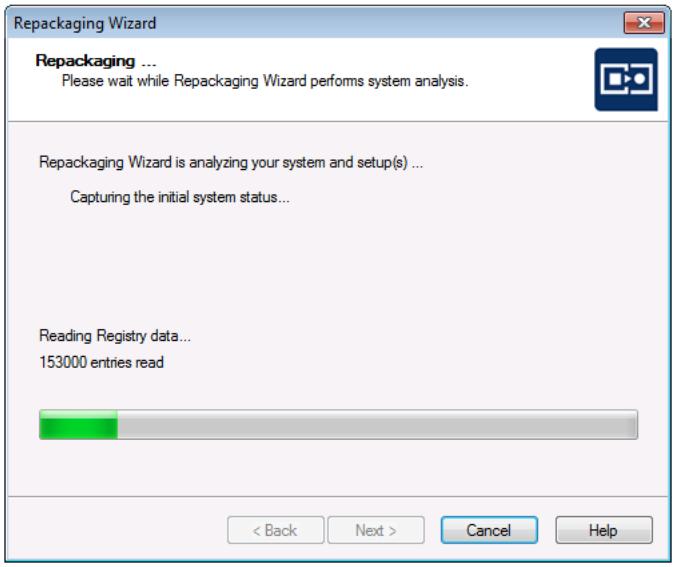
5. Select a directory to include and click **OK**. The selected directory is now listed on the **Analysis Options** dialog box. Repeat this process to add additional directories.
6. If you want to modify an existing restriction, or delete a restriction, select the listed directory and click **Edit** or **Delete**.
7. Click **OK** to return to the **Set Target Project Information and Capture Settings Panel**.
8. Continue with Step 7: Beginning the Repackaging Process.

Step 5: Beginning the Repackaging Process

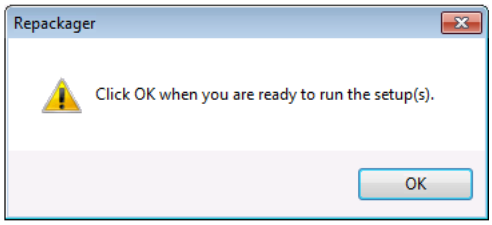
In this step you will begin the repackaging process.

Task ***To begin the repackaging process:***

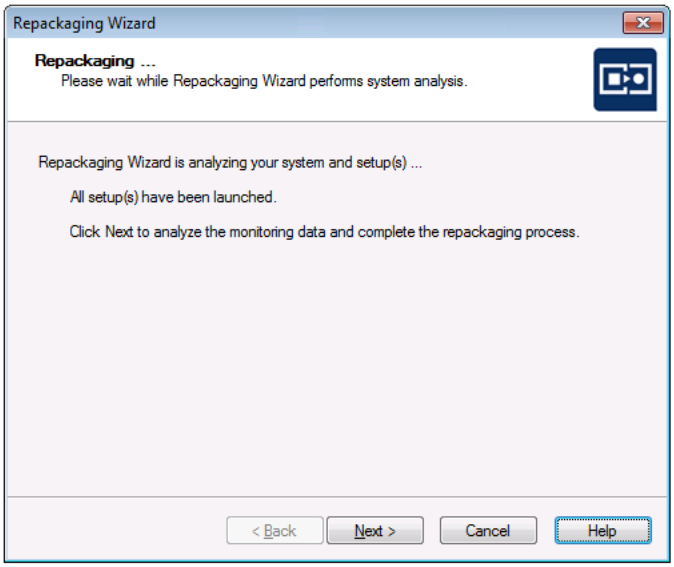
1. To begin the repackaging process, click **Start** on the **Set Target Project Information and Capture Settings Panel**. The **Repackaging Panel** opens and the Repackaging Wizard captures the initial system status.



Depending upon whether you chose the **Prompt before running the setup program(s)** option on the Snapshot Method Panel, either the installation that you selected will start or you will be prompted to start it.

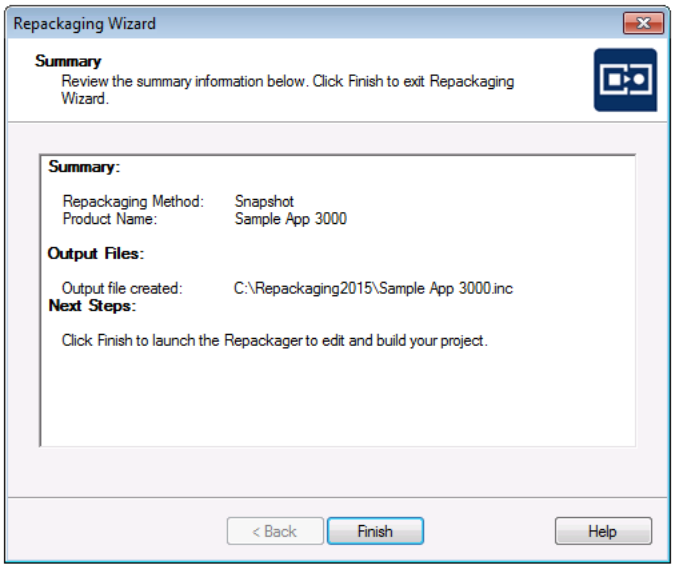


2. Install the application by following the prompts until the installation has completed.
3. When the installation is complete, you are prompted to make any additional changes to the system (such as deleting files and shortcuts) that you want to be recorded in this repackaged installation.



4. When you are ready to complete the repackaging process, click **Next**. The Repackaging Wizard then analyzes the system and setup data that it collected.

   Following repackaging, the **Summary Panel** is displayed, providing confirmation that the repackaging was successful and listing the location of the Repackager project that was just created.



5. Click **Finish**. Repackager launches and opens the Repackager project file (***.irp**) that you just created.
6. Continue with the instructions in Working With Repackager Projects.

Repackaging an InstallScript MSI Setup to a Basic MSI Setup

InstallScript MSI installations use a Windows Installer database for storage of all file/registry information, but the actual user interface, and much of the installation logic is driven by the InstallScript engine via a **setup.exe** file. This type of installation architecture can cause difficulties during deployment, such as:

- inability to customize or transform the application
- inability to perform conflict detection
- inability to suppress the user interface
- difficulty patching or upgrading the application

Also, if an InstallScript MSI installation is repackaged using traditional methods (OS Snapshot or Installation Monitoring), significant platform-specific or custom installation, maintenance, and uninstallation logic, and user interface information is lost because those methods only record the installation activities for the specific platform used during repackaging.

Therefore, it is recommended that you use InstallScript Scan to convert an InstallScript MSI installation to a Basic MSI package with InstallScript support. InstallScript Scan preserves the original components and much of the InstallScript installation logic, architecture, and maintainability of the original installation package.

Note • *If you want to convert an InstallScript MSI package to a Basic MSI package that preserves the InstallScript installation logic, and you are using the Snapshot method, you must select Single Step rather than Multiple Steps. If you select Multiple Steps, the InstallScript installation logic will not be preserved.*

Task ***To convert an InstallScript MSI Setup to a Basic MSI Setup with InstallScript support:***

1. Launch the **Repackaging Wizard** from Repackager. The **Welcome Panel** opens.
2. Click Next. The **Method Selection Panel** opens.
3. Select a **repackaging method**: Installation Monitoring or Snapshot.
4. Click Next. If you selected **Snapshot** on the **Method Selection Panel**, the **Snapshot Method Panel** appears. (If you selected **Installation Monitoring**, skip to Step 6.)
5. Select **Single Step** and click **Next**. The **Collect Product Information Panel** opens.

   Caution • *Because you are converting an InstallScript MSI package to a Basic MSI package with InstallScript support, you must select the Single Step Snapshot method (or use the Installation Monitoring method). If you select Multiple Step Snapshot, the InstallScript installation logic will not be preserved.*
6. On the **Collect Product Information Panel**, select the InstallScript MSI setup file and enter other product information.

***Caution** • While it is possible to click the Edit Setup List button and select additional setups, because you are converting an InstallScript MSI package, do not select additional setups.*

7. Click Next. Repackager will automatically determine if this is an InstallScript-based setup. If it is an InstallScript-based setup, the **InstallScript MSI Identified Panel** opens, informing you that the Repackaging Wizard has identified this setup as being an InstallScript MSI setup and prompting you to use InstallScript Scan to convert this setup.
8. Select Yes and click Next. The **InstallScript MSI Conversion Output Panel** opens.
9. In the Project Path to store files field, specify the location where you want the Repackaging Wizard to store files created during InstallScript Scan Analysis and where it will save the converted MSI package.

***Note** • To specify capture types for the repackaging session, click the Edit button to access the **Analysis Options** dialog box.*

10. Click Next. The **Repackaging Panel** appears, displaying the progress of the repackaging operation.
11. Following repackaging, the **Summary Panel** is displayed, providing confirmation that the repackaging was successful.
12. Click Finish to launch the Repackager to edit and build your project. See Working With Repackager Projects.

Running the Repackaging Wizard from the Command Line

To run the Repackaging Wizard from the command line, perform the following steps.

Task ***To run the Repackaging Wizard from the command line:***

1. Open a command-line prompt.
2. Type **Repack.exe** followed by any command-line options you want to pass. See Repackaging Wizard Command-Line Options.
3. Press Enter.

An example of a typical command line is as follows:

```
Repack.exe -app Setup.exe -o C:\MyRepackagedApps\Output
     -pp SomeApp -cs Custom -cf MyOptions.ini -sb
```

In the above example, the following options are used:

Table 8-8 • Repackager Command-Line Options used in Example

Option	Description
-app	Specifies the name of the setup.
-o	Specifies the location of the output directory

Table 8-8 • Repackager Command-Line Options used in Example (cont.)

Option	Description
-pp	Specifies the name of the product (and the name of the Repackager output file).
-cs	Specifies the name of the custom analysis options file to use.
-cf	Name of the analysis options file to use.
-sb	Allows you to run Repackager silently, with no user interaction.

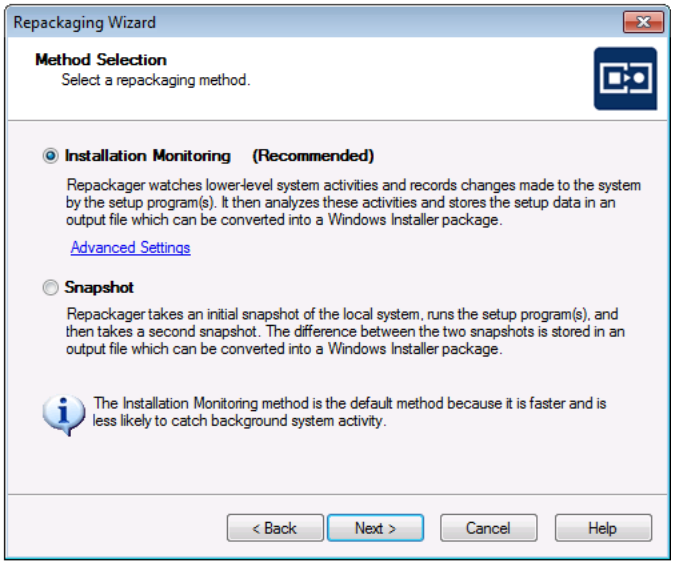
Repackaging a Windows Installer (.msi) Package

While it is not recommended that you repackage a Windows Installer (**.msi**) package, it sometimes may be necessary to repackage a Windows Installer package in order to convert it to a virtual package (perhaps due to the use of custom actions or other features that are not supported in application virtualization).

To repackage a Windows Installer (**.msi**) package, perform the following steps:

Task ***To repackage a Windows Installer package:***

1. From the Repackager interface, launch the **Repackaging Wizard** by clicking on the link or by selecting **Repackaging Wizard** from the **Tools** menu. The Welcome Panel opens.
2. Click **Next**. The **Method Selection Panel** opens.

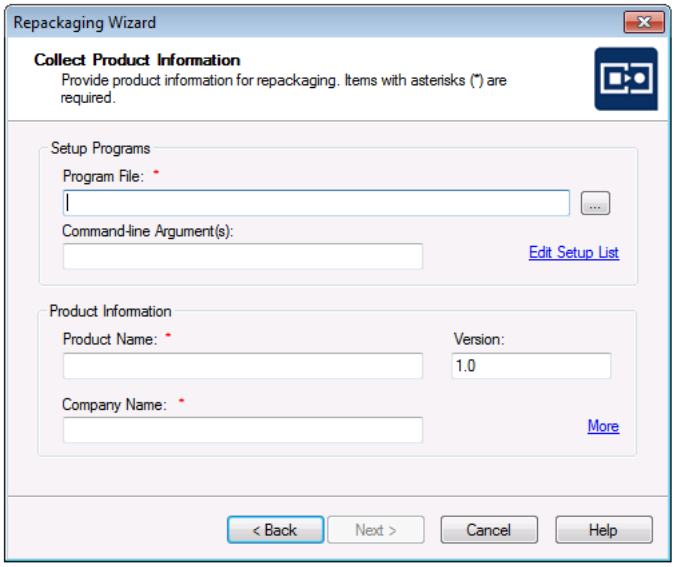


3. Select **Installation Monitoring** and click **Next**. The **Collect Product Information Panel** opens.

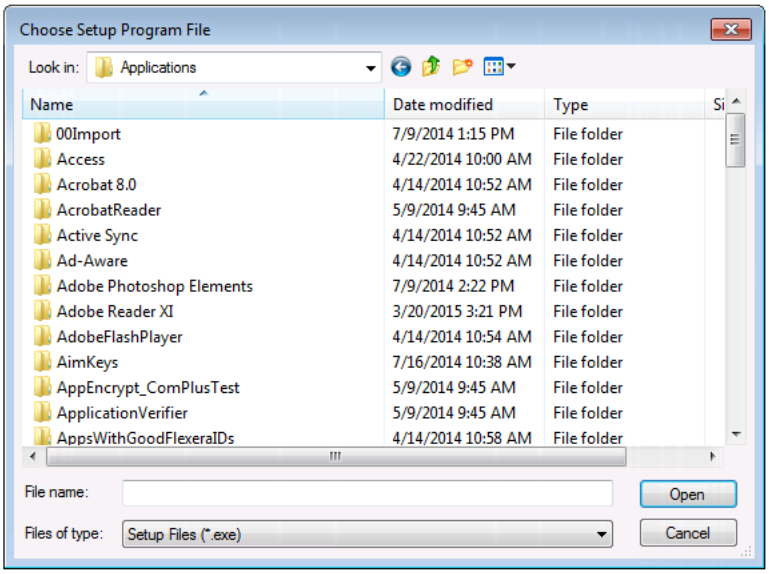
Note • *The **Installation Monitoring** method is recommended, but you may also choose the **Snapshot** method when repackaging a Windows Installer package. The **Installation Monitoring** method was used in the*

*instructions that follow. For instructions on using the **Snapshot** method, see Repackaging Using the Snapshot Method*

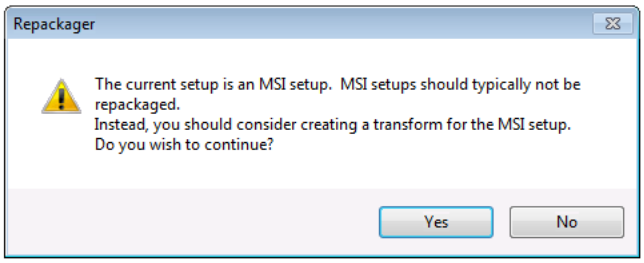
***Note** • The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.*



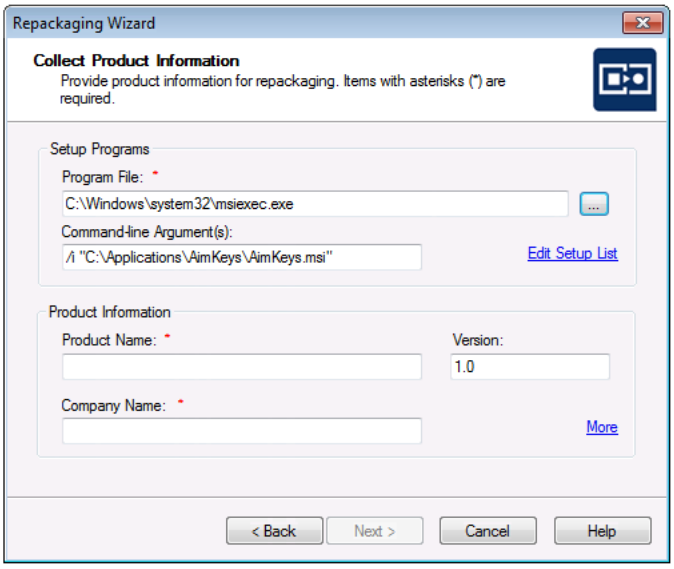
4. Click the Browse (...) button next to the **Program File** field to open the **Choose Setup Program File** dialog box.



5. From the **Files of type** list, select **All Files (*.*)**. All files in the selected directory are listed.
6. Click **Open** and select the Windows Installer package (.msi) that you are repackaging. A message appears warning you that MSI setups should not typically be repackaged.



7. Click **Yes** to close the message. Several fields in the Collection Product Information panel have been populated with the commands necessary to repackage a Windows Installer package.

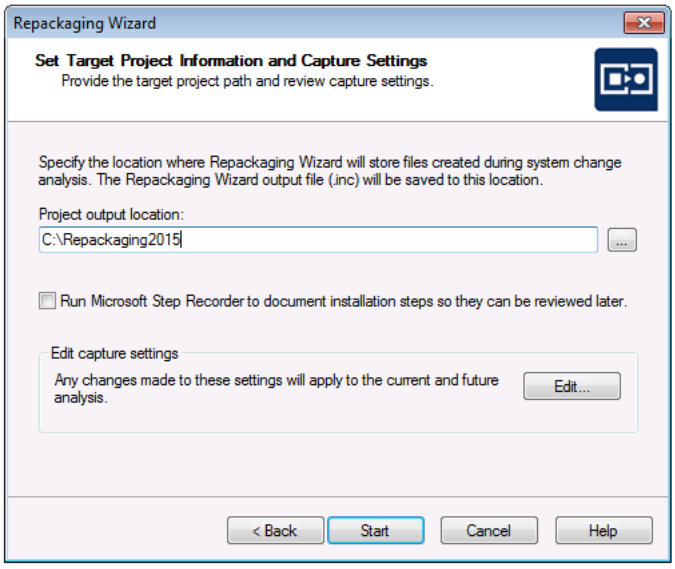


The following information was filled in:

Field	Entry
Program File	`C:\WINDOWS\system32\msiexec.exe`
Command line Argument(s)	`/i "C:\DIRECTORYPATH\PACKAGENAME.msi"`

Caution • *Do not edit the entries in the Program File or Command line Argument(s) fields.*

8. In the **Product Information** area, make entries in the **Product Name**, **Version**, and **Company Name** fields.
9. Click **Next**. The **Set Target Project Information and Capture Settings Panel** opens.

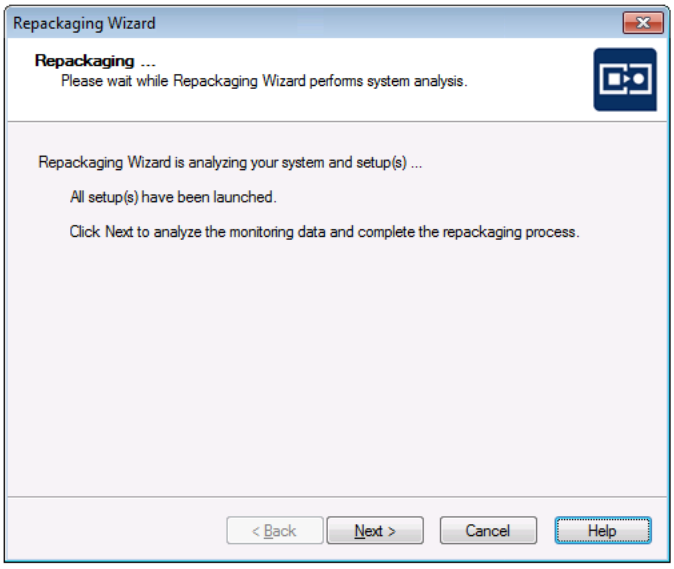


10. Click the Browse (...) button next to the **Project path to store files** field and select the directory where you want the Repackaging Wizard to place its output, including the Repackager project file (**.irp**), the Repackaging Wizard output files, and source files.

You can also enter the name of a new folder in the **Project path to store files** field, and you will be prompted to create it when you exit this panel.

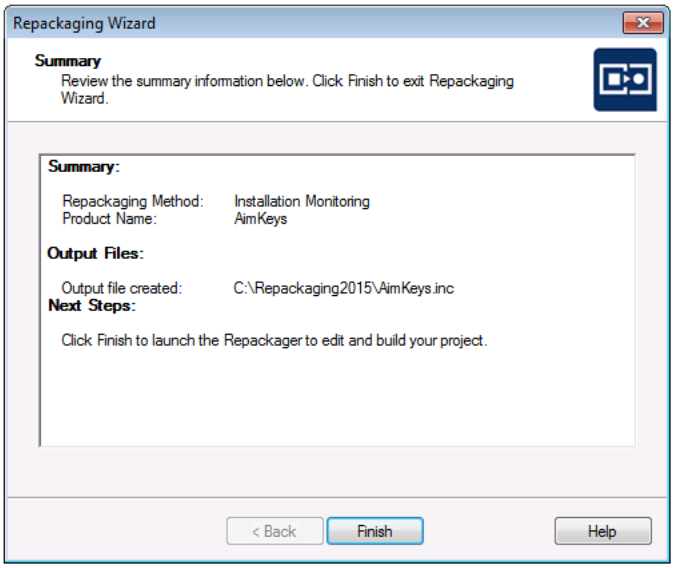
11. To begin the repackaging process, click **Start** on the Set Target Project Information and Capture Settings Panel. The **Repackaging Panel** opens and the Repackaging Wizard captures the initial system status. Then, the selected setup program will be launched.

12. Follow the prompts until the installation has completed. When the installation is complete, you are prompted to make any additional changes to the system (such as deleting files and shortcuts) that you want to be recorded in this repackaged installation.



13. When you are ready to complete the repackaging process, click **Next**. The Repackaging Wizard then analyzes the system and setup data that it collected.

    Following repackaging, the **Summary Panel** is displayed, providing confirmation that the repackaging was successful.



14. Click **Finish**. Repackager launches and opens the Repackager project file (***.irp**) that you just created.

15. Continue with the instructions in Working With Repackager Projects.

Documenting Repackaging Steps Using the Microsoft Step Recorder Tool

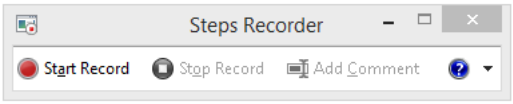
You can use the Microsoft Steps Recorder documentation tool with the Repackaging Wizard to automatically record the step-by-step actions that occur during repackaging. This information, which is saved in a web archive (**.mht**) file, includes a text description of where you clicked on each screen, along with a screen capture for each click.

To enable this option, select the **Run Microsoft Step Recorder to document installation steps so they can be reviewed later** option on the **Set Target Project Information and Capture Settings** panel of the Repackaging Wizard.

Task ***To use the Microsoft Steps Recorder during repackaging:***

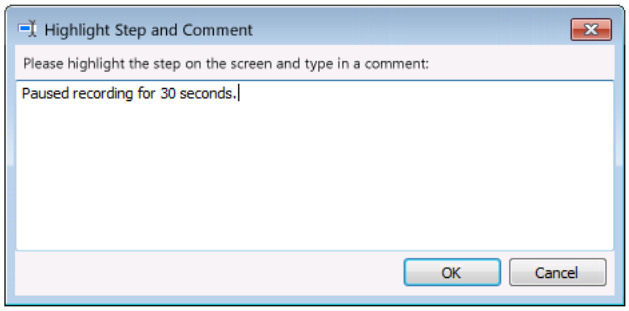
1. Launch the Repackaging Wizard.
2. On the **Method Selection** panel, select the desired method, as described in Installation Monitoring Method and Snapshot Method.
3. Proceed with repackaging, per the selected method, as described in the following help topics:
   - Repackaging Using the Installation Monitoring Method
   - Repackaging Using the Snapshot Method

4. On the **Set Target Project Information and Capture Settings** panel, select the **Run Microsoft Step Recorder to document installation steps so they can be reviewed later** option.
5. Click **Start** to begin the repackaging process. When the installer is launched, the **Steps Recorder** dialog box opens and recording automatically begins.



The **Steps Recorder** dialog box includes the following controls:

- **Pause Record**—Click to pause the recording. You would use this if you wanted to pause the repackaging process and use another application on your computer. If you do not pause the recording, all actions you take on the machine, whether or not they pertain to repackaging, will be recorded.
- **Stop Record**—Click to stop the recording.
- **Add Comment**—Click to pause the recording and open the **Highlight Step and Comment** dialog box where you can enter a comment. This comment will appear in the generated output file.



- **Elapsed time**—The time elapsed since the recording started is listed.

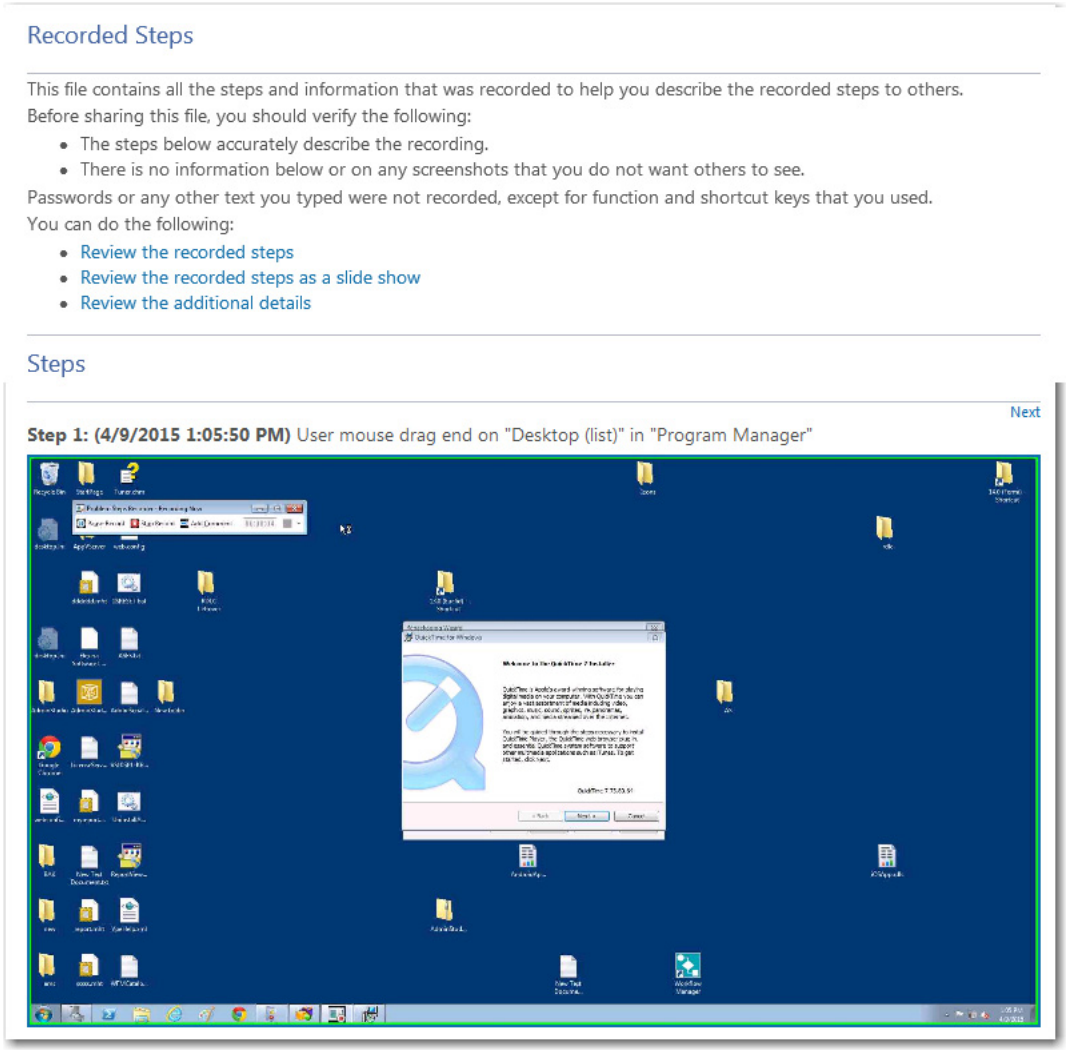
6. Click through the installer until it is completed.
7. Complete the panels on the Repackaging Wizard, per the selected method.
8. When repackaging is complete, open the Repackaged Output folder and locate the following web archive (**.mht**) file:

   *InstallerName*_Recording_*YYYYMMDD_TIME*.mht

   For example:

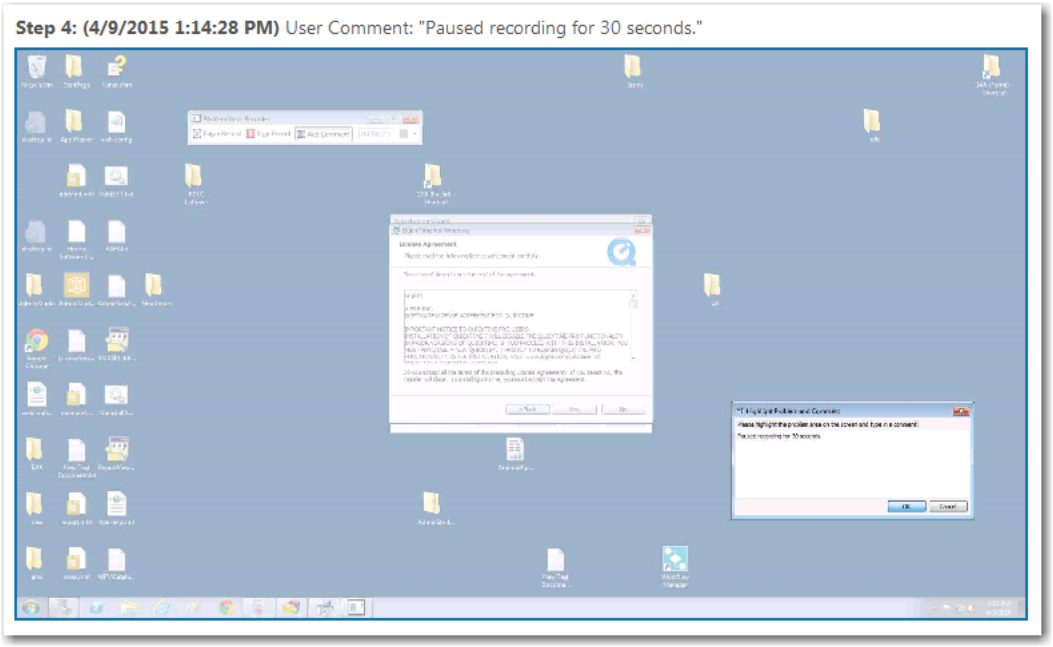
   QuickTime_Recording_20150409_1015.mht

9. Double-click the file to open it. The file opens in a browser window.
10. In the **Steps** section, scroll down to view all of the steps that you performed during repackaging along with screen captures of each step.

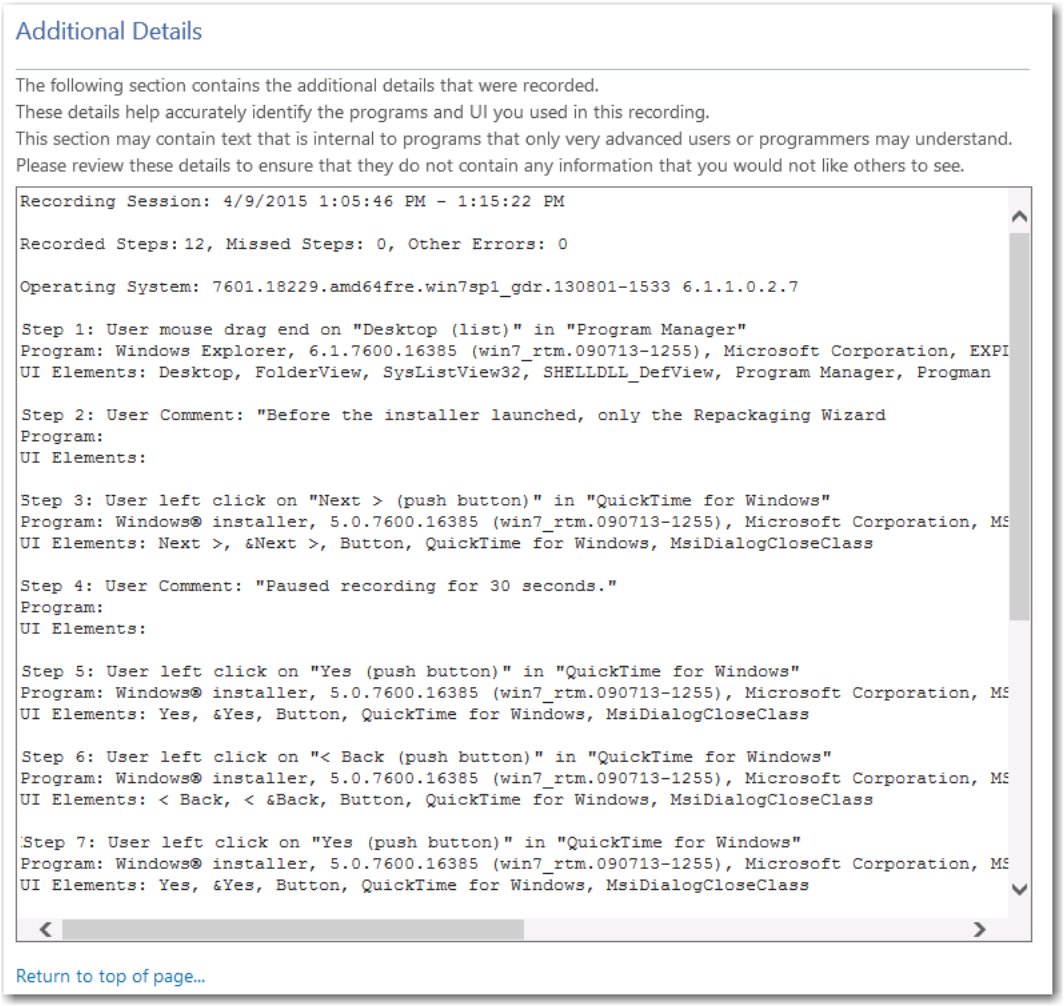


Tip • *If you want to view all of the screens as a slide show instead of scrolling through them, click* ***Review the recorded steps as a slide show****.*

If you entered any comments, they are listed in the file along with a screen capture of the **Highlight Step and Comment** dialog box.



11. Review the information in the **Additional Details** area, which contains a text description of the steps that were taken, along with information that is internal to the repackaged application.



Viewing the Recorded Archive File from Application Manager

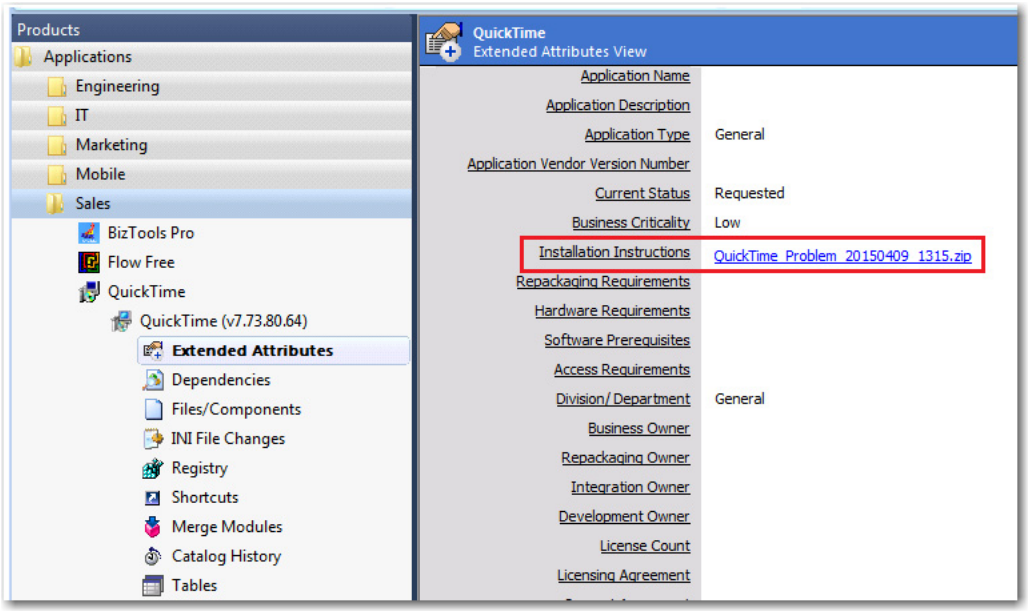
When you build a Windows Installer package using the Repackager project that was created during repackaging, this recorded web archive file will be copied to the Windows Installer package output folder.

Then, when you import this Windows Installer package into the Application Catalog, the recorded web archive file (or files) will also be imported.

To view a recorded web archive file in Application Manager, perform the following steps:

Task ***To view a recorded web archive file in Application Manager:***

1. Open Application Manager.
2. Locate the Windows Installer package and expand its package node.
3. Select the **Extended Attributes** subnode. The **Extended Attributes View** opens.



4. Next to **Installation Instructions**, click the name of the listed ZIP file. The ZIP file will open and display a list of the **.mht** files it contains.
5. Double-click on the **.mht** file that you want to view.

Repackaging Wizard Reference

This section describes each of the dialog boxes and Wizard panels that you might encounter when using the Repackaging Wizard. The help topics in the Repackager Reference are the same detailed documentation that is displayed when you press the F1 key or click the Help button while working in a dialog box.

Reference information is organized as follows:

Table 8-9 • Organization of Repackager Reference Section

Section	Description
Repackaging Wizard	This section provides a panel-by-panel description of the Repackaging Wizard.
Additional Repackaging Wizard Dialog Boxes	This section describes the dialog boxes that can be accessed from the Repackaging Wizard.
Repackaging Wizard Command-Line Options	This section lists the command-line options that are supported by the Repackaging Wizard.
Reboot Handling in the Repackaging Wizard	This section describes how the Snapshot Method and Installation Monitoring Method handle required reboots during repackaging.

Repackaging Wizard

Repackager provides the Repackaging Wizard to convert a legacy setup into a Repackager project. Using this Wizard, you can select the repackaging method (either Snapshot or Installation Monitoring), specify the setup(s) you want to repackage, and run the setup(s). When the Repackaging Wizard has finished its analysis, Repackager automatically creates a Repackager project (**.irp**) file, which can be modified in Repackager. You can then convert this file to an InstallShield Editor project (**.ism**) for further editing, or convert it directly to a Windows Installer package (**.msi**).

The Repackaging Wizard includes the following panels:

- Welcome Panel
- Method Selection Panel
- Snapshot Method Panel
- Collect Product Information Panel
- InstallScript MSI Identified Panel
- Set Target Project Information and Capture Settings Panel
- InstallScript MSI Conversion Output Panel
- Repackaging Panel
- Summary Panel
- Additional Repackaging Wizard Dialog Boxes

Welcome Panel

The Welcome panel appears when you first launch the Repackaging Wizard, providing some introductory information about the use of the Wizard, including that it is for use with traditional (non-Windows Installer-based) installations.

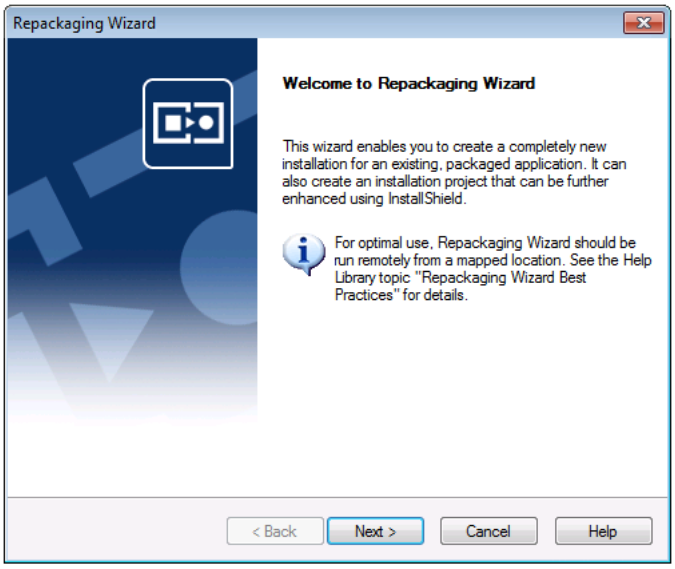


Figure 8-1: Repackaging Wizard Welcome Panel

Method Selection Panel

From the Method Selection panel, select the method(s) you want to use for repackaging.

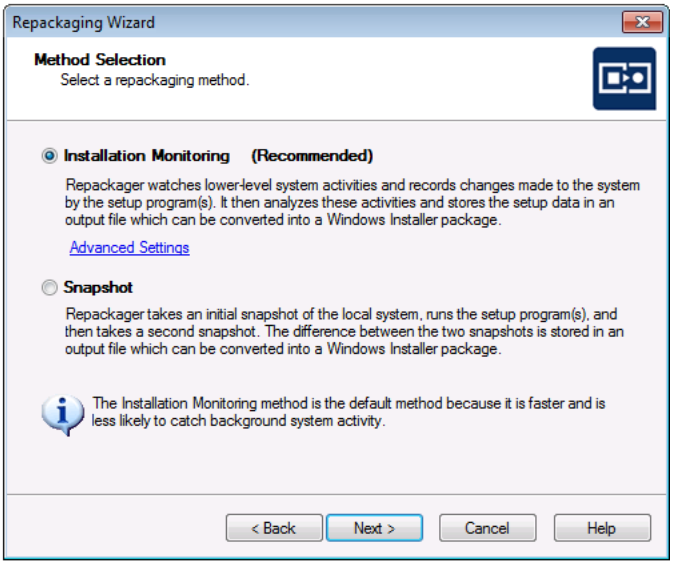

Figure 8-2: Repackaging Wizard Method Selection Panel

The available choices include:

Table 8-10 • Method Selection Panel Options

Options	Description
Snapshot	The Snapshot method involves taking system snapshots before and after an installation, and then creating the Windows Installer package from the difference between them. Any configurations you make between snapshots is also included in the generated Windows Installer package.
Installation Monitoring	Installation Monitoring watches all activities generated by an installation, and then determines the files, .ini files, registry entries and shortcuts that should be included in the generated Windows Installer package. Installation Monitoring is significantly faster than the Snapshot repackaging method. If there are services running on the machine that have nothing to do with the installation being repackaged, click the **Advanced Settings** link to open the Excluded Processes Dialog Box, where you can choose to exclude those processes. ***Edition*** • *The Installation Monitoring Method is included with AdminStudio Standard, Professional, and Enterprise Editions.* ***Tip*** • *If you know that the installation that you are capturing is from a self-extracting* ***.exe*** *file and if you want to use the* ***Installation Monitoring*** *method, you should click* ***Advanced Settings*** *and add the name of that* ***.exe*** *file to the excluded processes list.*

System Changes Captured by Repackager

Regardless of the repackaging method used, Repackager captures system changes made to the following:

- Application Paths
- Environment Variables
- Files
- INI Files
- NT Services
- ODBC Data Sources
- ODBC Drivers
- Printer Drivers
- Registry Entries
- Shortcuts

Snapshot Method Panel

The Snapshot Method Panel, which is only displayed if you use the snapshot technology, allows you to specify the way in which you perform repackaging.

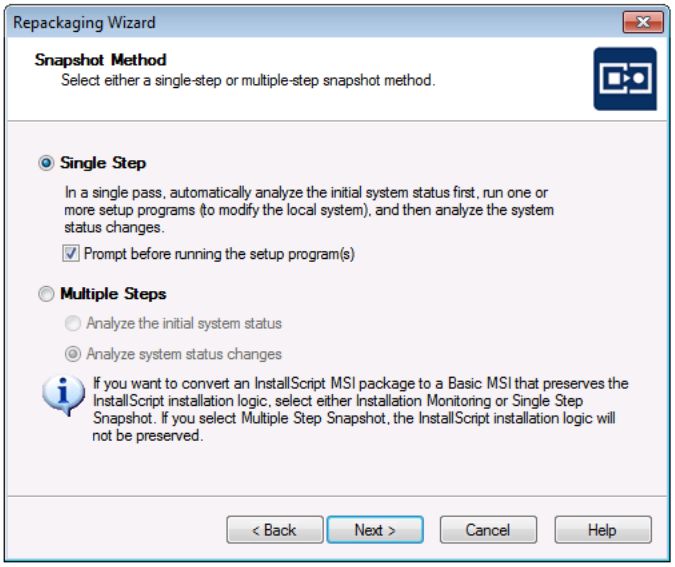

Figure 8-3: Repackaging Wizard Snapshot Method Panel

On the Snapshot Method Panel, you have the following two options:

Table 8-11 • Snapshot Method Panel Options

Option	Description
Single Step	Repackaging in a single step requires you specify at least one setup program to repackage. The Repackager first takes an initial system snapshot, then runs the setup program(s) you specify, and then takes a second snapshot to create the script file that can be converted into a Windows Installer package. You also have the option of requiring the Repackager to prompt you before running the setup program(s), allowing you the opportunity to make changes to your system that you want included in the final package.
Multiple Steps	Repackaging in multiple steps allows you to run the Repackager to obtain an initial system snapshot, after which the Repackager exits. You can then perform any modifications to the system, such as changing configurations, running installations, and so forth. After making the necessary modifications, run the Repackager again to analyze system status changes. The difference between the second Repackager execution and the first results in the script file that ultimately can be converted into a Windows Installer package.

The single step method is very straightforward if you are repackaging applications and not performing many system changes. The multiple step method allows greater flexibility because a setup is not required. This allows you to capture system configurations within the Repackager output, and ultimately within a Windows Installer package. For example, you could modify the screen color depth and create an MSI package for just that configuration.

If Single Step is selected, the **Collect Product Information Panel** is displayed when you click Next. If Multiple Steps is selected and you are performing the initial snapshot, the Collect Product Information panel is displayed, but the Setup Programs area is disabled. If you are performing a system status change analysis, the **Repackaging Panel** appears when you click **Next**.

Collect Product Information Panel

The **Collect Product Information** panel gathers information necessary for repackaging the installation(s).

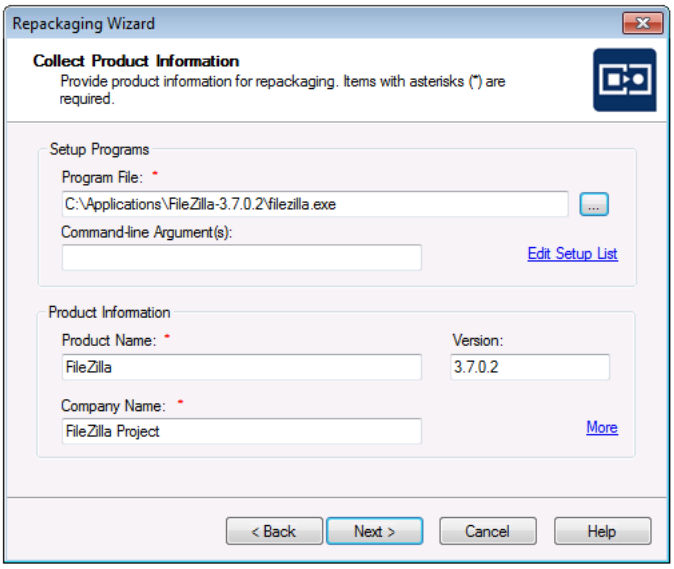

Figure 8-4: Repackaging Wizard Collect Product Information Panel

The information on the Collect Product Information Panel is divided into two sections: **Setup Programs** and **Product Information**.

Setup Programs Area

The Setup Programs area contains information about the setup you are repackaging. Repackager uses this information to launch the setup correctly following pre-analysis. The information collected includes:

Table 8-12 • Setup Programs Options

Properties	Description
Program File	The name and location of the setup executable. Click the Browse ... button to locate this file. This is a required field.
Command-Line Argument(s)	Any command-line arguments to be used when the setup is run.

Table 8-12 • Setup Programs Options (cont.)

Properties	Description
Edit Setup List	Click to display the **Additional Setup Programs** dialog box, from which you can enter additional installations to repackage together with this installation. Additional setups share the same product name, version number, and company name in the repackaged installation. However, as you locate each additional setup to repackage, you can specify command-line parameters pertaining only to that setup. You can also specify the order in which the installations are run, should it be necessary.

Product Information Area

In the Product Information area, you identify the repackaged installation's **Product Name**, **Version Number**, and **Company Name**.

Table 8-13 • Product Information Options

Field	Description
Product Name	Enter the name for final repackaged installation. This could be the name of the original installation (for example, Tuner), the name of a collective group of products (for example, Microsoft Applications), or another name of your selection (for example, My Apps). This is a required field.
Version Number	Enter the version of the product.
Company Name	Enter the name of the company.

Product Support Information

If you want to associate websites with this installation, click the **More** link in the Product Information area to open the Additional Product Information dialog box, where you can enter the **Product URL** and **Support URL** for the application you are repackaging.

InstallScript MSI Identified Panel

This panel opens if the Repackaging Wizard identifies an installation as an InstallScript MSI installation created with InstallShield Editor, InstallShield DevStudio, or InstallShield Developer.

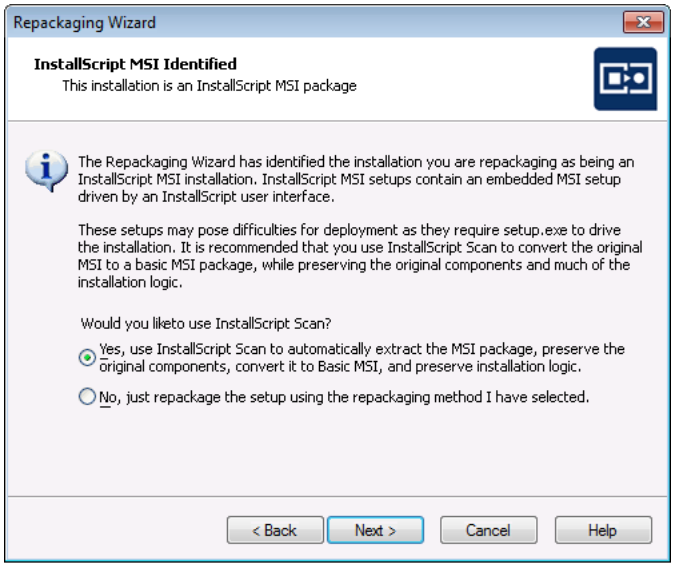

Figure 8-5: Repackaging Wizard InstallScript MSI Identified Panel

InstallScript MSI installations use a Windows Installer database for storage of all file/registry information, but the actual user interface, and much of the installation logic is driven by the InstallScript engine via a **setup.exe** file. This type of installation architecture can cause difficulties during deployment, such as:

- inability to customize or transform the application
- inability to conflict detect
- inability to suppress the user interface
- difficulty patching or upgrading the application

Also, if an InstallScript MSI installation is repackaged using traditional methods (OS Snapshot or Installation Monitoring), significant platform-specific or custom installation, maintenance, and uninstallation logic, and user interface information is lost because those methods only record the installation activities for the specific platform used during repackaging.

Therefore, it is recommended that you use InstallScript Scan to convert an InstallScript MSI installation to a Basic MSI package with InstallScript support. InstallScript Scan preserves the original components and much of the InstallScript installation logic, architecture, and maintainability of the original installation package.

Select one of the following options:

- **Yes**—Use InstallScript Scan to automatically extract the MSI package and convert it to Basic MSI, while preserving the original components and installation logic. This is the default selection.
- **No**—Repackage the installation using the repackaging method selected on the **Method Selection Panel** (Installation Monitoring or Snapshot).

Click **Next** to proceed.

Set Target Project Information and Capture Settings Panel

The location where you want files created by Repackager stored is defined in the **Project path to store files** field on the **Set Target Project Information Panel**.

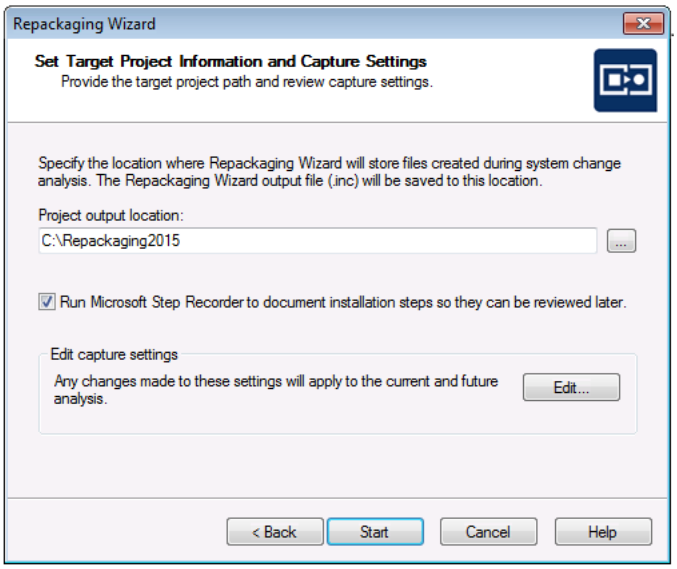

Figure 8-6: Repackaging Wizard Set Target Project Information and Capture Settings

It is recommended that this location not be located on your clean machine, but rather on the same machine as the Repackager executable (most likely on your administrator machine).

You can also review or edit current capture settings by clicking **Edit**, which displays the **Analysis Options** dialog box. See Analysis Options Dialog Box for more information.

You can use the Microsoft Steps Recorder documentation tool with the Repackaging Wizard to automatically record the step-by-step actions that occur during repackaging. This information, which is saved in a web archive (**.mht**) file, includes a text description of where you clicked on each screen, along with a screen capture for each click. To enable this option, select the **Run Microsoft Step Recorder to document installation steps so they can be reviewed later** option. For more information, see Documenting Repackaging Steps Using the Microsoft Step Recorder Tool.

Click **Start** to begin repackaging and display the **Repackaging Panel**.

InstallScript MSI Conversion Output Panel

On this panel, specify the location where you want Repackager to store the files it creates during InstallScript Scan analysis. The converted Windows Installer MSI package will be saved to this location.

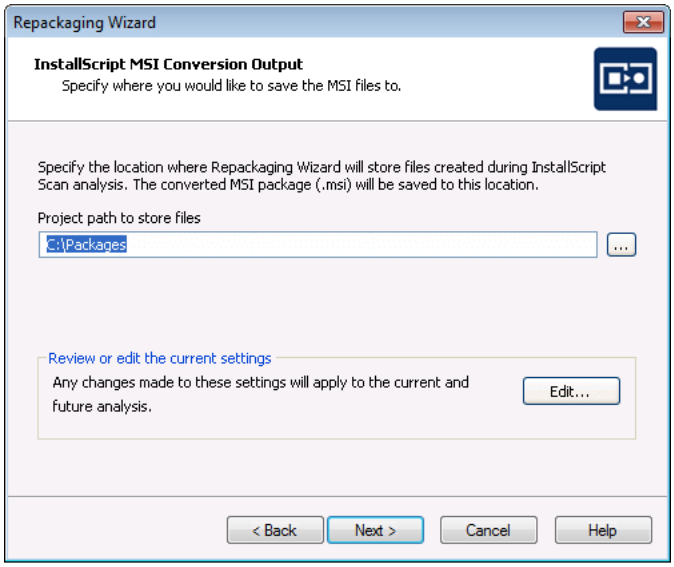

Figure 8-7: Repackaging Wizard InstallScript MSI Conversion Output Panel

It is recommended that this location not be located on your clean machine, but rather on the same machine as the Repackager executable (most likely on your administrator machine).

You can also review or edit current settings by clicking **Edit** to open the **Analysis Options** dialog box. On the **Analysis Options** dialog box, you can specify capture types for the repackaging session, and, for snapshot-mode captures, you can restrict directory analysis to specific directories.

Click **Start** to begin repackaging and display the **Repackaging Panel**.

Repackaging Panel

The Repackaging panel appears while Repackager analyzes your system.

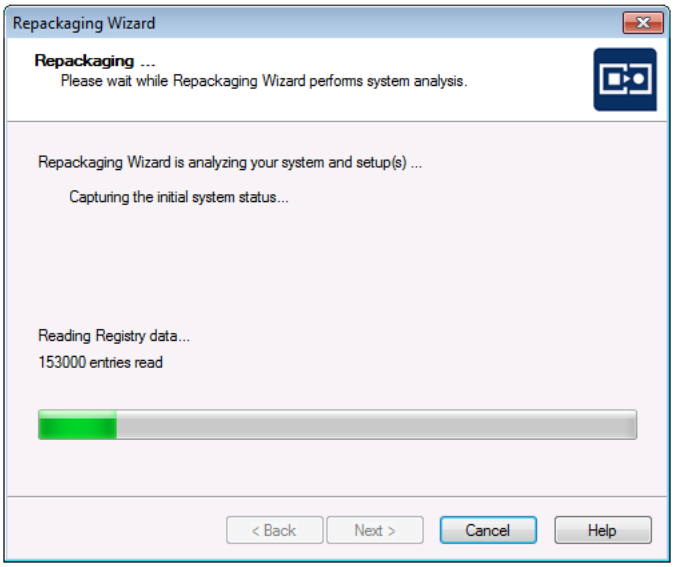

Figure 8-8: Repackaging Wizard Repackaging Panel 1

Depending on settings configured before starting repackaging, the analysis may stop following the initial phase, and again after setup has been run.

After the setups have been completed, you are prompted to click the **Next** button to complete the repackaging process.

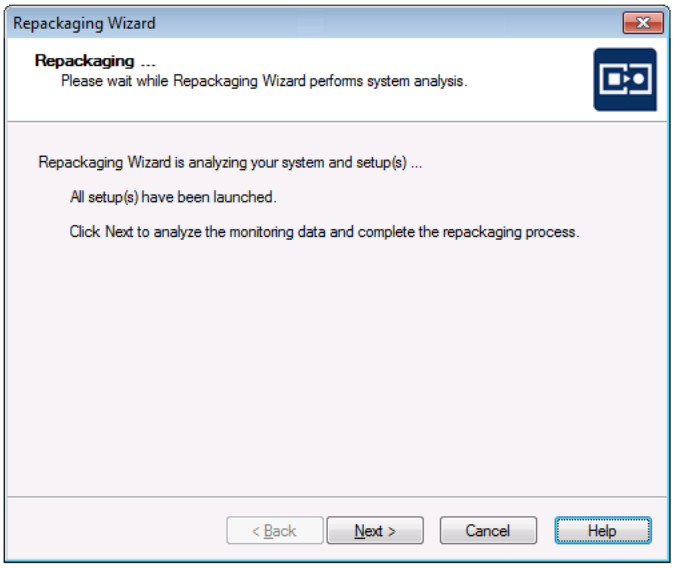

Figure 8-9: Repackaging Wizard Repackaging Panel 2

When you click **Next**, the repackaging is performed and its progress is displayed.

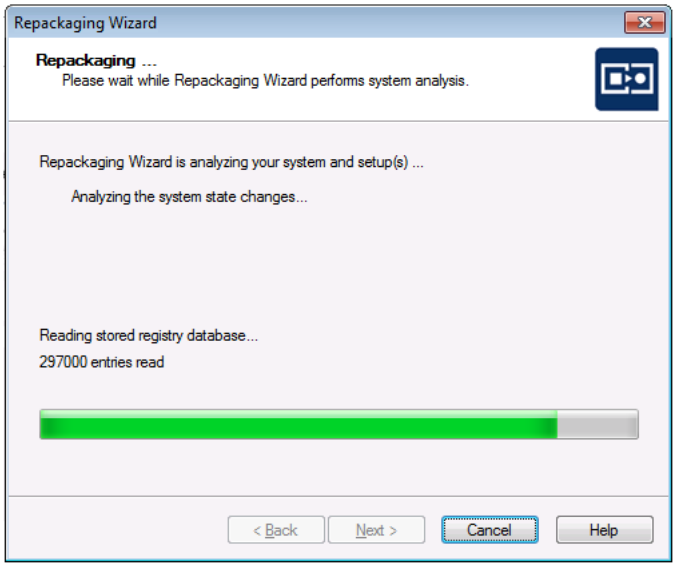

Figure 8-10: Repackaging Wizard Repackaging Panel 3

Following repackaging, the **Summary Panel** is displayed.

Summary Panel

The final panel displayed by Repackager is the Summary panel.

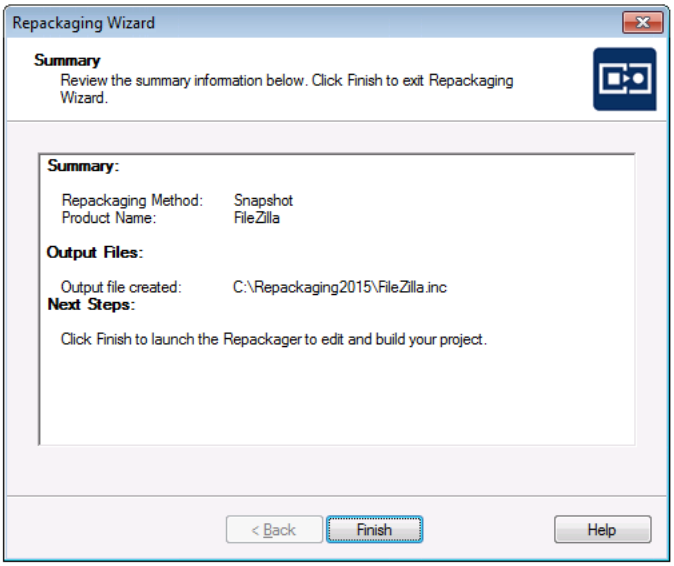

Figure 8-11: Repackaging Wizard Summary Panel

This panel provides confirmation that repackaging was successful, and provides the location of the source setup program(s), the Windows Installer package, and the InstallShield Editor project.

Additional Repackaging Wizard Dialog Boxes

The following dialog boxes can be accessed from the Repackaging Wizard:

- Additional Setup Programs Dialog Box
- Setup Information Dialog Box
- Excluded Processes Dialog Box
- Analysis Options Dialog Box

Additional Setup Programs Dialog Box

This dialog box, which is accessed by clicking the **Edit Setup List** button on the **Collect Product Information Panel** of the Repackaging Wizard, displays a list of additional setup programs you want to add to the final Windows Installer package.

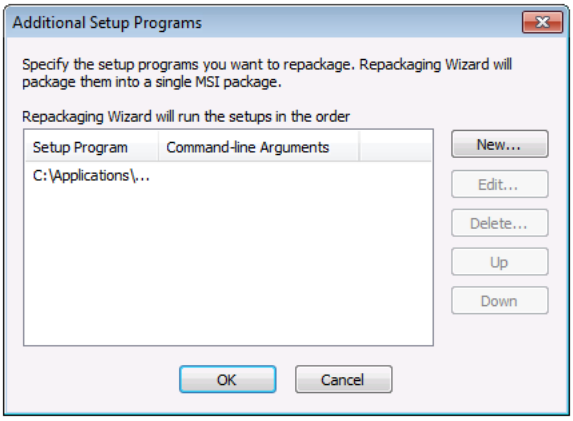

Figure 8-12: Repackaging Wizard's Additional Setup Programs Dialog Box

Essentially, this is a list of the other executables to run, in the order they are to be run, prior to final analysis. The following buttons are available:

Table 8-14 • Additional Setup Programs Dialog Box Buttons

Button	Description
New	Brings up the **Setup Information** dialog box to enter information about the setup programs.
Edit	Displays the **Setup Information** dialog box to edit information about the currently selected setup.
Delete	Removes the currently selected setup.
Up	Moves the selected setup up in the setup programs list.
Down	Moves the selected setup down in the setup programs list.

Setup Information Dialog Box

The **Setup Information** dialog box allows you to enter or edit information pertaining to the installations you are repackaging.

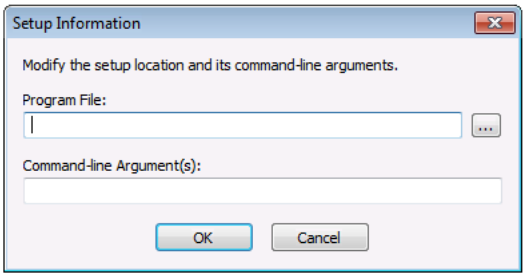

Figure 8-13: Setup Information Dialog Box

Accessible from the **Additional Setup Programs** dialog box, you can provide the name and location of an additional setup program, and any command-line arguments for the setup.

Excluded Processes Dialog Box

During Installation Monitoring, Repackager captures all of the activity of each service or process running on the machine, and then processes this collected data. However, many services running on a machine may have nothing to do with the installation being repackaged. Therefore, you may choose to exclude those processes by adding them to the list on the **Excluded Processes** dialog box.

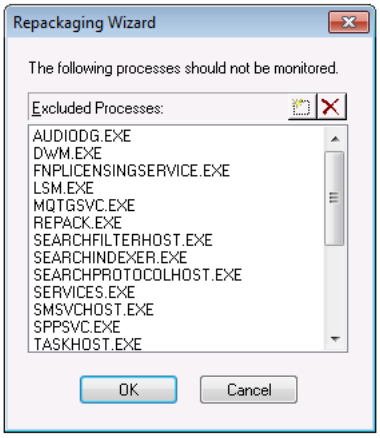

Figure 8-14: Repackaging Wizard Excluded Processes Dialog Box

You can open the **Excluded Processes** dialog box by clicking the **Advanced Settings** link on the Repackaging Wizard Method Selection Panel. The **Excluded Processes** dialog box initially lists a default set of processes.

- **To add a process to this list**, click the New ( ) button to add a new blank line to this list, and enter the name of the process that you want to exclude.
- **To delete a process from this list**, select the process and click the Delete ( ) button.

Analysis Options Dialog Box

The Analysis Options dialog box, accessible by clicking **Edit** from the **Set Target Project Information and Capture Settings Panel** or the **InstallScript MSI Conversion Output Panel**, allows you to specify capture types for the repackaging session. You can also edit or change the exclusions file that will be used for this repackaging session.

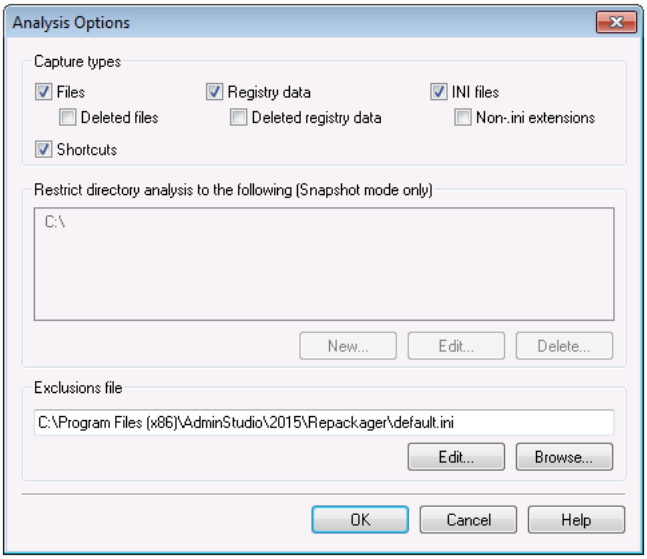

Figure 8-15: Analysis Options Dialog Box

Note • *Options set in this dialog box apply to the recurrent and subsequent repackaging sessions.*

Capture Types

To specify the type of files that will be captured during this repackaging session, make selections in the Capture types area:

Table 8-15 • Capture Types

Type	Description
Files	Capture file names during repackaging.
Deleted files	Capture deleted file names during repackaging. ***Note*** • *If you select this option, deleted files will be displayed on the Deleted Files View of the Repackager interface.*
Registry data	Capture registry data during repackaging.
Deleted registry data	Capture deleted registry data during repackaging. ***Note*** • *If you select this option, deleted registry entries will be displayed on the Deleted Registry Entries View of the Repackager interface.*
INI files	Capture .ini files during repackaging.

Table 8-15 • Capture Types

Type	Description
Non-ini extensions	Capture .ini files with non-.ini extensions during repackaging.
Shortcuts	Capture shortcuts during repackaging.

Restricting Directory Analysis to Specific Directories

For snapshot-mode captures, you can restrict directory analysis to specific directories, which can significantly improve repackaging performance. Selected directories are listed in the **Restrict directory analysis to the following** box.

- To add a directory restriction, click **New**.
- To modify an existing restriction, click **Edit**.
- To remove a restriction, click **Delete**.

Important • *By default,* ***C:*** *is listed in the* ***Restrict directory analysis to the following*** *list. If you want to restrict directory analysis to specific directories on a machine, you must not only add the specific directories, but you must also delete* ***C:*** *from this list.*

Editing or Changing Exclusions File

In the **Exclusions file** field, the path to the file that contains the default configuration for Repackager, including default exclusion information, is listed. By default, the location is:

[AdminStudioInstallDirectory]\Repackager\default.ini

- Click **Edit** to edit the listed exclusion file in the Exclusions Editor.
- Click **Browse** to browse to a different exclusion file.

Repackaging Wizard Command-Line Options

The following command-line options are supported by the Repackaging Wizard:

Table 8-16 • Repackaging Wizard Command-Line Options

Option	Description
`-?`	Displays a dialog box containing usage information for all Repackager command line options: • **If a option name is provided**, detailed help for the specified option will be displayed. • **If no option name is provided,** a dialog box containing general usage information for all options is displayed.

Table 8-16 • Repackaging Wizard Command-Line Options (cont.)

Option	Description
`-app <setup program list>`	Enables you to provide a pipe (|) delimited list of setups to run during repackaging. You can also pass command-line arguments to the setup by separating them from the setup name with a semicolon. If entering multiple setups, proper double quoting—including escaping nested quotes—is necessary: `-app "\"exe1path\";cmdline1|\"exe2path"|...exeN; cmdlineN`
`-cf <config.ini>`	This option allows you to select your own configuration template containing exclusions. A sample of this type of file (named **Default.ini**) can be found in the following directory: `[AdminStudioInstallDirectory]\Repackager` This particular file contains the default exclusion information.
`-cs <configuration type>`	This option allows you to select the configuration file type for exclusions. Possible values are: • **Shared**—Use shared settings from those stored in the **AdminStudio Shared** directory. • **Custom**—Use a custom configuration file (in conjunction with `-cf`).
`-is`	Regarding the Repackaging an InstallScript MSI Setup to a Basic MSI Setup procedure, use this parameter in the command line using the following syntax: `Repack.exe -app "c:\setup.exe" -o C:\apps\output -mm -is` In the above example, the user wants to repackage **c:\setup.exe** using the Installation Monitoring repackaging method (as specified by `-mm`) and InstallScript conversion (as specified by `-is`). Repackager would perform the InstallScript conversion process and produce a Basic MSI package with InstallScript support as output. Without the -is parameter, Repackager would perform repackaging without performing InstallScript conversion, and would only create a Repackager **.inc** file as the output. ***Note*** • *The command line parameter -is will be considered only if the setup to be repackaged is a InstallScript MSI setup. If user specified any other legacy setup that is not a InstallScript MSI setup then -is will be ignored.* ***Note*** • *If user chooses to use the Multiple Step Snapshot repackaging method, then the -is parameter will be ignored. Even if the setup is an InstallScript MSI setup, -is will still be ignored when using the Multiple Step Snapshot repackaging method.*

Table 8-16 • Repackaging Wizard Command-Line Options (cont.)

Option	Description
`-mode <snapshot mode>`	Repackager supports the following repackaging modes for snapshots: • **single**—Single step repackaging that creates an INC file as its output. • **pre**—Pre-scanning only scans the local drive for a baseline snapshot of the system. • **post**—Post-scanning only scans the local drive and compares the result with the pre-scan. The differences are written to the INC file as output.
`-mm`	Instructs Repackager to use installation monitoring as the repackaging technology.
`-ms`	Instructs Repackager to use snapshots as the repackaging technology.
`-o <inc path name>`	Specifies a folder path not including the filename. The file name is derived from the Product Name unless overridden with the -of switch.
`-of <inc file name>`	Specifies the .inc file name that should be used instead of the product name. Use -o to specify the path.
`-onp`	When using the **Installation Monitoring** method via command line to perform repackaging on a 64-bit operating system, you can use the `-onp` command line option to cause the **Installation Monitoring** method to only monitor new processes created on the system and to ignore any existing/ running ones. This option is useful to optimize the monitoring process on a 64-bit operating system.
`-pc <company name>`	Allows you to set the company name.
`-pp <product name>`	Allows you to set the product name. This will be the same name as the generated Repackager output file (**.inc**).
`-pv <product version>`	Allows you to set the product version.
`-sb`	This option allows you to run Repackager silently, with no user interaction. A progress dialog box is displayed. If no .ini file is specified using the -i parameter, Repackager uses **Repack.ini** as the default input file. If an output folder is not specified using -o, the default output folder is **C:\Packages**.
`-sn`	This option allows you to run Repackager silently, with no user interaction and no progress dialog box. If no .ini file is specified using the -i parameter, Repackager uses **Repack.ini** as the default input file. If an output folder is not specified using `-o`, the default output folder is **C:\Packages**.
`-version`	This option displays standard version information for Repackager, including the full version and copyright information.

Tip *• To open a help topic from the command line that lists command line options, enter the following:*

```
repack.exe /?
```

Note *• In addition to the - sign for command-line arguments, you can also use the / symbol.*

Reboot Handling in the Repackaging Wizard

During repackaging, a setup may require a reboot. For example, some operations may require a file which is in use be replaced, which can only be done after a reboot. Some nuances exist depending on the repackaging technology you are using (Snapshot or Installation Monitoring). In either case, when the Repackaging Wizard detects that a reboot is necessary, the Repackaging Wizard saves the appropriate data and waits until you confirm that you are ready to reboot the machine.

For Snapshot repackaging, the operating system completes the reboot operation. During startup, the operating system restarts all applications and processes and performs any pending file operations. One of the applications that restarts is Repackager. Before you continue processing in Repackager, be patient and ensure all processes and applications have restarted. This may take a minute or two. After the applications and processes have been launched, you can continue repackaging by clicking **Next**.

For Installation Monitoring, on reboot the operating system launches the Repackaging Wizard, which in turn launches applications and processes and waits until these are finished before prompting you to continue repackaging. However, in some cases the processes or applications launched by the Repackaging Wizard will launch other applications and processes. As in Snapshot repackaging, it is generally a good idea to wait a minute or two before clicking **Next**.

In both circumstances, waiting helps ensure the setup is fully installed and that captured data contains the necessary information to properly rebuild the setup as an MSI installation.

Note *• On Windows Vista and newer, system reboots are almost instantaneous and do not allow running applications to properly shut down, which may result in a loss of data. When using the* ***Installation Monitoring*** *method, Repackager successfully handles a system reboot and delays it until you click the* ***Reboot*** *button on the Repackaging Wizard.*

9

Converting Legacy Installations Using the Repackager Interface

A Repackager project file (.irp) can be built into an InstallShield Editor project (.ism) or a Windows Installer package (.msi). You can use the Repackager interface to create and modify Repackager project files. You can also use it to build an isolated Windows Installer package and to configure the exclusions used when repackaging a legacy installation.

Information about the Repackager interface is presented in the following sections:

Table 9-1 • Using the Repackager Interface

Section	Description
About the Repackager Interface	Explains how to launch the Repackager interface and how to set options.
Creating Repackager Projects	Explains how to create a Repackager project file (.irp), which can then be built into an InstallShield Editor project (.ism) or a Windows Installer package (.msi).

Table 9-1 • Using the Repackager Interface (cont.)

Section	Description
Working With Repackager Projects	Explains how to build an InstallShield Editor project and Windows Installer package from a Repackager project. The topics in this section include: • Building an InstallShield Editor Project • Building a Windows Installer Package • Automatically Generating a Virtual Application During Repackager Project Build • Viewing Repackager Project Properties • Using the Setup Intent Wizard to Detect File Dependencies in a Repackager Project • Creating a Setup Capture Report for a Project • Generating Software ID Tag Files During Repackaging • Saving Repackager Projects • Opening InstallShield Editor from Repackager
Isolating Windows Installer Packages	Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested. This section reviews isolation concepts and options, and explains how to build an isolated Windows Installer package.
Configuring Exclusions	Explains how to use Repackager and the Exclusions Editor to configure the exclusions used when repackaging a legacy installation.
Creating an InstallShield Editor Template to Use Within Repackager	Explains how to create an InstallShield Editor template to use to speed up the Repackaging process.
Repackager Interface Reference	Describes each of the views and dialog boxes that you might encounter when using the Repackager interface. The help topics in this section are the same detailed documentation that is displayed when you press the F1 key or click the Help button while working in a dialog box.

Note • *For information on other Repackager features, see Repackaging Legacy Installations Using the Repackaging Wizard.*

About the Repackager Interface

Information about using the Repackager interface is presented in this section:

- Launching the Repackager Interface

- Setting Repackager Options

Launching the Repackager Interface

Repackager can be launched from within the AdminStudio interface. Additionally, if you install Repackager on a network, use Windows Explorer to browse to the **islc.exe** executable on the shared drive.

Task ***To launch Repackager from the AdminStudio interface:***

1. Launch AdminStudio.
2. Click the **Tools** tab.
3. From the Tools Gallery, click the **Repackager** icon on the left side.

   The Repackager Start Page opens and you can begin the repackaging process.

Note • *You can also launch Repackager directly from the Windows* ***Start*** *menu by pointing to* ***All Programs****, AdminStudio,* ***AdminStudio 2016 Tools****, and clicking* ***Repackager****.*

Caution • *It is highly recommended that you repackage applications on a "clean" system. See Configuring Repackager to Ensure Optimal Installation Capture for more information.*

Setting Repackager Options

On the Options Dialog Box, which is opened by selecting **Options** from the **Tools** menu, you can specify the following Repackager options:

- Selecting Data Display Colors
- Specifying Additional Merge Module Directories
- Controlling the Display of ICE Validation Warnings
- Suppressing Build Output Folder Overwrite Warnings

Selecting Data Display Colors

On the **Colors** tab of the Repackager Options dialog box, you can configure the color of scanned items and deleted items in Repackager's exclusion views (Files, **.ini** Files, Registry Data, and Shortcuts).

Task ***To change the way excluded and included data is displayed in Repackager:***

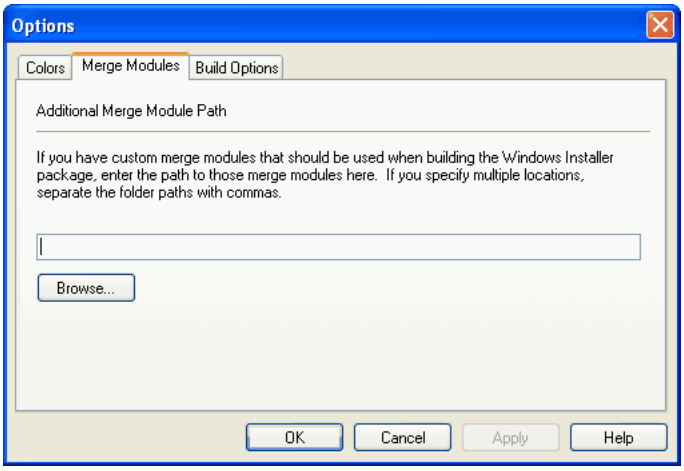
1. Open the Repackager interface.
2. From the **Tools** menu, select **Options**. The **Colors** tab of the **Options** dialog box opens.
3. Configure the display colors for **Excluded** and **Setup Intent** items.
4. Click OK.

Specifying Additional Merge Module Directories

If you have custom merge modules that should be used when building a Windows Installer package, you need to specify the directories that contain those custom merge modules on the **Merge Modules** tab of the Options dialog box.

Task ***To specify directories of additional Merge Modules:***

1. Open the Repackager interface.
2. From the Tools menu, select **Options**. The **Colors** tab of the Options dialog box opens.
3. Open the **Merge Modules** tab.



4. Enter the directory paths to the custom merge modules. To specify multiple directories, separate the folder paths with commas.

Note • *You can click* ***Browse*** *and navigate to a directory, but if you browse to a second directory, its directory path will replace the one you initially selected. Therefore, if you want to specify multiple directories separated by commas, you need to manually enter the directory paths.*

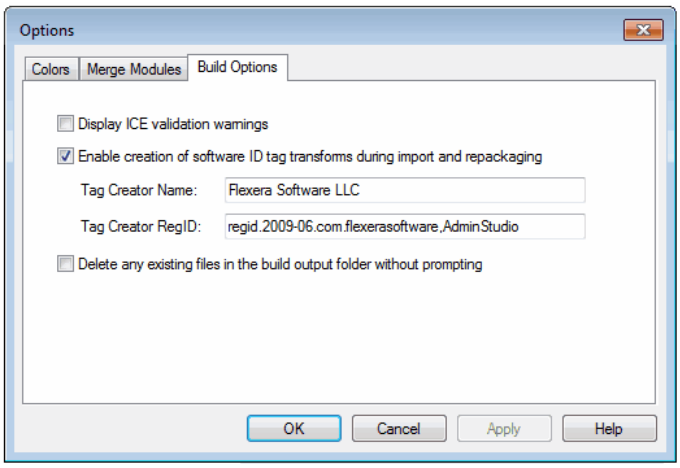
5. Click **OK**.

Controlling the Display of ICE Validation Warnings

On the **Build Options** tab of the Options Dialog Box, you can specify whether or not you want to list ICE validation warnings in the Repackager output window during the Build process.

Task ***To set the display of ICE validation warnings during builds:***

1. From the Repackager interface, select **Options** from the **Tools** menu. The Options dialog box opens.
2. Open the **Build Options** tab.



3. To display any ICE validation warnings that occur during the Repackager Build process, select the **Display ICE validation warnings** option. By default, this option is not selected.

Note • *For information on the software ID tag options on the* ***Build Options*** *tab of the* ***Options*** *dialog box, see Enabling Software ID Tag Generation During Repackaging.*

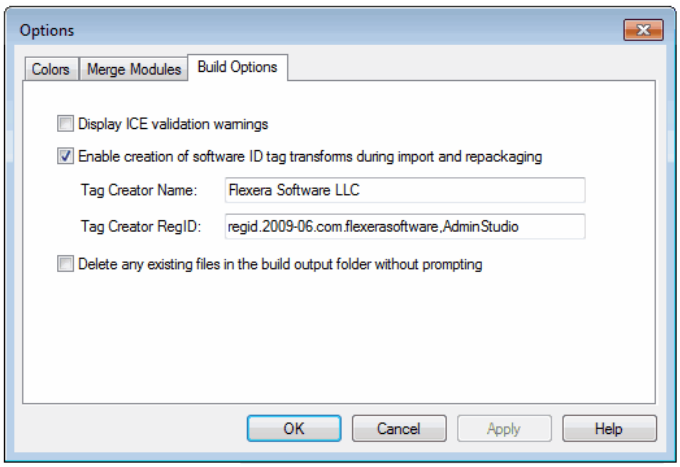
Suppressing Build Output Folder Overwrite Warnings

By default, Repackager will build the Repackager project's associated Windows Installer package in a directory named **MSI_Package**, which is a subdirectory of the directory containing the Repackager project. If you have edited the Repackager project's associated InstallShield Editor project to change this default location, each time you rebuild the Repackager project, Repackager will prompt you to confirm that you want to overwrite the existing files.

If you are repeatedly building from the Repackager interface into the same build output folder (which is not the default **MSI_Package** folder) and you do not want to be prompted to confirm that you will be overwriting the existing content, you can select an option on the Repackager **Options** dialog box to suppress the confirmation prompts.

Task ***To suppress build output folder overwrite warnings:***

1. On the **Tools** menu, click **Options**. The Repackager **Options** dialog box opens.
2. Open the **Build Options** tab.



3. Select the **Delete any existing files in the build output folder without prompting** option.
4. Click **OK**.

Creating Repackager Projects

Repackager projects (**.irp**) allow you to visually analyze the files, **.ini** files, shortcuts, and registry entries captured or changed during the conversion of a legacy setup into a Windows Installer package. You can also exclude files, shortcuts, registry entries, and **.ini** files from the resulting Windows Installer package, without affecting the original setup data.

There are two methods of creating Repackager projects:

Table 9-2 • Methods of Creating Repackager Projects

Method	Installation Source
Repackaging Wizard	You can use the Repackaging Wizard to convert the following installations: • InstallShield Professional 1.x to 5.1.x • InstallShield Professional 5.5 to 7.x • InstallShield InstallScript MSI • InstallShield DevStudio 9.x InstallScript • InstallShield Editor InstallScript See Repackaging Legacy Installations Using the Repackaging Wizard.

Table 9-2 • Methods of Creating Repackager Projects (cont.)

Method	Installation Source
Repackager Interface	You can use the Repackager interface to convert the following installations: • Repackager 3.x output (.inc) • Microsoft SMS projects (.ipf) • Novell ZENworks projects (.axt/.aot) • WinINSTALL projects (.txt) (6.0, 6.5, 7.x) • Wise installation projects (.wse) • InstallShield Professional log files (.isl) See Converting Legacy Installations Using the Repackager Interface.

Converting Legacy Installations Using the Repackager Interface

In addition to repackaging a legacy installation using the Repackaging Wizard, you can also convert many setup types directly to Repackager projects (**.irp**)—and ultimately to InstallShield Editor projects (**.ism**) and Windows Installer packages (**.msi**). Repackager can directly convert the following setup types:

- Converting Repackager 3.x Output Files
- Converting a Microsoft SMS Project to a Repackager Project
- Converting Novell ZENworks Projects
- Converting WinINSTALL Projects
- Converting Wise Installation Projects
- Converting InstallShield Professional Log Files

Converting Repackager 3.x Output Files

To convert a Repackager 3.x output file to a Repackager project, perform the following steps.

Task ***To convert a Repackager 3.x output file (.inc) to a Repackager project (which can subsequently be built into a Windows Installer package):***

1. Launch Repackager.
2. On the **File** menu, click **Open**. The **Open** dialog box opens.
3. Change the **Files of type** filter to **Legacy Repackager Files (*.inc)**.
4. Browse to locate the Repackager 3.x output file you want to convert.
5. Select the file and click **OK**.

The Repackager 3.x project is updated to the Repackager project (**.irp**) format. Files, **.ini** files, shortcuts, and registry entries within the project are visible through the appropriate views in the Repackager Interface.

Converting a Microsoft SMS Project to a Repackager Project

To convert a Microsoft SMS project to a Repackager project, perform the following steps.

Task ***To convert a Microsoft SMS project (.ipf) to a Repackager project (which can subsequently be built into a Windows Installer package):***

1. Launch Repackager.
2. From the File menu, select Open.
3. In the Open dialog box, change the Files of type filter to SMS Installer (*.ipf).
4. Browse to locate the SMS project you want to convert.
5. Select the project, and click OK.

The legacy project is converted to a Repackager project. Files, **.ini** files, shortcuts, and registry entries within the project are visible through the appropriate views in the Repackager Interface.

Converting Novell ZENworks Projects

You can convert Novell ZENworks projects (**.axt/.aot**) to Windows Installer packages (**.msi**) one at a time or in bulk:

- **Repackager Interface**—You can convert a ZENworks project to a Windows Installer package using the Repackager interface. See Converting a Novell ZENworks Project Using the Repackager Interface.
- **Command Line**—You can use the Command Line to bulk convert multiple ZENworks projects to Windows Installer packages. See Converting Multiple Novell ZENworks Projects Using the Command Line.

Note *• In order to convert an* ***.aot*** *file, the ZENworks Desktop Management Agent 6.5 or later (zenlite.dll) must be installed on the workstation where Repackager is installed. If this agent is not installed, Repackager can only convert ZENworks .axt files. See About .axt and .aot Application Object Template Files for more information.*

Converting a Novell ZENworks Project Using the Repackager Interface

Using Repackager, you can convert Novell ZENworks projects (**.axt/.aot**) to Windows Installer packages (**.msi**).

About .axt and .aot Application Object Template Files

In ZENworks Desktop Management, the `snAppShot` utility generates application object template files—with either an **.axt** or **.aot** extension—that contain the details that are required for the Application Launcher to be able to distribute an application to a workstation:

- registry entries to be added
- files to be copied

- changes to be made in the **.ini** files and system text files (**autoexec.bat** and **config.sys**)

Because an **.axt** file is a text file that can be edited with a text editor in order to modify it after it has been created, it can be opened and converted by Repackager.

However, in order to convert a **.aot** file (which is not a text file), the ZENworks Desktop Management Agent 6.5 or later (**zenlite.dll**) must be installed on the workstation where Repackager is installed. If this agent is not installed, Repackager can only convert ZENworks .axt files.

***Note** • For information on installing the ZENworks Desktop Management agent (version 6.5 or later) to a workstation, see Novell ZENworks 6.5 Desktop Management Installation Guide.*

Task ***To convert a Novell ZENworks project (.axt/.aot) to a Repackager project (which can subsequently be built into a Windows Installer package):***

1. Launch Repackager.
2. On the **File** menu, click **Open**.
3. In the **Open** dialog, change the **Files of type** filter to **Novell ZENworks (*.axt)** or **Novell ZENworks (*.axt/*.aot)**.

   ***Note** • If the ZENworks Desktop Management Agent 6.5 or later (zenlite.dll) is installed on the workstation where Repackager is installed, the Files of type filter will be Novell ZENworks (*.axt/*.aot). If this agent is not installed, the Files of type filter will be Novell ZENworks (*.axt) and you will be unable to select .aot files as the legacy setup source. See About .axt and .aot Application Object Template Files for more information.*
4. Browse to locate the ZENworks project you want to convert.
5. Select the project, and click **OK**.

The legacy project is converted to a Repackager project. Files, **.ini** files, shortcuts, and registry entries within the project are visible through the appropriate views in the Repackager Interface.

Converting Multiple Novell ZENworks Projects Using the Command Line

To perform a bulk conversion of ZENworks projects to Windows Installer packages, you use the `-Z` command line switch.

Task ***To convert multiple Novell ZENworks projects (.axt/.aot) to a Windows Installer package, a Repackager project, or an InstallShield Editor project:***

1. Create an **.ini** file using the following format:

```
[General]
OutputFormat=MSI|INC|ISM

[AXT]
C:\myData\Project1.axt
```

```
C:\myData\Project2.axt
C:\myData\Project3.axt

[AOT]
C:\myData\Project1.aot
C:\myData\Project2.aot
C:\myData\Project3.aot
C:\myData\Project4.aot
```

The following table describes the elements of this file:

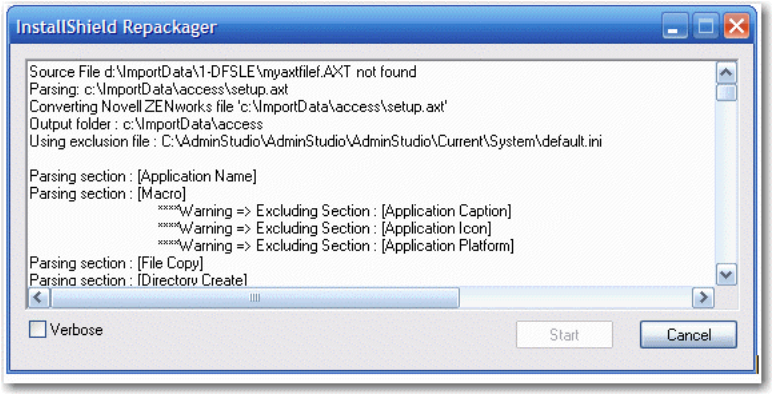
Section	Description
[General]	Controls the output format of the entire conversion process. Select one of the following to identify the output format: • **MSI**—Windows Installer package • **INC**—Repackager output file • **ISM**—InstallShield Editor project file
[AXT]	List the names and locations of the legacy ZENworks projects **(.axt)** you want to convert. Include the paths (absolute or relative) to the **.axt** files.
[AOT]	List the names and locations of the ZENworks **.aot** projects you want to convert. Include the paths (absolute or relative) to the **.aot** files.

2. Run the repackaging process from the command line using the `-Z` parameter:

```
ISLC.exe -Z"C:\DirectoryName\FileName.ini"
```

Caution • *You must enter a fully qualified path to identify the location of your .ini file.*

Repackager loads the `.ini` file and begins the conversion process. A dialog box opens to display progress messages.



To limit the volume of messages listed, clear the **Verbose** check box.

3. When the repackaging process is complete, the **Cancel** button changes to a **Close** button. Click **Close** to close this dialog box.

   You will find the converted files in the location specified in the **.ini** file as the location of the **.aot**/**.axt** input files.

Converting WinINSTALL Projects

Task ***To convert a WinINSTALL 6.0, 6.5, or 7.x project (.txt) to a Repackager project (which can subsequently be built into a Windows Installer package):***

1. Launch Repackager.
2. From the **File** menu, select **Open**.
3. In the **Open** dialog box, change the **Files of type** filter to **WinINSTALL (*.txt)**.
4. Browse to locate the WinINSTALL project you want to convert.
5. Select the project, and click **OK**.
6. If the **WinINSTALL Conversion** dialog box opens, fill in the WinINSTALL-specific variables and click **OK**.

   The legacy project is converted to a Repackager project. Files, **.ini** files, shortcuts, and registry entries within the project are visible through the appropriate views in the Repackager Interface.

Note • *WinINSTALL projects must be converted to .txt files prior to conversion to Repackager projects.*

Converting Wise Installation Projects

Task ***To convert a Wise Installation project (.wse) to a Repackager project (which can subsequently be built into a Windows Installer package):***

1. Launch Repackager.
2. From the File menu, select Open.
3. In the Open dialog box, change the Files of type filter to Wise Projects (*.wse).
4. Browse to locate the Wise Installer project you want to convert.
5. Select the project, and click OK.

   The legacy project is converted to a Repackager project. Files, **.ini** files, shortcuts, and registry entries within the project are visible through the appropriate views in the Repackager Interface.

Converting InstallShield Professional Log Files

You can convert an InstallShield Professional log file (**.isl**) to a Repackager project if you have access to the original setup media. When you open the log file, following the steps below, Repackager will try to find the original setup media automatically (in the location specified in the log file), but if it cannot, it will allow you to browse to it before continuing. If you do not have access to the original setup media, the conversion will fail.

Task ***To convert an InstallShield Professional Log File (.isl) to a Repackager project (which can subsequently be built into a Windows Installer package):***

1. Launch Repackager.
2. From the File menu, select Open.
3. In the Open dialog box, change the Files of type filter to InstallShield Pro Log Files (*.isl).
4. Browse to locate the InstallShield Professional log file you want to convert.
5. Select the file, and click OK.

   The log file is converted to a Repackager project. Files, **.ini** files, shortcuts, and registry entries within the project are visible through the appropriate views in the Repackager Interface.

Working With Repackager Projects

After creating a Repackager project—by Repackaging Legacy Installations Using the Repackaging Wizard or by Converting Legacy Installations Using the Repackager Interface—you can perform the following tasks:

- Building an InstallShield Editor Project
- Building a Windows Installer Package
- Automatically Generating a Virtual Application During Repackager Project Build
- Viewing Repackager Project Properties
- Using the Setup Intent Wizard to Detect File Dependencies in a Repackager Project
- Creating a Setup Capture Report for a Project
- Generating Software ID Tag Files During Repackaging
- Saving Repackager Projects
- Opening InstallShield Editor from Repackager

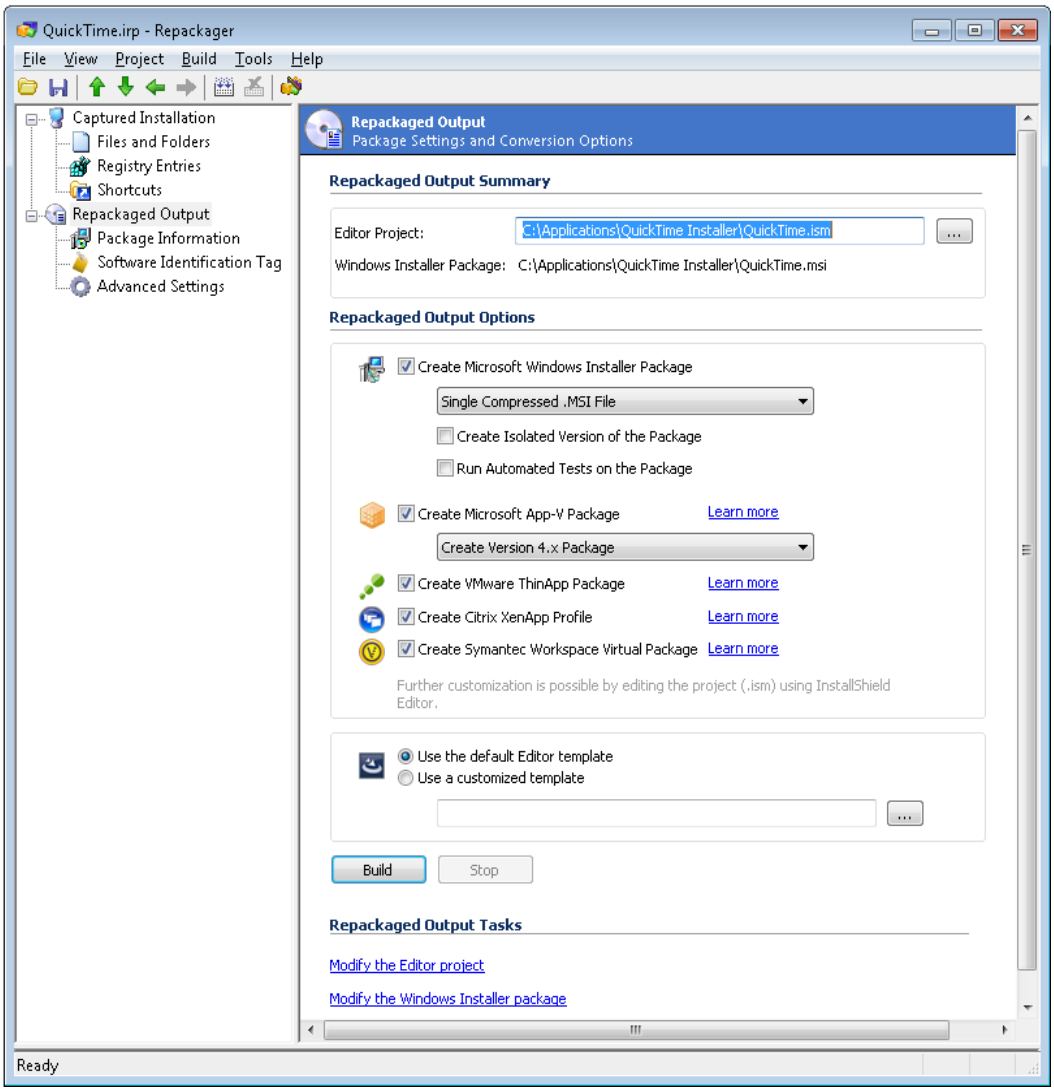
Building an InstallShield Editor Project

You can build an InstallShield Editor project (**.ism**) from your Repackager project (**.irp**).

You can also choose to build just an InstallShield Editor project, so that you can open it in InstallShield Editor and make some modifications prior to building.

Task ***To build an InstallShield Editor project (.ism):***

1. In the Repackager interface, open the Repackager project that you want to convert to an InstallShield Editor project.
2. Select **Repackaged Output** from the View List. The **Repackaged Output** view opens.

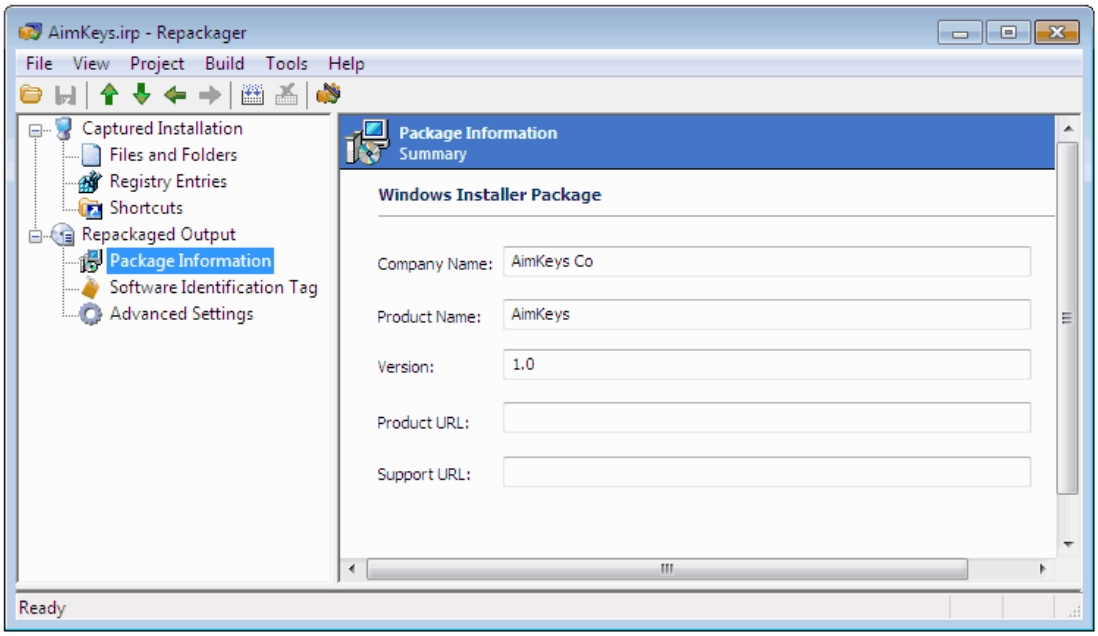


3. In the **Editor Project** field, enter the name and location of the InstallShield Editor Project file you want to create.
4. If you do not want to **Create Microsoft Windows Installer Package**, clear this option. If you want to create a Windows Installer Package, see Building a Windows Installer Package.
5. A project template contains all of the default settings and design elements that you want to use as a starting point when you create an installation project. In the **Repackaged Output Options** area, select the InstallShield Editor Project Template you want to use when creating the project:
   - **Use the default Editor template**—Select this option to use the default InstallShield Editor Project Template.

- **Use a customized template**—Select this option to use a customized InstallShield Editor Project Template.

  For example, if you wanted all of your InstallShield Editor projects to have a special custom dialog, a set of required redistributables, and a particular SQL script, you could create a project template that has all of those settings. Then, any time that you wanted to create a new project, you could base it off of your custom template. This enables you to avoid re-creating the custom dialog, re-adding the redistributables, and re-adding the SQL script every time that you create a new InstallShield Editor Project.

6. Select **Package Information** from the View List. The **Package Information** view opens, where you can specify information for the Windows Installer package that you build from the Repackager project. Much of this information may be prepopulated based on settings used in the Repackaging Wizard.



7. Enter the following information:

   a. **Company Name**—The name of the company that developed the product you are repackaging.

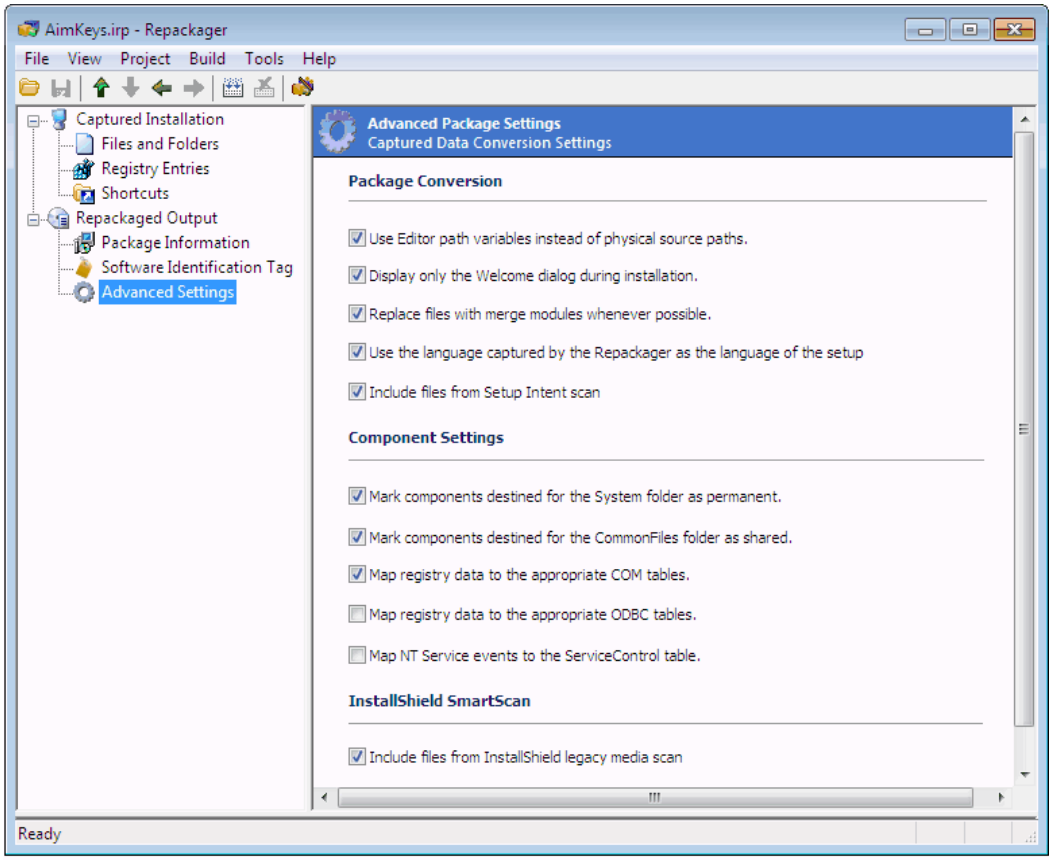
   b. **Product Name**—The name of the product you are repackaging.

   c. **Version**—The product's version number.

   d. **Product URL**—The URL for product information. This appears in **Add/Remove Programs** in the Control Panel.

   e. **Support URL**—A URL for support information. This also appears in **Add/Remove Programs** in the Control Panel, and is often changed during repackaging to provide an internal support URL.

8. Select **Advanced Settings** from the View List. The **Advanced Package Settings** view opens.



9. Select the options that you want to use, as described in Configuring Advanced Conversion Options.
10. Select **Repackaged Output** on the View List. The **Repackaged Output** view opens.
11. Click the **Build** button. The build process begins, and its progress is reported in the output window.

    When the build process is complete, a `Conversion completed` message appears in the output window, and a link to the build log file is provided.

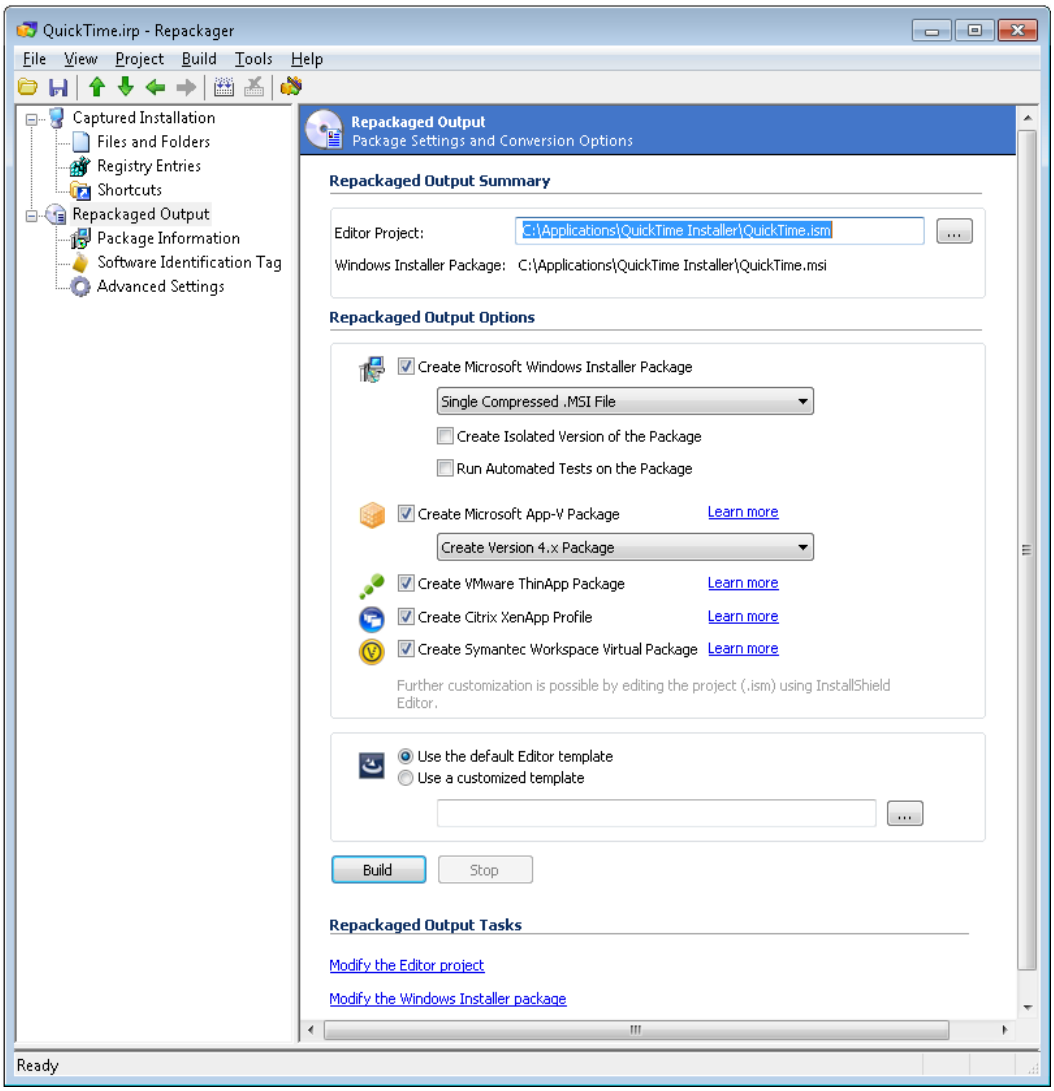
Building a Windows Installer Package

You can simultaneously build an InstallShield Editor project (**.ism**) and a Windows Installer package (**.msi**) from your Repackager project (**.irp**). However, before you do so, you must configure options in your Repackager project necessary for the build.

Note • *For information on building a virtual application, see Automatically Generating a Virtual Application During Repackager Project Build.*

Task ***To build an InstallShield Editor project (.ism) and a Windows Installer package (.msi):***

1. In the Repackager interface, open the Repackager project that you want to convert to an InstallShield Editor project and build a Windows Installer package.
2. Select **Repackaged Output** from the View List. The **Repackaged Output** view opens.



3. In the **Editor Project** field, enter the name and location of the InstallShield Editor Project file you want to create.
4. Select the **Create Microsoft Windows Installer Package** option, and select the following additional options:
   a. The compression option that you select for this package depends upon the size of your application's installation and your delivery method.

      Neither **Setup.exe** nor your **.msi** file can be spanned across multiple disks. So, if the source files associated with your Windows Installer package cannot fit on the same disk as the **setup.exe** and **.msi** file, you will need to include them in **.cab** files on other disks. But if you are performing a network installation and have unlimited space, there is no need to compress files or include additional files in .cab files.

From the list, select one of the following options:

Option	Description
Single Compressed .MSI File	Select this option if you want to compress all necessary files inside the .msi package, as opposed to storing them outside of the .msi database.
Single Compressed Setup.exe File	Select this option if you want to compress all files inside a setup.exe file, including the .msi file and all other necessary files.
.MSI File With External .CAB File	Select this option if you want to create an .msi file and want to compress the rest of the necessary files in an external .cab file. For example, you might have an installation that contains three features—each containing a 1.5 MB file, Setup.exe, and the installation files for Windows NT—and you want to create a custom media type that is 2 MB in size. The build will span multiple disks. • Disk one will contain Setup.exe, InstMsiW.exe (which contains the logic to install the Windows Installer service on Windows NT machines), Setup.ini (which is required for installations that include Setup.exe), and your .msi file. • The remaining disks will contain .cab files that store compressed copies of all your source files.
.MSI File With External .CAB File and Setup.exe	Select this option if you want to create an .msi file and a setup.exe file, and want to compress all the rest of the necessary files in an external .cab file.
Uncompressed .MSI File	Select this option if you want to create an uncompressed .msi file. All of the rest of the necessary files, in uncompressed format, would be shipped with the .msi file.
Uncompressed .MSI File With Setup.exe	Select this option if you want to create an uncompressed .msi file along with a setup.exe file. All of the rest of the necessary files, in uncompressed format, would be shipped with the .msi and setup.exe files.

b. To reduce versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested, select the **Create Isolated Version of the Package**. An additional Windows Installer package will be created in the same directory as the **.ism** file and the other **.msi** file, with the naming convention of:

appname`.isolated.msi`

For more information on how Repackager isolates applications and the available isolation options, see Isolating Windows Installer Packages.

c. Select the **Run Automated Tests on the Package** option to automatically run best practice tests against the newly built Windows Installer package to determine if it is built according to Windows Installer standards, and if it is in compliance with the installation requirements of the Windows operating system.

d. To build a virtual application, select the **Create Microsoft App-V Package**, **Create VMware ThinApp Package**, **Create Citrix XenApp Profile**, and/or **Create a Symantec virtual application** option. See Automatically Generating a Virtual Application During Repackager Project Build.

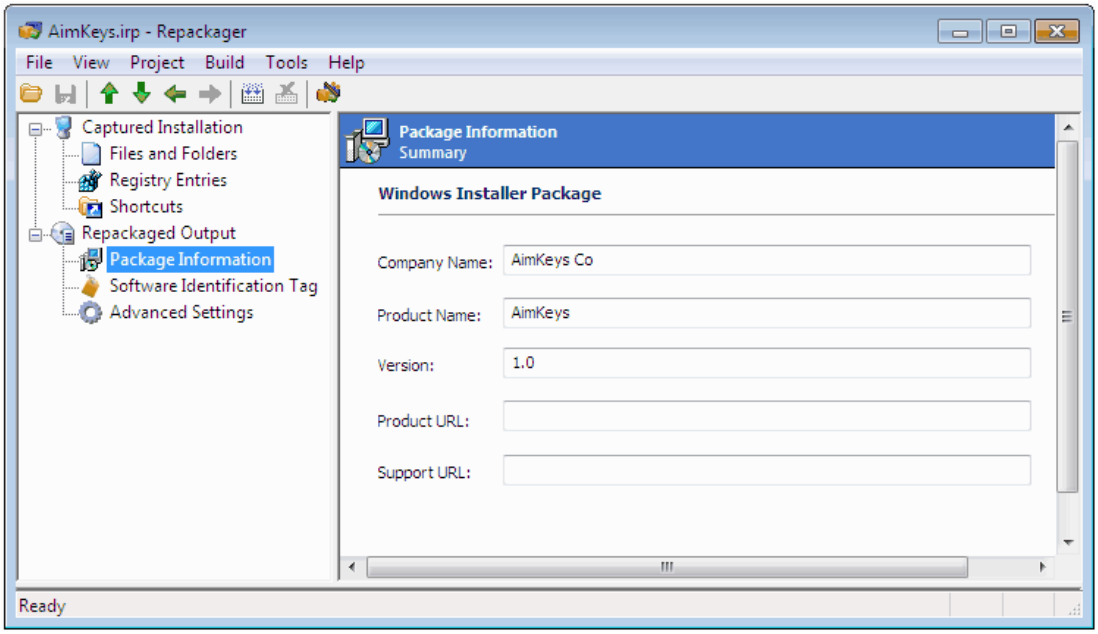
Note • *In order to select one of these virtualization options, you must have already selected the* ***Create Microsoft Windows Installer Package*** *option.*

5. A project template contains all of the default settings and design elements that you want to use as a starting point when you create an installation project. In the **Repackaged Output Options** area, select the InstallShield Editor Project Template you want to use when creating the project:

- **Use the default Editor template**—Select this option to use the default InstallShield Editor Project Template.
- **Use a customized template**—Select this option to use a customized InstallShield Editor Project Template.

  For example, if you wanted all of your InstallShield Editor projects to have a special custom dialog, a set of required redistributables, and a particular SQL script, you could create a project template that has all of those settings. Then, any time that you wanted to create a new project, you could base it off of your custom template. This enables you to avoid re-creating the custom dialog, re-adding the redistributables, and re-adding the SQL script every time that you create a new InstallShield Editor Project.

6. Select **Package Information** from the **View List**. The **Package Information** view opens, where you can specify information for the Windows Installer package that you build from the Repackager project. Much of this information may be prepopulated based on settings used in the Repackaging Wizard.



7. Enter the following information:

a. **Company Name**—The name of the company that developed the product you are repackaging.

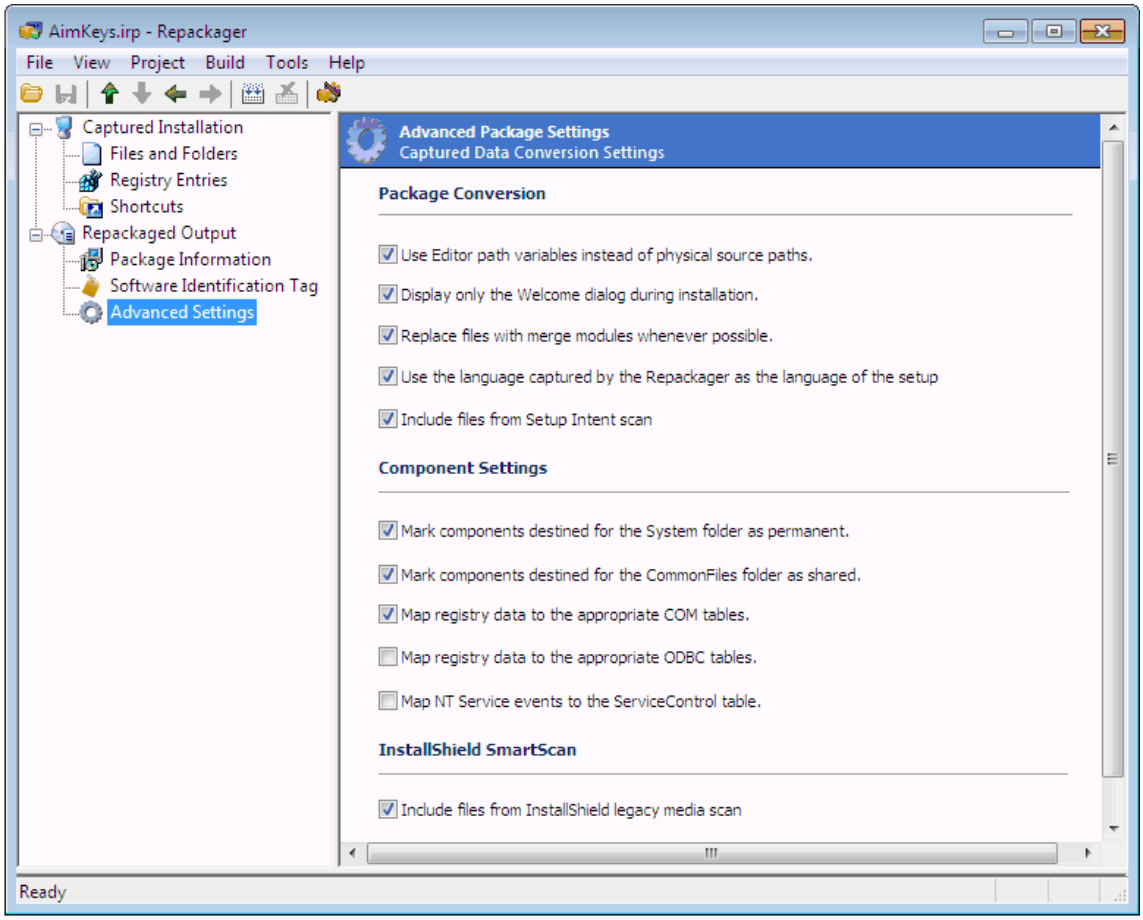
b. **Product Name**—The name of the product you are repackaging.

c. **Version**—The product's version number.

d. **Product URL**—The URL for product information. This appears in **Add/Remove Programs** in the Control Panel.

e. **Support URL**—A URL for support information. This also appears in **Add/Remove Programs** in the Control Panel, and is often changed during repackaging to provide an internal support URL.

8. Select **Advanced Settings** from the View List. The **Advanced Package Settings** view opens.



9. Select the options that you want to use, as described in Configuring Advanced Conversion Options.

10. Select **Repackaged Output** on the View List. The **Repackaged Output** view opens.

11. Click the **Build** button. The build process begins, and its progress is reported in the output window.

    When the build process is complete, a `Conversion completed` message appears in the output window, a link to the build log file is provided, and the location of the **.msi** file is listed. For example:

    ```
    Output file: C:\1516261\WinZip.msi
    ```

About the Context.msi File

When some Windows Installer packages are repackaged, some of their data (such as files or registry entries) are excluded according to the normal Repackager exclusion settings. For example, files destined for the **\Windows\Installer** folder are typically excluded. However, this type of information is occasionally necessary in order to successfully convert a Windows Installer package to a virtual package.

To address this issue, when Repackager builds a Windows Installer package, it now produces two **.msi** files: **packagename.msi** and **packagename.context.msi**.

Figure 9-1: Repackaged Output: application.msi and application.context.msi

The **.context.msi** file contains context data that is necessary in order to convert a **.msi** file to a virtual package. When creating a virtual package, Repackager combines the data in both the main **.msi** file and the **.context.msi** file to produce the final virtual package.

Note • *For more information on the* ***.context.msi*** *file, see Capturing Virtualization Context in the AdminStudio Help Library.*

Important • *If you are not converting a package to a virtual package, you can ignore its* ***.context.msi*** *file.*

Note • *Context data is not displayed in the Repackager interface when viewing captured Files/Registry details.*

Configuring Advanced Conversion Options

To set package conversion and component settings in your Repackager project, perform the following steps.

Task ***To configure advanced conversion options:***

1. Select **Advanced Settings** from the Repackager View List. The **Advanced Package Settings** view opens.
2. Under **Package Conversion**, select the package conversion options you want to use during conversion:

Option	Description
Use Editor path variables instead of physical source paths	When storing files in the InstallShield Editor project (**.ism**), the Wizard uses path variable locations whenever possible.
Display only the Welcome dialog box during installation	Only the Welcome dialog box is displayed when the Windows Installer package is run on a target machine. If this option is unchecked, the default UI sequence is displayed when the setup is installed.
Replace files with merge modules wherever possible	Following best practice rules, Repackager replaces components with comparable merge modules whenever possible.
Use the language captured by the Repackager as the language of the setup	When selected, the target package's language will be the language detected by Repackager (as displayed in the Captured Installation view).

Option	Description
Include files from Setup Intent scan	Any files identified when running the Setup Intent Wizard will be included in the package (unless you have manually excluded them from the project).

3. Under **Component Settings**, select the component settings options you want to use during conversion:

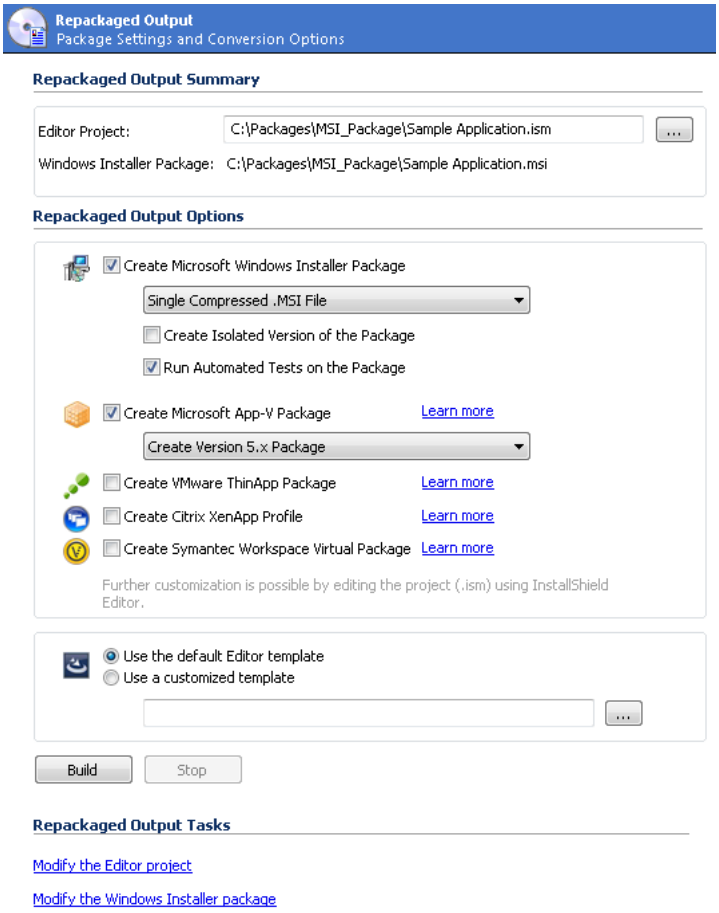
Option	Description
Mark components destined for the System folder as permanent	Executable files installed to the system folder (System32Folder) are marked as Permanent files and will not be uninstalled when the package is uninstalled. This eliminates ICE09 validation errors.
Mark components destined for the CommonFiles folder as shared	Executable files installed to the CommonFilesFolder (or a subfolder of CommonFilesFolder) are marked as shared files. This ensures that these components can coexist with DLLs installed by previous setups.
Map registry data to the appropriate COM tables	Setting this option reduces the number of ICE33 warnings that can occur during package validation, resulting from data not being mapped to the appropriate MSI tables.
Map registry data to the appropriate ODBC tables	If selected, ODBC-related registry data is mapped to ODBC tables instead of the Registry table. This data will only function correctly if Windows Installer supports the ODBC resource being mapped; it is recommended that you do not enable this option if you are unsure whether the ODBC resources are supported correctly by Windows Installer.
Map NT Service events to the ServiceControl table	If selected, NT Service–related registry data is mapped to ServiceControl table instead of the Registry table.

Automatically Generating a Virtual Application During Repackager Project Build

You can simultaneously build an InstallShield Editor project (**.ism**), a Windows Installer package (**.msi**), a Microsoft App-V application (4.x or 5.x), a ThinApp application, a Citrix profile, and/or a Symantec virtual application from your Repackager project (**.irp**). To do this, you need to select options on the Repackager **Repackaged Output** view.

Task ***To automatically generate a virtual application during Repackager project build:***

1. In the Repackager interface, open a Repackager project.
2. Select **Repackaged Output** from the View List. The **Repackaged Output** view opens.



3. In the **Editor Project** field, enter the name and location of the InstallShield Editor Project file you want to create.
4. Select the **Create Microsoft Windows Installer Package** option, and select the associated compression, isolation, and automated test options as described in Building a Windows Installer Package.

Important • *When building a virtual package, the* ***Create Microsoft Windows Installer Package*** *option* ***must*** *be selected. If it is not selected, the virtualization options are disabled.*

5. Select one or more of the virtual application options:
   - **Create Microsoft App-V Package**, and then also select one of the following from the list:
     - **Create Version 4.x Package**
     - **Create Version 5.x Package**
   - **Create VMware ThinApp Package**
   - **Create Citrix XenApp Profile**
   - **Create Symantec Workspace Virtual Package**

Note • *If you would like to further customize the virtual application using the InstallShield Microsoft App-V Assistant, ThinApp Assistant, or Citrix Assistant, you can click the* ***Modify the Editor Project*** *link below to open this project in InstallShield Editor. This option is not available until after you build the Repackager project the first time.*

Note • *You can also use the Automated Application Converter to convert a Windows Installer package to a virtual package. See Performing Virtualization and Repackaging Using the Automated Application Converter in the AdminStudio Help Library.*

6. Select whether to use the default Editor template or a customized template, as described in Building a Windows Installer Package.
7. Select **Package Information** from the View List and set **Package Information** options as described in Building a Windows Installer Package.
8. Select **Advanced Settings** from the View List and select the options that you want to use, as described in Configuring Advanced Conversion Options.
9. Select **Repackaged Output** on the View List. The **Repackaged Output** view opens.
10. Click the **Build** button. The build process begins, and its progress is reported in the output window.

    When the build process is complete, a `Conversion completed` message appears in the output window, and a link to the build log file is provided.

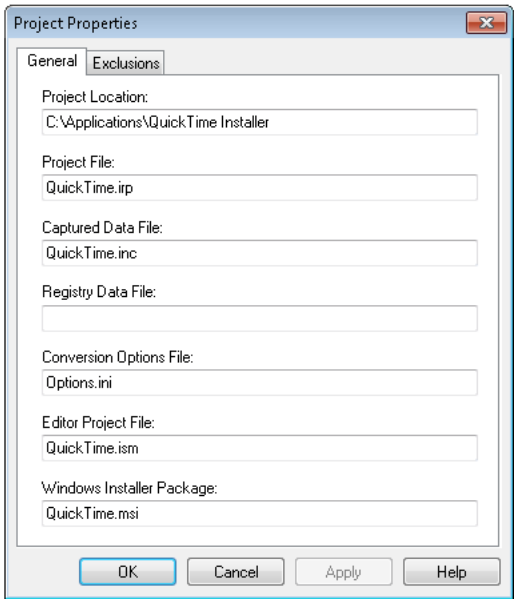
    - **If you chose the App-V 4.x or 5.x application option**, a folder named **App-VPackage** was created in the location you specified in the **Editor Project** field. This folder contains the App-V application for this package and all of its associated files, as described in Components of an App-V 4.x Package (.sft) or Components of an App-V 5.0 Package (.appv) in the AdminStudio Help Library.
    - **If you chose the ThinApp application option**, a folder named **ThinAppPackage** was created in the location you specified in the **Editor Project** field. This folder contains the ThinApp application for this package and all of its associated files, as described in Components of a ThinApp Application in the AdminStudio Help Library.
    - **If you chose the Citrix XenApp profile option**, a folder named **CitrixProfile** was created in the location you specified in the **Editor Project** field. This folder contains the Citrix profile for this package and all of its associated files, as described in About Citrix Profiles (.profile) in the AdminStudio Help Library.
    - **If you chose the Symantec virtual application option**, a folder named **SymantecPackage** was created in the location you specified in the **Editor Project** field. This folder contains the Symantec Workspace virtual package nd all of its associated files, as described in About Symantec Workspace Virtual Packages.

Viewing Repackager Project Properties

You can view the properties of the currently open Repackager project by opening the Project Properties dialog box.

Task ***To view properties for the current Repackager project:***

1. Open a project in the Repackager interface.
2. From the **Project** menu, select **Properties**. The **General** tab of the **Project Properties** dialog box opens.



The following properties are listed:

- **Project Location**—The full path of the directory where the current Repackager project file (**.irp**) is located.
- **Project File** —The name of the current Repackager project file.
- **Captured Data File**—The name and location of the captured data file (**.inc**), which was either created by the Repackaging Wizard or during conversion of a Novell ZENworks project, Microsoft SMS project, or WinINSTALL project. The path is relative to the current Repackager project file.
- **Registry Data File**—The name and location of the file containing captured registry data. The path is relative to the current Repackager project file.
- **Conversion Options File**—The name and location of the **Options.ini** file, which contains an exhaustive list of all options you can use during conversion of the Repackager project to an InstallShield Editor project and Windows Installer package.
- **Editor Project File**—The name and location of the InstallShield Editor project file as set in the Product View (MSI Package). The path is relative to the current Repackager project file.
- **Windows Installer Package**—The name and location of the Windows Installer package. The path is relative to the current Repackager project file.

3. When finished viewing properties in the **General** tab, click OK.

Using the Setup Intent Wizard to Detect File Dependencies in a Repackager Project

Although an installation may have intended to install certain files, these files sometimes may not be installed—often because the files already exist on the target machine (either as the same version or a newer version). These files, although not installed or updated, are needed for the product to execute properly when the setup is run on a system that does not already have these files.

You can use the **Setup Intent Wizard** to detect file dependencies that may not be included in your Repackager project (**.irp**). The **Setup Intent Wizard** scans a setup to identify files that may not have been captured during repackaging—effectively recognizing the installation's intent for these files.

To use the **Setup Intent Wizard**, perform the following steps:

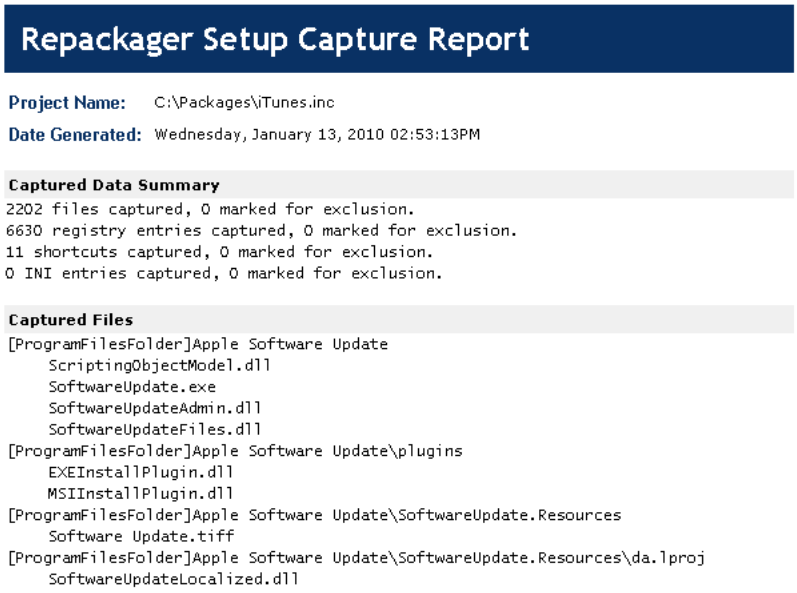
Task ***To detect file dependencies:***

1. From the Project menu, select Setup Intent Wizard. The **Welcome Panel** opens.
2. From the **Welcome** panel, click **Next**. The **Scanning Project Panel** opens.
3. Once scanning is finished, the **Results Panel** opens, listing new files that your setup requires.
4. From the **Results Panel**, select the files you want added to your Repackager project and click **Finish**.
5. Save your Repackager project.

Note • *Because the Setup Intent Wizard analyzes files in the Repackager project and searches for dependent files, you must run the Setup Intent Wizard from the same machine where repackaging was performed (with the Repackaging Wizard). You can then save the Repackager project and transfer it to another machine.*

Creating a Setup Capture Report for a Project

You can generate an HTML or text document that summarizes the data that was captured when a setup was repackaged.



Repackager Setup Capture Report

Project Name: C:\Packages\iTunes.inc

Date Generated: Wednesday, January 13, 2010 02:53:13PM

Captured Data Summary

2202 files captured, 0 marked for exclusion.
6630 registry entries captured, 0 marked for exclusion.
11 shortcuts captured, 0 marked for exclusion.
0 INI entries captured, 0 marked for exclusion.

Captured Files

[ProgramFilesFolder]Apple Software Update
    ScriptingObjectModel.dll
    SoftwareUpdate.exe
    SoftwareUpdateAdmin.dll
    SoftwareUpdateFiles.dll
[ProgramFilesFolder]Apple Software Update\plugins
    EXEInstallPlugin.dll
    MSIInstallPlugin.dll
[ProgramFilesFolder]Apple Software Update\SoftwareUpdate.Resources
    Software Update.tiff
[ProgramFilesFolder]Apple Software Update\SoftwareUpdate.Resources\da.lproj
    SoftwareUpdateLocalized.dll

Figure 9-2: Sample Repackager Setup Capture Report

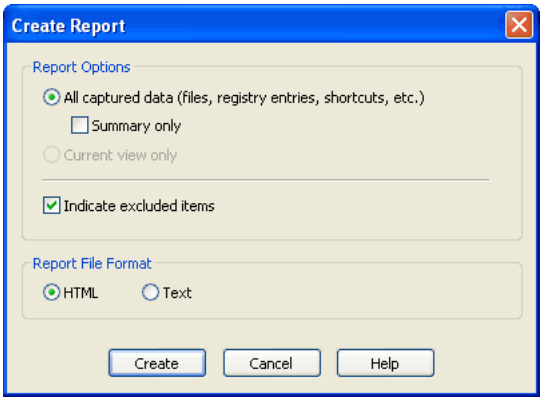
The following information is available to be displayed in this report:

- Captured files
- Captured shortcuts
- Captured .ini file entries
- Captured Registry entries

The report also indicates which of the files, shortcuts, **.ini** file entries, or Registry entries, if any, have been marked for exclusion. Those marked for exclusion are not included in the Repackager project.

Task ***To create a report detailing captured data:***

1. From the **Project** menu, select **Create Report**. The **Create Report** dialog box opens.



2. Select whether you want the report to contain **All captured data** (all of the data collected during the entire capture), or just the **Current view**.

3. If you want the report to contain data from the entire capture, specify whether you want to just display summary information.
4. Specify whether you want to display excluded items in the report.
5. Select the file format for the report. You can generate an **HTML** report or a **Text** report.
6. Click **Create**. A Save As dialog box opens.
7. From the resulting Save As dialog box, browse to the location where you want to save the file, and provide a name for the report.
8. Click **Save**. The report is saved to the specified location and automatically opens.

Generating Software ID Tag Files During Repackaging

AdminStudio includes ISO/IEC 19770-2 software tagging support. ISO/IEC 19770-2 is an international standard for the creation of software identification tags.

AdminStudio adds software ID tag files—which contain both ISO 19770-2 compliant tag information and AdminStudio's extended tag information—to Windows Installer packages that it processes in two locations:

- **Packages built by Repackager**—By default, whenever Repackager builds a Windows Installer package (even when building one silently), a software ID tag file is created for that package.
- **Packages imported into the Application Catalog**—By default, tag files are created for each package that is imported into the Application Catalog. When Application Catalogs from versions of AdminStudio prior to 11.0 are upgraded, AdminStudio will, upon your approval, create tag files for all packages during upgrade. For more information, see Generating Software ID Tag Files During Package Import in the AdminStudio Help Library.

In both of these cases, AdminStudio stores the ISO tag file in an external transform file.

In this section, Repackager's support for creating and editing software ID tag files is described in the following topics:

- Enabling Software ID Tag Generation During Repackaging
- Viewing and Editing Software ID Tag Information in the Repackager Interface

***Note** • For detailed information on AdminStudio's support for software ID tag files, see About Software ID Tag File Generation in the AdminStudio Help Library.*

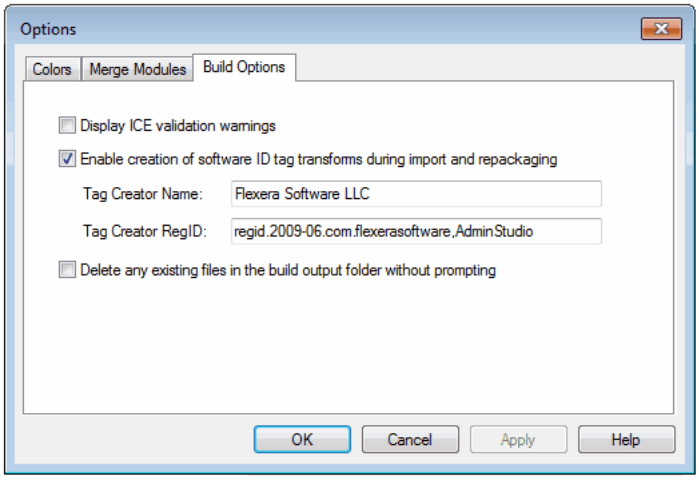
Enabling Software ID Tag Generation During Repackaging

On the **Build Options** tab of the Repackager **Options** dialog box, you can enable or disable automatic software tag file creation and can set the default values for **Tag Creator Name** and **Tag Creator RegID**.

***Important** • Any changes that you make to the software tagging options on the **Build Options** tab of the Repackager **Options** dialog box will also automatically be made to the options on the **General Options** > **Import Options** > **Software Tagging** tab of the Application Manager **Options** dialog box.*

Task ***To set software tagging options in Repackager:***

1. Launch Repackager.
2. On the **Tools** menu, click **Options**. The **Options** dialog box opens.
3. Open the **Build Options** tab.



4. To instruct AdminStudio to automatically create a transform file containing software tag file(s) for Windows Installer packages that are imported into the Application Catalog or built using Repackager, make sure that the **Enable creation of software ID tag transforms during import and repackaging** option is selected. By default, this option is selected.

Note • *Whenever a Windows Installer package is imported into the Application Catalog or built using Repackager, AdminStudio creates a software ID tag file (which is stored in the Application Catalog), but if the* ***Enable creation of software ID tag transforms during import and repackaging*** *option it not selected, AdminStudio does not create the transform.*

5. In the **Tag Creator Name** field, enter a name to identify the creator of the software ID tag files that will be created by AdminStudio. By default, the value is `Flexera Software LLC`.

Note • *For more information, see About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields in the AdminStudio Help Library.*

6. In the **Tag Creator RegID** field, enter an ID to uniquely identify the creator of the software ID tag files that will be created by AdminStudio, using the following format:

```
regid.YYYY-MM.ReversedDomainName,optional_division
```

For example:

```
regid.2009-06.com.yourcompany,GlobalProductDivision
```

By default, the value is AdminStudio's RegID:

```
regid.2009-06.com.flexerasoftware,AdminStudio
```

Note • *For more information on RegIDs, see About Software Tagging RegIDs in the AdminStudio Help Library.*

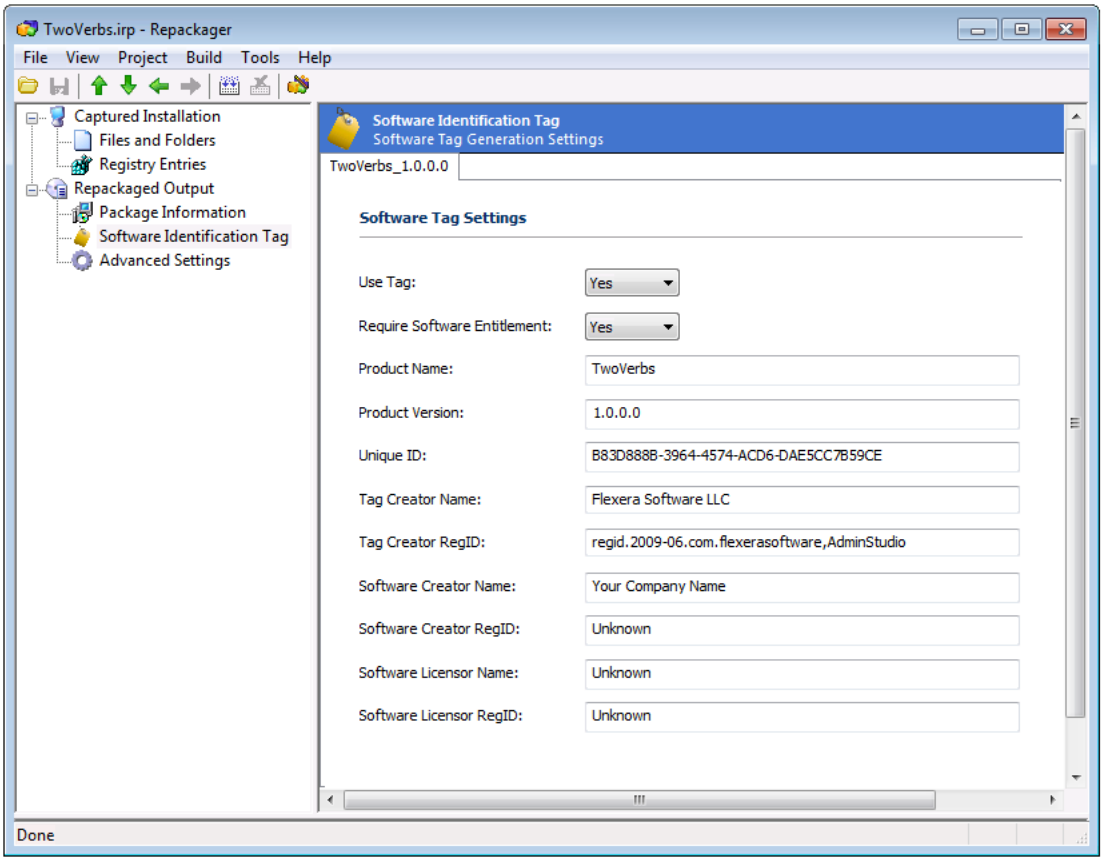
Viewing and Editing Software ID Tag Information in the Repackager Interface

When you use Repackager to convert a legacy package to a Windows Installer package, by default a tag file is generated for each package when the Windows Installer package is built.

You can view and edit tag information in the Repackager interface's **Software Identification Tag** view.

Task ***To view and edit software ID tag file information in Repackager:***

1. Open a Repackager project in the Repackager interface.
2. Under **Repackaged Output**, select the **Software Identification Tag** node. The **Software Identification Tag** view opens.



3. Edit the view and edit the information in the fields, as described in Software Identification Tag View.
4. To save your edits, select **Save** on the **File** menu.

Saving Repackager Projects

Edition •

To save a Repackager project, perform the following steps:

Task ***To save the current Repackager project:***

1. Select **Save** from the **File** menu.

   or

2. Click the Save button ( ) on the toolbar.

Task ***To save the current Repackager project under a different name:***

Select Save As from the File menu.

Opening InstallShield Editor from Repackager

After building your Repackager project into a Windows Installer package and/or an InstallShield Editor project, you may want to launch InstallShield Editor for additional modifications.

Task ***To launch the generated InstallShield Editor project (.ism) in InstallShield Editor:***

From the Repackager **Project** menu, select **Edit InstallShield Project**. If installed, InstallShield Editor opens the project file.

Task ***To launch the generated Windows Installer package (.msi) in InstallShield Editor:***

From the Repackager **Project** menu, select **Edit Windows Installer Package**. If installed, InstallShield Editor opens the package in Direct MSI Edit mode.

Isolating Windows Installer Packages

Application isolation is one solution to component versioning conflicts. Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested.

When building a Windows Installer package from your Repackager project, you can also choose to create an isolated version of that package by selecting an option on the **Repackaged Output** view.

Information about application isolation is presented in the following topics:

- About Application Isolation

- About Assemblies
- About Manifests
- About Digital Certificates
- Setting Isolation Options
- Building an Isolated Windows Installer Package

About Application Isolation

Application isolation, which is a technique used to minimize the dependencies of an application on system components or dynamic elements, is one solution to component versioning conflicts. Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components and dynamic elements with which it was originally developed and tested.

Isolation is accomplished by:

- Providing DLLs and other shared components for specific applications, *and*
- Placing information traditionally stored in the Registry into other files that specify the locations of these isolated components.

Application isolation provides increased stability and reliability for applications because they are unaffected by changes caused by installation and ongoing maintenance of other applications on the system.

Depending on the isolation options chosen, you can partially or totally isolate an application. When using assemblies and manifests to isolate applications, the assemblies can be updated following deployment without necessitating application reinstallation.

Reasons to Isolate Applications

You would want to isolate an application if:

- You want to resolve incompatibilities between different versions of shared components.
- You want to reduce the complexity of the installation by storing COM activation data in a manifest instead of the registry.
- You want to insulate the application from changes to shared components.

Reasons Not to Isolate an Application

You would not want to isolate an application if, following application isolation, you discover that the application no longer works because of an internal dependency on a component that has been moved during the isolation process.

Tip *• Following isolation, you can use the Dynamic Dependency Scanner in InstallShield Editor to verify isolated files are loaded from a different directory.*

Isolating Windows Installer Packages Using Application Isolation Wizard

In addition to being able to generate an isolated version of a repackaged setup immediately after the build step in Repackager, you can also use Application Isolation Wizard to isolate a Windows Installer package.

Application Isolation Wizard is a stand-alone tool which accepts a Windows Installer package as input and outputs a new, isolated Windows Installer package.

The Application Isolation Wizard provides a user interface experience that allows the user to extend the initial "dependency scanning" process for identifying file isolation candidates, while in Repackager you specify your assembly and digital signing isolation options on the Isolation Options dialog box, and then those selections are applied to all isolated packages created by Repackager.

For more information, see Isolating Applications Using Application Isolation Wizard in the AdminStudio Help Library.

About Assemblies

Assemblies are DLLs or other portable executable files that applications require to function. These can be either shared or private. Private assemblies are typically stored in the same directory as the application they support. Shared assemblies are stored in the **WinSxS** directory, and are digitally signed.

By creating manifests for assemblies, Repackager allows you to create self-contained applications that can use different versions of the same DLL or other portable executable, without any version conflicts.

Shared Assemblies

Shared assemblies are assemblies available to multiple applications on a computer. Applications that require these assemblies specify their dependence within a manifest. Multiple versions of shared assemblies can be used by different applications running simultaneously.

These assemblies are stored in the **WinSxS** directory, and must be digitally signed for authenticity. After deployment, the version of shared assemblies can be changed, allowing for changes in dependencies.

Private Assemblies

Private assemblies are assemblies created for exclusive use by an application. They are accompanied by an assembly manifest, which contains information normally stored in the registry. Private assemblies allow you to totally isolate an application, eliminating the possibility that dependent files may be overwritten by other applications.

These assemblies are always stored in the same location as their associated executable.

About Manifests

Manifests, which are used during isolation, are XML files that describe an application. Repackager can create two types of manifests: application manifests and assembly manifest.

Application Manifests Describe an Isolated Application

Application manifests are XML files that describe an isolated application. This descriptive information includes the relationship between the application and its dependent files.

Typically, the naming convention for a manifest is:

```
ApplicationName.Extension.manifest
```

For example, if the application was **HelloWorld.exe**, the manifest file is called:

```
HelloWorld.exe.manifest
```

Assembly Manifests Describe an Application's Assemblies

Assembly manifests are XML files that describe an application's assemblies. This includes components such as DLLs.

Information stored in the assembly manifest, such as COM registration information, ProgIDs, etc., is usually stored in the Registry. However, by making it independent from the Registry, only that application can use the dependent files described in the manifest. This enables you to have multiple versions of the same DLL or other portable executable file on a system without generating compatibility conflicts.

Typically, the naming convention for a manifest is:

```
AssemblyName.Extension.manifest
```

For example, if the component was **Goodbye.dll**, the manifest file is called:

```
Goodbye.dll.manifest
```

Manifests as New Components

When you create manifests, Repackager supports putting them into new components. If you do not select the **Create new component for each assembly** option on the **Manifest Options** tab of the **Isolation Options** dialog box, the manifest will be added to the same component as the assembly.

About Digital Certificates

Digital certificates identify you and/or your company to end users to assure them the assembly they are about to use has not been altered. They are issued by a certification authority such as VeriSign, or created using a combination of software publishing credentials (**.spc**) and a private key (**.pvk**), both also issued by a certification authority. The certificate includes the public cryptograph key, and, when used in combination with a private key, can be used by end users to verify the authenticity of the signor.

The following digital certificate concepts are defined in this topic:

- Private Keys
- Software Publishing Credentials
- Using a Certificate Store
- Creating a Certificate File

Private Keys

A private key (a file with the extension .pvk) is granted by a certification authority. Repackager uses the private key you enter in the **Digital Signature** tab of the Isolation Options dialog box to digitally sign your shared assembly and ensure end users of its content's authenticity.

The .spc (Software Publishing Credentials) file and .pvk file you enter in the Digital Signature tab compose the digital certificate for shared assemblies.

Contact a certification authority such as VeriSign for more information on the specifics of software publishing credentials.

Software Publishing Credentials

You must supply a certification authority with specific information about your company and software to obtain software publishing credentials in the form of an .spc file. Your software publishing credentials are used to generate a digital signature for your assembly.

The **.spc** file and **.pvk** (private key) file you enter as in the Digital Signature tab of the Advanced Options dialog box compose the digital certificate for shared assemblies.

Contact a certification authority such as VeriSign for more information on the specifics of software publishing credentials.

Using a Certificate Store

To perform code signing, both private key and software publishing credential information must be supplied. This must occur each time a package is signed. Most server operating systems store a certificate locally on the computer that the user used to request the credential information.

Instead of having to store credential files on each of the user computers, you can create a Certificate Store, a storage location which will have numerous certificates, which enables all users or computers with adequate permissions to retrieve the certificate as needed.

Using a Certificate Store allows you to associate the same credentials and private key files with multiple packages. This simplification is particularly useful when isolating applications, as typically the code signing information will be identical for all shared assemblies. Ultimately, the Certificate Store removes the burden of managing private key and software publishing credential information.

Creating a Certificate File

You can create a certificate file from the constituent PVK and SPC files and import it into the Certificate Store using the PVK Digital Certificate Files Importer. You can then export the certificate (**.cer**) file for use outside of the Certificate Store.

Caution • *Certificate files must be 2048-bit or higher. For more information, see the article: Assembly Signing Example on the Microsoft Developer Network website.*

Setting Isolation Options

Application isolation is one solution to component versioning conflicts. Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested.

On the Isolation Options Dialog Box, which is opened by selecting **Isolation Options** from the **Tools** menu, you can specify the following Repackager isolation options:

- **Assembly Options**—Specify the type of assemblies Repackager will create: private side-by-side assemblies in the application folder or shared side-by-side assemblies in the **WinSxS** folder. You can also specify the assembly naming conventions. See Specifying Manifest Options.

- **Digital Signature Options**—You can configure the certificate information required when using shared assemblies. This required digital signature provides an extra layer of protection, allowing you to obtain information about the company who created a global assembly. See Setting Digital Signature Options for Shared Assemblies.

Specifying Manifest Options

On the **Manifest Options** tab of the Isolation Options Dialog Box, which is opened by selecting **Isolation Options** from the **Tools** menu, you can specify the following options:

- Selecting the Assembly Type
- Specifying the Assembly Naming Conventions

***Note** • For more information on assemblies and manifests, see About Assemblies and About Manifests.*

Selecting the Assembly Type

On the **Manifest Options** tab of the Isolation Options Dialog Box, which is opened by selecting **Isolation Options** from the **Tools** menu, you can specify the type of assemblies Repackager will create: private side-by-side assemblies in the application folder or shared side-by-side assemblies in the **WinSxS** folder.

Task ***To select the assembly type:***

1. Open the Repackager interface.
2. From the **Tools** menu, select **Isolation Options**. The **Manifest Options** tab of the **Isolation Options** dialog box opens.
3. Select one of the following **Assembly Type** options:
   - Create private side-by-side assemblies in the application folder.
   - Create shared side-by-side assemblies in **WinSxS** directory.

***Note** • Manifests for shared assemblies must be digitally signed. See Setting Digital Signature Options for Shared Assemblies.*

***Note** • The modifications you make on the **Isolation Options** dialog box will be recorded in the **isolationconfig.ini** file, which is stored in the **AdminStudio Shared** directory.*

Specifying the Assembly Naming Conventions

On the **Manifest Options** tab of the Isolation Options Dialog Box, which is opened by selecting **Isolation Options** from the **Tools** menu, you can specify the type of naming conventions Repackager will use when creating assemblies.

Task ***To set the default naming convention for assemblies:***

1. Open the Repackager interface.
2. From the **Tools** menu, select **Isolation Options**. The **Manifest Options** tab of the **Isolation Options** dialog box opens.
3. In the **Assembly Naming Conventions** area, enter your **Company** name and **Division**. These two fields create the default assembly naming convention (in the form **Company.Division.Assembly** followed by a number).
4. If you want to create a new component for each assembly, select the **Create new component for each assembly** option.

Assemblies created during application isolation will follow the naming convention as specified.

Note *• The modifications you make on the* ***Isolation Options*** *dialog box will be recorded in the* ***isolationconfig.ini*** *file, which is stored in the* ***AdminStudio Shared*** *directory.*

Setting Digital Signature Options for Shared Assemblies

You can configure the certificate information required when using shared assemblies on the **Digital Signature** tab of the **Isolation Options** dialog box.This required digital signature provides an extra layer of protection, allowing you to obtain information about the company who created a global assembly.

Note *• The modifications you make on the Isolation Options dialog box will be recorded in the* ***isolationconfig.ini*** *file, which is stored in the* ***AdminStudio Shared*** *directory.*

Note *• For more information, see About Digital Certificates.*

Task ***To set digital signature options:***

1. Open the Repackager interface.
2. From the **Tools** menu, select **Isolation Options**. The **Manifest Options** tab of the **Isolation Options** dialog box opens.
3. Open the **Digital Signatures** tab.
4. Click the Browse (…) button next to the **Certificate File** field and navigate to the certificate file you are using to sign assemblies.

   A digital certificate identifies you and/or your company to end users and assures them the data they are about to receive has not been altered.

5. In the **Code Signing Technology** area, select the type of code signing technology you want to use for the digital signature. You can use one of the following technologies:

Technology	Description
Credentials	Select this option to use credential files as the code signing technology. If you select this option, you must supply the name and location of both your software publishing credential files: • **SPC File**—Specify the name and location of your software publishing credentials file (**.spc**). • **PVK**—Specify the name and location of your private key file (**.pvk**). In order to receive a software publishing credentials and a private key, you must supply a certification authority, such as VeriSign with specific information about your company and software.
Certificate Name in the store	Select this option to use the name of an existing certificate file in the Certificate Store as the code signing technology. The Certificate Store is a central repository for certificate files. Using a Certificate Store allows you to reuse the certificate files for different purposes as necessary. As an alternative to providing **.spc** and **.pvk** files, you can specify the certificate name as it appears in the certificate store.

Building an Isolated Windows Installer Package

To reduce versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested, select the **Create Isolated Version of the Package** option on the Repackager **Repackaged Output** view. An additional Windows Installer package will be created in the same directory as the **.ism** file and the other **.msi** file, with the naming convention of:

appname`.isolated.msi`

For more information on how Repackager isolates applications and the available isolation options, see Isolating Windows Installer Packages.

Configuring Exclusions

Repackaging exclusions refer to exclusions made during repackage time using the Repackaging Wizard. Any files, registry entries, .ini files, or shortcuts excluded at this point are not included in the Repackager project.

There are two methods of configuring exclusions:

- Configuring Exclusions Using Repackager
- Configuring Exclusions Using the Exclusions Editor

Configuring Exclusions Using Repackager

There are three types of exclusions used when repackaging a legacy installation:

Table 9-3 • Repackager Exclusion Types

Exclusion Type	Description
Repackaging Exclusions	Repackaging exclusions refer to exclusions made during repackage time using the Repackaging Wizard. Any files, registry entries, .ini files, or shortcuts excluded at this point are not included in the Repackager project. Therefore, if you exclude a directory you later need, you need to repackage the legacy setup again. The Repackager best practice is to capture everything using the Repackaging Wizard, and then exclude visually in the Repackager Interface. This way, you avoid having to run the Repackaging Wizard again if you accidentally exclude necessary files. In some cases, you may want to avoid capturing specific data types during repackaging. For example, your organization may never want to capture shortcuts. You can disable capture of shortcuts during repackage time, thereby eliminating the need to exclude them later. In Snapshot mode, you may want to limit the analysis to a certain directory to reduce the time it takes to capture the initial and final snapshot.
Project Exclusions	Each Repackager project can use a project exclusion list which marks files, registry entries, shortcuts, and .ini files as excluded in the Repackager project. If your process dictates that you capture everything and only exclude items in the Repackager Interface, then you should set up commonly captured but unnecessary items from the project by default. Because all the data from the original capture is intact, if you accidentally exclude necessary files, you can always reinclude them from the Repackager Interface and quickly rebuild your Windows Installer package.
Individual Project Exclusions	Because each project is different, and may require you to make decisions as to whether certain captured data is necessary, you can also selectively exclude or reinclude items on a per-package basis. These individual project exclusions allow you a fine-level of control as you prepare to build your Windows Installer package from the Repackager project.

Excluding Files

To exclude a captured file from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude a captured file from the InstallShield Editor project and Windows Installer package:***

1. Select **Files and Folders** from the View List. The **Files and Folders View** opens.
2. Expand the directory tree and select the directory containing the file you want to exclude.
3. In the file list, right-click the file and then click **Exclude**.

Excluding All Files in a Directory

To exclude all captured files in a directory from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude all captured files in a directory from the InstallShield Editor project and Windows Installer package:***

1. Select **Files and Folders** from the View List. The **Files and Folders** view opens.
2. Expand the directory tree and select the directory containing the files you want to exclude.
3. Right-click the directory and then click **Exclude**.

Excluding Directories and Subdirectories

To exclude all captured files and subdirectories within a directory from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude all captured files and subdirectories within a directory from the InstallShield Editor project and Windows Installer package:***

1. Select **Files and Folders** from the View List. The **Files and Folders** view opens.
2. Expand the directory tree to display the directory containing the files and subdirectories you want to exclude.
3. Right-click the directory and then click **Exclude All**.

Adding Files and Folders to the Global Exclusions List from the Files and Folders View

You can add a file or a directory of files to the Repackager global exclusion list (**isrepackager.ini**) from the **Files and Folders** view of the Repackager interface.

Note • *You can also configure exclusions using the Exclusions Editor, as described in Configuring Exclusions Using the Exclusions Editor.*

To add items to the global exclusions list from the **Files and Folders** view, perform the following steps.

Task ***To add files and/or folders to the exclusions list:***

1. Select **Files and Folders** from the View List. The **Files and Folders** view opens.
2. Expand the directory tree to display the directory containing the files and subdirectory you want to exclude.
3. Right-click on a directory or file and then select **Add to Exclusions** from the shortcut menu.

Note • *If you selected a directory, you are then prompted to click* ***Yes*** *or* ***No*** *to indicate whether you want to also add the directory's subdirectories to the exclusion list.*

The directory name and/or file name are now displayed in red to indicate that they are excluded.

4. To remove a previously selected item from the global exclusion list, right-click on the item and then select **Remove from Exclusions** from the shortcut menu.

Excluding Registry Keys

To exclude a registry key from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude a registry key from the InstallShield Editor project and Windows Installer package:***

1. Select **Registry Entries** from the View List. The **Registry Entries** view opens.
2. Expand the Registry tree to display the registry key you want to exclude.
3. Right-click the registry key and then click **Exclude**.

Excluding Registry Values

To exclude a captured registry value from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude a captured registry value from the InstallShield Editor project and Windows Installer package:***

1. Select **Registry Entries** from the View List. The **Registry Entries** view opens.
2. Expand the Registry tree and select the registry key containing the value you want to exclude.
3. In the **Registry Value** list, right-click the value and then click **Exclude**.

Excluding .ini Files

To exclude a captured .ini file from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude a captured .ini file from the InstallShield Editor project and Windows Installer package:***

1. Select **INI Files** from the View List. The **INI Files** view opens.
2. Expand the **INI Files** tree to display the .ini file you want to exclude.
3. Right-click the .ini file and then click **Exclude**.

Excluding .ini File Sections

To exclude a section in a captured .ini file from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude a section in a captured .ini file from the InstallShield Editor project and Windows Installer package:***

1. Select **INI Files** from the View List. The **INI Files** view opens.
2. Expand the **INI Files** tree to display the .ini file containing the section you want to exclude.
3. Right-click the section and then click **Exclude**.

Excluding Shortcuts

To exclude a captured shortcut from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude a captured shortcut from the InstallShield Editor project and Windows Installer package:***

1. Select **Shortcuts** from the View List. The **Shortcuts** view opens.
2. Expand the Shortcuts tree to display the shortcut you want to exclude.
3. Right-click the shortcut and then click **Exclude**.

Excluding All Shortcuts in a Directory

To exclude all captured shortcuts in a directory from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude all captured shortcuts in a directory from the InstallShield Editor project and Windows Installer package:***

1. Select **Shortcuts** from the View List. The **Shortcuts** view opens.
2. Expand the Shortcuts tree to display the directory containing the shortcuts you want to exclude.
3. Right-click the directory and then click **Exclude**.

Excluding Shortcuts from Subdirectories

To exclude all captured shortcuts within a directory or its subdirectories from the InstallShield Editor project and Windows Installer package, perform the following steps.

Task ***To exclude all captured shortcuts within a directory or its subdirectories from the InstallShield Editor project and Windows Installer package:***

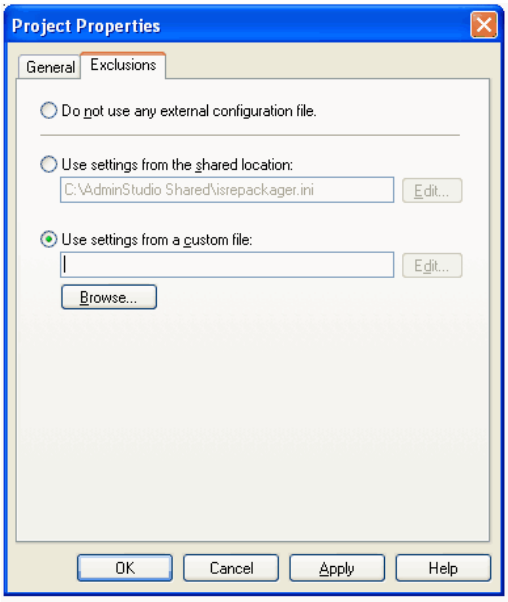
1. Select **Shortcuts** from the View List. The **Shortcuts** view opens.
2. Expand the **Shortcuts** tree to display the directory containing the shortcuts and/or subdirectories containing shortcuts you want to exclude.
3. Right-click the directory and then click **Exclude All**.

Specifying the External Configuration File

To specify an external configuration file which you want to use as a filter when converting legacy setups, perform the following steps.

Task ***To specify an external configuration file which you want to use as a filter when converting legacy setups:***

1. From the Repackager **Project** menu, select **Properties**. The **General** tab of the **Project Properties** dialog box opens.
2. Open the **Exclusions** tab.



3. Select the **Use settings from the shared location** or the **Use settings from a custom file** option. The **Browse** button for that option is activated.
4. Click **Browse** and select the configuration file you want to use.

Tip • *After you select a configuration file, the **Edit** button is activated, enabling you to open the file in the Exclusions Editor.*

5. Click **OK**.

When you apply a configuration file, Repackager automatically updates all views to reflect the configuration file's exclusions. However, if you have already excluded items using Repackager, item states are retained.

Modifying External Configuration Files

To configure an external configuration file, perform the following steps.

Task ***To configure an external configuration file:***

1. From Repackager's **Project** menu, click **Properties**. The **General** tab of the **Project Properties** dialog box opens.
2. Select the **Exclusions** tab.
3. Select the file you want to modify in either the **Use settings from the shared location** option or **Use settings from a custom file** options.
4. Click **Edit**. The **Exclusions Editor** opens.
5. Make necessary modifications using the **Exclusions Editor**.
6. When you finish editing the configuration file, click **OK**.
7. Click **OK** to close the **Project Properties** dialog box.

When you apply a configuration file, Repackager automatically updates all views to reflect the configuration file's exclusions. However, if you have already excluded items using Repackager, item states are retained.

Configuring Exclusions Using the Exclusions Editor

The Exclusions Editor allows you to configure three types of exclusions: Repackaging, Project, and OS Snapshot.

Repackaging Exclusions

Repackaging exclusions refer to exclusions made during repackage time using the Repackaging Wizard. Any files, registry entries, **.ini** files, or shortcuts excluded at this point are not included in the Repackager project. Therefore, if you exclude a directory you later need, you need to repackage the legacy setup again.

The Repackager best practice is to capture everything using the Repackaging Wizard, and then exclude visually in the Repackager Interface. This way, you avoid having to run the Repackaging Wizard again if you accidentally exclude necessary files.

In some cases, you may want to avoid capturing specific data types during repackaging. For example, your organization may never want to capture shortcuts. You can disable capture of shortcuts during repackage time, thereby eliminating the need to exclude them later. In Snapshot mode, you may want to limit the analysis to a certain directory to reduce the time it takes to capture the initial and final snapshot.

Project Exclusions

Each Repackager project can use a project exclusion list which marks files, registry entries, shortcuts, and **.ini** files as excluded in the Repackager project. If your process dictates that you capture everything and only exclude items in the Repackager Interface, then you should set up commonly captured but unnecessary items from the project by default. Because all the data from the original capture is intact, if you accidentally exclude necessary files, you can always reinclude them from the Repackager Interface and quickly rebuild your Windows Installer package.

OS Snapshot Exclusions

Like pre-capture repackaging exclusions, you can use the Exclusions Editor to configure exclusions to apply during the capture of OS snapshots. However, to maximize the usefulness of OS snapshots, you should avoid editing the default snapshot exclusion list (ISSnapshot.ini).

Exclusions and Repackager

Exclusions in Repackager refer to files, registry entries, shortcuts, and **.ini** files that are marked as excluded in the Repackager Interface by default when you open a Repackager project or if you change your exclusions file. The captured data is only marked as excluded and not ignored or discarded during capture. You can create an exclusion file in the Exclusions Editor, and link it to Repackager from the **Exclusions Tab** of the **Project Properties** dialog box in Repackager.

Exclusions and the OS Snapshot Wizard

When using the Exclusions Editor to configure analysis options for capturing OS snapshots, you are creating an exclusion list for files, directories, **.ini** files, **.ini** file sections, and registry data. Items in the exclusion list are not captured during the OS snapshot process, and will not be included in the OS snapshot file which is created.

Launching Exclusions Editor

The Exclusions Editor can be launched either within the Repackager interface or outside of Repackager. You can edit the default exclusions file, **isrepackager.ini**, using either interface.

Note *• You can also add items to the default exclusions file from the* ***Files and Folders*** *view of the Repackager interface. See Adding Files and Folders to the Global Exclusions List from the Files and Folders View.*

However, if you want to create a new, custom exclusions file, you must launch the Exclusions Editor outside of Repackager.

- Launching Exclusions Editor Outside of Repackager
- Launching Exclusions Editor Within Repackager

Launching Exclusions Editor Outside of Repackager

To launch the Exclusions Editor outside of the Repackager interface, perform the following steps.

Task ***To add a file to the exclusion list:***

1. Launch the Exclusions Editor by locating and executing the following file:

   ```
   [AdminStudioInstallDirectory]\Repackager\AnalysisOptions.exe
   ```

   The **Files** tab of the Exclusions Editor opens.

2. Perform one of the following to open an exclusions file:

   - **Shared Exclusions**—To edit the shared exclusions file, on the **Files** menu, point to **Open** and click **Shared Exclusions**. The exclusions in the shared exclusions file are now listed on the **Files** tab.
   - **Custom Exclusions**—To create a new custom exclusions file, on the **Files** menu, click **New**. A default set of exclusions is listed.

3. Make edits to the file.
4. Save the file by selecting **Save** on the **File** menu.
5. If you were creating a custom exclusions file, specify a name and location for this exclusions file and click **Save**.

Launching Exclusions Editor Within Repackager

To add a file to the exclusion list, perform the following steps.

Task ***To add a file to the exclusion list:***

1. Launch Repackager and open a project.
2. On the **Project** menu, click **Properties**. The **Project Properties** dialog box opens.
3. On the **Exclusions** tab, do one of the following:

   - To edit the default exclusions file, select **Use settings from the shared location** and click **Edit**.
   - To edit a custom exclusions file, select **Use settings from a custom file**, browse to the file you want to open (if it is not listed), and click **Edit**.

   The **Files** tab of the Exclusions Editor opens, with the appropriate exclusions file open.

4. Make edits to the file.
5. Save the file and close the Exclusions Editor by clicking **OK**.

Note *• Note that when opening the Exclusions Editor from within Repackager, there is no* ***File*** *menu displayed, meaning that you can only edit an existing exclusions file; you cannot create a new exclusions file.*

Excluding Files

You use the Exclusions Editor to create an exclusion list for files so that those files are not captured during the OS snapshot process, and will not be included in the OS snapshot file.

Task ***To add a file to the exclusion list:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor.
2. On the **Files** tab, click **New**. The **File Exclusion Information** dialog box opens.
3. Enter or browse to the directory **Path** containing the file you want to exclude.
4. Enter the name of the file you want to exclude, or browse to it by clicking the Browse (...) button to the right of the **Excluded Files** field. If you want to exclude multiple files from the same directory, separate them with pipes (|). If you want to exclude all files in a directory, enter an asterisk (*).
5. Click **OK** to close the **File Exclusion Information** dialog box. The new exclusion appears in the **Files** tab.
6. Save the exclusions file as described in Launching Exclusions Editor.

Note *• When configuring file exclusions for Repackager, you are only configuring Repackager to automatically mark the file as excluded; this can be changed from within Repackager on a file-by-file basis. However, when configuring file exclusions for the OS Snapshot Wizard, files in the exclusion list are not captured in the OS snapshot file.*

Excluding Files with Specific Extensions

To exclude files with specific extensions from the exclusion list, perform the following steps.

Task ***To exclude files with specific extensions from the exclusion list:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. On the **Files** tab, click **New**. The **File Exclusion Information** dialog box opens.
3. In the **File Exclusion Information** dialog box, enter or browse to the directory containing the files you want to exclude. If you want to exclude files with a certain extension from all directories, enter an asterisk (*****) for the **Path** value.
4. Enter an asterisk followed by the extension you want excluded in the **Excluded Files** field. For example, if you want to exclude all **.bak** files, enter ***.bak**. If you want to exclude multiple file types from the same directory (or from all directories), separate each exclusion with a pipe (**|**).
5. Click **OK** to close the **File Exclusion Information** dialog box. The new exclusion appears in the **Files** tab.
6. Save the exclusions file as described in Launching Exclusions Editor:

Note *• When configuring file exclusions for Repackager, you are only configuring Repackager to automatically mark the file as excluded; this can be changed from within Repackager on a file-by-file basis. However, when configuring file exclusions for the OS Snapshot Wizard, files in the exclusion list are not captured in the OS snapshot file.*

Excluding Directories

To add a directory to the exclusion list, perform the following steps.

Task ***To add a directory to the exclusion list:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. On the **Files** tab, click **New**. The **File Exclusion Information** dialog box opens.
3. In the **File Exclusion Information** dialog box, enter or browse to the directory **Path** containing the files you want to exclude.
4. Enter an asterisk (*) in the **Excluded Files** field.
5. Click **OK** to close the **File Exclusion Information** dialog box. The new exclusion appears in the **Files** tab.
6. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring file exclusions for Repackager, you are only configuring Repackager to automatically mark the file as excluded; this can be changed from within Repackager on a file-by-file basis. However, when configuring file exclusions for the OS Snapshot Wizard, files in the exclusion list are not captured in the OS snapshot file.*

Editing Existing File Exclusions

To edit an existing file exclusion, perform the following steps.

Task ***To edit an existing file exclusion:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Select the appropriate exclusion and click **Edit**. The **File Exclusion Information** dialog box opens.
3. In the **File Exclusion Information** dialog box, modify the **Path** and **Excluded Files** information.
4. Click **OK** to close the **File Exclusion Information** dialog box. The edited exclusion is listed in the **Files** tab.
5. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring file exclusions for Repackager, you are only configuring Repackager to automatically mark the file as excluded; this can be changed from within Repackager on a file-by-file basis. However, when configuring file exclusions for the OS Snapshot Wizard, files in the exclusion list are not captured in the OS snapshot file.*

Removing File Exclusions

To remove an existing file exclusion, perform the following steps.

Task ***To remove an existing file exclusion:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Select the appropriate exclusion and click **Delete**.
3. Confirm the exclusion by clicking **OK**. The deleted exclusion is removed from the list.
4. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring file exclusions for Repackager, you are only configuring Repackager to automatically mark the file as excluded; this can be changed from within Repackager on a file-by-file basis. However, when configuring file exclusions for the OS Snapshot Wizard, files in the exclusion list are not captured in the OS snapshot file.*

Excluding .ini Files

To add an .ini file to the exclusion list, perform the following steps.

Task ***To add an .ini file to the exclusion list:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Open the **INI Files** tab.
3. Click **New**. The **INI File Exclusion Information** dialog box opens.
4. Enter or browse to the **.ini** file you want to exclude.
5. If there are specific sections you want to exclude from the **.ini** file, put the section names in brackets ([]) and separate them with pipes (|) in the **Excluded Sections** field. If you want to exclude all sections, put an asterisk (*) in the **Excluded Sections** field.
6. Click **OK** to close the **INI File Exclusion Information** dialog box. The new exclusion appears in the list on the **INI Files** tab.
7. Save the exclusions file as described in Launching Exclusions Editor.

Note • *When configuring .ini file exclusions for Repackager, you are only configuring Repackager to automatically mark the .ini file and/or sections as excluded; this can be changed from within Repackager on an .ini file by .ini file basis. However, when configuring .ini file exclusions for the OS Snapshot Wizard, .ini files in the exclusion list are not captured in the OS snapshot file.*

Excluding Sections from .ini Files

To add a specific .ini file section to the exclusion list, perform the following steps.

Task ***To add a specific .ini file section to the exclusion list:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Open the **INI Files** tab.
3. Click **New**. The **INI File Exclusion Information** dialog box opens.
4. Enter or browse to the **.ini** file containing the section you want to exclude.
5. To exclude a specific **.ini** file section, enter the section name in brackets ([]) in the **Excluded Sections** field. If there are multiple sections, separate them with pipes (|).
6. Click **OK** to close the **INI File Exclusion Information** dialog box. The new exclusion appears in the INI Files and Sections Excluded During Analysis dialog box.
7. Click **OK** to close the **INI File Exclusion Information** dialog box. The new exclusion appears in the list on the **INI Files** tab.
8. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring .ini file exclusions for Repackager, you are only configuring Repackager to automatically mark the .ini file and/or sections as excluded; this can be changed from within Repackager on an .ini file by .ini file basis. However, when configuring .ini file exclusions for the OS Snapshot Wizard, .ini files in the exclusion list are not captured in the OS snapshot file.*

Editing Existing .ini File Exclusions

To edit an existing .ini file exclusion, perform the following steps.

Task ***To edit an existing .ini file exclusion:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor.
2. Open the **INI Files** tab.
3. Select the appropriate exclusion and click **Edit**. The **INI File Exclusion Information** dialog box opens.
4. In the **File Exclusion Information** dialog box, modify the **INI File** and **Excluded Sections** information.
5. Click **OK** to close the **INI File Exclusion Information** dialog box. The edited exclusion appears in the list on the **INI Files** tab.
6. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring .ini file exclusions for Repackager, you are only configuring Repackager to automatically mark the .ini file and/or sections as excluded; this can be changed from within Repackager on an .ini file by .ini file*

basis. However, when configuring .ini file exclusions for the OS Snapshot Wizard, .ini files in the exclusion list are not captured in the OS snapshot file.

Removing .ini File Exclusions

To delete an existing .ini file exclusion, perform the following steps.

Task ***To delete an existing .ini file exclusion:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Open the **INI Files** tab.
3. Select the appropriate exclusion and click **Delete**.
4. Confirm the exclusion by clicking **OK**. The deleted exclusion is removed from the list.
5. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring .ini file exclusions for Repackager, you are only configuring Repackager to automatically mark the .ini file and/or sections as excluded; this can be changed from within Repackager on an .ini file by .ini file basis. However, when configuring .ini file exclusions for the OS Snapshot Wizard, .ini files in the exclusion list are not captured in the OS snapshot file.*

Excluding Registry Data

To add registry data to the exclusion list, perform the following steps.

Task ***To add registry data to the exclusion list:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Open the **Registry** tab.
3. Click **New**. The **Choose Registry Key** dialog box opens.
4. Enter or browse to the registry key you want to exclude and click **OK**. The key is added to the list on the **Registry** tab.
5. If you want to exclude a certain value in the key, select it from the list and click Edit. The **Edit Registry Key** dialog box opens.
6. Provide the **Value Name** you want to exclude, and click **OK** to close the dialog box. The exclusion information is reflected in the list on the **Registry** tab.
7. Save the exclusions file as described in Launching Exclusions Editor:

***Note** • When configuring registry exclusions for Repackager, you are only configuring Repackager to automatically mark the registry entry and/or values as excluded; this can be changed from within Repackager on an registry key by registry key basis. However, when configuring registry exclusions for the OS Snapshot Wizard, registry data in the exclusion list is not captured in the OS snapshot file.*

Editing Existing Registry Exclusions

To edit existing registry exclusions, perform the following steps.

Task ***To edit an existing registry exclusion:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Open the **Registry** tab.
3. Select the registry key that you want to edit and click **Edit**. The **Edit Registry Key** dialog box opens.
4. Modify the exclusion as necessary and click **OK**. The edited information is reflected in the list on the **Registry** tab.
5. Save the exclusions file as described in Launching Exclusions Editor:

***Note** • When configuring registry exclusions for Repackager, you are only configuring Repackager to automatically mark the registry entry and/or values as excluded; this can be changed from within Repackager on an registry key by registry key basis. However, when configuring registry exclusions for the OS Snapshot Wizard, registry data in the exclusion list is not captured in the OS snapshot file.*

Removing Registry Exclusions

To delete an existing registry exclusion, perform the following steps.

Task ***To delete an existing registry exclusion:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. Open the **Registry** tab.
3. Select the registry key that you want to delete and click **Delete**.
4. Confirm the deletion by clicking **OK**. The deleted exclusion is removed from the list.
5. Save the exclusions file as described in Launching Exclusions Editor:

Note • *When configuring registry exclusions for Repackager, you are only configuring Repackager to automatically mark the registry entry and/or values as excluded; this can be changed from within Repackager on an registry key by registry key basis. However, when configuring registry exclusions for the OS Snapshot Wizard, registry data in the exclusion list is not captured in the OS snapshot file.*

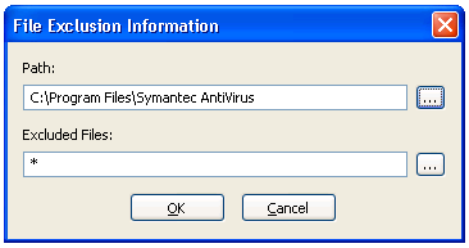
Repackaging and Anti-Virus Software

Any machine that you use to repackage most likely has anti-virus software installed on it, even a "clean" machine. During repackaging, the real-time virus detection feature of anti-virus software could automatically update various cached files in its directories.

Therefore, in order to avoid repackaging errors when using the Snapshot repackaging method, you should exclude the software directories containing your anti-virus software.

Task ***To exclude anti-virus software directories:***

1. Launch the Exclusions Editor and open an exclusions file by performing the steps listed in Launching Exclusions Editor:
2. On the **Files** tab, click **New**. The **File Exclusion Information** dialog box opens.



3. Enter or browse to the directory **Path** containing the anti-virus files that you want to exclude. For example, if you wanted to exclude Symantec AntiVirus software, you would select the following directory:

   C:\Program Files\Symantec AntiVirus
4. Enter an asterisk (*) in the **Excluded Files** field.
5. Click **OK** to close the **File Exclusion Information** dialog box. The new exclusions appear on the **Files** tab.
6. Save the exclusions file as described in Launching Exclusions Editor:

Important • *It is strongly recommended that you leave your anti-virus software running during repackaging.*

Creating an InstallShield Editor Template to Use Within Repackager

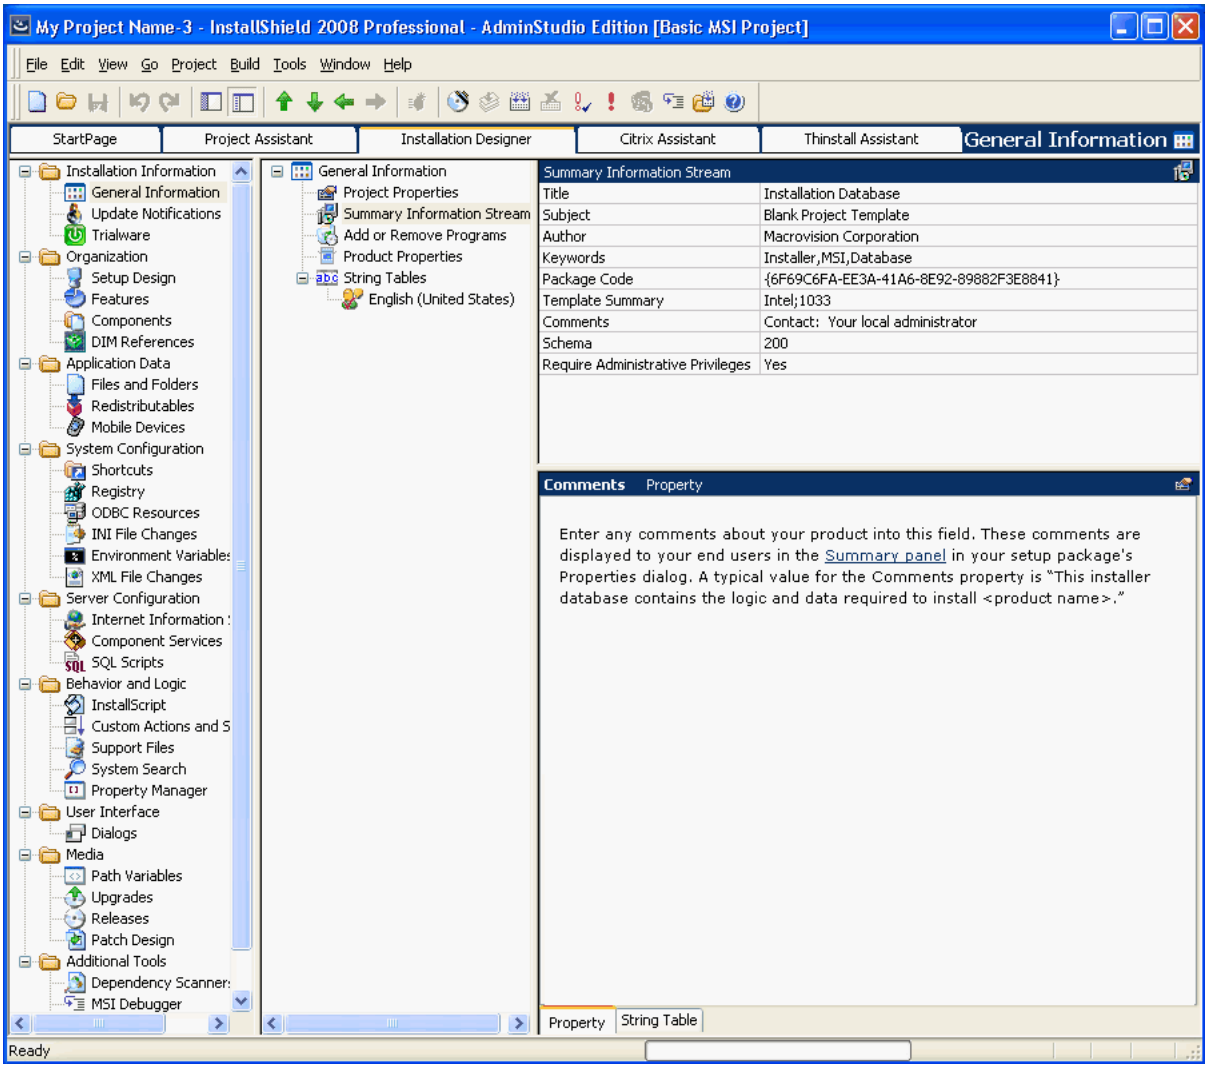
One of the main reasons you use AdminStudio is to significantly reduce the time it takes to package an application for deployment. You can use the following procedure to speed up the packaging process even more.

You can create an InstallShield Editor template that you can use within the Repackager interface to save additional time when customizing a package. By using this template, all future InstallShield Editor **.ism** project files generated by Repackager will contain the company-specific default settings that were specified in the template. Using a template is also beneficial for organizations with multiple packagers, since it helps enforce consistency by enabling all packagers to make the same standard customizations to packages.

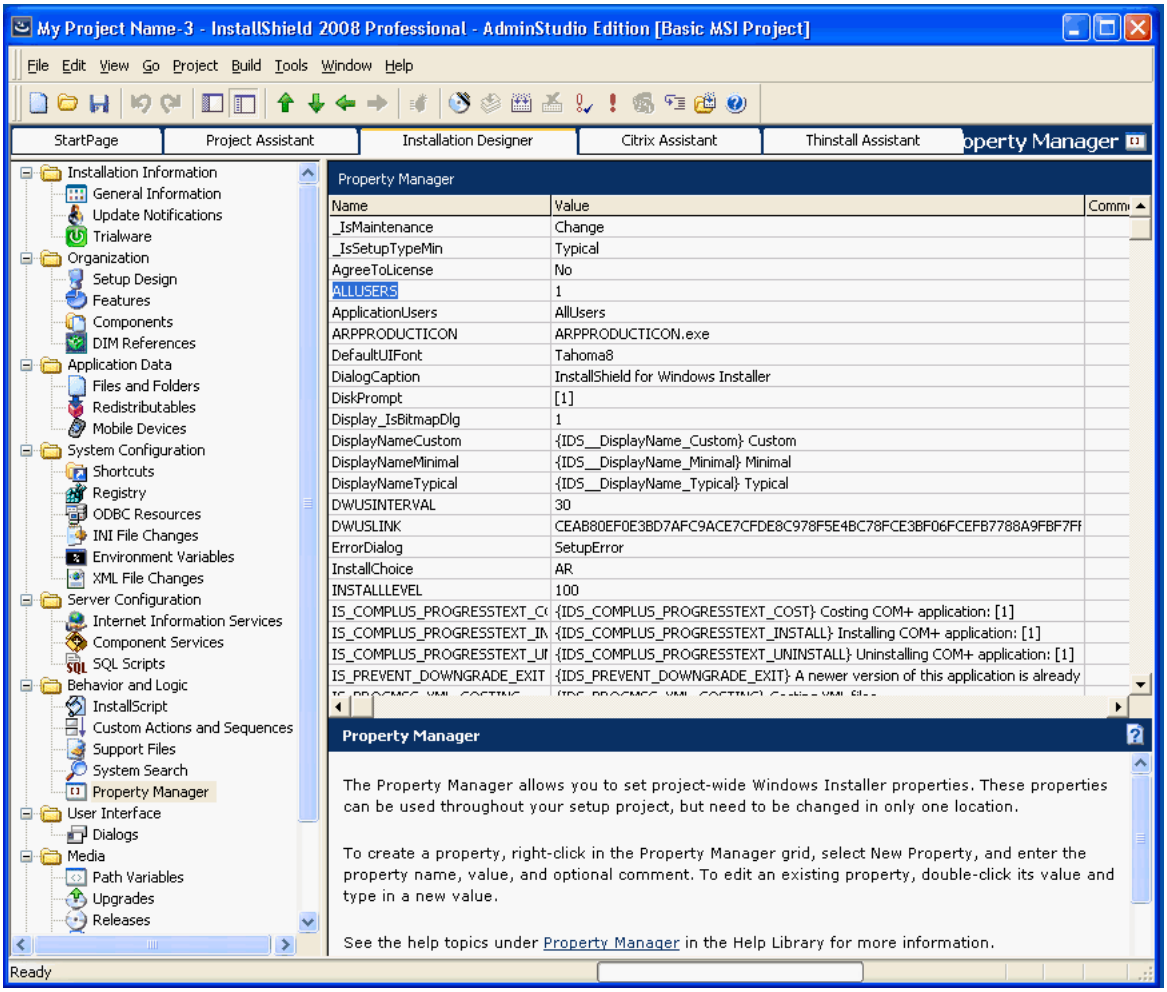
To create an InstallShield Editor template to use within Repackager, perform the following steps.

Task ***To create a customized InstallShield Editor template:***

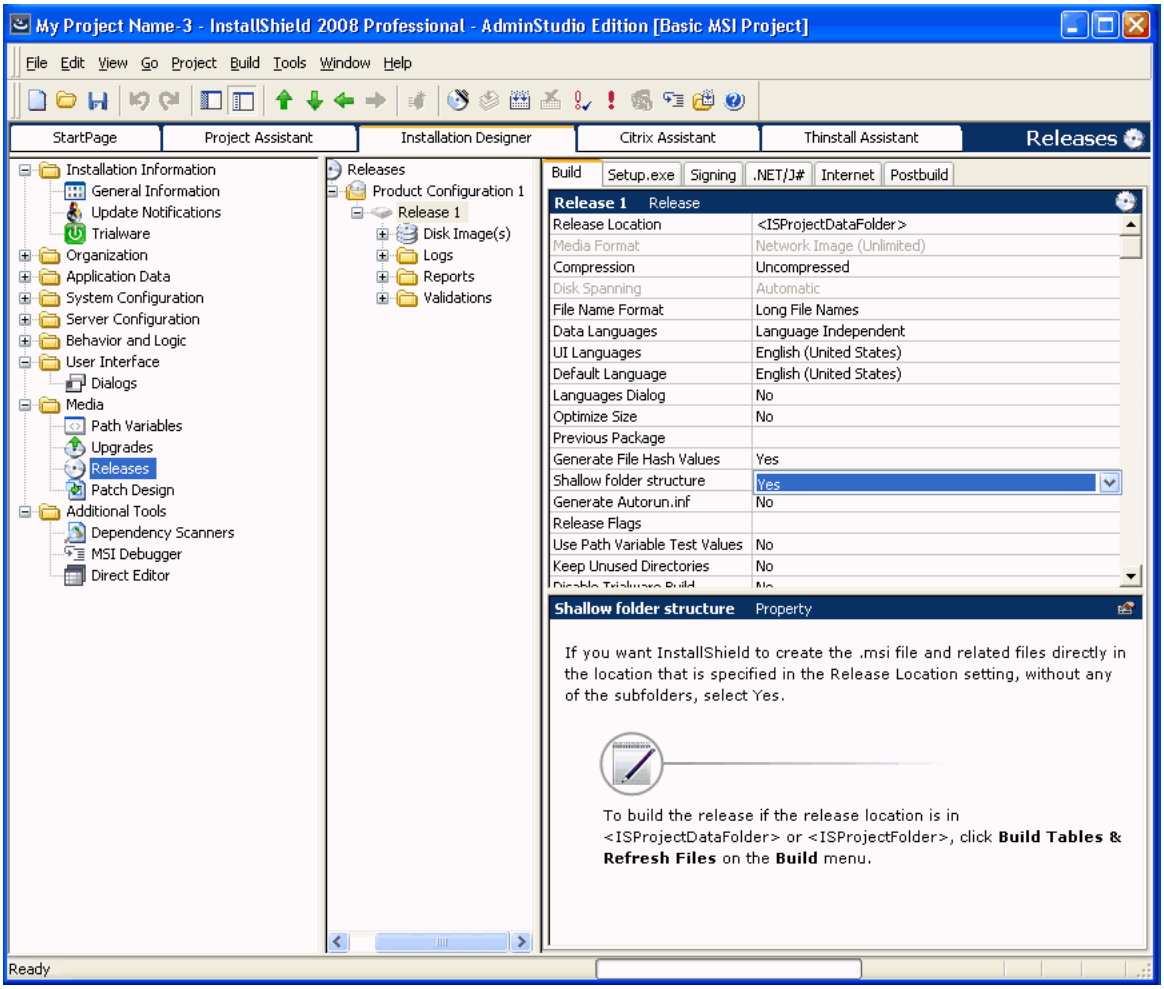
1. Create a new **Basic MSI Project** in the InstallShield Editor.
2. On the **Installation Designer** tab, select the **General Information** node under **Installation Information**, and enter your company-specific information as required.



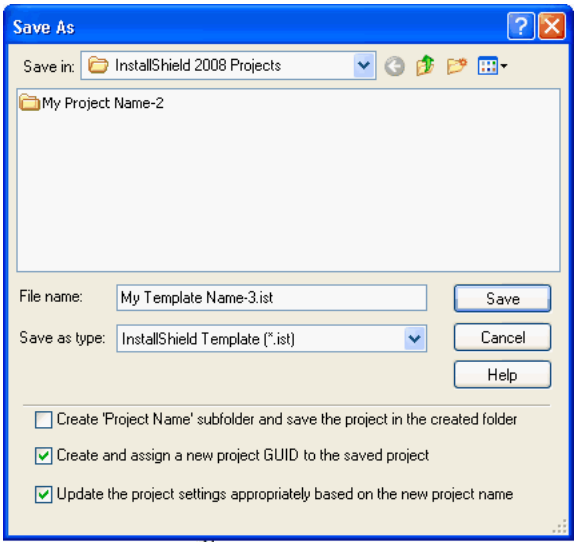
3. Under **Behavior and Logic**, select the **Property Manager** node and add the required properties like `ALLUSERS`, `ISSCRIPTDRIVEN`, etc.



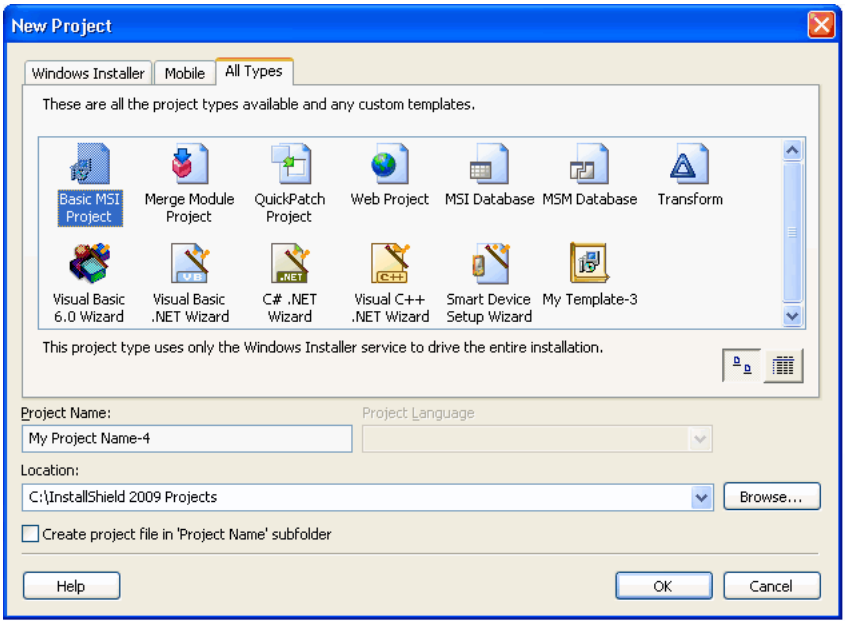
4. You can also optionally set **Shallow Folder Structure** to **Yes** in the **Releases** view under **Media**.



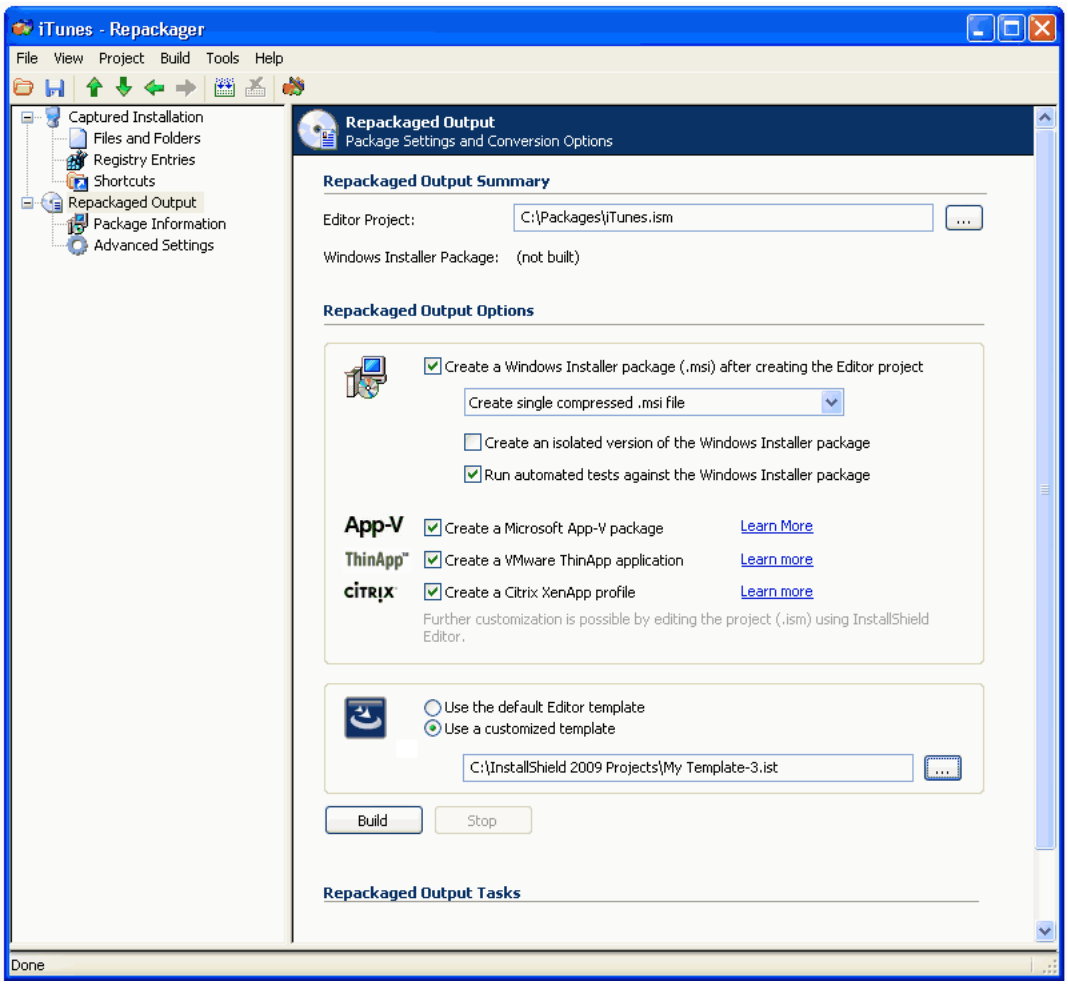
5. After making all required changes, save the project as an InstallShield Editor Template (**.ist**) type.



6. This new template should now be available along with other project types in the InstallShield Editor.



7. From within the Repackager interface, you can start using this customized template by selecting the **Use a customized template** option in the **Repackaged Output** view, and selecting the InstallShield Editor template that you just created.



Repackager Interface Reference

This section describes each of the dialog boxes and Wizard panels that you might encounter when using the Repackager interface. The help topics in this section are the same detailed documentation that is displayed when you press the F1 key or click the Help button while working in a dialog box.

- Repackager Interface
- Setup Intent Wizard
- VMware Repackaging Wizard
- Exclusions Editor Interface
- Options.ini File
- Files Associated with Repackager
- Using InstallShield to Chain Multiple Windows Installer Packages Together
- Troubleshooting

Repackager Interface

***Edition** • The full functionality of the Repackager interface is available in AdminStudio Standard, Professional, and Enterprise Editions.*

From the Repackager Interface, you can:

- Open the Repackaging Wizard and repackage legacy setups.
- Open the Exclusions Editor and configure exclusions.
- Convert Novell ZENworks, Microsoft SMS, and WinINSTALL projects into Repackaging projects.
- Create a package exclusion list.
- Build a Repackager project into an InstallShield Editor project and Windows Installer package.

The Interface consists of several menus, a toolbar, the status bar, the output window, the View List, and several associated views.

- Menus and the toolbar are discussed in the Menus and Toolbar topic.
- Individual views are covered in their respective help topics.
- The status bar, output window, and View List are described in the following table.

Table 9-4 • Repackager Interface Elements

Interface Element	Description
Status Bar	The status bar, which can be toggled from the **View** menu, displays information when you hover over buttons in the toolbar.

Table 9-4 • Repackager Interface Elements

Interface Element	Description
View List	The View List allows you to navigate to different views in the Repackager project. The corresponding view is displayed when you select an item in the tree. You can also use the Forward, Back, Navigate Up, and Navigate Down buttons in the View List. The View List includes the following views: • Captured Installation View • Files and Folders View • Registry Entries View • Shortcuts View • INI Files View • Deleted Files View • Deleted Registry Entries View • Repackaged Output View • Package Information View • Software Identification Tag View • Advanced Package Settings View
Output Window	When you open Repackager 3.x output, Novell ZENworks projects, Microsoft SMS projects, WinINSTALL projects, or Wise installation projects in the Repackager Interface, conversion information appears in the Output window. This window can be toggled from the **View** menu.

Repackager Start Page

Edition • *The full functionality of the Repackager interface is available in AdminStudio Standard, Professional, and Enterprise Editions.*

When you first launch Repackager, the **Repackager Start Page** opens.

This page gives you a brief overview of Repackager functionality and uses, and gives you links to launch the Repackaging Wizard, convert a Windows Installer package to an application virtualization format, open an existing Repackager project, convert a legacy setup to a Repackager project, upgrade a legacy Repackager file, and open a recently accessed package.

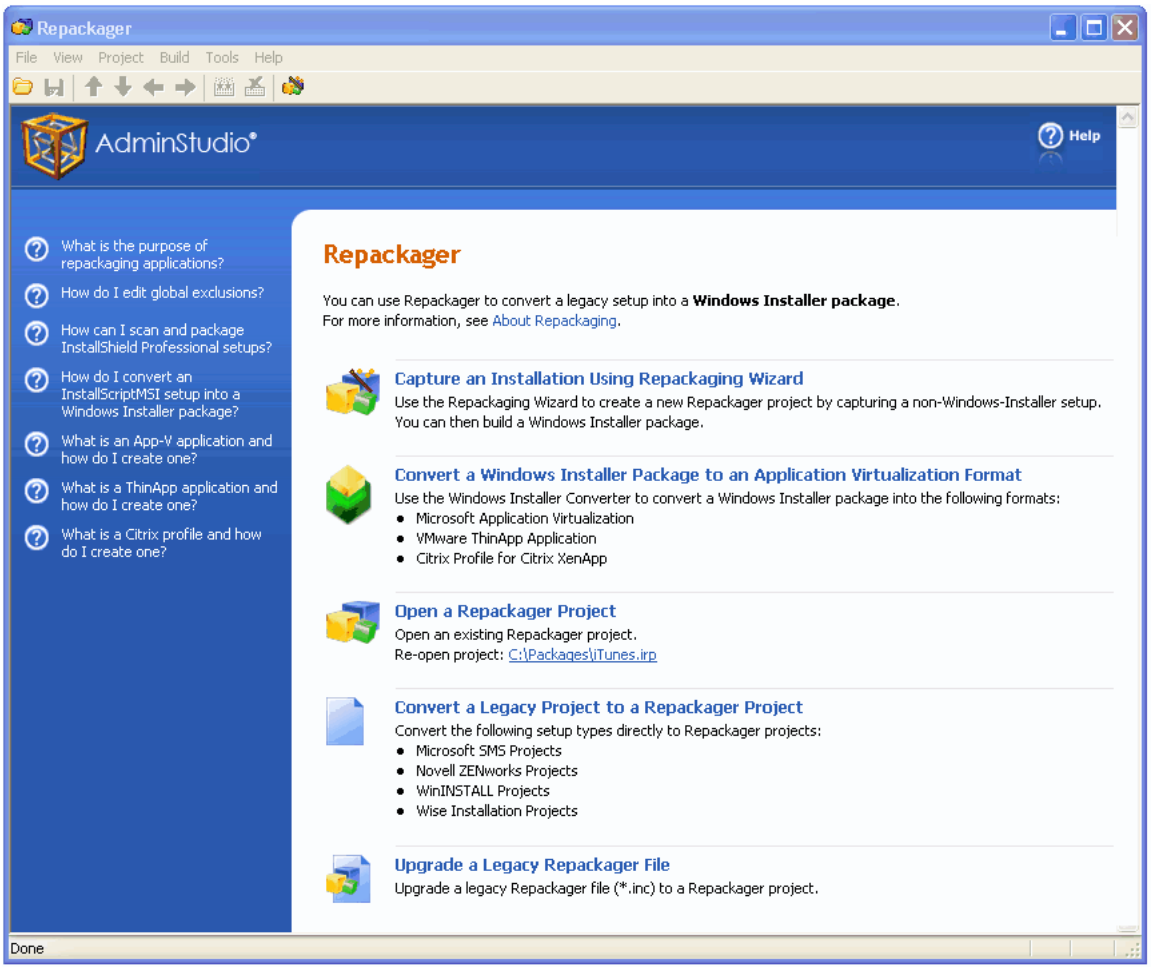


Figure 9-3: Repackager Start Page

Menus and Toolbar

The following table provides a description of each menu command and toolbar button:

Table 9-5 • Repackager Menus and Toolbars

Menu	Command	Toolbar Button	Keyboard Shortcuts	Description
File	**Open**		Ctrl+O	Allows you to open: • An existing Repackager project (**.irp**) • Repackager 3.x output (**.inc**) • Novell ZENworks project (**.axt/.aot**) • Microsoft SMS project (**.ipf**) • WinINSTALL converted project (**.txt**) (6.0, 6.5, or 7.x) • Wise Installer project (**.wse**)
File	**Save**		Ctrl+S	Saves the current project.
File	**Save As**			Saves the current project using the name and location you specify.
File	**1,2,3,4**			Allows you to open the four most recently accessed Repackager projects.
File	**Exit**			Exits Repackager.
View	**Toolbar**			Toggles display of the toolbar.
View	**Status Bar**			Toggles display of the status bar.
View	**Output**			Toggles display of the Output window.
View	**Refresh**		F5	Refreshes the current view.
Project	**Edit Windows Installer Package**			Once you build the Repackager project into a Windows Installer package (**.msi**), opens the package in InstallShield Editor (in Direct MSI Edit mode).
Project	**Edit InstallShield Project**			Once you build the Repackager project into an InstallShield Editor project (**.ism**), opens the project in InstallShield Editor.
Project	**Setup Intent Wizard**			Launches the Setup Intent Wizard.

Table 9-5 • Repackager Menus and Toolbars

Menu	Command	Toolbar Button	Keyboard Shortcuts	Description
Project	**Create Report**		Ctrl+R	Allows you to create a report for the project in text or HTML format.
Project	**Properties**			Displays properties for the current project, including exclusion information.
Build	**Build**		F7	Builds the Repackager project into an InstallShield Editor project and a Windows Installer package.
Build	**Stop Build**		Ctrl+Break	Terminates an in-process build.
Tools	**Repackaging Wizard**			Launches the Repackaging Wizard.
Tools	**VMware Repackaging Wizard**			Launches the VMware Repackaging Wizard.
Tools	**Options**			Displays the Options dialog box.
Tools	**Isolation Options**			Displays the Isolation Options dialog box, where you can specify assembly and digital signature isolation options.
Help	**Contents**			Launches the Help Library, displaying the Contents tab.
Help	**Index**			Launches the Help Library, displaying the Index tab.
Help	**Search**			Launches the Help Library, displaying the Search tab.
Help	**Support Central**			Accesses the AdminStudio Support website.
Help	**Web Community**			Accesses the AdminStudio Web Community.
Help	**ReadMe**			Displays the AdminStudio ReadMe file.
Help	**Feedback**			Accesses the feedback form on the AdminStudio website.

Table 9-5 • Repackager Menus and Toolbars

Menu	Command	Toolbar Button	Keyboard Shortcuts	Description
Help	**AdminStudio on the Web**			Accesses the AdminStudio website.
Help	**About Repackager**			Displays the About Repackager dialog box.
	Up			Moves you up one view in the View List.
	Down			Moves you down one view in the View List.
	Back			Displays the previously displayed view in the View List.
	Forward			Returns you to the view from which you selected the Back button.

Dialog Boxes

Repackager includes the following dialog boxes to assist you in your project creation:

- Create Report Dialog Box
- Isolation Options Dialog Box
- Options Dialog Box
- Project Properties Dialog Box
- WinINSTALL Conversion Dialog Box

About Repackager Dialog Box

This dialog box available by selecting **About Repackager** from the **Help** menu, displays version information for Repackager.

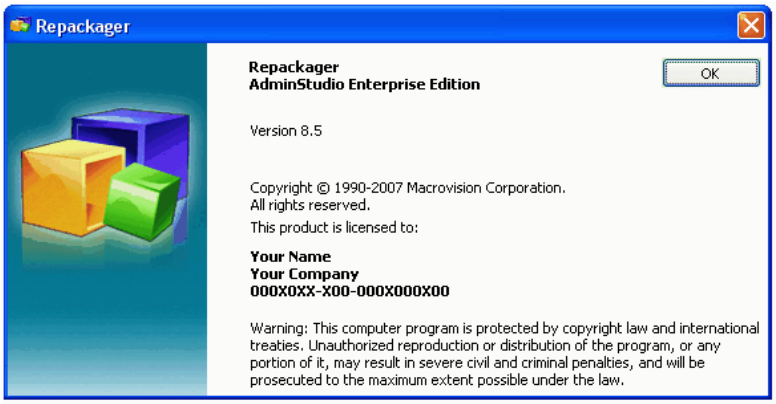

Figure 9-4: About Repackager Dialog Box

Create Report Dialog Box

The Create Report dialog box, available by selecting Create Report from the Project menu, allows you to configure a report for the current Repackager project, or a specific subset of captured data.

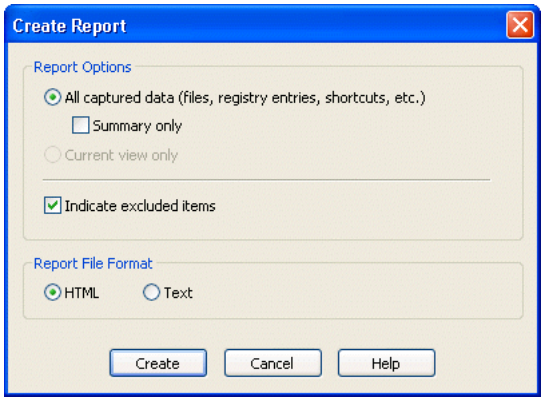

Figure 9-5: Create Report Dialog Box

This dialog box contains the following options:

Table 9-6 • Create Report Dialog Box Options

Option	Description
All captured data (files, registry entries, shortcuts, etc.)	Select to have the report include all captured data.
Summary only	If you select All captured data, you can select this option to only display summary information in the report (the number of items captured and the number of items excluded for files, .ini files, registry data, and shortcuts).
Current view only	Select this option to include only the currently selected view in the report.

Table 9-6 • Create Report Dialog Box Options

Option	Description
Indicate excluded items	Select to display items that have been marked as excluded in Repackager.
Report File Format	Select the file format for Repackager reports: HTML or Text.
Create	When you click Create, you are prompted for a name and location for the outputted report.

Isolation Options Dialog Box

Application isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested.

On the Isolation Options dialog box, which is opened by selecting **Isolation Options** from the **Tools** menu, you can specify the following Repackager isolation options:

- **Assembly Options**—Specify the type of assemblies Repackager will create, and the assembly naming conventions. See Manifest Options Tab
- **Digital Signature Options**—Configure the certificate information required when using shared assemblies. See Digital Signature Tab.

Note • *The modifications you make on the Isolation Options dialog box will be recorded in the* ***isolationconfig.ini file****, which is stored in the* ***AdminStudio Shared*** *directory.*

Manifest Options Tab

The Manifest Options tab allows you to configure several settings associated with manifests. The following settings are included:

Table 9-7 • Isolation Options Dialog Box / Manifest Options Tab

Option	Description
Assembly Type	This option allows you to select the type of assemblies that Repackager will create and use: • Create private side-by-side assemblies in the application folder • Create shared side-by-side assemblies in the WinSxS folder (Default)  ***Note*** • *Manifests for shared assemblies must be digitally signed. This can be done in the Digital Signature Tab.*  ***Note*** • *A 2048-bit key is required to sign an assembly/manifest being installed to the WinSxS folder.*

Table 9-7 • Isolation Options Dialog Box / Manifest Options Tab (cont.)

Option	Description
Assembly Naming Conventions	Specify your company and division information to define the default naming convention that Repackager will use when creating assemblies during application isolation By default, assembly names are specified in the form of: `Company.Division.Assembly` ***Note*** • *See see About Assemblies and About Manifests for more information.*
Create a new component for each assembly	Select this option if you want to create a new component for each assembly created during isolation. This check box applies to all assemblies created. ***Caution*** • *If you are creating assemblies for applications files within multiple components, this option must be selected for successful application isolation.*

Digital Signature Tab

On the **Digital Signature** tab, you can configure the certificate information required when using shared assemblies.This required digital signature provides an extra layer of protection, allowing you to obtain information about the company who created a global assembly.

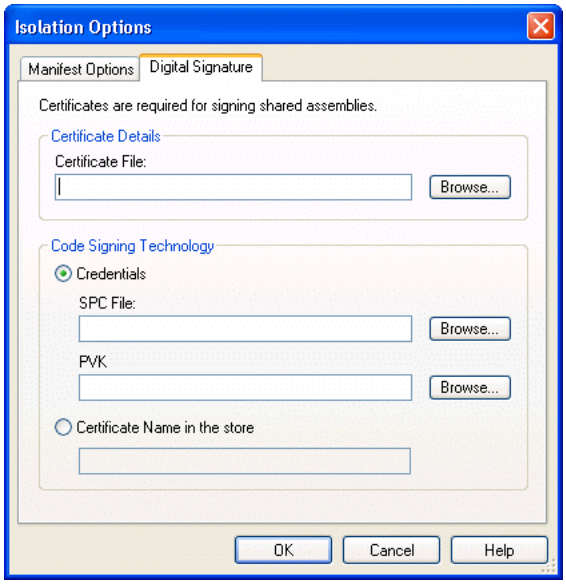

Figure 9-6: Isolation Options Digital Signature Options Tab

Caution • *Repackager uses timestamping when signing global assemblies. Consequently, you must have an Internet connection on the computer when you create a global assembly.*

You must configure the following options when signing these assemblies:

Table 9-8 • Isolation Options Dialog Box / Digital Signatures Tab

Item	Description
Certificate File	Click the Browse (...) button next to the field and navigate to the certificate file you are using to sign assemblies. A digital certificate identifies you and/or your company to end users and assures them the data they are about to receive has not been altered.
Credentials	Select this option to use credential files as the code signing technology. If you select this option, you must supply the name and location of both your software publishing credential files: **SPC File** and **PVK** File.  ***Note*** • *In order to receive a software publishing credentials and a private key, you must supply a certification authority, such as VeriSign, with specific information about your company and software.*
SPC File	Specify the name and location of your software publishing credentials file (**.spc**).
PVK	Specify the name and location of your private key file (**.pvk**).
Certificate Name in the Store	Select this option to use the name of an existing certificate file in the Certificate Store as the code signing technology. The Certificate Store is a central repository for certificate files. Using a Certificate Store allows you to reuse the certificate files for different purposes as necessary.

Note • *For more information, see About Digital Certificates.*

Options Dialog Box

The **Options** dialog box, available from the **Tools** menu, presents options on three tabs: **Colors**, **Merge Modules**, and **Build Options**.

Colors Tab

On the **Colors** tab, you can configure the color of scanned items and deleted items in Repackager's exclusion views (**Files**, **.ini Files**, **Registry Data**, and **Shortcuts**).

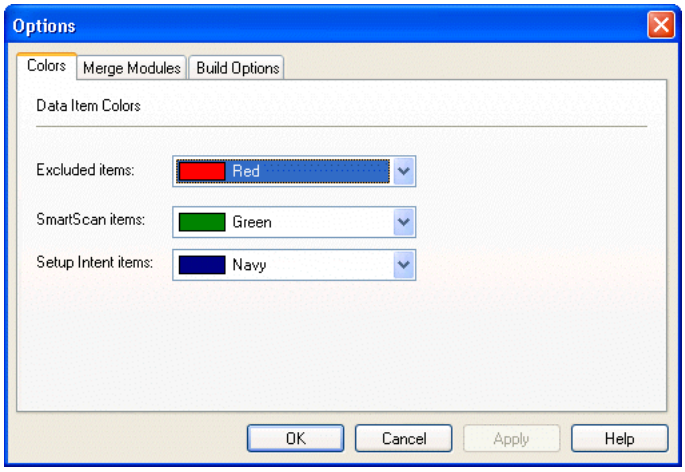

Figure 9-7: Colors Tab of the Options Dialog Box

Merge Modules Tab

On the **Merge Modules** tab, you can specify additional directories containing custom merge modules to use during repackaging.

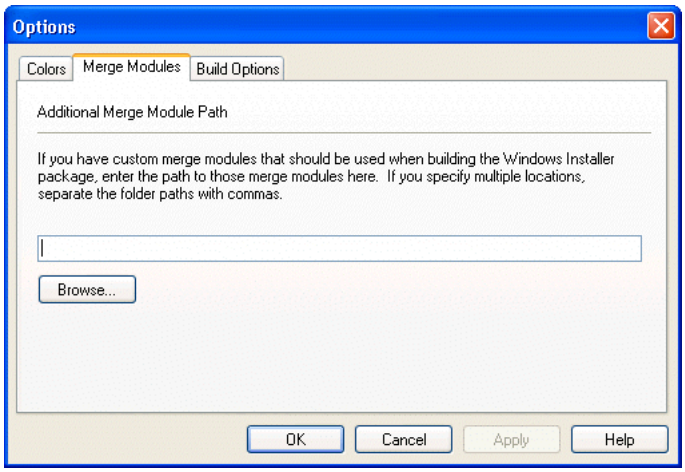

Figure 9-8: Merge Modules Tab of the Options Dialog Box

Build Options Tab

On the **Build Options** tab, you can specify whether or not you want to list ICE validation warnings in the Repackager output window during the Build process and you can set software ID tag file generation options.

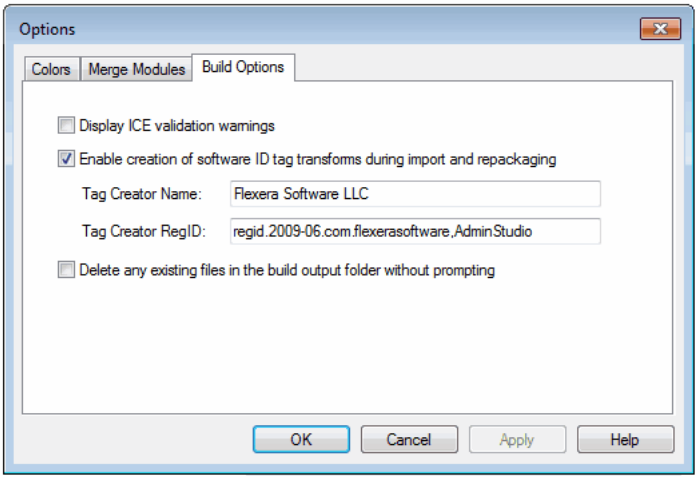

Figure 9-9: Build Options Tab of the Options Dialog Box

The **Build Options** tab includes the following options:

Table 9-9 • Options Dialog Box / Build Options Tab

Option	Description
Display ICE validation Warnings	Select this option to display any ICE validation warnings that occur during the Repackager Build process. By default, this option is not selected.
Enable creation of software ID tag transforms during import and repackaging	Select to instruct AdminStudio to automatically create a transform file containing software tag file(s) for Windows Installer packages that are imported into the Application Catalog or built using Repackager. By default, this option is selected. ***Note*** • *Whenever a Windows Installer package is imported into the Application Catalog or built using Repackager, AdminStudio creates a software ID tag file (which is stored in the Application Catalog), but if the* ***Enable creation of software ID tag transforms during import and repackaging option*** *it not selected, AdminStudio does not create the transform.*
Tag Creator Name	Enter a name to identify the creator of the software ID tag files that will be created by AdminStudio. By default, the value is `Flexera Software LLC`.
Tag Creator RegID	Enter an ID to uniquely identify the creator of the software ID tag files that will be created by AdminStudio, using the following format: `regid.YYYY-MM.ReversedDomainName,optional_division` For example: `regid.2009-06.com.yourcompany,GlobalProductDivision` By default, the value is AdminStudio's RegID: `regid.2009-06.com.flexerasoftware,AdminStudio`

Table 9-9 • Options Dialog Box / Build Options Tab

Option	Description
Delete any existing files in the build output folder without prompting	By default, Repackager will build the Repackager project's associated Windows Installer package in a directory named **MSI_Package**, which is a subdirectory of the directory containing the Repackager project. If you have edited the Repackager project's associated InstallShield Editor project to change this default location, each time you rebuild the Repackager project, Repackager will prompt you to confirm that you want to overwrite the existing files. If you are repeatedly building from the Repackager interface into the same build output folder (which is not the default **MSI_Package** folder) and you do not want to be prompted to confirm that you will be overwriting the existing content, then select this option to suppress the confirmation prompts.

Important • *Any changes that you make to the software tagging options on the* ***Build Options*** *tab of the Repackager* ***Options*** *dialog box will also automatically be made to the options on the* ***General Options*** *>* ***Import Options*** *>* ***Software Tagging*** *tab of the Application Manager* ***Options*** *dialog box.*

Note • *For more information, see About Software Tagging RegIDs and About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields in the AdminStudio Help Library.*

Project Properties Dialog Box

The Project Properties dialog box, accessed by selecting Properties from the Projects menu, contains two tabs:

Table 9-10 • Project Properties Dialog Box Tabs

Tab	Description
General Tab	Allows you to view properties for the current Repackager project.
Exclusions Tab	Use to configure the location of the default exclusion file.

General Tab

The General tab of the Project Properties dialog box displays information about the current Repackager project (**.irp**).

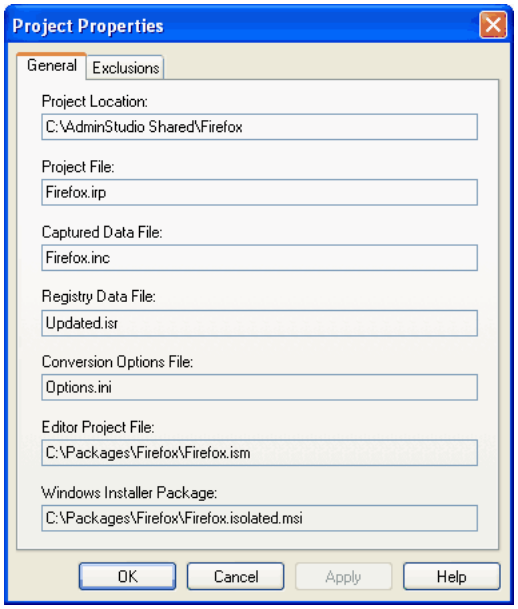

Figure 9-10: Project Properties Dialog Box General Tab

The following options are displayed:

Table 9-11 • General Tab Options

Option	Description
Project Location	The full path of the current Repackager project file (**.irp**).
Project File	The name of the current Repackager project file.
Captured Data File	The name and location of the captured data file (**.inc**), which was either created by the Repackaging Wizard or during conversion of a Novell ZENworks project, Microsoft SMS project, or WinINSTALL project. The path is relative to the current Repackager project file.
Registry Data File	The name and location of the file containing captured registry data. The path is relative to the current Repackager project file.
Conversion Options File	The name and location of the Options.ini file, which contains an exhaustive list of all options you can use during conversion of the Repackager project to an InstallShield Editor project and Windows Installer package.
Editor Project File	The name and location of the InstallShield Editor project file as set in the Product view (MSI Package). The path is relative to the current Repackager project file.
Windows Installer Package	The name and location of the Windows Installer package. The path is relative to the current Repackager project file.

Exclusions Tab

The Exclusions tab allows you to select an exclusion file to use as a filter when importing captured data into a Repackager project.

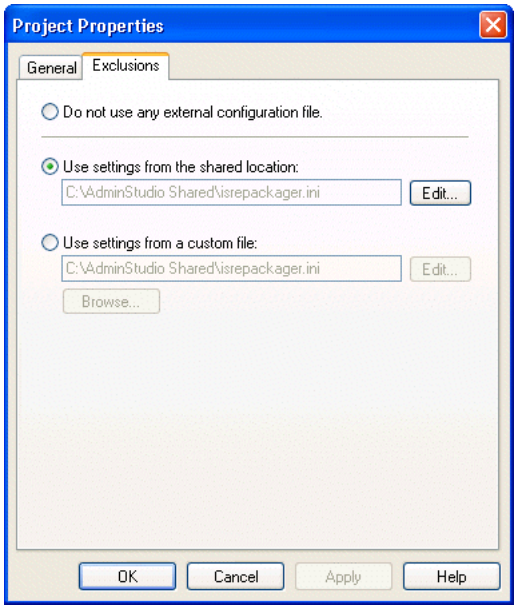

Figure 9-11: Project Properties Dialog Box Exclusions Tab

Select one of the following options for the configuration file:

Table 9-12 • Exclusions Tab Properties

Option	Description
Do not use any external configuration	Repackager will import all captured data into the Repackager project.
Use settings from the shared location	Repackager will use the settings contained in isRepackager.ini in the **AdminStudio Shared** directory (configured during installation). Use this option when you are working in a team environment where the exclusion list needs to be stored in a centralized location.
Use settings from InstallShield defaults	Repackager will use the settings contained in the default.ini file in the Repackager folder. These are the InstallShield Editor-recommended exclusions. It is recommended that you do not modify these exclusions so you can return to them if you need to restart your exclusion list.
Edit	Click to open the Exclusions Editor, which you can use to exclude files, registry entries, .ini files, or shortcuts from the Repackager project. See Configuring Exclusions Using the Exclusions Editor and Exclusions Editor Interface for more information.

Table 9-12 • Exclusions Tab Properties

Option	Description
Use settings from a custom file	Specify or browse to a file created with the Exclusions Editor that you want to use as your filter during conversion to a Repackager project. You would create a custom exclusion file based upon your company's requirements.

Caution • *Using the custom settings option, it is possible to use the local settings file (**isRepackager.ini**) in the Windows directory. This file is also used for default exclusions for the Repackaging Wizard. By modifying this file, you introduce the possibility of excluding data at repackaging time in subsequent Repackaging Wizard executions, as opposed to marking items as excluded in a Repackager project (which does not affect the captured data). For this reason, it is highly recommended that you do not use the **isRepackager.ini** configuration file in the local Windows folder for your Repackager exclusions.*

WinINSTALL Conversion Dialog Box

When you convert a WinINSTALL project to a Repackager project, this dialog box appears to allow you to set WinINSTALL-specific variables. These variables are:

Table 9-13 • WinINSTALL Variables

Variable	Description
@Server	The machine name of the server where the WinINSTALL directory is located.
@WinstallDir	The location of the directory where the WinINSTALL executables are located.

Repackager Views

Repackager includes several views, from which you can examine the captured data that will be used to create an InstallShield Editor project (**.ism**) and Windows Installer package (**.msi**). Depending on the presence or absence of certain data types, some views may not be displayed. For example, if the setup does not include any **.ini** files, the INI Files view will not be displayed in the View List.

The following views are available in Repackager:

- Captured Installation View
- Files and Folders View
- Registry Entries View
- Shortcuts View
- INI Files View
- Deleted Files View
- Deleted Registry Entries View
- Repackaged Output View

- Package Information View
- Software Identification Tag View
- Advanced Package Settings View

Note • *Information listed in the views (such as files, .ini files, or registry entries) is limited to 267 characters in length. Anything longer than this limit will be truncated in the view. The full value can be viewed in InstallShield Editor.*

Captured Installation View

From the **Captured Installation** view, you can review summary information about the setup you are converting into a Windows Installer package.

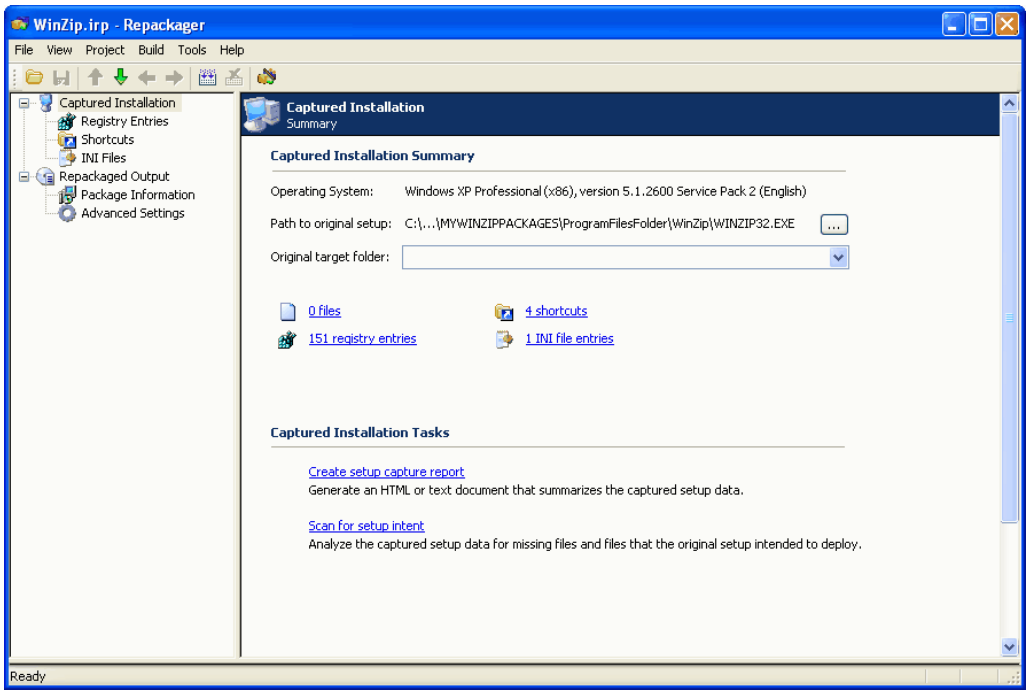

Figure 9-12: Repackager Captured Installation View

The **Captured Installation** view lists the following information:

Table 9-14 • Repackager Captured Installation View

Property	Description
Operating System	Identifies the operating system—including version, service pack, and processor type (32 or 64-bit)—of the machine where the capture was performed.
Path to original setup	Location of setup that was repackaged. Click the browse (…) button to select a different setup.

Table 9-14 • Repackager Captured Installation View

Property	Description
Original target folder	From this list, select the original target folder for the installation. In most cases, this will be a subdirectory of `[ProgramFilesFolder]`. Alternatively, you can enter your own target. This value will be set as the value for `INSTALLDIR`, and is a mandatory property. ***Note*** • *Information about the provided install locations can be found in the SystemFolder Property topic of the Windows Installer Help Library.*
Number of Files, Shortcuts, Registry Entries, and INI File Entries	Links that list the number of files, shortcuts, and registry entries captured, and the number of **.ini** file changes made. Click these links to open the following subviews: • Files and Folders View • Registry Entries View • Shortcuts View • INI Files View Each subview of this view allows you to view the names and associated information of each item captured, and selectively exclude (or reinclude) these items from the ultimate Windows Installer package. If no entries were captured of a particular type, the corresponding view does not appear in the View List. For example, if no **.ini** file changes were captured, the **INI Files** view is not displayed.
Create setup capture report	Click to generate the **Setup Capture Report**, an HTML or text document that summarizes the data that was captured when a setup was repackaged. For more information, see Creating a Setup Capture Report for a Project. ***Edition*** • *The Setup Capture Report feature is included with AdminStudio Standard, Professional, and Enterprise Editions.*
Scan for setup intent	Click to launch the **Setup Intent Wizard**, which you can use to scan a setup to identify files that may not have been captured during repackaging—effectively recognizing the installation's intent for these files. For more information, see Using the Setup Intent Wizard to Detect File Dependencies in a Repackager Project. ***Edition*** • *The **Setup Intent Wizard** is included with AdminStudio Standard, Professional, and Enterprise Editions.*

Files and Folders View

From the **Files and Folders** view, you can examine information about each captured file, selectively exclude files or directories from the package you are creating, or reinclude files that you previously excluded. You can also add files or directories to the global exclusion list, or remove them from the list.

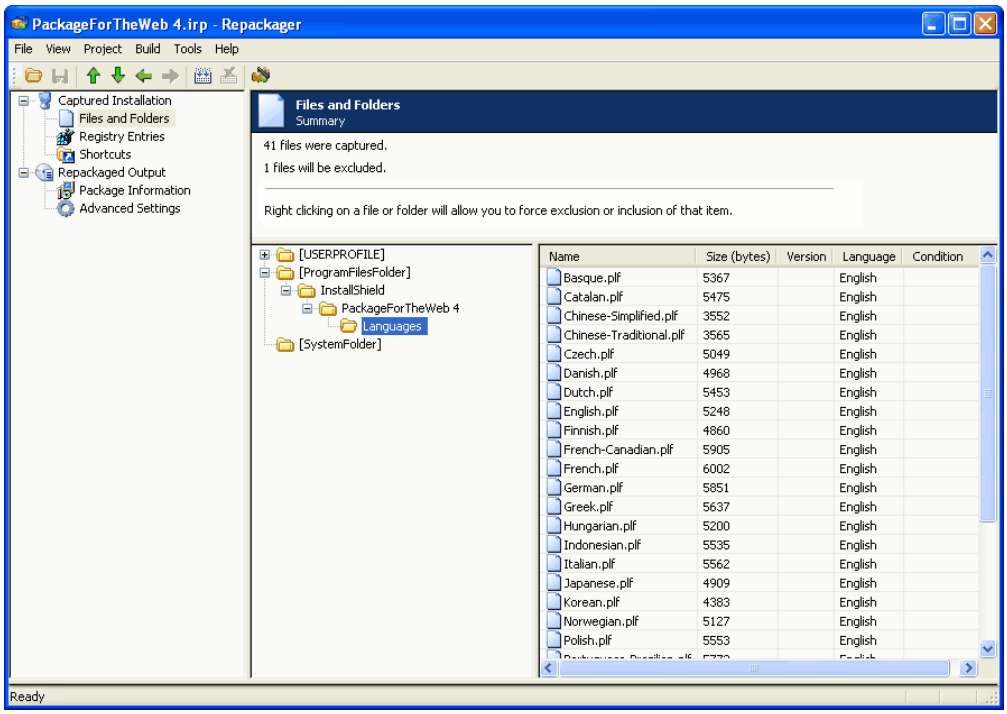

Figure 9-13: Repackager Files and Folders View

The upper pane displays the number of files captured and how many of these files will be excluded from the Windows Installer package when built. The lower-left pane provides a tree from which you can see where files will be installed and the names of the files.

When you select a file from the tree, the lower-right pane displays attributes for that file. These attributes are:

Table 9-15 • File Attributes

Attribute	Description
Name	The file's name.
Size	The file's size in bytes.
Version	The file's version.
Short Name	The short name for the file (if the file's author defined it).
Language	The file's language.

Excluding Files and Subdirectories

To specify which files and subdirectories you want to include in the package, use the **Exclude**, **Exclude All**, **Include**, **Include All**, **Add to Exclusions**, and **Remove from Exclusions** commands on the shortcut menu:

Table 9-16 • Excluding Files and Subdirectories

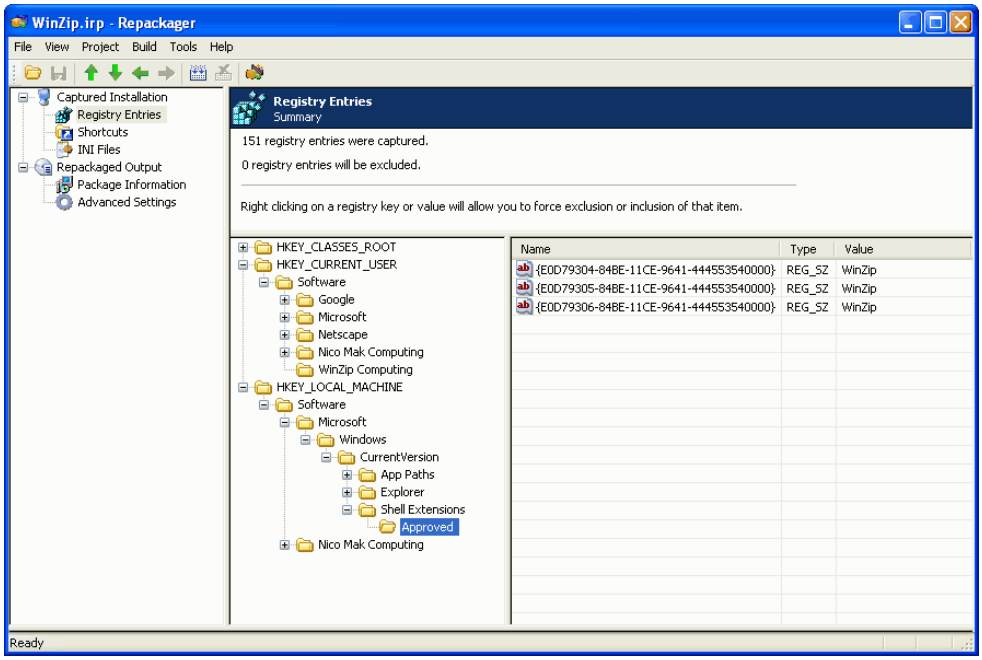
Category	To ...	Right-click on ...	Select on shortcut menu ...
Project Exclusions	**Exclude a captured file**	File you want to exclude	**Exclude**
	Exclude captured files within a directory	Directory containing the files you want to exclude	• **Exclude** (to exclude only the files in the selected directory) or • **Exclude All** (to exclude all of the files in the selected directory and all of its subdirectories)
	Include a captured file that had previously been excluded	File you want to include	**Include**
	Include captured files within a directory that had previously been excluded	Directory containing the files you want to include	• **Include** (to include only the files in the selected directory) or • **Include All** (to include all of the files in the selected directory and all of its subdirectories).

Table 9-16 • Excluding Files and Subdirectories

Category	To ...	Right-click on ...	Select on shortcut menu ...
Global Exclusion List	**Add a captured file to the global exclusions list**	File you want to add to the global exclusions list	**Add to Exclusions**
	Add captured files within a directory to the global exclusions list	Directory containing the files you want to add to the global exclusion list	**Add to Exclusions** You will be prompted to indicate whether you want to also exclude files in subdirectories of the selected directory.
	Remove a captured file that had previously been added to the global exclusions list	File you want to remove	**Remove from Exclusions**
	Remove captured files within a directory that had previously been added to the global exclusions list	Directory containing the files you want to remove from the global exclusion list	**Remove from Exclusions**

Registry Entries View

From the **Registry Entries** view, you can examine information about each captured registry entry, selectively exclude registry values or registry keys from the package you are creating, or reinclude registry values that you previously excluded.



The upper pane displays the number of registry entries captured and how many of these entries will be excluded from the Windows Installer package when built. The lower-left pane provides a tree displaying the registry keys and subkeys captured. When you select a key from the tree, the lower-right pane displays any registry values for that key. Displayed information includes:

Table 9-17 • Registry Attributes

Attribute	Description
Name	The registry value name.
Type	The registry value type. This can be either a string value, an expandable string value, a multistring value, a dword value, or a binary value.
Value	The content of the registry value.

Excluding Registry Entries

To specify which registry entries you want to include in the package, use the **Exclude**, **Exclude All**, **Include**, and **Include All** commands on the shortcut menu:

- **To exclude a registry entry**, select the registry entry you want to exclude and select **Exclude**.
- **To exclude registry entries within a registry key or registry hive**, select the key or hive from the tree and select either **Exclude** (to exclude the registry entries in the selected hive or key only) or **Exclude All** (to exclude all of the registry entries in the selected hive or key and all of its keys and subkeys).
- **To include a registry entry that had previously been excluded**, select the registry entry and select **Include**.
- **To include registry entries within a registry key or registry hive that had previously been excluded**, select the key or hive from the tree and select either **Include** (to include the registry entries in the selected hive or key only) or **Include All** (to include all of the registry entries in the selected hive or key and all of its keys and subkeys).

Shortcuts View

From the Shortcuts view, you can examine information about each captured shortcut, selectively exclude shortcuts from the package you are creating, or reinclude shortcuts that you previously excluded.

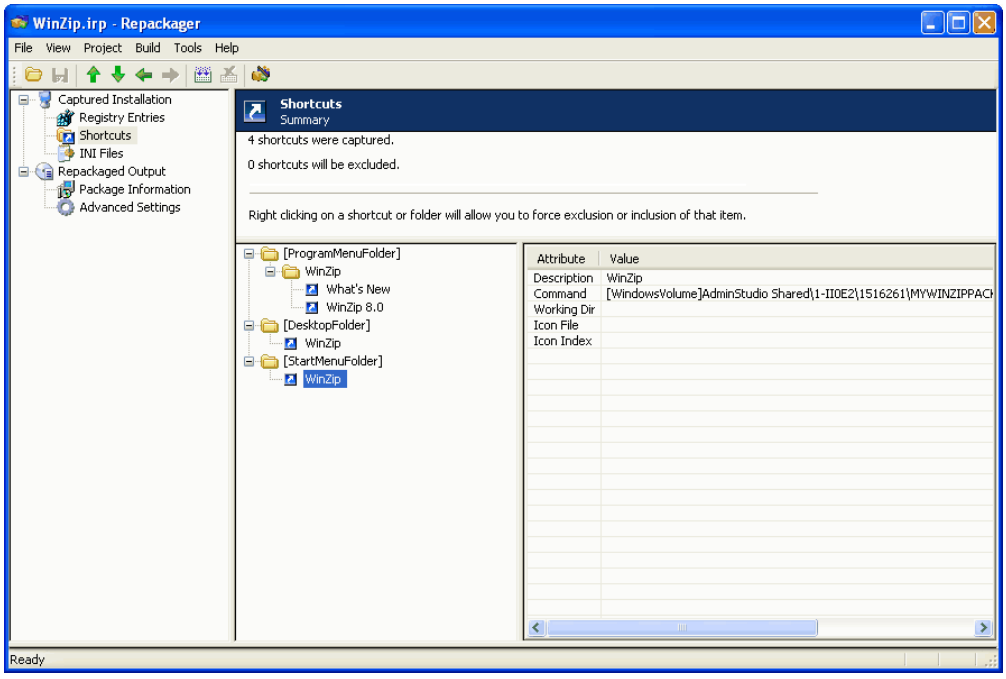


Figure 9-14: Repackager Shortcuts View

The upper pane displays the number of shortcuts captured and how many of these shortcuts will be excluded from the Windows Installer package when built. The lower-left pane provides a tree from which you can see where shortcuts will be installed and the names of the shortcuts. When you select a shortcut from the tree, the lower-right pane displays attributes for that shortcut. These attributes are:

Table 9-18 • Shortcuts View Attributes

Attribute	Description
Description	The name of the shortcut as it appears on the desktop.
Command	The fully-qualified path and name of the file to which the shortcut points.
Working Dir	The shortcut's working directory, which may need to be specified so required files can load. This is equivalent to the **Start in** value found when right-clicking a shortcut from the desktop and selecting **Properties**.
Icon File	The name of the file containing the shortcut's icon.
Icon Index	The index number for the icon in the icon file.

Note • *Shortcuts can be excluded from the Windows Installer package you are building on an individual shortcut basis or by directory.*

Excluding Shortcuts

To specify which shortcuts you want to include in the package, use the **Exclude**, **Exclude All**, **Include**, and **Include All** commands on the shortcut menu:

- **To exclude a shortcut**, select the shortcut you want to exclude and select **Exclude**.
- **To exclude shortcuts within a directory**, select the directory containing the shortcuts you want to exclude and select either **Exclude** (to exclude only the shortcuts in the selected directory) or **Exclude All** (to exclude all of the shortcuts in the selected directory and all of its subdirectories).
- **To include a shortcut that had previously been excluded**, select the shortcut you want to include and select **Include**.
- **To include shortcuts within a directory that had previously been excluded**, select the directory containing the shortcuts you want to include and select either **Include** (to include only the shortcut in the selected directory) or **Include All** (to include all of the shortcuts in the selected directory and all of its subdirectories).

INI Files View

From the INI Files view, you can examine information about each captured **.ini** file, selectively exclude **.ini** files or **.ini** file sections from the package you are creating, or reinclude **.ini** files or sections that you previously excluded.

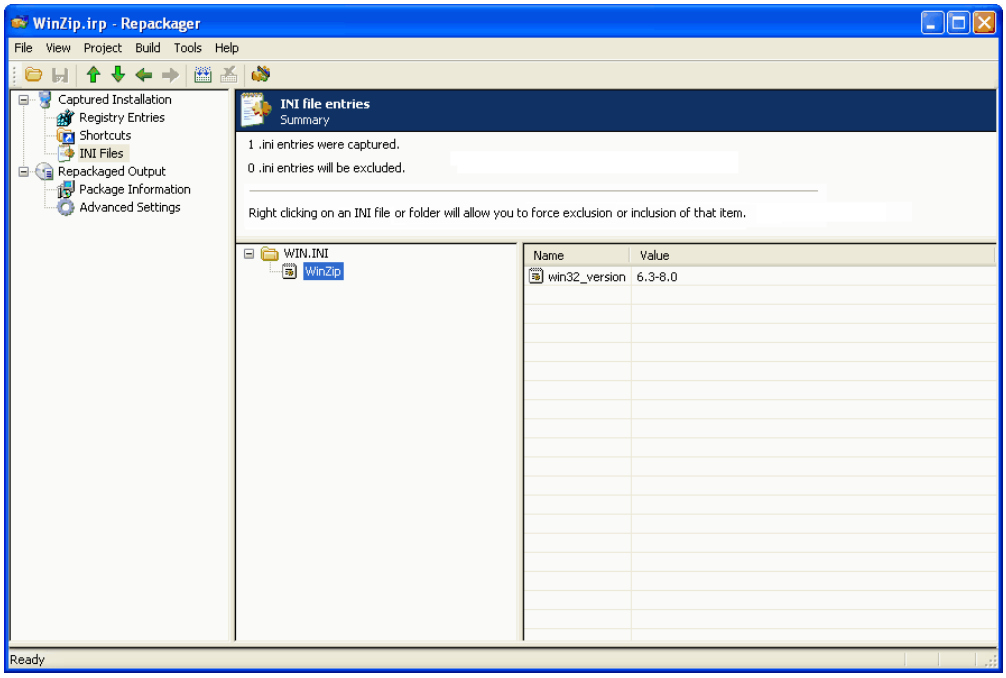

Figure 9-15: Repackager INI Files View

The upper pane displays the number of **.ini** files captured and how many of these **.ini** files will be excluded from the Windows Installer package when built. The lower-left pane provides a tree from which you can see the full path to captured **.ini** files and sections contained within the **.ini** files. When you select a section from the tree, the lower-right pane displays name/value pairs in that section.

Excluding INI Files

To specify which INI files you want to include in the package, use the **Exclude**, **Exclude All**, **Include**, and **Include All** commands on the shortcut menu:

- **To exclude an INI file**, select the INI file you want to exclude and select **Exclude**.
- **To exclude INI files within a directory**, select the directory containing the INI files you want to exclude and select either **Exclude** (to exclude only the INI files in the selected directory) or **Exclude All** (to exclude all of the INI files in the selected directory and all of its subdirectories).
- **To include an INI file that had previously been excluded**, select the INI file you want to include and select **Include**.
- **To include INI files within a directory that had previously been excluded**, select the directory containing the INI files you want to include and select either **Include** (to include only the INI file in the selected directory) or **Include All** (to include all of the INI files in the selected directory and all of its subdirectories).

Deleted Files View

From the **Deleted Files** view, you can examine information about each file deleted during repackaging, selectively exclude files or directories from the package you are creating, or reinclude previously excluded files.

The **Deleted Files** view is populated if you select the **Deleted files** option on the **Analysis Options** dialog box of the Repackaging Wizard

***Note** • The **Analysis Options** dialog box is opened by clicking **Edit** on the **Set Target Project Information and Capture Settings** panel of the Repackaging Wizard.*

The upper pane displays the number of files captured and how many of these files will be excluded from the Windows Installer package when built. The lower-left pane provides a tree from which you can see where files will be installed and the names of the files. When you select a file from the tree, the lower-right pane displays attributes for that file. These attributes are:

Table 9-19 • Deleted Files View Attributes

Attribute	Description
Name	The file's name.
Size	The file's size in bytes.
Version	The file's version.
Short Name	The short name for the file (if the file's author defined it).
Language	The file's language.

Excluding Files and Subdirectories

To specify which files and subdirectories you want to include in the package, use the Exclude, Exclude All, Include, and Include All buttons:

- To exclude a captured file from the package, select the file you want to exclude and click Exclude.
- To exclude all captured files and subdirectories within a directory from the package, select the directory containing the files and subdirectories you want to exclude and click Exclude All.
- To include a captured file in the package that had previously been excluded, select the file you want to include and click Include.
- To include all captured files and subdirectories within a directory, select the directory containing the files and subdirectories you want to include and click Include All.

Deleted Registry Entries View

From the **Deleted Registry Entries** view, you can examine information deleted from the registry repackaging, selectively exclude registry keys from the package you are creating, or reinclude previously excluded data.

The **Deleted Registry Entries** view is populated if you select the **Deleted registry entries** option on the **Analysis Options** dialog box of the Repackaging Wizard

***Note** • The **Analysis Options** dialog box is opened by clicking **Edit** on the **Set Target Project Information and Capture Settings** panel of the Repackaging Wizard.*

The upper pane displays the number of deleted registry entries captured and how many of these entries will be excluded from the Windows Installer package when built. The lower-left pane provides a tree displaying the registry keys and subkeys captured. When you select a key from the tree, the lower-right pane displays any registry values for that key. Displayed information includes:

Table 9-20 • Deleted Registry Entries View Attributes

Attribute	Description
Name	The registry value name.
Type	The registry value type. This can be either a string value, an expandable string value, a multistring value, a dword value, or a binary value.
Value	The content of the registry value.

Excluding Registry Entries

To specify which registry entries you want to include in the package, use the Exclude, Exclude All, Include, and Include All buttons:

- To exclude a registry entry from the package, select the registry entry you want to exclude and click Exclude.
- To exclude all registry entries and subdirectories within a directory from the package, select the directory containing the registry entries you want to exclude and click Exclude All.
- To include a registry entry in the package that had previously been excluded, select the registry entry you want to include and click Include.
- To include all registry entries and subdirectories within a directory, select the directory containing the shortcuts and subdirectories you want to include and click Include All.

Repackaged Output View

From this view, you can configure build options for the project, including whether to build an MSI package automatically following conversion.

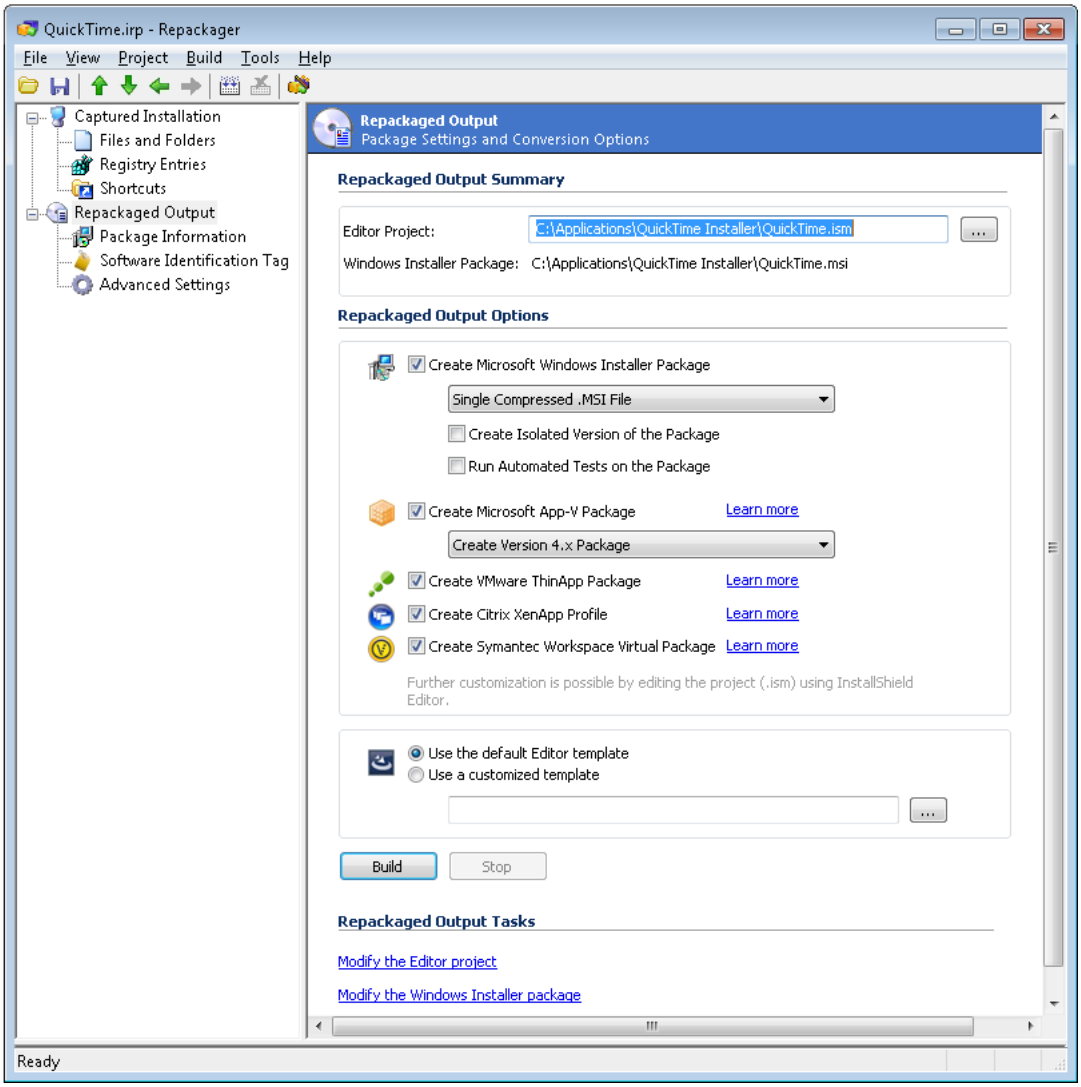

Figure 9-16: Repackager Repackaged Output View

The following properties are available for configuration:

Table 9-21 • Repackaged Output View Options

Option	Description
Editor Project	Provide the name and location of the InstallShield Editor project (**.ism**) file.

Table 9-21 • Repackaged Output View Options

Option	Description
Windows Installer Package	The name and location of the Windows Installer package (**.msi**). By default, Repackager creates the Windows Installer package in a subdirectory, named `MSI_Package`, of the directory containing the Repackager project file. To change this default location, you need to edit this Repackager project's associated InstallShield Editor project file.  ***Note*** • *If a Windows Installer package has not yet been built from this Repackager project,* `(not built)` *is listed.*
Create Microsoft Windows Installer Package	If this option is selected, after creating the InstallShield Editor project file (**.ism**), a Windows Installer (**.msi**) file will also be built.
Windows Installer Package Options	If you have selected the **Create Microsoft Windows Installer Package** option, you need to also select one of the following options: • **Single Compressed .MSI File**—Select this option if you want to compress all necessary files inside the .msi package, as opposed to storing them outside of the .msi database. • **Single Compressed Setup.exe File**—Select this option if you want to compress all files inside a setup.exe file, including the .msi file and all other necessary files. • **.MSI File With External .CAB File**—Select this option if you want to create an .msi file and want to compress the rest of the necessary files in an external .cab file. • **.MSI File With External .CAB File and Setup.exe**—Select this option if you want to create an .msi file and a setup.exe file, and want to compress all the rest of the necessary files in an external .cab file. • **Uncompressed .MSI File**—Select this option if you want to create an uncompressed .msi file. All of the rest of the necessary files, in uncompressed format, would be shipped with the .msi file. • **Uncompressed .MSI File With Setup.exe**—Select this option if you want to create an uncompressed .msi file along with a setup.exe file. All of the rest of the necessary files, in uncompressed format, would be shipped with the .msi and setup.exe files.

Table 9-21 • Repackaged Output View Options

Option	Description
Create Isolated Version of the Package	Select this option to create a second, isolated version of the Windows Installer package when the Windows Installer package is built. Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested. If this option is selected, an additional Windows Installer package will be created in the same directory as the **.ism** file and the other **.msi** file, with the naming convention of: *appname*`.isolated.msi` For more information on how Repackager isolates applications and the available isolation options, see Isolating Windows Installer Packages. ***Note*** • *This option is only enabled when the* ***Create Microsoft Windows Installer Package*** *option is selected and one of the following values is chosen:* • *Single Compressed .MSI File* • *.MSI File With External .CAB File* • *Uncompressed .MSI File*
Run Automated Tests on the Package	Select this option to automatically run best practice tests against the newly built Windows Installer package to determine if it is built according to Windows Installer standards, and if it is in compliance with the installation requirements of the Windows operating system. ***Note*** • *This option is only enabled when the* ***Create Microsoft Windows Installer Package*** *option is selected and any of the values except for* ***Single Compressed Setup.exe File*** *is chosen.*
Create Microsoft App-V Package	If this option is selected, after building a Windows Installer (.msi) file, a Microsoft App-V application will also be built. ***Note*** • *This option requires that you build a Windows Installer package.*
Create VMware ThinApp Package	If this option is selected, after building a Windows Installer (.msi) file, a VMware ThinApp application will also be built. ***Note*** • *This option requires that you build a Windows Installer package.*

Table 9-21 • Repackaged Output View Options

Option	Description
Create Citrix XenApp Profile	If this option is selected, after building a Windows Installer (.msi) file, a Citrix profile compatible with Citrix XenApp will also be built. ***Note*** • *This option requires that you build a Windows Installer package.*
Create Symantec Workspace Virtual Package	If this option is selected, after building a Windows Installer (.msi) file, a Symantec Workspace virtual package will also be built. ***Note*** • *This option requires that you build a Windows Installer package.*
Use the default Editor template	When building an InstallShield Editor project, select this option to use the default InstallShield Editor template. A project template contains all of the default settings and design elements that you want to use as a starting point when you create an installation project.
Use a customized template	When building an InstallShield Editor project, select this option to specify a customized InstallShield Editor Project Template to use. For example, if you wanted all of your InstallShield Editor projects to have a special custom dialog, a set of required redistributables, and a particular SQL script, you could create a project template that has all of those settings. Then, any time that you wanted to create a new project, you could base it off of your custom template. This enables you to avoid re-creating the custom dialog, re-adding the redistributables, and re-adding the SQL script every time that you create a new InstallShield Editor Project.
Build	Click to initiate the build process to build a Windows Installer package.
Repackaged Output Tasks	After an InstallShield Editor project and a Windows Installer package has been built, you can use these links to perform the following tasks: • **Modify the Editor project**—Open this Repackager project's associated InstallShield Editor project in InstallShield Editor. • **Modify the Windows Installer package**—Open this Repackager project's associated Windows Installer package in InstallShield Editor.

Once you have built the Windows Installer package and/or InstallShield Editor file, you can launch InstallShield Editor from the **Repackaged Output** area of the view.

Package Information View

The Package Information view allows you to specify information for the Windows Installer package that you build from the Repackager project. Much of this information may be prepopulated based on settings used in the Repackaging Wizard.

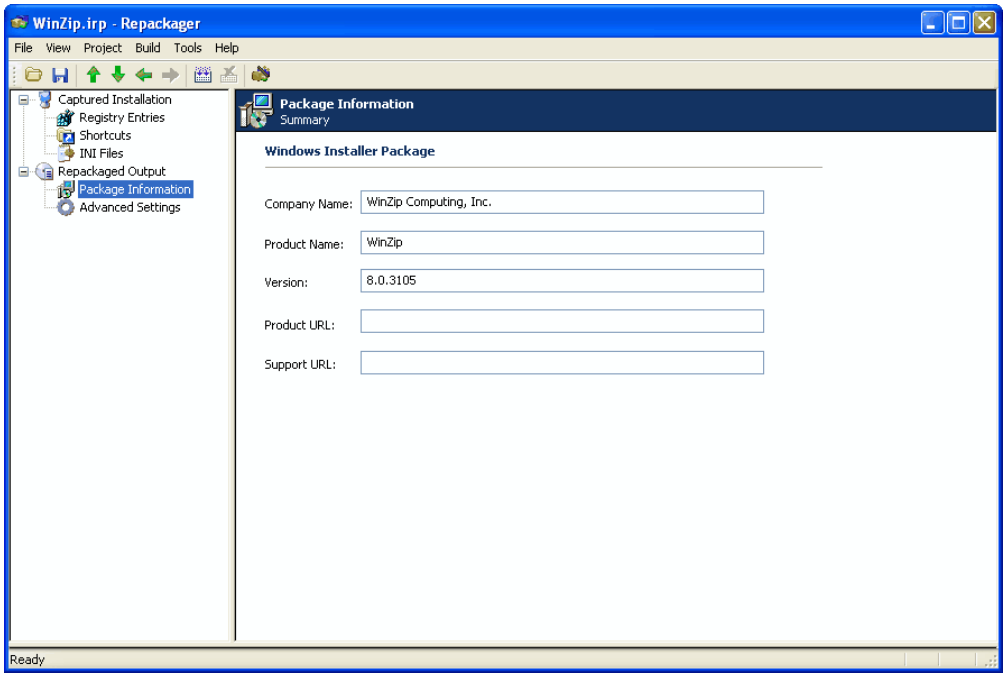

Figure 9-17: Repackager Package Information View

You can configure the following options:

Table 9-22 • Package Information View Options

Option	Description
Company Name	The name of the company that developed the product you are repackaging.
Product Name	The name of the product you are repackaging.
Version	The product's version number.
Product URL	The URL for product information. This appears in Add/Remove Programs in the Control Panel.
Support URL	A URL for support information. This also appears in Add/Remove Programs in the Control Panel, and is often changed during repackaging to provide an internal support URL.

Software Identification Tag View

When you use Repackager to convert a legacy package to a Windows Installer package, by default a tag file is generated for each package when the Windows Installer package is built. You can view and edit tag information in the Repackager interface's **Software Identification Tag** view.

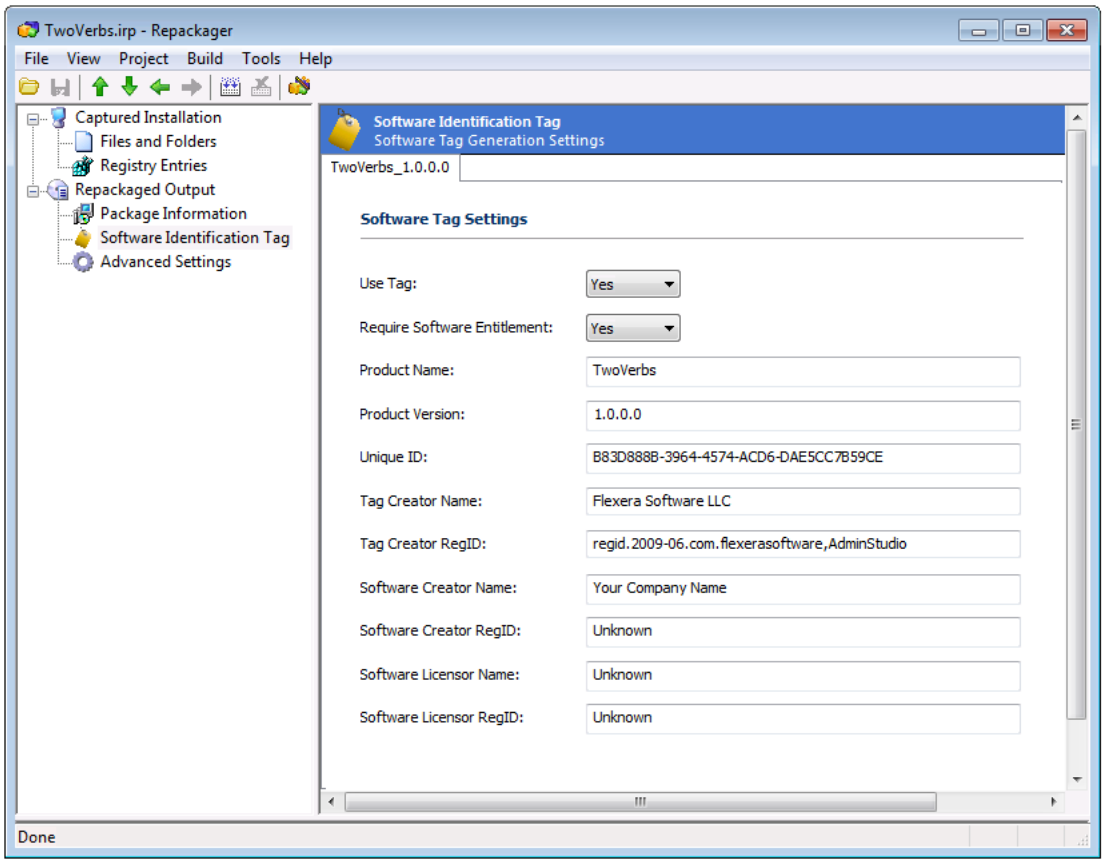

Figure 9-18: Software Identification Tag View

The **Software Identification Tag** tab includes the following properties:

Table 9-23 • Software Identification Tag View Properties

Property	Description
Use Tag	Select **Yes** to enable software ID tag file generation for this package or select **No** to disable it. Using this option enables you to override the setting on the **Build Options** tab of the Repackager **Options** dialog box for this project. The default value is **Yes**.
Require Software Entitlement	To specify that you want to require your product to have a corresponding software entitlement in order for software reconciliation to be considered successful, set this property to **Yes**. In general, if the software must be purchased, this property should be set to **Yes**; if the software is free, this property should be set to **No**.
Product Name	Name of the product, read from the Product Name property of the Windows Installer package.
Product Version	Version of the product, read from the Product Version property of the Windows Installer package.

Table 9-23 • Software Identification Tag View Properties

Property	Description
Unique ID	The product GUID, which is the ProductCode of the MSI package or the unique string used for the Add and Remove Programs uninstall key name, is used to uniquely identify the product in the software identification tag file.
Tag Creator Name	Enter a name to identify the creator of this tag file. The default value is: `Flexera Software LLC`
Tag Creator RegID	Enter a RegID to identify the creator of this tag file, using the following format: `regid.YYYY-MM.ReversedDomainName,optional_division` For example: `regid.2009-06.com.yourcompany,GlobalProductDivision`
Software Creator Name	(Optional) Enter a name to identify the creator of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.
Software Creator RegID	(Optional) Enter a RegID to identify the creator of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.
Software Licensor Name	(Optional) Enter a name to identify the licensor of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.
Software Licensor RegID	(Optional) Enter a RegID to identify the licensor of this package. By default, the value is **Unknown**. If the value of this field is left as **Unknown**, then that exact string will appear in the tag file to indicate that it is not possible to determine the actual value for this field.

Note • *For more information, see About Software Tagging RegIDs and About the Tag Creator Name, Software Creator Name, and Software Licensor Name Fields in the AdminStudio Help Library.*

Advanced Package Settings View

From the **Advanced Package Settings** view, you can configure several additional settings that may apply to your repackaged setup.

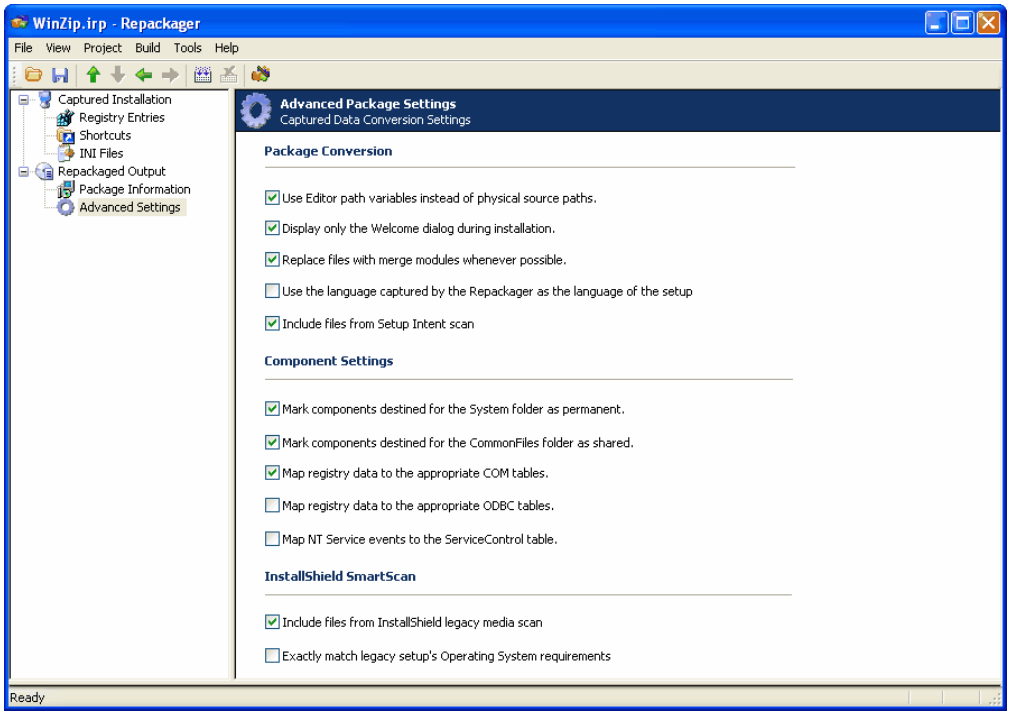

Figure 9-19: Repackager Advanced Package Settings View

Select the appropriate options:

Package Conversion Options

The following package conversion options are available:

Table 9-24 • Package Conversion Options

Option	Description
Use Editor path variables instead of physical source paths	When storing files in the InstallShield Editor project (**.ism**), the Wizard uses path variable locations whenever possible.
Display only the Welcome dialog box during installation	Only the Welcome dialog box is displayed when the Windows Installer package is run on a target machine. If this option is unchecked, the default UI sequence is displayed when the setup is installed.
Replace files with merge modules wherever possible	Following best practice rules, Repackager replaces components with comparable merge modules whenever possible.
Use the language captured by the Repackager as the language of the setup	When selected, the target package's language will be the language detected by Repackager (as displayed in the Captured Installation view).
Include files from Setup Intent scan	Any files identified when running the Setup Intent Wizard will be included in the package (unless you have manually excluded them from the project).

Component Settings Options

The following component settings options are available:

Table 9-25 • Component Settings Options

Option	Description
Mark components destined for the System folder as permanent	Executable files installed to the system folder (System32Folder) are marked as Permanent files and will not be uninstalled when the package is uninstalled. This eliminates ICE09 validation errors.
Mark components destined for the CommonFiles folder as shared	Executable files installed to the CommonFilesFolder (or a subfolder of CommonFilesFolder) are marked as shared files. This ensures that these components can coexist with DLLs installed by previous setups.
Map registry data to the appropriate COM tables	Setting this option reduces the number of ICE33 warnings that can occur during package validation, resulting from data not being mapped to the appropriate MSI tables.
Map registry data to the appropriate ODBC tables	If selected, ODBC-related registry data is mapped to ODBC tables instead of the Registry table. This data will only function correctly if Windows Installer supports the ODBC resource being mapped; it is highly recommended that you do not enable this option if you are unsure whether the ODBC resources are supported correctly by Windows Installer.
Map NT Service events to the ServiceControl table	If selected, NT Service–related registry data is mapped to ServiceControl table instead of the Registry table.

Setup Intent Wizard

Although an installation may have intended to install certain files, these files sometimes may not be installed—often because the files already exist on the target machine (either as the same version or a newer version). These files, although not installed or updated, are needed for the product to execute properly when the setup is run on a system that does not already have these files.

The Setup Intent Wizard allows you to scan a setup to identify files that may not have been captured during repackaging—effectively recognizing the installation's intent for these files.

Tip • *Any files found will be displayed in Repackager in a different color (as specified in the* ***Color*** *tab of the Options dialog box).*

The Setup Intent Wizard consists of the following panels:

- Welcome Panel
- Scanning Project Panel
- Results Panel

Welcome Panel

The first panel in the Setup Intent Wizard informs you the purpose of the Wizard, and warns you the source files for your project must be present for successful scanning.

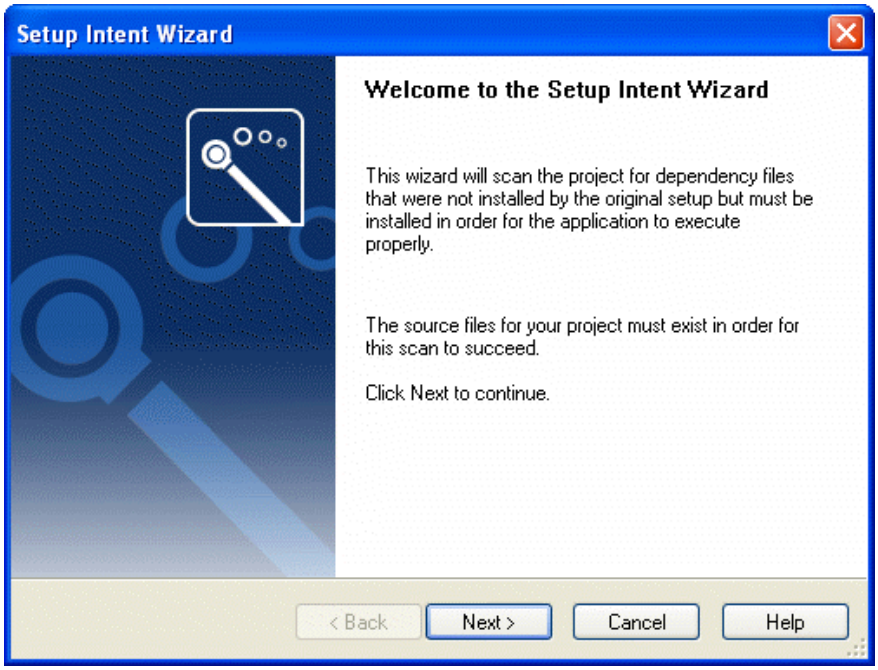

Figure 9-20: Setup Intent Wizard Welcome Panel

Click Next to start the scan and display the **Scanning Project Panel**.

Scanning Project Panel

The Scanning Project Panel is displayed while scanning is in progress. Each file scanned is listed, and a progress bar displays the overall scan progress.

When the scan is complete, the **Results Panel** opens, listing new files that your setup required.

Results Panel

The final panel in the Setup Intent Wizard allows you to view and select new files detected by the Wizard, but not already included in your Repackaging project.

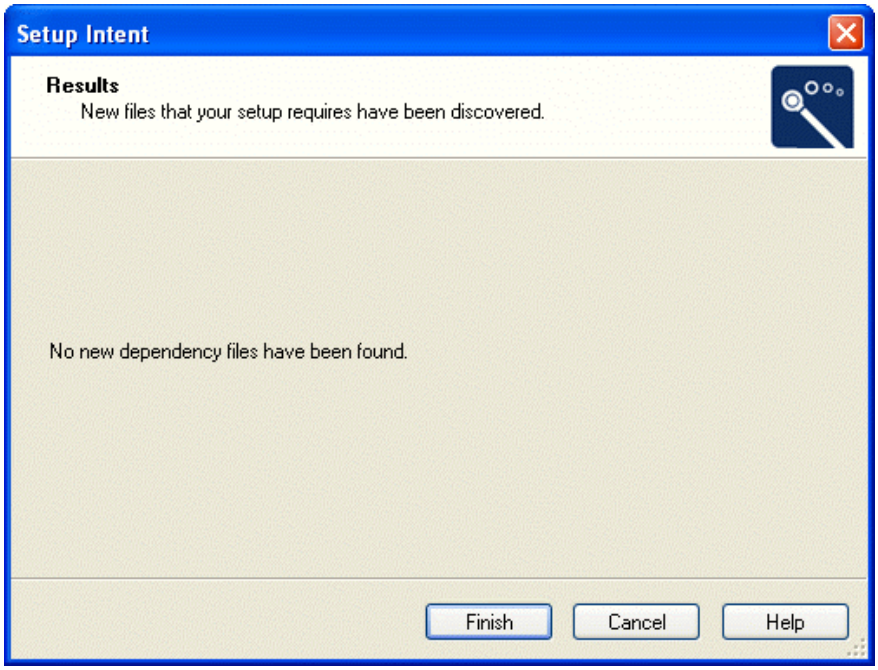

Figure 9-21: Setup Intent Wizard Results Panel

Select the files you want to include in your project which were not identified during repackaging.

Click **Finish** to exit the Setup Intent Wizard and return to the Repackaging project (with selected files automatically added to the project), or click **Back** to return to the **Scanning Project Panel**.

VMware Repackaging Wizard

Repackager includes integration with VMware Workstation's virtual machine technology. This provides you with the ability to launch a VMware session for repackaging purposes, and run different operating systems on the same computer. By using VMware, you are able to forego the traditional "ghosting" for clean images each time a new application is repackaged by simply electing not to save changes to the VMware session. You can then reload the clean state of the operating system, and proceed to the next package.

Note • *AdminStudio supports VMware 3.0 and later.*

Note • *The* ***VMware Repackaging Wizard*** *menu item on the* ***Tools*** *menu is enabled if Repackager finds VMware 3.0 and later installed on the workstation, and if a VMware image exists on that machine. If no VMware images are found, the VMware Repackaging Wizard menu item will be disabled. Repackager reads the information about VMware images from a* `.vmls` *file that can usually be found in the VMware installation directory or in a subdirectory of the user's* `AppData` *directory. The* `.vmls` *file is a text file that contains information about individual VMware images and where the configuration file for each image is located. This file should contain information for at least one VMware image for the* ***VMware Repackaging Wizard*** *menu item to be enabled.*

Using the VMware Repackaging Wizard, you select an available VMware operating system, and then Repackager automatically launches the selected operating system within a VMware session.

The VMware Repackaging Wizard includes two panels:

- Welcome Panel
- VMware Virtual Machines Panel

Welcome Panel

The first panel displayed in the VMware Repackaging Wizard is the Welcome panel. It explains the purpose of this Wizard: to display available VMware images on the current workstation, allowing you to select and launch the one you need.

VMware Virtual Machines Panel

On the VMware Virtual Machines panel, you select a VMware virtual machine available on the current workstation. Repackager automatically launches the selected virtual machine operating system within a VMware session so that you can begin repackaging in that environment.

***Note** • AdminStudio supports VMware 3.0 and later.*

Click Back to return to the **Welcome Panel**; click Launch to launch the selected VMware image.

Exclusions Editor Interface

The following topics cover each tab, menu, and dialog box in the Exclusions Editor:

- Menus
- Files Tab
- .ini Files Tab
- Registry Tab
- File Exclusion Information Dialog Box
- INI File Exclusion Information Dialog Box
- Choose Registry Key Dialog Box
- Edit Registry Key Dialog Box
- About Exclusions Editor Dialog Box

Menus

Menus are not available when running the Exclusions Editor from within Repackager. They are only available when you launch the Exclusions Editor by opening the following file:

```
[AdminStudioInstallDirectory]\Repackager\AnalysisOptions.exe
```

Note • *See Launching Exclusions Editor for more information.*

The following table provides a description of each menu command:

Table 9-26 • Exclusions Editor Menu Commands

Menu	Command	Keyboard Shortcut	Description
File	**New**	Ctrl+N	Creates a new, blank settings file.
File	**Open | Shared Exclusions**		Opens the settings file (**isrepackager.ini**) from the **AdminStudio Shared** directory. Open this settings file when working in a team environment where the exclusion list needs to be stored in a centralized location.
File	**Open | Custom Exclusions**		Allows you to browse to an Exclusions Editor settings file and open it. You would create a custom exclusion file based upon your company's requirements.
File	**Save**	Ctrl+S	Saves the current Exclusions Editor settings file.
File	**Save As**		Saves the current Exclusions Editor settings file to the name and location specified.
File	**Exit**		Exits the Exclusions Editor.
Help	**Help Library**		Displays the online Help Library.
Help	**About Exclusions Editor**		Displays the About Exclusions Editor dialog box.

Files Tab

File exclusions for Repackager indicate which files are automatically marked as excluded in the Repackager project. File exclusions in the OS Snapshot Wizard indicate files that will be excluded from the captured OS snapshot.

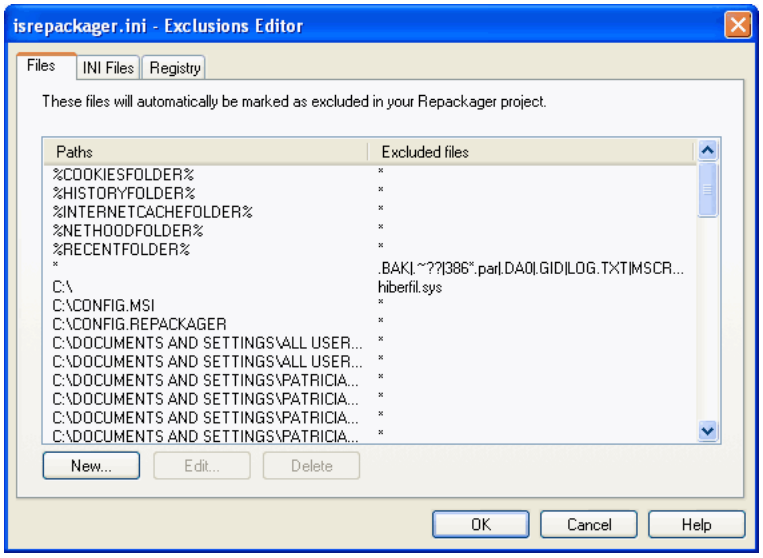

Figure 9-22: Exclusions Editor Files Tab

This **Files** tab contains a list of paths and files currently excluded from the capture process. Specific files, file extensions, and the entire contents of specified directories can be excluded.

The following three buttons allow you to add, edit, and remove files and directories from the exclusion list:

Table 9-27 • Exclusions Editor / Files Tab Buttons

Button	Description
New	Displays the **File Exclusion Information** dialog box from which you can specify additional file exclusions.
Edit	Brings up a dialog box from which you can change settings for the currently selected path in the exclusion list.
Delete	Deletes the currently selected path from the exclusion list.

Note • *It is highly recommended that you do not edit the default exclusions for the OS Snapshot Wizard.*

.ini Files Tab

.ini file exclusions for Repackager indicate which .ini files and sections are automatically marked as excluded in the Repackager project. **.ini** file exclusions in the OS Snapshot Wizard indicate **.ini** files and sections that will be excluded from the captured OS snapshot.

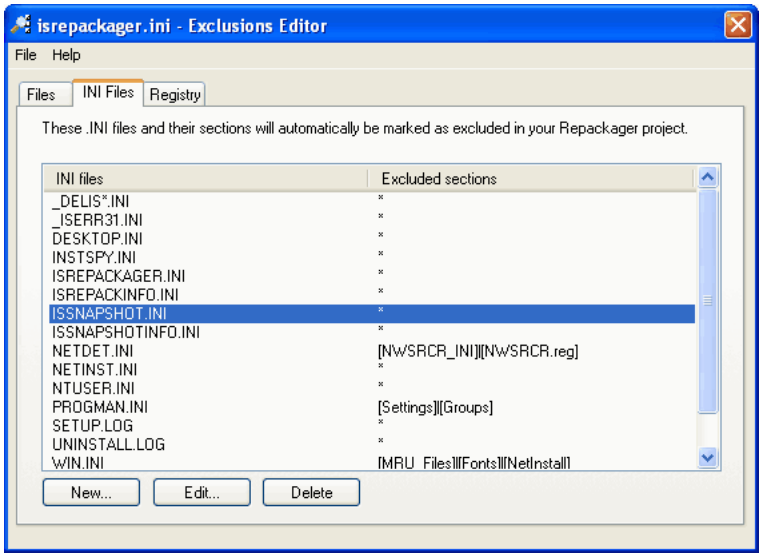

Figure 9-23: Exclusions Editor INI Files Tab

The **INI Files** tab contains a list of the **.ini** files and sections within **.ini** files excluded during analysis. If all sections are excluded, an asterisk (*****) is used in the Excluded Sections column.

The following three buttons allow you to add, edit, and remove **.ini** files from the exclusion list:

Table 9-28 • Exclusions Editor / .ini Files Tab Buttons

Button	Description
New	Displays the **INI File Exclusion Information** dialog box from which you can specify additional .ini file exclusions.
Edit	Brings up a dialog box from which you can edit currently excluded .ini files.
Delete	Deletes the selected .ini file from the exclusion list.

Note • *It is highly recommended that you do not edit the default exclusions for the OS Snapshot Wizard.*

Registry Tab

Registry exclusions for Repackager indicate which registry keys are automatically marked as excluded in the Repackager project. Registry exclusions in the OS Snapshot Wizard indicate registry keys that will be excluded from the captured OS snapshot.

The **Registry** tab contains a list of keys and values to be excluded during registry analysis. For keys that have specific values excluded, the value name appears in the Value column. For keys that have all values excluded, an asterisk (*) represents the entire key in the Value column.

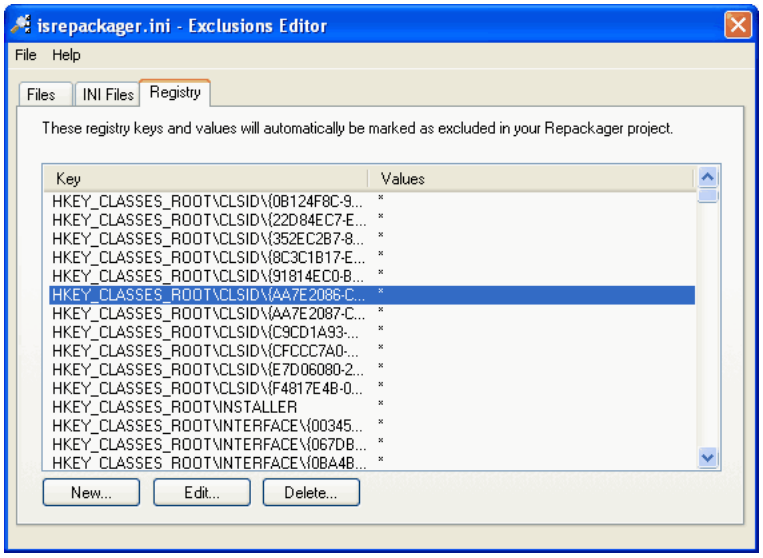

Figure 9-24: Exclusions Editor Registry Tab

There are three buttons available from this dialog box that are used to add, edit, or remove keys from the exclusion list:

Table 9-29 • Exclusions Editor / Registry Tab Buttons

Button	Description
New	Displays the **Choose Registry Key** dialog box, from which you can select registry keys and values for exclusion during analysis.
Edit	Brings up a dialog box from which you can modify the selected key's exclusion settings.
Delete	Removes the selected key from the exclusion list.

Note • *It is highly recommended that you do not edit the default exclusions for the OS Snapshot Wizard.*

File Exclusion Information Dialog Box

The **File Exclusion Information** dialog box, which is accessed by clicking **New** or **Edit** on the Files Tab, allows you to specify files to be excluded from analysis by the capture tool.

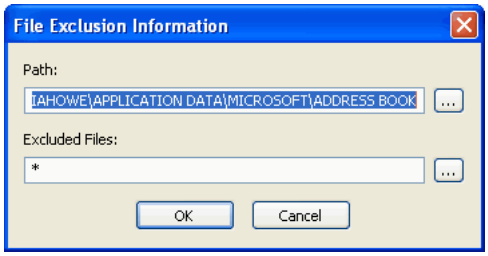

Figure 9-25: File Exclusion Information Dialog Box

Click the Browse button next to the **Path** field and select the directory that contains the file or files you want to exclude. Then, click the Browse button next to the **Excluded Files** field and select the file or files you want to exclude. In the **Excluded Files** field, you can specify files to exclude in the following ways:

- To exclude multiple files from the same directory, separate the file names with pipes (|), such as:

  `file.dll|myfile.exe|anotherfile.exe`

- To exclude all files with a certain extension in the selected directory, enter an asterisk (*) plus the extension, such as:

  `*.txt`

- To exclude all files in the selected directory, enter an asterisk (*) .

Click **OK** to return to the Files Tab.

INI File Exclusion Information Dialog Box

The INI File Exclusion Information dialog box, which is accessed by clicking **New** or **Edit** on the .ini Files Tab, allows you to specify **.ini** files to be excluded from analysis by the capture tool.

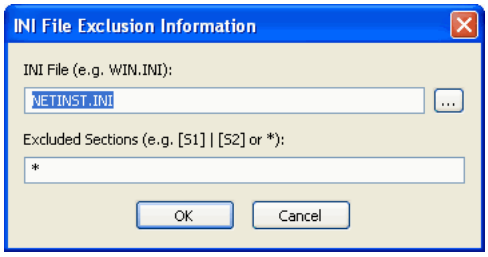

Figure 9-26: INI File Exclusion Information Dialog Box

Enter or browse to the **.ini** file you want to exclude, and provide the section(s) to be excluded. Sections must be enclosed in square brackets ([]), and separated by vertical bars (|) if more than one section in an **.ini** file is to be excluded (for example, [Groups],[Settings]). You can also exclude all **.ini** file sections by only entering an asterisk in the Excluded Sections field.

Click **OK** to return to the .ini Files Tab.

Choose Registry Key Dialog Box

The Choose Registry Key dialog box, which is accessed by clicking **New** on the Registry Tab, provides a way for you to select registry keys that you want excluded from analysis.

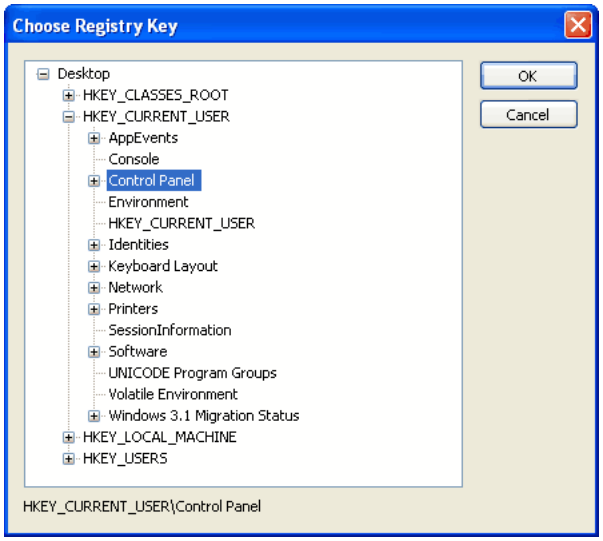

Figure 9-27: Choose Registry Key Dialog Box

Navigate through the tree until you find the key you want to exclude and click **OK** to return to the Registry Tab.

By default, all values in that key are excluded. To modify this, select the key from the Registry Tab and click **Edit** to display the **Edit Registry Key** dialog box.

Tip • *You can also select a registry hive to exclude. As with individual registry keys, all values (and keys) contained in the hive are excluded by default.*

Edit Registry Key Dialog Box

When you select a registry key on the Registry Tab and click **Edit**, the **Edit Registry Key** dialog box opens.

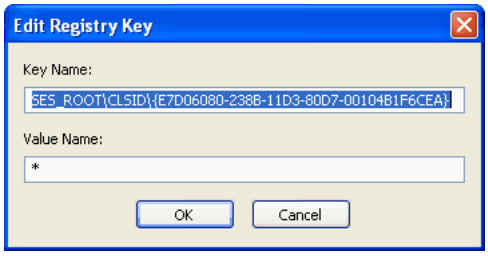

Figure 9-28: Edit Registry Key Dialog Box

You can modify the **Key Name** and/or **Value Name** excluded during analysis.

Click OK to return to the Registry Tab.

About Exclusions Editor Dialog Box

The About Exclusions Editor dialog box displays version and copyright information for the Exclusions Editor. This may be useful if you need to report a problem encountered when using the Exclusions Editor.

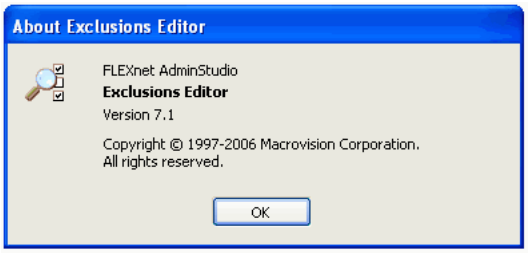

Figure 9-29: About Exclusions Editor Dialog Box

Options.ini File

The **Options.ini** file is created by Repackager and is used during the conversion of Repackager output into an InstallShield Editor project (**.ism**). It includes basic project settings which are required by Repackager. Information about this file is presented in the following sections:

- [MMExclusions] Section
- [General] Section
- [IgnoreShortcuts] Section
- Options.ini File Defaults

Note • *Although many of these settings have a one-to-one correspondence with settings available in the Repackager interface, some can only be accessed by editing this .ini file directly.*

[MMExclusions] Section

This section lists the merge module GUIDs that should not be included in your package. This section only applies if you have selected to replace files with merge modules during conversion.

[General] Section

Following are descriptions of properties that can be set in the [General] section of the Options.ini file.

Table 9-30 • Options.ini File/General Section Properties

Properties	Description
AddlMMSearchPath	Use to specify additional directories containing custom merge modules to use during repackaging.

Table 9-30 • Options.ini File/General Section Properties (cont.)

Properties	Description
ALLUSERS	If this option is set to **Y** and if the template file (specified using the `ProjectTemplate` option) does not contain **ALLUSERS** in its Property table, then a property named **ALLUSERS** with a value of 2 will be added to the Property table. This will cause silent installs to behave as non-silent installs do (non-silent installs rely on a custom action to set this property). This option is set to **Y** by default.
ARPPublisher	This populates the **Publisher** field in **Add/Remove Programs** in the Control Panel.
ARPPublisherURL	This populates the **Publisher URL** field in **Add/Remove Programs** in the Control Panel.
ARPSupportURL	This populates the **Support URL** field in **Add/Remove Programs** in the Control Panel.
AutoUpgrade	Upgrades the InstallShield Editor template project file (if used) if needed. This option is set to **Y** by default.
BuildCompressed	This option, set to **Y** by default, compresses all necessary files inside the MSI package, as opposed to storing them outside of the MSI database.
BuildFeatures	No longer used.
BuildMSI	Specifies whether or not to build the MSI package after building ISM. This option is set to **Y** by default.
BuildProduct	Identifies the InstallShield Editor Product configuration to build.
BuildProScannedFiles	Files identified in the Media Scan Wizard will be included in the package (unless you have manually excluded them from the project). This option is set to **Y** by default.
BuildRelease	Identifies which InstallShield Editor Release configuration to build.
BuildStaticScannedFiles	Any files identified when running the Setup Intent Wizard will be included in the package (unless you have manually excluded them from the project). This option is set to **Y** by default.

Table 9-30 • Options.ini File/General Section Properties (cont.)

Properties	Description
COMMapping	When this option is set to **Y**, registry data pertaining to COM information will be mapped to the appropriate MSI tables whenever possible. This reduces the number of ICE33 warnings that can occur during package validation. This option is set to **Y** by default.
CreateSetupExe	This option, which is set to **N** by default, allows you to automatically create a **Setup.exe** file to begin the installation.
EnablePathVariables	Set this option to **Y** to use path variables. If enabled, the repackaged setup is significantly more portable between computers (with dependencies to the system where the setup was repackaged removed). This option is set to **Y** by default.
ExtraHKCRPermanent	When this option is set to **Y**, any changes made to existing registry data during repackaging which cannot be identified as belonging to a file installed by the setup are placed in permanent components, which are not removed by default when the repackaged setup is uninstalled. This prevents inadvertently removing registry entries required by other applications that were not originally made by the repackaged setup. By default, this option is set to **Y**, and it is strongly recommended that you retain this setting to prevent unexpected results when the package is uninstalled.
INSTALLDIR	This value will be used for **INSTALLDIR** (the installation directory) and can use a Windows Installer property such as `[ProgramFilesFolder]\MyProgram`
ISProSetup	If one of the original setups that was repackaged was created by InstallShield Professional 5.5 or later, this option will be set to **Y**. This option is set to **N** by default.
LimitedUI	Set this option to **Y** display only the InstallWelcome dialog box when the MSI package is run. This option is set to **Y** by default.
MultiUserShortcuts	When this option is set to **Y**, non-advertised shortcuts will work for all users on the target system. This will generate ICE43 warnings when validation is run. If you know the installation is for a single-user environment, change this option to **N** to avoid these warnings. This option is set to **Y** by default.

Table 9-30 • Options.ini File/General Section Properties (cont.)

Properties	Description
MMPathVersion	When including merge modules, if this option is set to **Y**, compare path and version information. This option is set to **Y** by default.
NewInstallDir	Value for INSTALLDIR variable.
ODBCMapping	If selected, ODBC-related registry data is mapped to ODBC tables instead of the Registry table. This data will only function correctly if Windows Installer supports the ODBC resource being mapped; it is recommended that you do not enable this option if you are unsure whether the ODBC resources are supported correctly by Windows Installer. This option is set to **N** by default.
OSGranular	For ProLogged Projects: • **If this is set to Y**, component conditions will store specific operating system information. For example, if the filter is NT4, the condition will be (VersionNT=4). • **If this is set to N**, component conditions will store a grouping of the operating system. For example, if the filter is NT4, the condition will be (VersionNT). This is set to **N** by default.
OtherComponentFileExtensions	Specify additional extensions to use when defining components. MSI has rules governing component creation for file types. For example, portable executable (PE) files must have separate components. Therefore, certain extensions have been defined (EXE, DLL, etc.). Additional extensions can be defined in the options.ini file in the format of: `Type1:Extension1|Type2:Extension2` where Type is one of the following numbers: `0 = other` `1 = PE` `2 = help` `3 = font` `4 = INI` This option is set to 1:QTX|1:AX by default.
OtherFilesNewComponents	When this option is set to Y, one component will be created for every file in your setup. Otherwise, new components will only be created for each portable executable file. This option is set to N by default.

Table 9-30 • Options.ini File/General Section Properties (cont.)

Properties	Description
PermanentSystemFiles	Set this option to Y to mark portable executable files installed to a system folder (System32Folder) as Permanent files (will not be uninstalled). This option is set to Y by default.
PermanentSystemFilesSubfolders	Set this option to Y to mark files installed to a subfolder of a system folder as Permanent files (will not be uninstalled). This option is set to N by default.
ProductName	The name of the product. You must provide a value for this option either in this file or in Repackager.
ProductVersion	The version of the product. You must provide a value for this option either in this file or in Repackager.
Project	Name of InstallShield Editor project file.
ProjectTemplate	The name and location of the default InstallShield Editor project template (**.ism**) used in the conversion process.
ServiceControlEvents	When this option is set to Y, the ServiceControl table will be populated for NT Services. This option is set to N by default.
SharedCommonFiles	Set this option to Y to mark portable executable files installed to the CommonFilesFolder (or subfolder) as Shared files. This option is set to Y by default.
SISAuthor	This option populates the Author field of the Summary Information Stream (accessible from the package's properties). This option is set to Repackager by default.
SISSubject	This option populates the Subject field of the Summary Information Stream (accessible from the package's properties).
SkipMMIfShortcut	Merge Modules that have files pointed to by shortcuts should be skipped even if they are not in the exclusion list. This option is set to Y by default.
UseAdvertisedShortcuts	Create advertised shortcuts where applicable. This option is set to Y by default.

Table 9-30 • Options.ini File/General Section Properties (cont.)

Properties	Description
UseHKCUProxy	Set this option to Y to copy all registry entries in HKEY_CURRENT_USER to HKEY_USERS\.default. This option is set to N by default.
UseLanguage	When selected, the target package's language will be the language detected by Repackager (as displayed in the Captured Installation view). This option is set to N by default.
UseMergeModules	Set this option to Y to replace files with merge modules whenever possible during conversion. Exceptions are listed under the [MMExclusions] section. This option is set to Y by default.
UseSrcFolder	Set this option to Y to make the InstallShield Editor project (**.ism**) folder default to the Repackager output project (**.inc**) folder. This option is set to Y by default.

[IgnoreShortcuts] Section

Shortcuts that refer to executables listed in this section will be ignored during conversion.

Options.ini File Defaults

This section lists the default settings in the **Options.ini** file that is shipped with Repackager:

```
[MMExclusions]

[General]
UseSrcFolder=Y
EnablePathVariables=Y
UseHKCUProxy=N
LimitedUI=Y
SISAuthor=InstallShield Repackager
OtherFilesNewComponents=N
UseMergeModules=Y
SharedCommonFiles=Y
PermanentSystemFiles=Y
PermanentSystemFilesSubfolders=N
ExtraHKCRPermanent=Y
COMMapping=Y
ODBCMapping=N
ServiceControlEvents=N
ALLUSERS=Y
ProjectTemplate=
BuildCompressed=Y
CreateSetupExe=N
MultiUserShortcuts=Y
ISProSetup=N
```

```
BuildFeatures=Y
OtherComponentFileExtensions=1:QTX|1:AX
OSGranular=N
MMPathVersion=N

[IgnoreShortcuts]
TargetExe1=isuninst.exe
TargetExe2=uninst.exe
TargetExe3=setup.exe
TargetExe4=uninst.dll
TargetExe5=rnuninst.exe
```

Files Associated with Repackager

Several files are associated with Repackager. Some are output files, and some contain default information for Repackager to function. These files are described in the tables below.

Files Used By the Repackaging Wizard

The following files are used by the Repackaging Wizard.

Table 9-31 • Files Used by the Repackaging Wizard

File	Location	Description
`Repack.ini`	**Windows** If the file is not found in the Windows directory, then the Repackaging Wizard extracts a default file from the resource and stores it in the Windows directory.	This is an input file for the Repackaging Wizard. It contains a list of the exclusions for the files, folders, `.ini` files and registry entries for the last used configuration of Repackager. During the Snapshot and Install Monitoring modes of repackaging, the entries in this file are filtered out from the repackaged output. See Repack.ini File for more information.

Table 9-31 • Files Used by the Repackaging Wizard (cont.)

File	Location	Description
`Options.ini`	Repackager output directory (specified in the Set Target Project Information and Capture Settings Panel). The Repackaging Wizard makes a copy of the default **options.ini** that is present in the following directory: `[AdminStudioInstallDirectory]\Repackager` and saves this file in the same location as the current repackaged output file (`.inc`). Additionally, the `UseSrcFolder` flag can be used to store the created InstallShield Editor file in the same directory as the `.inc` file.	This is an output file from the Repackaging Wizard. It contains configuration information about the repackaged setup, including whether to use path variables, whether to display a limited user interface during installation of the repackaged setup and whether every file will go into its own component.
`productname``.inc`	Created in the **Repackager** output directory (specified in the Set Target Project Information and Capture Settings Panel).	This is an output file from the Repackaging Wizard. It contains the locations of files, **.ini** files, and shortcuts detected by Repackager as having been created, modified, or removed during repackaging. Also, it contains a link to the **standard.nir** and **deleted.isr** files for registry information.
`updated.isr`	Created in the **Repackager** output directory (specified in the Set Target Project Information and Capture Settings Panel).	This is an output file from the Repackaging Wizard when the Install Monitoring method is used. It contains registry additions and modifications detected during repackaging using installation monitoring only.
`deleted.isr`	Created in the **Repackager** output directory (specified in the Set Target Project Information and Capture Settings Panel).	This is an output file from the Repackaging Wizard. It contains registry deletions detected during repackaging using Installation Monitoring and Snapshot.
`standard.nir`	Created in the Repackager output directory (specified in the Set Target Project Information and Capture Settings Panel).	This is an output file from the Repackaging Wizard when the Snapshot method is used. It contains registry additions and modifications detected during repackaging using the Snapshot method.

Table 9-31 • Files Used by the Repackaging Wizard (cont.)

File	Location	Description
*.spy	Created in the following folder: *WindowsDrive***InstallHook**	This is an output file from the Repackaging Wizard when the Install Monitoring method is used. It contains API call logs for installation monitoring.
Default.ini	**[AdminStudioInstallDirectory]\Repackager**	Contains the default configuration for Repackager, including default exclusion information.
Repack.log	*WindowsFolder*	Log file created by the Repackaging Wizard.

Files Used By the Repackager Interface

The following files are used by the Repackager interface.

Table 9-32 • Files Used by the Repackager Interface

File	Location	Description
*.irp	Saved in the same location as the .inc file.	This is a Repackager project file. It is the main file for each repackaged or converted setup. It contains information about the .inc files referred to and also stores the file, folder, .ini files and registry exclusions made in the Repackager Interface.
<Exclusion List>.ini	varies	This is an input file for the conversion of the .inc file to an MSI package. It contains the list of files, folder, .ini files and registry entries exclusions. Users can choose a different exclusion file from the Repackager Interface and the exclusions will be reflected in the Interface.
Options.ini	Saved in the same location as the .inc file.	This is an input file for the conversion of the .inc file to an MSI package. It contains configuration information about the repackaged setup, including whether to use path variables, whether to display a limited user interface during installation of the repackaged setup, and whether every file will go into its own component. Additionally, the UseSrcFolder flag can be used to store the created InstallShield Editor file in the same directory as the .inc file.

Repack.ini File

The **Repack.ini** file is the default capture exclusion file for the Repackaging Wizard. It contains exclusions to be applied during repackaging, and mainly focuses on specific items that should not be included in applications, such as InstallShield Professional-specific COM settings, OS settings, and Internet Explorer settings. Any item excluded during capture will not be available for exclusion/inclusion in the Repackager project file.

The file is located in the Windows folder, and can be edited using the Exclusions Editor, or using a text editor.

Note *• It is strongly recommended that you not modify this file, as it increases the likelihood of either inadvertently omitting necessary pieces of applications you are repackaging, or including registry entries or files that should not be part of the repackaged application. In the first scenario, you may need to recapture your application; in the second, you may need to exclude more from the Repackager project.*

Instead, capture your application using the default exclusions in the Repackaging Wizard, and then selectively exclude captured data using the Repackager Interface. This way, if you inadvertently exclude a necessary piece, you need only reinclude it in Repackager—not recapture the application entirely.

Using InstallShield to Chain Multiple Windows Installer Packages Together

If your application includes more than one Windows Installer (***.msi**) package, you can use InstallShield Editor to chain them together using a nested MSI Custom Action. This enables you to run multiple MSI files within a single setup process.

To do this, you open the InstallShield Editor **Custom Actions** view and use the **Custom Action Wizard**.

Task ***To add a Nested MSI Custom Action:***

1. Launch **InstallShield Editor**.
2. Open your Windows Installer package in Direct Edit Mode.
3. In the Installation Designer, expand the **Behavior and Logic** tree and select the **Custom Actions** node. The Custom Actions view opens.
4. In the middle pane, right-click **Custom Actions** and then click **Custom Action Wizard**.
5. Follow the **Nested Installations** procedure in the InstallShield Editor user documentation to create a nested MSI Custom Action.

Troubleshooting

Repackager Troubleshooting information is presented in the following topics:

- Troubleshooting Guidelines for WinINSTALL Conversion
- Troubleshooting Guidelines for SMS Conversion
- Resolving an "Error Building Table File" Error

Troubleshooting Guidelines for WinINSTALL Conversion

Use the following troubleshooting guidelines to identify and fix WinINSTALL conversion problems.

- **Repackager tool supports 6.0, 6.5, and 7.x project formats only.** For all other formats, please use the WinINSTALL LE tool available as a free download in Windows 2000 to convert to 7.x files.
- **Repackager tool cannot convert WinINSTALL .NAI files**—It can only convert WinINSTALL projects that have been converted to text (**.txt**).
- **All files must be available**—All the files that were available to the original WinINSTALL installation project must be available to the converted installation at the exact same locations.
- **Not all elements of a WinINSTALL installation are converted**—Because WinINSTALL installations are based on a different technology than Windows Installer, not all elements of a WinINSTALL installation are converted. Only the installation of files, registry changes, and other system changes are converted.
- **Custom logic is not converted**—Custom logic written in WinINSTALL's custom scripting language is not converted.
- **WinINSTALL environment variable assignments are not converted**—To re-add environment variable assignments in a Windows Installer installation, open the converted project in InstallShield Editor and use the Environment Variable view.
- **WinINSTALL variables are converted to a Windows Installer variable**—If the target path of a file contains a WinINSTALL variable, then the WinINSTALL variable is converted to a Windows Installer variable.
- **Specify @ variables at conversion time**—If the source path of a file in WinINSTALL contains either the @Server or @Wininstall variable, you can specify the values of these two variables at conversion time in the Repackager.
- **The WinINSTALL Preinstall and Postinstall scripts are not converted.**

Troubleshooting Guidelines for SMS Conversion

Use the following troubleshooting guidelines to identify and fix SMS conversion problems.

- **All files must be available**—All the files that were available to the original SMS installation project must be available to the converted installation at the exact same locations.
- **Not all elements of an SMS installation are converted**—Because SMS installations are based on a different technology than Windows Installer, not all elements of a SMS installation are converted. Only the installation of files, registry changes, **.ini** Files, ODBC, NT Services, Fonts, Shortcuts, Variables, and other system changes are converted.
- **Custom logic is not converted**—Custom logic written in SMS's custom scripting language is not converted.
- **SMS environment variable assignments are not converted**—To re-add environment variable assignments in a Windows Installer installation, open the converted project in InstallShield Editor and use the Environment Variable view.

Resolving an "Error Building Table File" Error

When building with Repackager, if you have received the following error message during the build:

```
ISDEV: fatal Error 5023: Error building table File
```

your first step is to go to the Repackager Interface and check whether the number of files installed by this setup is greater than 32,767. If it is, this error occurs because Windows Installer supports 32,767 files in the File table but the package being built exceeds this limit. See Authoring a Large Package in Windows Installer Help for more information.

If you want to fix this error using Repackager, perform the steps listed below.

Task ***To fix this error using Repackager:***

1. Browse to the appropriate directory:
   - If you are using the standalone Repackager, browse to the Repackager folder.
   - If you are using the Repackager on a machine where AdminStudio is fully installed, browse to the following directory:

     `<AdminStudio INSTALLDIR>\Editor\Support\0409`
2. Locate the `IsMsiPKg.itp` and `IsMsiPKgLarge.itp` files in this directory.
3. Rename `IsMsiPKg.itp` to `IsMsiPKg.itp.bak`.
4. Make a copy of `IsMsiPKgLarge.itp` and rename the copy `IsMsiPKg.itp`.
5. Perform the conversion and create the MSI.
6. Delete `IsMsiPKg.itp`.
7. Rename `IsMsiPKg.itp.bak` back to `IsMsiPKg.itp`, thereby restoring the original file.

Note • *Transforms and patches cannot be created between two packages with different column types.*

Note • *For more information, see the Authoring a Large Package and File Table topics in the Windows Installer Help.*

10

Performing Virtualization and Repackaging Using the Automated Application Converter

Edition *• The Automated Application Converter is included with AdminStudio Professional and Enterprise Editions, and you can use it to perform automated repackaging on a virtual machine. However, if you want to also use it to perform conversion to virtual packages, you need to also purchase the Virtualization add-on pack.*

You can use the Automated Application Converter to convert a single package or a group of packages into Microsoft App-V, VMware ThinApp, Citrix XenApp, and Symantec Workspace virtual application formats.

When converting a Windows Installer package to a virtual package, you often need to repackage it prior to being able to successfully convert it. The reason for this is that it is not possible to determine the run-time behavior of certain Windows Installer package elements—such as custom actions, conditional components, and launch conditions—without actually installing the package.

You can use the Automated Application Converter to:

- Examine a group of selected setups.
- Perform automated virtualization of setups that can be cleanly virtualized.
- Perform automated repackaging of those setups that cannot be cleanly virtualized (due to custom actions, etc.), and then perform automated virtualization of those repackaged MSIs.

Note *• You can also use the Application Manager* ***Conversion Wizard*** *to quickly convert one or multiple Windows Installer packages or legacy installers to virtual packages using default Automated Application Converter settings. For more information, see* *Using the Conversion Wizard to Perform Express Conversion to Virtual Packages or Automated Repackaging**.*

Information about using the Automated Application Converter is presented in the following sections:

Table 10-1 • AdminStudio Automated Application Converter Help Library

Section	Description
About the Automated Application Converter	Describes the benefits of using the Automated Application Converter to perform automated repackaging and virtualization, and provides an overview of its workflow.
Getting Started With the Automated Application Converter	Explains how to use the Application Conversion Project Wizard to get started using the Automated Application Converter to perform automated repackaging and virtualization.
Managing Virtual Machines	Explains how to use the Virtual Machine Import wizard to add new virtual images to the Automated Application Converter and how to manage virtual machines on the **Machines** tab.
Managing Packages to Convert	Explains how to use the Package Import Wizard to add packages to the Automated Application Converter, and how to manage packages on the **Packages** tab.
Using the Application Conversion Wizard to Perform Automated Package Conversion	Explains how to use the Application Conversion Wizard to perform a conversion run using the selected packages and virtual machines, and how to view conversion run log report information.
Testing Packages	Explains how to quickly launch a package for testing on a virtual machine directly from Automated Application Converter.
Importing Converted Packages into the Application Catalog	Explains how to import converted virtual packages or repackaged Windows Installer packages into the AdminStudio Application Catalog.
Publishing Converted Packages to a Distribution System	Explains how to publish an application containing converted virtual packages or repackaged Windows Installer packages to a distribution system.
Setting Default Project Properties	Explains how to set project-wide default options on the **Project Options** dialog box.
Capturing Virtualization Context	Explains the purpose of the *packagename*.**context.msi** file that is created during repackaging.
Reference	Describes each of the user interface elements and Wizard panels that you might encounter when using the Automated Application Converter. The help topics in this Reference section are the same detailed documentation that is displayed when you press the F1 key or click the **Help** button while working in a dialog box.
Troubleshooting	Includes information to help you resolve typical problems that you might encounter when using the Automated Application Converter.

Note • *Automated Application Converter is available in a Single Application Version (one-at-a-time conversion) and a Multiple Application Version (batch conversion). For more information, see AdminStudio Editions and Components.*

Getting Started With Application Virtualization

AdminStudio provides support for the conversion of Windows Installer packages to the following virtual application formats:

- Microsoft App-V virtual packages (versions 4.x and 5.0)
- VMware ThinApp virtual packages
- Citrix XenApp virtual packages
- Symantec Workspace virtual packages

You have several options when deciding how you want to create a virtual application, depending upon your source files, whether you are an enterprise user or an independent software vendor, and the degree of customization you want to perform:

Table 10-2 • Application Virtualization Support in AdminStudio

If you have ...	And want to ...	Use ...	Description
Windows Installer package(s)  Legacy application(s) 	**Convert it to a virtual package with ...** • Customized App-V options • Default ThinApp, XenApp, Symantec options • Default isolation options	**Automated Application Converter**	Use Automated Application Converter to convert a single or group of Windows Installer (**.msi**) and legacy (**.exe**) packages to virtual applications. For detailed information, see Using the Application Conversion Project Wizard to Perform an End-to-End Conversion. ***Note*** • *For more information, see Using Automated Application Converter vs. the InstallShield Virtual Assistants.*

Table 10-2 • Application Virtualization Support in AdminStudio (cont.)

If you have ...	And want to ...	Use ...	Description
Windows Installer package or InstallShield project 	**Convert it to a virtual package with ...** • Modified package contents, registry settings, and shortcuts • Custom isolation options on folders and registry entries • Operating system and/or language requirements	**InstallShield Editor Microsoft App-V Assistant** **or** **InstallShield Editor Citrix Assistant** **or** **InstallShield Editor ThinApp Assistant**  ***Important*** • *InstallShield Editor does not support conversion to Symantec Workspace virtual package format.*	Use the InstallShield Editor Microsoft App-V Assistant, ThinApp Assistant or Citrix Assistant to create a virtual application from an InstallShield project or a Windows Installer package. Customization options include: • Modifying package contents, registry settings, and shortcuts • Setting custom isolation options on folders and registry entries • Setting operating system and/or language requirements • Specifying deployment server  ***Note*** • *For more information, see Using Automated Application Converter vs. the InstallShield Virtual Assistants*. For detailed information on how to use the Microsoft App-V Assistant, ThinApp Assistant, and Citrix Assistant, see *Creating Customized Virtual Applications* in the InstallShield Help Library.

Table 10-2 • Application Virtualization Support in AdminStudio (cont.)

If you have ...	And want to ...	Use ...	Description
Repackager Project 	**Convert it to a virtual package with ...** • No modifications • Default isolation options	**Repackager**	By selecting an option on the **Repackaged Output** view, you can simultaneously build an InstallShield Editor project, a Windows Installer package, and any of the following virtual package types: • Microsoft App-V 4.x or 5.0 • VMware ThinApp • Citrix XenApp • Symantec Workspace For information on this feature, see Automatically Generating a Virtual Application During Repackager Project Build.

Using Automated Application Converter vs. the InstallShield Virtual Assistants

Whether you should choose to use Automated Application Converter or an InstallShield Virtual Assistant to perform virtualization could depend upon whether you are a system administrator for an enterprise or an independent software vendor (ISV):

- **Enterprises: Automated Application Converter**—Automated Application Converter is the tool of choice when doing a mass conversion of a variety of setups to virtual packages because it can operate on multiple packages in one project and handle repackaging when it is necessary. This scenario most often applies to enterprises.
- **ISVs: InstallShield Virtual Assistants**—InstallShield Virtual Assistants could be used when focusing on one particular Windows Installer package that does not need to be repackaged. This scenario most often applies to ISVs.

Important • *InstallShield Editor does not support conversion to Symantec Workspace virtual package format. Also, the Microsoft App-V Assistant does not offer the option to perform conversion to App-V 5.0 format using the Microsoft App-V 5.0 Sequencer (which is offered by the Automated Application Converter). The App-V Assistant uses AdminStudio's native technology to perform the conversion.*

The InstallShield Virtual Assistants allow for customizing the various virtualization-related options for converting a Windows Installer package to a virtual package. In addition, it is possible to make modifications to the source Windows Installer **.msi** file.

Most of the package-level virtualization options—such as whether to compress the package or not—are also available in Automated Application Converter, but file and registry-specific isolation options are only available in the InstallShield Virtual Assistants.

Also, while Automated Application Converter enables you to customize the majority of App-V virtualization options, it does not enable you to set VMware ThinApp or Citrix XenApp conversion options. If the user needs to set some ThinApp or XenApp conversion options, then it would be necessary to use the InstallShield Virtual Assistant for VMware ThinApp or Citrix XenApp.

About Application Virtualization

Note • *This section provides a description of virtualization in general for those that are not familiar with it. It does not represent the architecture of any specific vendor.*

A typical Windows application has dependencies on components that are shared by multiple applications, such as registry entries or COM controls. When an installation author recognizes that their application requires a shared component—such as MDAC (Microsoft Data Access Components)—they include a merge module to install that component.

When one of these shared components is installed during an application's installation, it is possible that a previously-installed version of the same component could be overwritten, causing the existing application to break. Because of these possible problems, extensive compatibility testing needs to be performed before an application can be distributed in the enterprise environment. The following diagram provides an example of two conflicting installed applications.

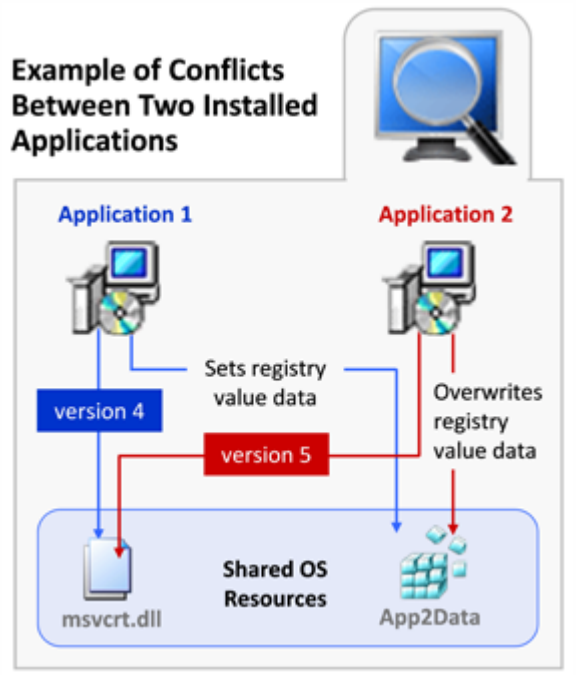

Figure 10-1: Example of Conflicts Between Two Installed Applications

Virtualization simplifies the situation by keeping the application layer and the operating system layer separate, so that the virtual application has no impact on the other applications. In application virtualization, a container or isolation environment is created around the application: a controlled virtual space for application execution that separates the interaction between an application and the underlying operating system's resources in order to protect applications from conflicting with each other.

The following diagram provides an example of how application virtualization would solve the conflicts shown in the previous example.

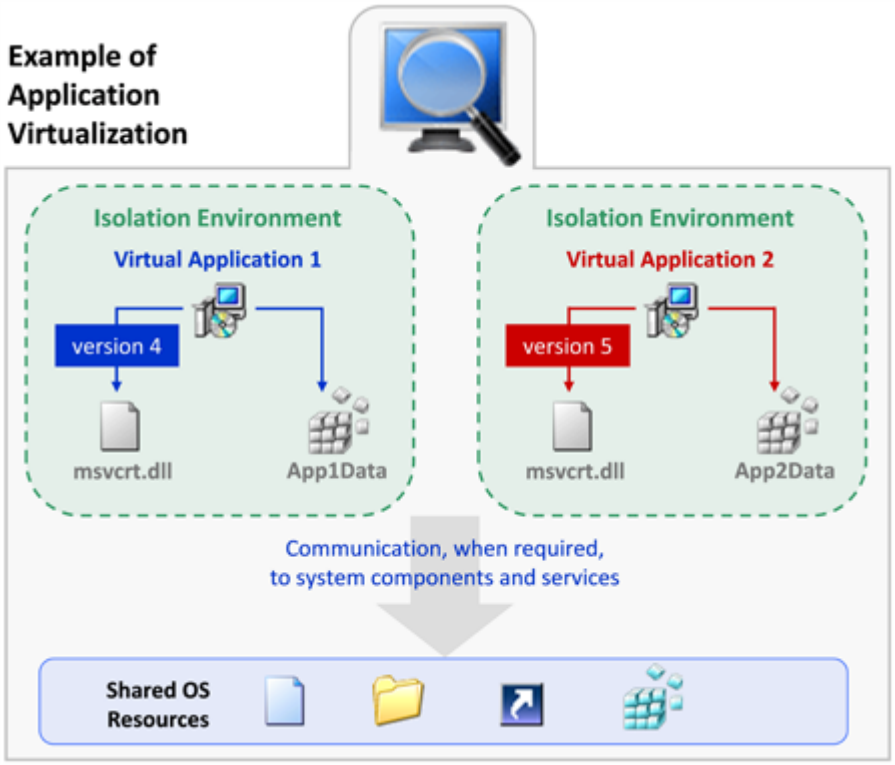

Figure 10-2: Example of Application Virtualization

Application virtualization allows the configuration of an application to be standardized to an isolation environment, rather than to an individual user's desktop machine. Application objects, files and registry settings are contained within this isolation environment. Critical application resources are managed locally by the isolation environment, thus minimizing resource dependencies between applications.

Application virtualization greatly reduces the scope for conflicts between applications and, therefore, simplifies compatibility testing.

About Microsoft Application Virtualization

Microsoft Application Virtualization (App-V) provides the capability to make applications available to end user computers without having to install the applications directly on those computers. Information on Microsoft Application Virtualization is presented in the following topics:

- About Microsoft Application Virtualization (App-V)
- Components of an App-V Package
- Comparison of the App-V 5.0 Conversion Methods
- Support for App-V 5.0 SP2 Shell Extension and Runtime Features
- Creating 64-Bit App-V Packages
- Editing an OSD File to Make Advanced Changes to an App-V 4.x Package

- How Windows Services Are Integrated into an App-V Package

About Microsoft Application Virtualization (App-V)

Microsoft Application Virtualization (App-V) enables applications to run as network services, removing the need for local installation of the applications. An App-V package runs in a self-contained, virtual environment. The virtual environment contains the information necessary to run the application on the client without installing the application locally. Only the App-V client needs to be installed on the client machines. Even though these virtual applications are never installed, they can communicate with the local operating system, middle ware, plug-ins, and other applications.

Because App-V packages are not installed on the client, there is minimal impact on the host operating system or other applications. As a result, application conflicts and the need for regression testing are dramatically reduced.

Using Microsoft Application Virtualization enables you to centralize the installation and management of deployed applications, and control access to applications. The App-V client presents to the end user a list of applications to which that user has access.

The Microsoft Application Virtualization (App-V) infrastructure includes:

- **App-V Sequencer**—The App-V Sequencer converts application data into a format which is compatible with the App-V server and client, producing an App-V package.
- **App-V Server**—An App-V package can be placed on one or more App-V servers so that it can be streamed down to the clients on demand and cached locally.
- **App-V Client**—The App-V Client is the system component that enables the end user to interact with the App-V packages that are available on the App-V server.

Components of an App-V Package

Version • *Automated Application Converter has support for both App-V 4.x and 5.0 packages.*

The files that comprise an App-V package depend on the version of the App-V package.

Components of an App-V 5.0 Package (.appv)

The following table describes the main components of an App-V 5.0 package (**.appv**):

Table 10-3 • Components of an App-V 5.0 Package

File	Description
.appv	The **.appv** file is the compressed package file that contains all of the other parts of the package.
AppxBlockMap.xml	This file contains a list of files with details such as header size and file size.

Table 10-3 • Components of an App-V 5.0 Package

File	Description
AppxManifest.xml	This file contains information about the package name and version, OS requirements, and all of the integration points with the system such as shortcuts, file type associations, environment variables, services, URL Protocols, Default Programs, Software Clients, and COM registration.
FilesystemMetadata.xml	This file contains information such as short file names, the directory-file hierarchy, and the mapping between the root folder and `INSTALLDIR`.
Registry.dat	This file contains registry data for the package.
StreamMap.xml	This file contains publishing and primary feature block information.
<package name>_DeploymentConfig.xml	This file provides a way for the user to customize the integration points (such as disabling, modifying, or adding them) and can be applied when publishing the package for all users.
<package name>_UserConfig.xml	This file provides similar functionality as the **DeploymentConfig.xml** file when publishing for individual users. User created scripts can be added to these files as well.

Components of an App-V 4.x Package (.sft)

The following table describes the main components of an App-V 4.x package (**.sft**):

Table 10-4 • Components of an App-V 4.x Package

File	Description
.sft	The **.sft** file contains all of the files, registry information, and other configuration details of the package.
Manifest file	This file is an XML file that lists all of the **.osd** files in an App-V package.
.osd	The **.osd** files are XML-based files that describe the package's shortcuts, file extensions, dependencies, and other data that can influence the environment.
.ico	The **.ico** files are icons files that are used for published shortcuts and file type associations.
.sprj	This file is the Microsoft App-V Sequencer project file. It contains references to the **.sft** and **.osd** files, and to a large number of settings related to the sequencing process.

Comparison of the App-V 5.0 Conversion Methods

When you use AdminStudio to convert a Windows Installer package to App-V 5.0 format, you can choose to use AdminStudio's native virtual conversion functionality to perform the conversion or you can choose to use the Microsoft App-V 5.0 Sequencer. When preparing to convert a package to App-V 5.0 format, you are required to select one of the following **Package Creation** methods (as described in Selecting the App-V Conversion Method):

Table 10-5 • App-V 5.0 Conversion Methods

Method	Description
App-V 5.x with AdminStudio	The conversion workflow for this method depends upon whether the package requires repackaging: • **Package requires repackaging**—The Windows Installer or legacy executable (**.exe**) package is copied to a VM snapshot, along with the Repackager files. The package is then repackaged, copied back to the AdminStudio machine, and then converted to App-V 5.0 format using the AdminStudio virtual converter. • **Package is a Windows Installer package and does not require repackaging**—Package is directly converted to App-V 5.0 using the AdminStudio virtual converter.
App-V 5.x with Sequencer	When using this method, the Windows Installer or legacy executable (**.exe**) package is copied to a virtual machine snapshot that has the Microsoft App-V 5.0 Sequencer installed on it. The App-V 5.0 Sequencer converts the package to App-V 5.0 format. The virtual package is then copied back to the AdminStudio machine.

Advantages / Disadvantages of Each Method

There are advantages of using each App-V 5.x **Package Creation** methods:

Table 10-6 • Advantages / Disadvantages of AdminStudio's App-V 5.x Package Creation Methods

Method	Advantages	Disadvantages
App-V 5.x with AdminStudio	• **Provides post-installation configuration option**—Enables you to perform both pre-installation and post-installation configuration tasks. (The **App-V 5.x with Sequencer** option only offers pre-installation configuration.) See Enabling Pre-Installation and Post-Installation Configuration.	

Table 10-6 • Advantages / Disadvantages of AdminStudio's App-V 5.x Package Creation Methods

Method	Advantages	Disadvantages
App-V 5.x with Sequencer	• **App-V 5.x with Sequencer method could be quicker**—When using this method, you are not required to copy the Repackager files to the virtual machine. Also, no intermediate Windows Installer package is built. Therefore, this method could perform conversion slightly quicker than the **App-V 5.x with AdminStudio** method. • **Uses Microsoft technology**—You may prefer this method if your organization prefers to use Microsoft technology to perform App-V 5.x conversion.	• **Installation directory must be known before sequencing can begin**—In order to sequence the application effectively, you must have detailed knowledge of the how the installation is supposed to work. Prior to beginning the sequencing process, you are required to specify the installation directory for the application being sequenced. This information is often not readily available, and may require you to open the installation in an editing tool, such as InstallShield, in order to find it, or to run the installation one time prior to sequencing.
Both Methods	• **Can perform App-V package testing prior to deployment**—Automated Application Converter includes a launch utility that allows you to launch and test the App-V package locally immediately after conversion before distributing them to the App-V Server. • **Bulk conversions**—You can use either App-V 5.x conversion method to perform bulk conversions of multiple applications in a directory hierarchy. The Automated Application Converter has both a user interface and a command line interface.  ***Note*** • *To perform bulk conversion, you need to have purchased Automated Application Converter (Multiple Application Version).*	

App-V Conversion Methods Available in Repackager and InstallShield Editor

In addition to using Automated Application Converter, you can also use Repackager or the InstallShield Editor App-V Assistant perform conversion to App-V 4.x or 5.0 format. However, these tools offer only one App-V 5.x conversion method: **App-V 5.x with AdminStudio**.

Support for App-V 5.0 SP2 Shell Extension and Runtime Features

App-V 5.0 packages created by AdminStudio fully support the following new features of App-V 5.0 SP2:

- **Shell extensions**—App-V 5.0 packages created by AdminStudio support shell extensions, including:
  - Context menu handler
  - Drag-and-drop handler
  - Drop target handler
  - Data object handler
  - Property sheet handler
  - Infotip handler
  - Column handler
- **ActiveX controls**—App-V 5.0 packages created by AdminStudio support ActiveX controls, which are now registered and supported via the **AppxManifest.xml** file.
- **Browser helper objects**—App-V 5.0 packages created by AdminStudio support browser plug-ins, which aids scenarios where applications need to integrate with Internet Explorer.
- **Side-by-side (SxS) runtime dependencies**—App-V 5.0 packages created by AdminStudio support side-by-side runtime dependencies. App-V 5.0 SP2 automatically detects side-by-side assemblies and deployment on the computer running the App-V 5.0 SP2 client.
- **Full VFS write mode**—App-V 5.0 packages created by AdminStudio support the **Full VFS Write Mode** option, which gives a virtual application full write permissions to its virtual file system files and folders.

***Note** • The **Full VFS Write Mode** feature was introduced in App-V 5.0 SP2 HotFix 4.*

Creating 64-Bit App-V Packages

AdminStudio supports converting 64-bit applications into Microsoft App-V 4.6 and 5.x package formats, which can be deployed on Windows 64-bit systems with Microsoft App-V 64-bit clients installed. This process can be a direct conversion from a 64-bit Windows Installer package or one involving repackaging on a 64-bit machine.

***Note** • Automated Application Converter converts 64-bit packages to App-V 4.6 and converts non-64-bit packages to App-V 4.5 to increase the backwards compatibility of the package. 64-bit application support was the main new feature of App-V 4.6.*

***Note** • App-V 4.5 packages created using earlier versions of AdminStudio can be made compatible with App-V 4.6. In some cases, it may be necessary to manually edit the **.osd** files to specify support for 64-bit operating systems.*

Important • *It is highly recommended that you perform the conversion of 64-bit Windows Installer packages to App-V packages on a Windows 64-bit machine. If you attempt conversion on a 32-bit Windows machine, it could result in a failure to extract COM information for 64-bit binaries. Also, in some cases, Windows Installer packages contain shortcuts that target executables not found in the package itself. If these shortcuts target executables found in 64-bit Windows folder locations, then these shortcuts will not be handled correctly on 32-bit machines.*

Editing an OSD File to Make Advanced Changes to an App-V 4.x Package

Version • *This information applies to App-V 4.x packages.*

An **.osd** file is an XML-based file that describes an App-V 4.x package's shortcuts, file extensions, dependencies, and other data that can influence the environment of the application.

For advanced control over the information that is stored in the **.osd** files, you can edit the **.osd** file in an XML or text editor. For example, you may want to edit an **.osd** file directly in a text editor to specify the location of an **.sft** file, instead of configuring the location in the Automated Application Converter or on the Package Information page of the InstallShield Microsoft App-V Assistant. The following instructions explain how to do this. These instructions are for advanced users only.

To use a text or XML editor to edit an **.osd** file for making advanced changes, such as specifying the App-V server location for an **.sft** file, perform the following steps:

Task ***To use a text or XML editor to edit an .osd file:***

1. Open the OSD file using any XML or ASCII text editor—for example, Microsoft Notepad.

   Note • *Before modifying the **.osd** file, read the schema prescribed by the **.xsd** file in the install directory. Failing to follow this schema might introduce errors that prevent a sequenced application from starting successfully.*

2. Locate the `CODEBASE` element. Below is a sample `CODEBASE` element:

```
<CODEBASE HREF="HTTP://%SFT_SOFTGRIDSERVER%:80/orca.sft" GUID="A895355A-5883-41C6-A144-
    1BDA12242AAA" PARAMETERS="" FILENAME="{A895355A-5883-41C6-A144-1BDA12242AAA}\Orca.exe"
    SYSGUARDFILE="{A895355A-5883-41C6-A144-1BDA12242AAA}\osguard.cp" SIZE="2555268"/>
```

3. Locate the `HREF` attribute of the `CODEBASE` element and enter a valid URL to the published location of that App-V package's **.sft** file.

Guidelines for Editing an .OSD File

When editing an **.osd** file, adhere to the prescribed schema and the following guidelines:

- Ensure that named elements are nested within the `<SOFTPKG>` root element.
- Ensure that element names are in all uppercase letters.
- Be aware that attribute values are case sensitive.

- Type carefully, and observe the XML specifications.

How Windows Services Are Integrated into an App-V Package

When you use the Automated Application Converter to convert a Windows Installer package to an App-V package, references to Windows services that are encountered are integrated into the App-V package. In a Windows Installer package, a Windows service may be indicated by either an entry in its **ServiceInstall** table or by a Registry entry for Windows services.

- **ServiceInstall table**—If a Windows Installer package's use of a Windows service is indicated by an entry in the **ServiceInstall** table, Automated Application Converter will convert that entry to a standard Registry entry for Windows services.
- **Registry entry**—If a Windows Installer package's use of a Windows service is indicated by a Registry entry for Windows services (perhaps as the result of being repackaged), Automated Application Converter does not need to make any changes to support the application's use of the Windows service within the virtual environment.

Start Up and Shut Down Sequences

If an App-V package has an associated Windows service, App-V will start up the Windows service first, in the virtual environment, and then start up the App-V package. You will see the Windows service start up in the Task Manager as a separate process, but App-V will be running the service within the virtual environment.

Upon shut down, App-V will first shut down the App-V package and then shut down the Windows service.

About VMware ThinApp Virtual Packages

You can use the Automated Application Converter to convert a Windows Installer package to a VMware ThinApp virtual application. Information about ThinApp applications is presented in the following topics:

- About ThinApp Applications
- Prerequisites for Building a ThinApp Application

***Note** • You can also convert a Windows Installer package to a ThinApp application using InstallShield Editor's ThinApp Assistant. Using the ThinApp Assistant, you can configure a ThinApp application's Active Directory settings, files, folders, shortcuts, registry settings, isolation options, and build options. See Getting Started With Application Virtualization and the InstallShield Help Library for information on the ThinApp Assistant.*

***Note** • For information on how to simultaneously build an InstallShield Editor project, a Windows Installer package, and a ThinApp application from your Repackager project, see Automatically Generating a Virtual Application During Repackager Project Build.*

About ThinApp Applications

VMware ThinApp is a self-contained application virtualization solution that requires no client-side agents or supporting server infrastructure. A ThinApp application runs within a virtual environment that prevents it from interfering with other software running on the same machine.

ThinApp applications can be deployed on a machine without modifying the local operating system or file system. They run in a "sandbox" (or virtual environment) which protects the local operating system from installation modifications that could affect stability or security. Also, ThinApp applications can be run safely from restricted user accounts without local installation.

Information about ThinApp applications is presented in the following sections:

- ThinApp Virtual Operating System
- Benefits of Deploying ThinApp Applications
- Components of a ThinApp Application

ThinApp Virtual Operating System

A ThinApp application runs in a virtual operating system—a small light-weight component which is embedded with each ThinApp application—that consists of a virtual file system and a virtual registry. When the ThinApp application is run, the virtual operating system environment is merged with the real system environment.

The virtual operating system technology enables entire applications to be packaged into a single **.exe** file that can be run without an installation process, and without modifying the resident operating system.

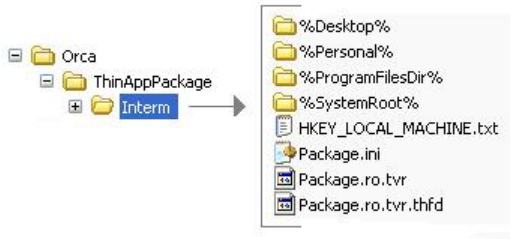
A ThinApp application can be run from a network or offline on the local machine.

Components of a ThinApp Application

When you use Automated Application Converter, Repackager, or InstallShield Editor to build a ThinApp virtual package, the resources you generate are called **ThinApp applications**.

When package conversion is complete, a `Conversion completed` message appears in the **Output** window and the path to the generated ThinApp application is listed, such as:

```
C:\AdminStudio Shared\My Application\ThinAppPackage
```



The ThinApp application is created in a folder named **ThinAppPackage** that is created in the same directory as the Windows Installer package you converted.

The number of files included in a ThinApp application depends upon how many shortcuts are defined:

Table 10-7 • Components of a ThinApp Application

Number of Shortcuts	ThinApp Application Components	Description
1 shortcut	`ProductName.exe` 	The ThinApp application consists of a single executable (**.exe**) file: • **Launching the application**—This executable file is used to launch the ThinApp application. • **Location of application data**—This executable file contains all of the files, registry keys, DLLs, ThinApp components, and third party libraries that are required for the application to run.
More than 1 shortcut	`ProductName.exe` `FeatureName.exe` `Package.DAT` 	The ThinApp application consists of two or more executable files and a **Package.DAT** file: • **Launching the application**—Each of the executables is used to launch the ThinApp application or a specific feature of the ThinApp application. • **Location of application data**—The **Package.DAT** file contains all of the files, registry keys, DLLs, ThinApp components, and third party libraries that are required for the application to run.
Metadata File	`metadata.ami`	A file created during AdminStudio 9.0+ package conversion that contains metadata identifying the original Windows Installer package that was used to create the virtual package. ***Note*** • *Because of this file, you are able to import this virtual package into the Application Catalog and associate it with its source Windows Installer package.*

Caution • *Modifying these files directly is not recommended. To make any modifications, use the InstallShield ThinApp Assistant.*

Intermediate Data Files: Interm Directory

When a ThinApp application is built, files that support the ThinApp application build process are extracted out of the Windows Installer package and saved in a subdirectory of the **ThinAppPackage** directory named the **Interm** directory.

Figure 10-3: Interm Subdirectory of the ThinAppPackage Directory

The data in this directory is then compiled into ThinApp application as part of the build process. The data in the **Interm** directory *does not* need to be distributed with the ThinApp application.

Benefits of Deploying ThinApp Applications

Deploying ThinApp applications provides the following benefits:

- **Reduces time to deployment and costs associated with testing**—Applications can be deployed and run in independent sandboxes, eliminating the need for expensive and time-consuming multi-application regression testing. This reduces the time to deployment and the costs associated with testing.
- **Fast, lightweight virtualization** —ThinApp does not use emulation, so all processes are executed natively at full speed.
- **Reduces the cost of maintaining secure locked-down desktops**—ThinApp applications can run in restricted user accounts without requiring any host modifications.
- **Enhances work-force mobility, business continuity and disaster recovery**—ThinApp applications can be run off-line, directly from any external media including USB Flash, CD-ROM, and off-line laptops.
- **No infrastructure changes needed**—ThinApp applications can be deployed using any existing software deployment systems including Active Directory and SMS. ThinApp has no client or server components to manage or maintain and ThinApp can transparently stream large applications from any network attached storage devices without server software.
- **Sandboxing prevents modifications**—ThinApp redirects all changes intended for the host computer's file system and registry to a private per-user sandbox. Sandboxes can be located on a network share, allowing application settings to follow users as they move from machine to machine. For mobile users, sandboxes can be stored on local USB flash drives, thus preventing damage to the host computer or accidental host storage of sensitive data.

Prerequisites for Building a ThinApp Application

AdminStudio will convert the package installation into a format compatible with VMware ThinApp. However, the ThinApp build process requires the availability of certain ThinApp tools.

As a prerequisite to building a ThinApp application from AdminStudio, you must have installed VMware ThinApp **and accepted any and all license agreements**.

Caution • *If you install ThinApp but you have not yet accepted the license agreement, the build process will fail. For more information, see the VMware website.*

About Citrix XenApp Virtual Packages

You can use the Automated Application Converter to convert a Windows Installer package to a Citrix profile for deployment on Citrix XenApp.

Information about using the Automated Application Converter is presented in the following topics:

- About Citrix XenApp and Citrix Profiles
- Benefits of Deploying Citrix XenApp Profiles

***Note** • You can also convert a Windows Installer package to a Citrix profile using InstallShield Editor's Citrix Assistant. Using the Citrix Assistant, you can configure a Citrix profile's operating system and language requirements, files, folders, shortcuts, registry settings, script execution, isolation options, and build options. See Getting Started With Application Virtualization and the InstallShield Help Library for information on the Citrix Assistant.*

***Note** • For information on how to simultaneously build an InstallShield Editor project, a Windows Installer package, and a Citrix profile from your Repackager project, see Automatically Generating a Virtual Application During Repackager Project Build.*

About Citrix XenApp and Citrix Profiles

Citrix XenApp is an application delivery system for Windows applications. When you use Repackager or InstallShield Editor to prepare a Windows Installer package for deployment on Citrix XenApp, the resources you generate are called **profiles**.

Overview information about Citrix XenApp and Citrix profiles is presented in the following topics:

Table 10-8 • Overview of Citrix XenApp

Topic	Description
About Citrix XenApp	Provides an overview of how Citrix XenApp works and provides a diagram illustrating application delivery.
About Citrix Profiles (.profile)	Lists the files and directories that comprise a Citrix profile.

About Citrix XenApp

Citrix XenApp is an application delivery system for Windows applications that offers both application virtualization and application streaming. Applications are centralized on Citrix XenApp and then those applications are deployed to users throughout the enterprise. These deployed applications run within isolation environments that prevent them from interfering with other software running on the same machine.

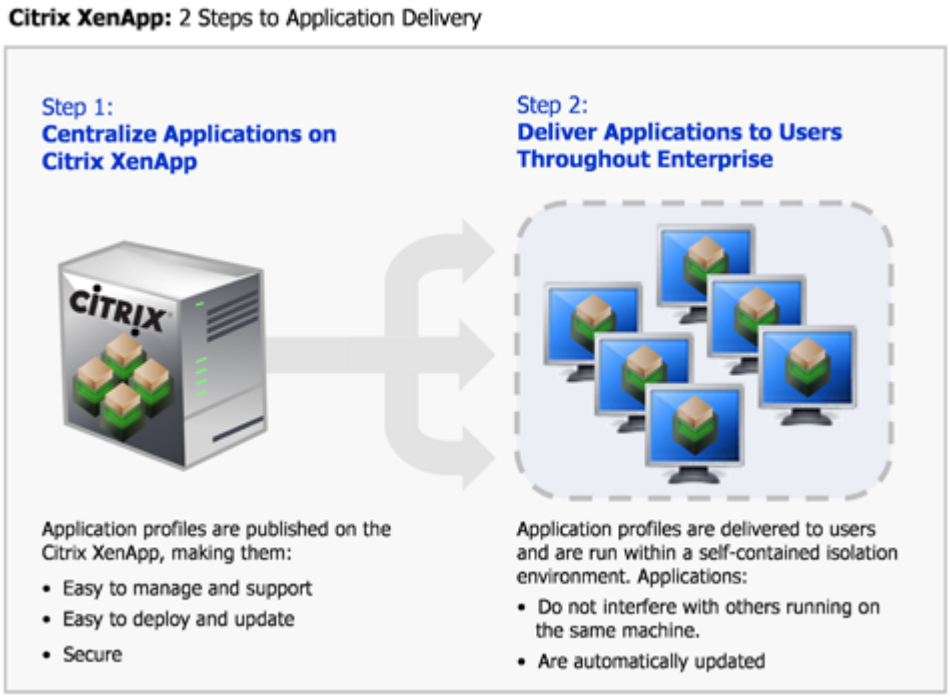


Figure 10-4: Citrix XenApp: Two Steps to Application Delivery

When applications are deployed on a Citrix XenApp, users can run those applications in an isolation environment, without installing, while connected or offline. Applications behave just like they were installed locally, but without any of the problems of installation, such as interfering with other applications on the same device. Files are saved locally and individual settings are preserved. Every time the application is run, it checks for errors or updates and they are delivered automatically.

Note • *For more information, see Benefits of Deploying Citrix XenApp Profiles.*

About Citrix Profiles (.profile)

When you use Automated Application Converter, Repackager, or InstallShield Editor to prepare a Windows Installer package for deployment on Citrix XenApp, the resources you generate are called **profiles**.

When package conversion is complete, the Automated Application Converter, Repackager, or InstallShield Editor displays the path to the generated virtual package, such as:

```
C:\AdminStudio Shared\MyPackage\CitrixProfile\MyPackage.profile
```

These files are saved in a subfolder of a folder named **CitrixProfile** that is created in the same directory as the Windows Installer package you converted. The profile, which is published on Citrix XenApp, consists of the following:

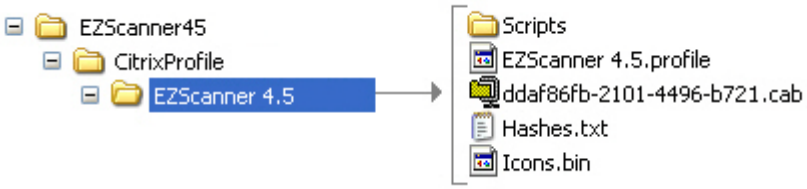

Figure 10-5: Profile Files and Directories

A profile contains the following files and directories:

Table 10-9 • Components of an Application Profile

Component	Name	Description
Profile Manifest File	`myapp.profile`	An XML file that defines the profile.
CAB File	`[alphanumeric_string].cab`	Compressed cabinet file that provides the isolation environment contents for the application.
Hashes File	`Hashes.txt`	Hash key file for digital signatures and signing profiles.
Icons File	`Icons.bin`	Icons repository.
Scripts Folder	`Scripts`	Folder containing any pre- launch or post-exit scripts that you have chosen to include.
Metadata File	`metadata.ami`	A file created during AdminStudio 9.0+ package conversion that contains metadata identifying the original Windows Installer package that was used to create the virtual package. ***Note*** • *Because of this file, you are able to import this virtual package into the Application Catalog and associate it with its source Windows Installer package.*

Caution • *Modifying these files directly is not recommended. To make any modifications, use the InstallShield Citrix Assistant.*

A profile can contain a single application or suite of applications.

Benefits of Deploying Citrix XenApp Profiles

Converting a Windows Installer package to a Citrix profile and deploying it on a Citrix XenApp offers the following benefits:

- Reduces Application Conflicts
- Enables Rapid, Low Cost Application Deployment
- Enables Automatic Software Updates
- Centralized Application Management Provides Controlled Access and Security
- Enables User-Based Application Access Rather Than Machine-Based Access

Reduces Application Conflicts

Traditionally to deploy an application throughout an enterprise, the application was installed on each user's desktop. Therefore, prior to installation, each application had to be tested for conflicts against each target desktop image (operating system with existing applications). After resolving conflicts that were found during testing, each application then had to be installed on each desktop. This process was very time consuming not only during initial installation, but also when applying patches or upgrading.

Citrix profiles run within isolation environments, which separate the interaction between an application and the underlying operating system's resources in order to prevent the applications from interfering with others running on the same machine. Because applications do not interact, the need to perform any conflict analysis and regression testing prior to deployment is eliminated. This not only results in rapid application deployment, but it also reduces the total cost of application delivery, due to decreased labor by IT.

Also, because users running applications in an isolation environment encounter no conflicts with other applications, user calls to the help desk are decreased.

Enables Rapid, Low Cost Application Deployment

Deploying Citrix profiles on Citrix XenApp simplifies the deployment of new applications, updates and patch deployment, regardless of the diversity of the access devices, software languages, computing architectures, and networks that are involved.

- **Only a single instance of the application is installed**—Instead of deploying, managing, updating and securing a vast array of heterogeneous client software on each individual user's access device, a single instance of the application is installed on Citrix XenApp. The IT department only has to test for one environment, and deploy and update in one place. This reduces the cost of application installation and support. Also, you can deploy a Citrix profile once on a Citrix XenApp and replicate it to other Citrix XenApps within the existing enterprise infrastructure.
- **Prevents application-specific server silos**—Deploying applications on Citrix XenApp prevents the build-up of application-specific server silos because you can safely install and reliably run multiple application versions and incompatible applications on the same server.
- **Enables you to quickly install and update software throughout your enterprise**—Because you can manage the delivery of all of your Windows-based applications from one centralized location, there is no need to go from desktop to desktop, travel from office to office, or wait for laptops to return to headquarters in order to install or update software. With Citrix XenApp, you can deliver applications and updates instantly anywhere, any time—to offshore employees, outsourcers, new branch offices, new mergers and acquisitions, and mobile workforces.

Enables Automatic Software Updates

When an upgrade or patch needs to be deployed, you would only need to update the Citrix profile on Citrix XenApp, which will then automatically update all of the instances of that Citrix profile throughout the enterprise. This means that users always have the latest application updates and patches, automatically.

Centralized Application Management Provides Controlled Access and Security

With Citrix XenApp, you can centralize applications and data in secure data centers, which increases data security and ensures fast, reliable performance. Centralized application management using Citrix XenApp provides the following benefits:

- **Enhances security**—Enables you to control, protect, and retain intellectual property centrally to reduce the chance for data loss and theft. Citrix XenApp helps you prevent data from leaving the data center without your explicit permission, which supports regulatory compliance and security objectives. You can provide authorized access to appropriate users—such as employees, customers, and partners—while verifying the ongoing security of the environment.
- **Can provide managed access to applications to users outside of your organization**—You can standardize the use of applications, without having to standardize the machines that the applications use. This enables you to provide managed access to applications from computers that are not your own corporate assets, such as from contractor or consultant computers.
- **Monitors application usage and performance**—Citrix XenApp gives you end-to-end visibility into application usage and performance. It gives IT administrators the power to understand who is using what, how often, and to what extent. They can observe, monitor, measure, audit, report and archive all the dimensions of information flow throughout the computing environment. This enables informed decisions regarding application consolidation and retirement, capacity planning, service level agreements and departmental charge-back.
- **Enables identity-driven access**—Citrix XenApp enables you to provide identity-driven access tailored to any user environment. It automatically analyzes the user's permissions and then delivers the appropriate level of access to applications without compromising security. Depending on who and where users are and what device and network they're using, they may be granted different levels of access. You can also easily "decommission" applications by simply turning off a user's permission to it.

Enables User-Based Application Access Rather Than Machine-Based Access

Users can access their applications anywhere on the network, regardless of where they are or what device they are using.

About Symantec Workspace Virtualization

A Symantec Workspace virtual package contains all the files and registry settings of an application. After a Symantec Workspace virtual package is copied to a special location on a client computer and is activated using the Symantec Workspace Virtualization Agent (which is installed on the client computer), it becomes visible along with its files, folders, and settings. Even though it is a virtual application, to the end user, it looks and behaves like any other normally-installed application.

Benefits of Deploying Symantec Workspace Virtual Packages

Deploying Symantec Workspace virtual packages (instead of traditionally-installed packages) offers the following benefits:

- **Reduces conflicts**—Deploying Symantec Workspace virtual packages reduces the possibility of conflicts between applications and the base operating system, such as incompatible Windows 7 or Windows 8 applications. Common problems, such as DLL version conflicts, are eliminated without modifying the base operating system and without interfering with other applications. This ensures system and application compatibility under any circumstances.
- **Reduces pre-deployment testing requirements**—Symantec Workspace virtual packages do not require as much pre-deployment testing as traditionally-installed applications, which accelerates the deployment cycle.
- **Quick activation, deactivation, and repair**—With Symantec Workspace virtual packages, application availability is instantaneous—you can immediately activate or deactivate your applications by sending a single command to the client computer. Also, corrupted applications can be reverted to the original installed version instantly, requiring no IT intervention.

Prerequisites for Building a Symantec Workspace Virtual Package

In order to use Automated Application Converter to convert Windows Installer packages to Symantec Workspace virtual packages, you need to have installed the Symantec Workspace Virtualization Agent on the same machine where AdminStudio is installed.

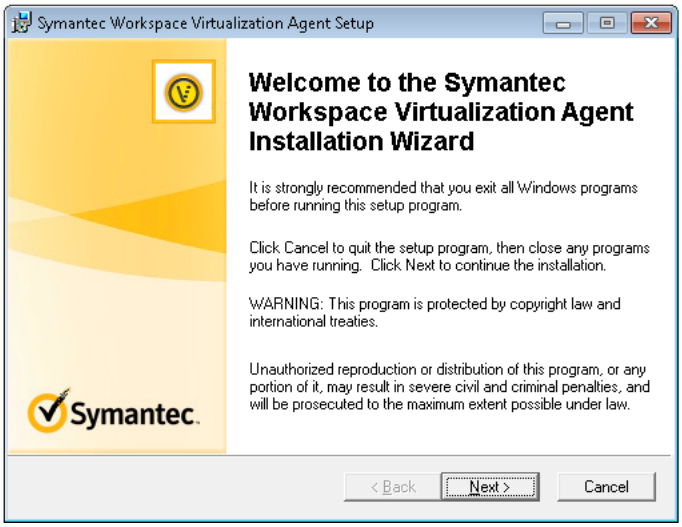

Figure 10-6: Symantec Workspace Virtualization Agent Installer

You receive the Symantec Workspace Virtualization Agent installer from Symantec when you purchase Symantec Workspace Virtualization.

When performing this installation, you need to choose to install an additional feature on the **Select Features** panel:

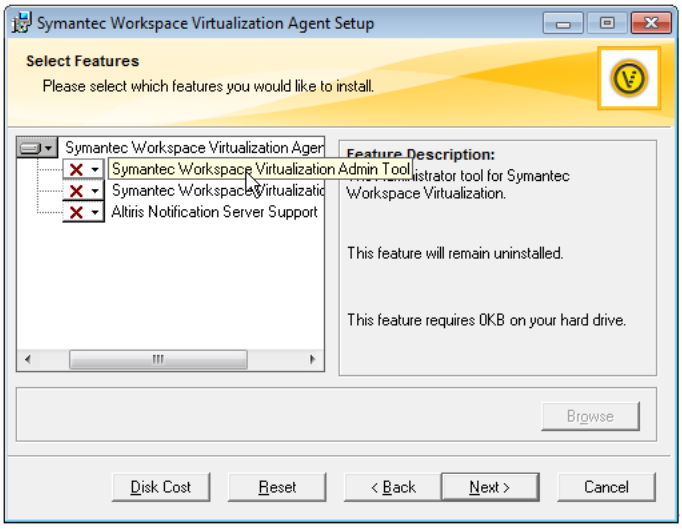

Figure 10-7: Select Features Panel of Symantec Workspace Virtualization Agent Setup

On the **Select Features** panel of the Symantec Workspace Virtualization Setup, select to also install the **Symantec Workspace Virtualization Admin Tool** feature.

Important • *If this agent is not installed, the* ***Symantec Workspace Virtualization Packages (*.xpf)*** *option on the* ***Select Output Formats*** *panel of the* ***Application Conversion Wizard*** *will be disabled.*

About Symantec Workspace Virtual Packages

When you use Automated Application Converter or Repackager to create a Symantec Workspace virtual package, an **.xpf** file (e**X**tensible **P**ackage **F**ormat) file is created named *ProductName*.**xpf**.

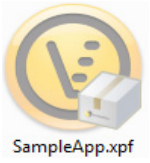

Figure 10-8: Symantec Workspace Virtual Package (.xpf)

An **.xpf** file is a single package type that could be used in Symantec Workspace Virtualization or Symantec Workspace Streaming without any additional modifications. In other words, if you have an **.xpf** file you can import it into the Symantec Workspace Virtualization agent or load it into the streaming server as is.

A Symantec Workspace **.xpf** file is a simple zip file. Therefore, if you rename the Symantec package's extension to **.zip**, you could then view its contents by extracting it.

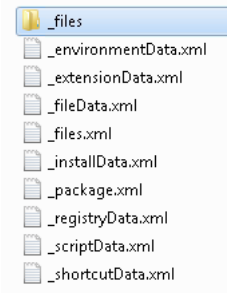

Figure 10-9: "Unzipped" Symantec Workspace Package File

About the Automated Application Converter

The AdminStudio Automated Application Converter combines the functionality of the Windows Installer Batch Converter with the additional capability to automatically repackage and convert Windows Installer packages, as well as setups in other formats, into virtual applications. You can also choose to automatically repackage setups into Windows Installer packages.

Information about the Automated Application Converter is presented in the following sections:

- Benefits of Using the Automated Application Converter
- Automated Application Converter Workflow Diagram
- Supported Operating Systems
- Supported Virtual Machines

Benefits of Using the Automated Application Converter

Previously, when converting a Windows Installer package to a virtual application, there were cases when you needed to capture its installation prior to being able to perform a successful conversion. Repackaging is sometimes required because it is not possible to determine the run-time behavior of certain Windows Installer package elements—such as conditional components and custom actions—without actually running the install. While converting a Windows Installer package to a virtual application is automated and is a batch process, repackaging setups is a manual process requiring a packager to individually repackage each setup on clean machines and then to convert them into virtual applications—which is a time consuming task requiring several hours of a packagers time.

The Automated Application Converter examines a group of setups to automatically determine which need to be repackaged and which can be virtualized without repackaging. It converts the setups that can be directly converted and then automatically repackages the others by launching virtual machines, running the setups, and capturing them prior to converting them into the target virtual formats.

The Automated Application Converter provides the following benefits:

- **Automated repackaging on virtual machines**—The Automated Application Converter provides an interface to provision and manage virtual machines, silently repackage installs on them, and create virtual packages for the resulting MSIs.
- **Ability to repackage non-MSI setups**—You can use the Automated Application Converter to repackage legacy (non-MSI) setups to create an MSI package that can be converted to a virtual package.

Note • *These setups must support silent install mode.*

- **Conversion of packages from multiple sources**—Using the Automated Application Converter, you can convert setups from multiple sources:
  - AdminStudio Application Catalog
  - Specified directory or file
- **Efficiently manages repackaging queue on multiple virtual machines**—The Automated Application Converter efficiently manages the virtual machine queue, allowing setups to be packaged simultaneously on multiple machines.
- **Easy-to-understand reports**—The Automated Application Converter generates easy-to-understand HTML reports for each conversion run, providing detailed information on each package.
- **Easy-to-read progress indicators with one-click access to virtual machines**—The Automated Application Converter provides dashboard-type progress indicators with one-click access to open a virtual machine in a Remote Desktop session, enabling you to view the progress of a repackaging session and to quickly perform troubleshooting.
- **Provides option to use App-V 5.0 Sequencer when converting to App-V 5.0 format**—When converting a package to Microsoft App-V 5.0 format, you can choose to either use AdminStudio's virtualization technology to perform the conversion or to use the App-V 5.0 Sequencer, Microsoft's native technology. For more information, see Comparison of the App-V 5.0 Conversion Methods.

Automated Application Converter Workflow Diagram

You can use the Automated Application Converter to examine a group of setups to automatically determine which need to be repackaged and which can be virtualized without repackaging. It converts the setups that can be directly converted and then automatically repackages the others by launching virtual machines, running the setups, and capturing them prior to converting them into the target virtual formats.

The following diagram provides an overview of the AdminStudio Automated Application Converter workflow including:

- Input sources
- Virtualization readiness check
- Automated repackaging on virtual machines
- Conversion to virtual packages
- Output types

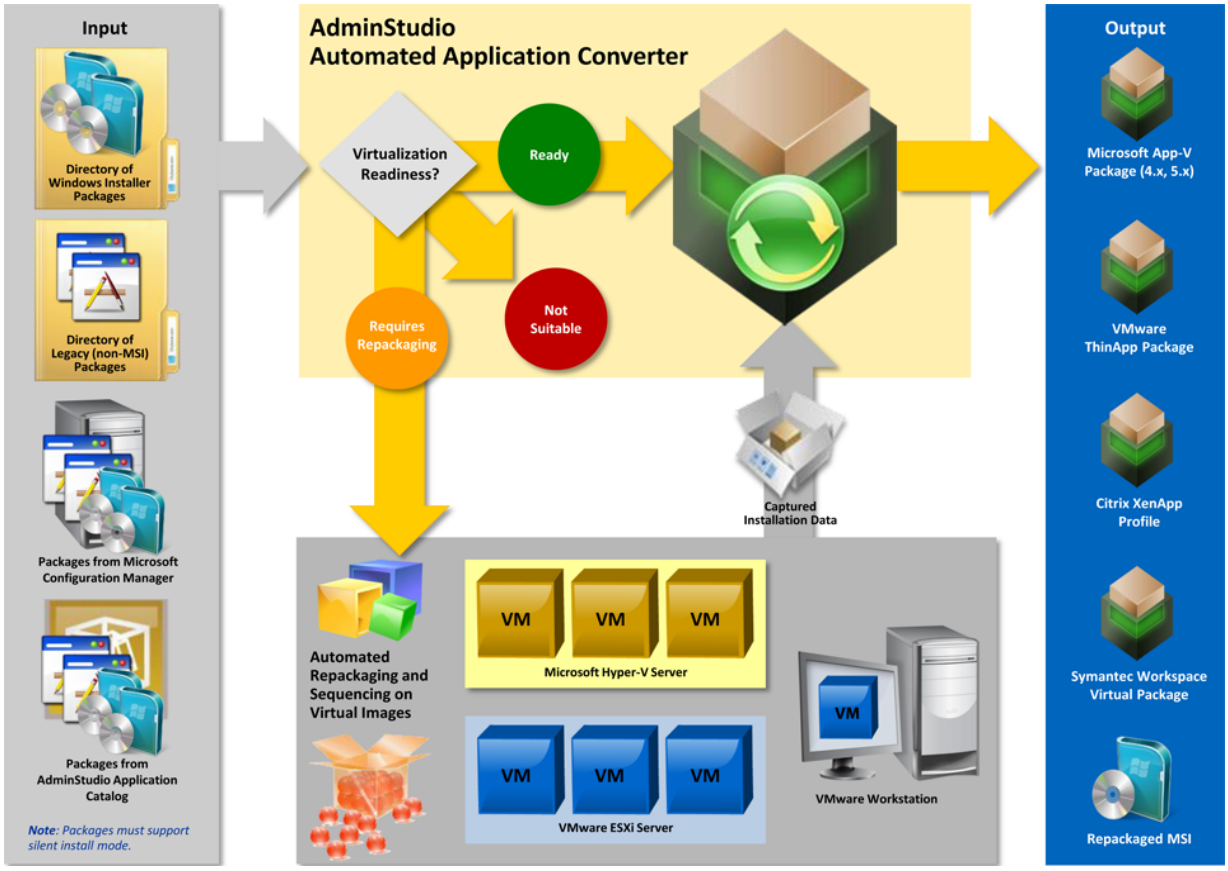

Figure 10-10: AdminStudio Automated Application Converter Workflow Diagram

Supported Operating Systems

The Automated Application Converter supports the following operating systems:

- Windows Vista (32-bit and 64-bit)
- Windows 7 (32-bit and 64-bit)
- Windows 8 (32-bit and 64-bit)
- Windows Server 2003 (32-bit and 64-bit)
- Windows Server 2008 (32-bit and 64-bit)
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 R2

Supported Virtual Machines

The Automated Application Converter supports automated repackaging on virtual machines from the following platforms:

- Microsoft Hyper-V Server
- VMware ESX or ESXi Server
- VMware Workstation 6.5 or later

Launching the Automated Application Converter

The Automated Application Converter can be launched by doing either of the following:

- On the Windows Start Menu, point to **All Programs**, **AdminStudio**, **AdminStudio Tools**, and click **Automated Application Converter**.
- Launch **Repackager**, and then click the **Automatically Repackage Installations on Your Virtual Machines** link on the Repackager Home Page.

The **Open Project** panel of the Application Conversion Project Wizard opens.

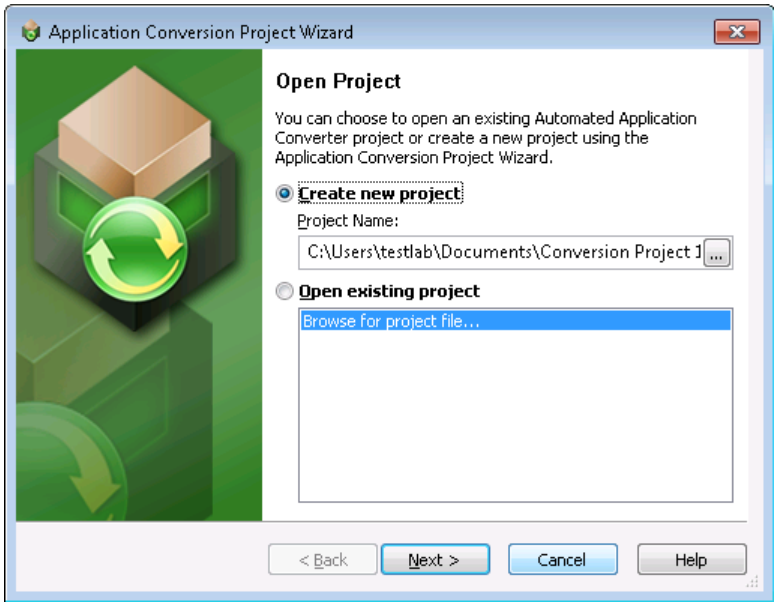

Figure 10-11: Open Project Panel of Application Conversion Project Wizard

On the **Open Project** dialog box, you can choose to create a new project or open an existing project. For more information, see Opening a Project.

Getting Started With the Automated Application Converter

The quickest way to get started using the Automated Application Converter is to use the end-to-end **Application Conversion Project Wizard**, which takes you through the three main steps in automated batch virtualization: selecting the packages to convert, selecting the virtual machines to use for repackaging, and converting the selected packages. See Using the Application Conversion Project Wizard to Perform an End-to-End Conversion for instructions.

You can also choose to perform each of these tasks separately by using one of the other three wizards that are provided:

Table 10-10 • Automated Application Converter Wizards

If you want to ...	Use this wizard ...	Description and Purpose
Add virtual machines	**Virtual Machine Import Wizard**	Add virtual machines to use to perform automated repackaging to Windows Installer packages. See Adding Virtual Machines Using the Virtual Machine Import Wizard.
Add packages	**Package Import Wizard**	Add packages from an AdminStudio Application Catalog or from a local or network file system. See Adding Packages from an AdminStudio Application Catalog and Adding Packages from a Local Machine or Network.
Virtualize or repackage packages	**Application Conversion Wizard**	Virtualize packages to the virtual formats you specify. You can also perform repackaging. See Using the Application Conversion Wizard to Perform Automated Package Conversion.

Opening a Project

When you launch the Automated Application Converter, the **Open Project** dialog box opens, prompting you to either create a new project or open an existing project.

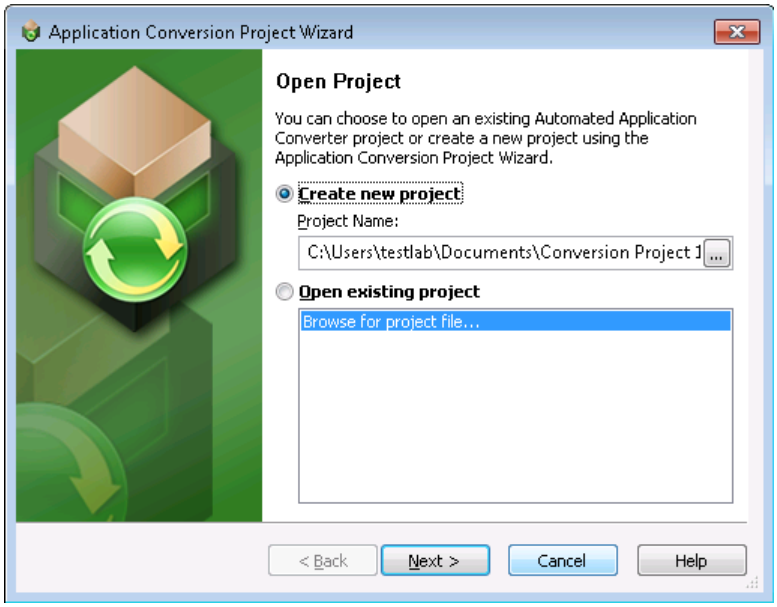

Figure 10-12: Open Project Dialog Box

The following procedures explain how to create a new project or open an existing project.

- Creating a New Project

- Opening an Existing Project

Creating a New Project

To create a new project, perform the following steps.

Task ***To create a new project:***

1. Do one of the following depending upon whether the Automated Application Converter is open:
   - **Not open**—Launch the Automated Application Converter.
   - **Open**—On the **File** menu, click **New Project**.

   The **Open Project** dialog box opens.
2. Select **Create new project**.
3. Click the Browse button next to the **Project Name** field. The **Save As** dialog box opens.
4. Enter a name (with an **.aacx** extension) and location for the new project file and click **Save**. The new project name is now listed in the **Project Name** box.
5. Click **Next**. The **Select Package Source** panel of the Application Conversion Project Wizard opens.
6. Continue with the steps in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion.

Opening an Existing Project

To open an existing project, perform the following steps.

Task ***To open an existing project:***

1. If the Automated Application Converter is not open, perform the following steps:
   a. Launch the Automated Application Converter. The **Open Project** dialog box opens.
   b. Select **Open existing project**.
   c. From the list, either select a project name or select **Browse for project file**.
   d. Click **Finish**. One of the following occurs:
      - **If you selected an existing project** from the list, the project opens in the Automated Application Converter interface.
      - **If you selected Browse for project file**, the **Open** dialog box opens. Select a project file and click **Open**. The project opens in the Automated Application Converter interface.
2. If the Automated Application Converter is open, perform the following steps:
   a. On the **File** menu, click **Open**. The **Open** dialog box opens.
   b. Browse to the project file you want to open and click **Open**. The project opens in the Automated Application Converter interface.

***Note** • If you had unsaved changes in the project file that was already open, you will be prompted to save those changes prior to opening the new project file.*

Using the Application Conversion Project Wizard to Perform an End-to-End Conversion

When using Automated Application Converter to perform conversion, you need to perform the following tasks:

- **Task 1**: Add virtual machines to use during conversion
- **Task 2**: Add packages to convert
- **Task 3**: Perform conversion

You can perform these tasks all at once using one wizard (**Application Conversion Project Wizard**) or perform these tasks separately using three different wizards:

- **Virtual Machine Import Wizard**
- **Package Import Wizard**
- **Application Conversion Wizard**

The following instructions explain how to use the **Application Conversion Project Wizard** to perform these three tasks using the same wizard.

***Note** • For instructions on how to perform these conversion tasks separately, see:*

- *Adding Virtual Machines Using the Virtual Machine Import Wizard*
- *Adding Packages from an AdminStudio Application Catalog* or *Adding Packages from a Local Machine or Network*
- *Performing a Conversion Using the Application Conversion Wizard*

To get started using the **Application Conversion Project Wizard**, perform the following steps:

Task ***To get started using the Application Conversion Project Wizard:***

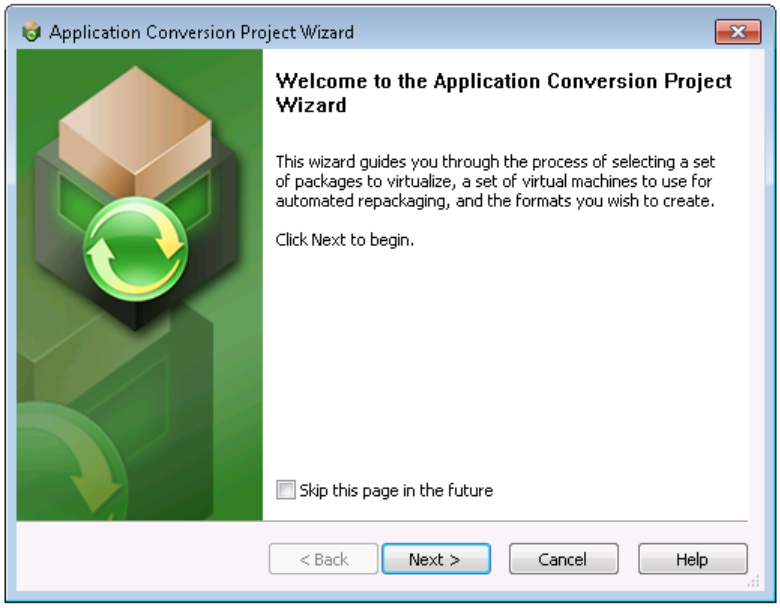
1. Perform the steps in Preparing Your Virtual Machines for Use With the Automated Application Converter to prepare your virtual machines to use for automated repackaging.
2. Launch the Automated Application Converter by doing one of the following:
   - On the Windows Start Menu, point to **All Programs**, **AdminStudio**, **AdminStudio Tools**, and click **Automated Application Converter**.
   - Launch **Repackager**, and then click the **Automatically Repackage Installations on Your Virtual Machines** link on the Repackager Home Page.

   The Automated Application Converter opens.

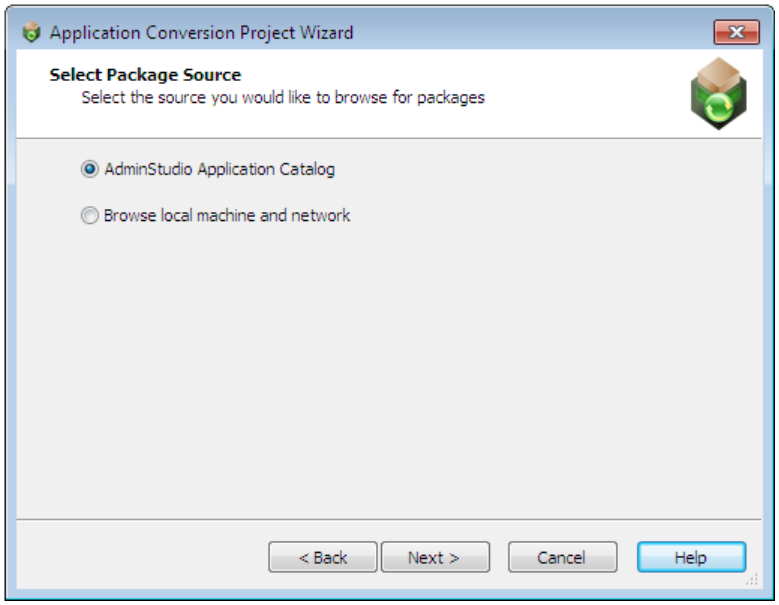
Note • *See Automated Application Converter User Interface for more information.*

3. Create a new project or open an existing project, as described in Opening a Project.

4. On the **Tools** menu, click **Project Wizard** (or click the icon in the toolbar). The **Welcome to the Application Conversion Project Wizard** panel opens.



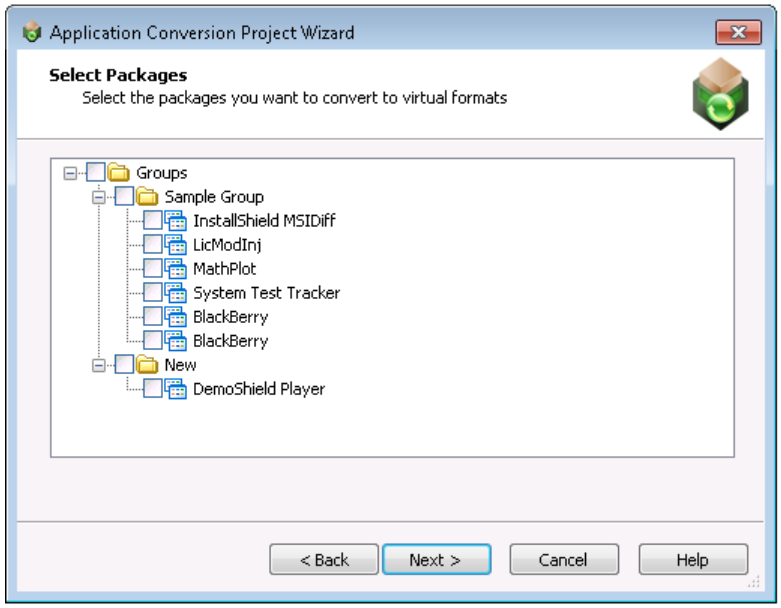
5. Click **Next**. The **Select Package Source** panel opens, prompting you to select the source that contains the packages you want to convert.



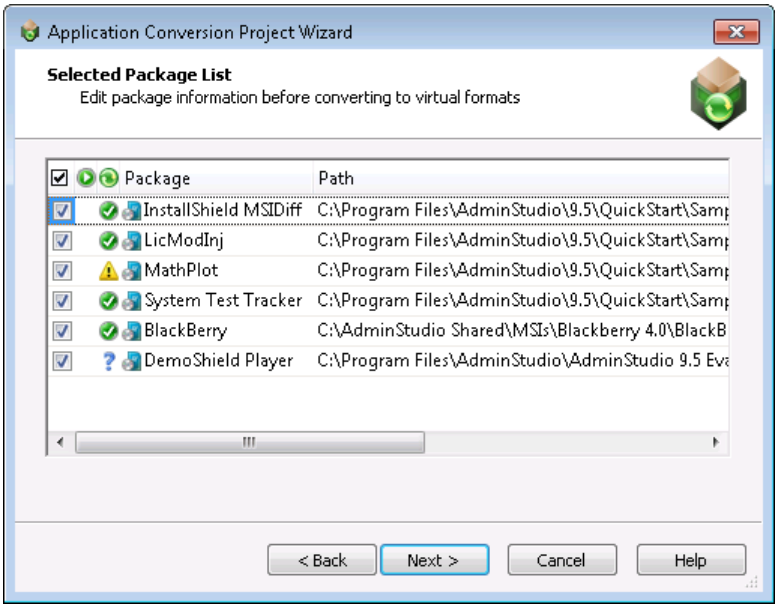
6. Select one of the following options:

Option	Description
AdminStudio Application Catalog	Select this option to connect to an AdminStudio Application Catalog and add all of the installations in that catalog to the list of packages to convert. If you select this option, the Connect to an AdminStudio Application Catalog panel opens, prompting you to login to an Application Catalog. ***Tip*** *• To select packages from Microsoft Configuration Manager to convert, first import those packages into the Application Catalog, as described in Importing From Microsoft System Center Configuration Manager.*
Browse local machine and network	Select this option to browse a local or network machine to add installations to the list of packages to convert. If you select this option, the **Select Packages** panel opens, where you are prompted to select an installation file or a directory of installation files to add to the list of packages to convert. ***Note*** *• For information on the rules that the Automated Application Converter uses to determine which packages in the selected directory's subdirectories would be added to the list on the* ***Selected Package List*** *panel, see Automated Application Converter's Selection Rules When Adding Packages from a Directory.*

If you connected to an Application Catalog, the **Select Packages** panel opens.



When you have finished this step, packages will be listed and selected on the **Selected Package List** panel, and an icon indicates each package's virtualization readiness status.

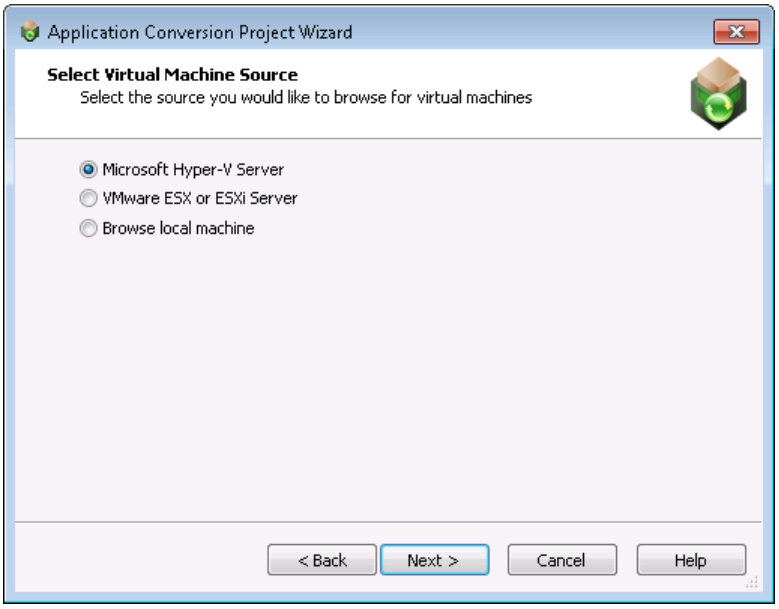


One of the following icons is listed in each package's Virtualization Readiness ( ) column:

Icon	Meaning	Description
	Ready	Package is ready to virtualize; no repackaging is required. ***Note*** *• If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required.* *An example of an unsupported table is the* ***IniFile*** *table, which changes files on the target machine in ways that cannot be statically determined.*
	Requires repackaging	Package must be repackaged before it can be successfully virtualized.

Icon	Meaning	Description
	**Virtualization not supported**	Automated Application Converter has determined that virtualization is not supported due to one of the following issues: • Package contains DLL surrogates. • Package installs boot services. • Package contains OS integrated files. • Package relies on a system-level driver. • Package's .sft file name is over 56 characters in length.  ***Important*** • *Packages with a status of* ***Virtualization not supported*** *will not be virtualized. In order to virtualize the package, you must first override the status and change it to* ***Ready to Virtualize*** *or* ***Requires Repackaging****.*  ***Note*** • *For more information, see Application Virtualization Compatibility Tests.*
	**Virtualization not recommended**	Automated Application Converter has determined that this package is not recommended for virtualization due to one of the following issues: • Package does not contain a shortcut. • Package includes a custom shell extension. • Package utilizes ClickOnce technology.  ***Note*** • *For more information, see Application Virtualization Compatibility Tests.*
	**Unknown**	The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.

7. Click **Next**. The **Select Virtual Machine Source** panel opens, prompting you to select the type of virtual machine that you are going to use for automated repackaging.

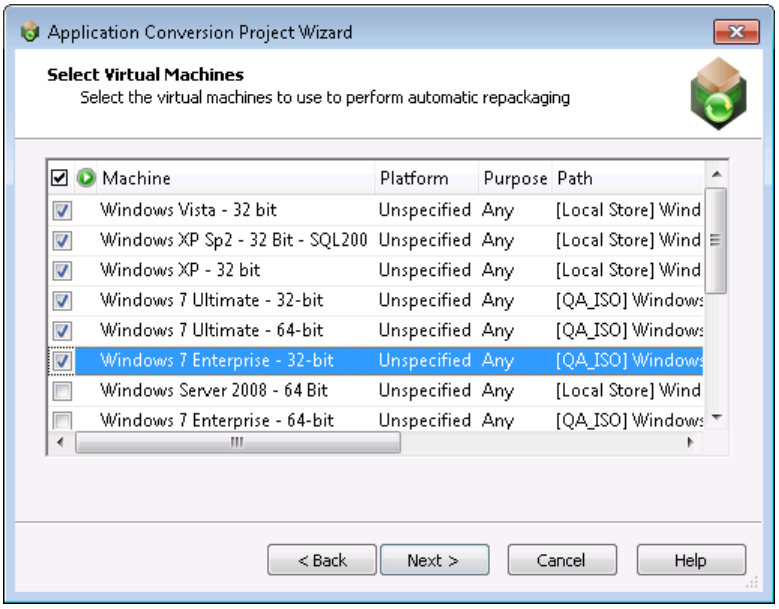


Note • *If none of the packages selected on the* ***Selected Package List*** *panel require repackaging in order to be converted into a virtual package, the* ***Select Virtual Machine Source*** *panel will not be displayed. Instead, the* ***Initial Configuration Complete*** *panel will open.*

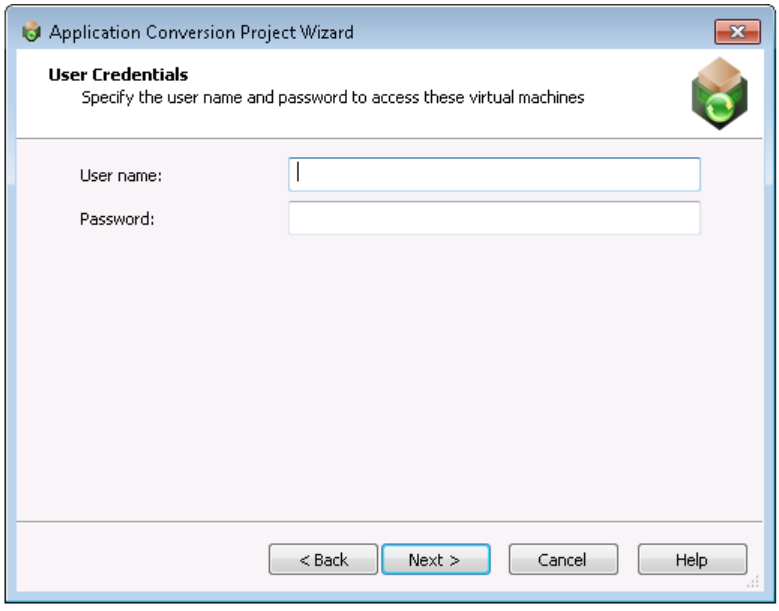
Select one of the following options and click **Next**:

Option	Description
Microsoft Hyper-V Server	Select this option to connect to a Microsoft Hyper-V Server. You will then be prompted for login information on the Select Virtual Machines from a Microsoft Hyper-V Server panel.
VMware ESX or ESXi Server	Select this option to connect to a VMware ESX or ESXi Server. You will then be prompted for login information on the Select Virtual Machines from a VMware ESX or ESXi Server panel.
Browse local machine	Select this option to connect to a VMware Workstation virtual image installed locally. The Select Virtual Machines opens, where will be prompted to select either a VMware Workstation image or directory of images.

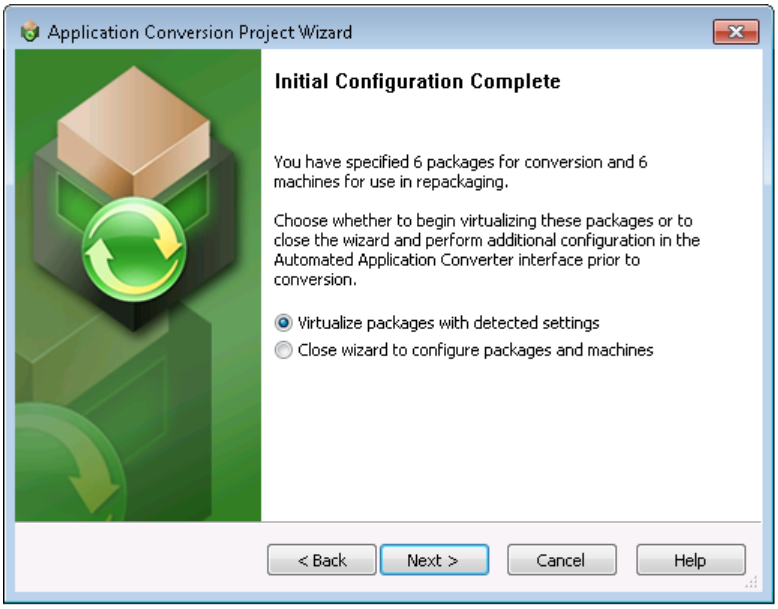
When you have finished this step, the virtual machines will be listed (but not selected) on the **Select Virtual Machines** panel.



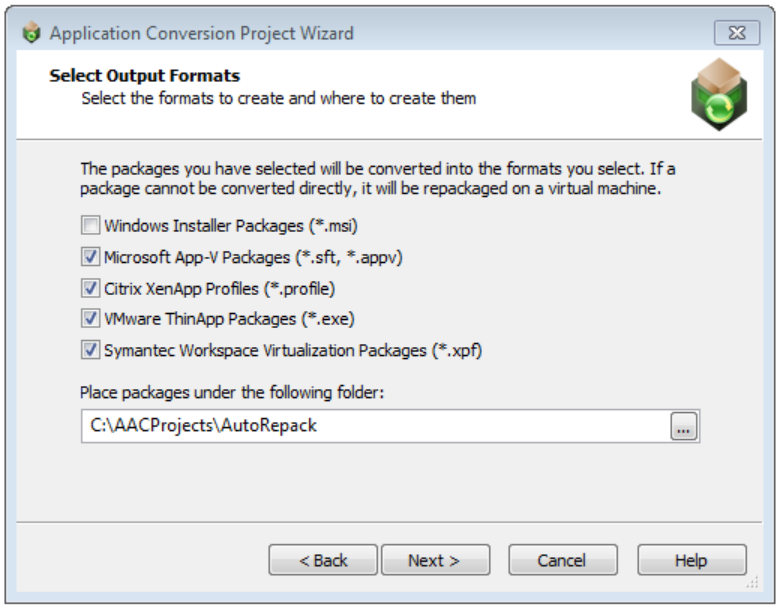
8. On the **Select Virtual Machines** panel, select the virtual machine images that you want to use to perform automated repackaging.
9. For each selected image, click in the **Platform** column and identify its platform.
10. Optionally, if you want to limit the use of a virtual machine to either repackaging only or testing only, click in the **Purpose** column and select **Repackaging** or **Testing** from the list. The default value is **Any**.
11. Click **Next**. The **User Credentials** panel opens, prompting you to specify the login credentials to use to access the selected virtual machines.



12. Enter login credentials and click **Next**. The **Initial Configuration Complete** panel opens, listing a summary of your selections, and prompting you to select whether you want to begin to **Virtualize packages with detected settings** or to **Close wizard to configure packages and machines**.



13. Select **Virtualize packages with detected settings** and click **Next**. The **Select Output Formats** panel opens, prompting you to select one or more output formats:

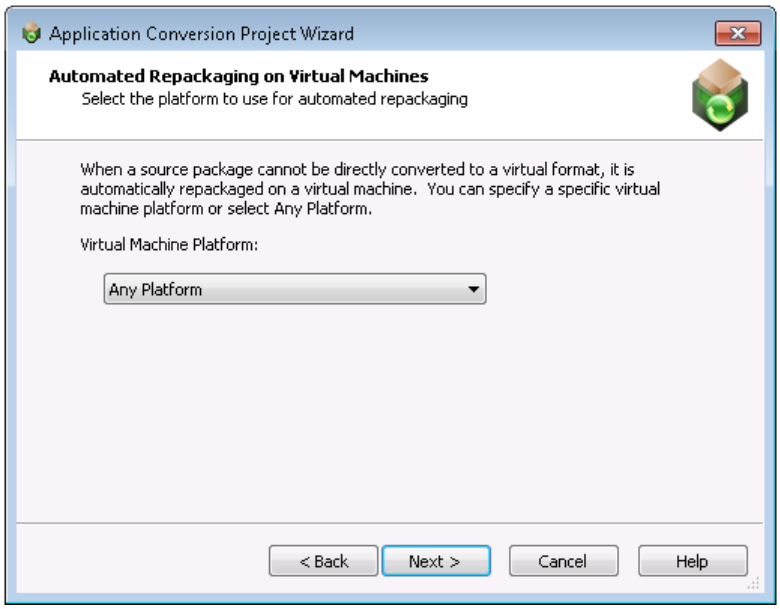


Note • *If you have selected Windows Installer packages on the* ***Selected Package List*** *panel, but those packages do not require repackaging prior to virtualization, the* ***Windows Installer Package (*.msi)*** *option on the* ***Select Output Formats*** *panel will be disabled. If you want to force the Automated Application Converter to repackage that package, return to the* ***Selected Package List****, click in that package's Virtualization Readiness column and select* ***Requires repackaging*** *from the list.*

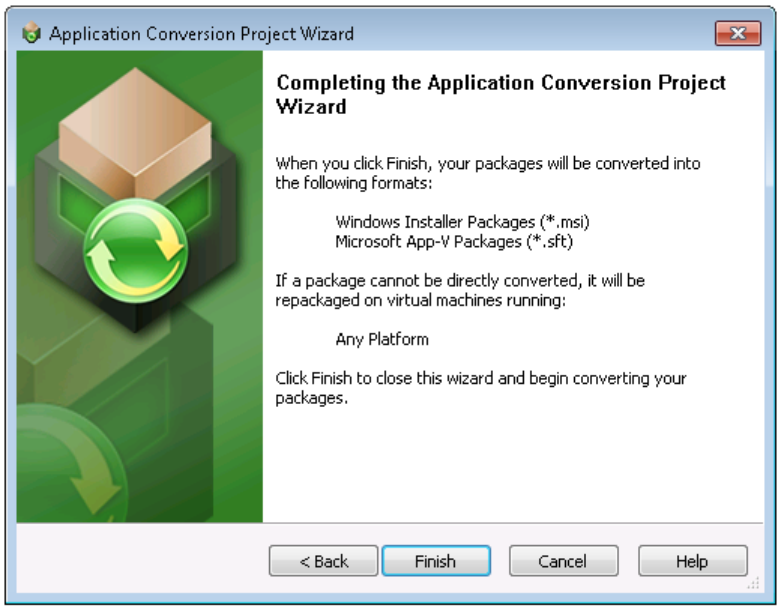
14. On the **Select Output Formats** panel, select one or more of the following formats:

Option	Description
Windows Installer Packages (*.msi)	Select this option to repackage the selected packages into Windows Installer packages (.msi).
Microsoft App-V Packages (*.sft)	Select this option to convert the selected packages to Microsoft App-V virtual applications. ***Note*** *• If you select this option, your packages will be converted using the* ***Package Creation*** *method (described in Comparison of the App-V 5.0 Conversion Methods) that is selected on the* ***Project Options*** *dialog box:* • *App-V 4.6 with AdminStudio* • *App-V 5.x with AdminStudio* • *App-V 5.x with Sequencer* *However, if a method is selected in the* ***Package Creation*** *field of a package's* ***Properties*** *window, the selected method will be used.*
Citrix XenApp Profiles (*.profile)	Select this option to convert the selected packages to Citrix XenApp profiles.
VMware ThinApp Packages (*.exe)	Select this option to convert the selected packages to VMware ThinApp virtual applications.
Symantec Workspace Virtualization Packages (*.xpf)	Select this option to convert the selected packages to Symantec Workspace virtual packages.

15. Under **Place packages under the following folder**, select the output location where you want to store the packages.
16. Click **Next**. The **Automated Repackaging on Virtual Machines** panel opens, prompting you to select the platform of the virtual machines that you want to use to perform automated repackaging during this conversion process.



17. From the **Virtual Machine Platform** list, select a platform, or leave **Any Platform** selected, and click **Next**. The **Application Conversion Project Wizard Complete** panel opens.



18. Click **Finish** to close the wizard and begin converting the selected packages.The conversion process begins. The **Results** tab opens and messages are displayed in the **Output** window.

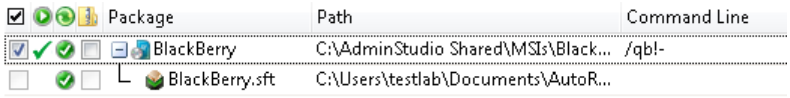
Icons displayed on the **Results** tab indicate each package's progress:

Column	Icon	Description
Copy In  **Repackage**  **Copy Out** 		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) was successfully performed.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) was successfully performed, but warnings were encountered. View the results AdminStudio Automated Application Converter Log Report for detailed information on these warnings.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) failed. • **Copy In**—Error could have been caused by not being able to connect to the virtual machine. • **Repackage**—Error means that repackaging has failed. • **Copy Out**—Error could mean that you ran out of hard drive space at the package source location or that there is a permission problem preventing you from writing to the selected directory. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) was skipped. Possible reasons that the operation was skipped could be: • **Repackaging not required**—Because repackaging was not required, these three operations were not required. • **Could not connect to virtual machine**—The Automated Application Converter could not successfully connect to the virtual machine, so therefore the **Repackage** and **Copy Out** operations were skipped.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) is currently being performed.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) is still being performed even though a warning was generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		Operation was cancelled

Column	Icon	Description
Conversion Column		Package was converted to a virtual application successfully.
		Package was converted to a virtual application, but warnings were generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		Package was converted to a virtual application, but errors were generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		The Automated Application Converter was unable to convert this package to a virtual application.
		Conversion is in progress.
		Conversion is in progress, but a warning has been generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		An error was generated when converting one of the virtual formats which caused it to fail. However, the conversion to another one of the selected virtual formats continues.
		Conversion was cancelled

19. When conversion is complete, the virtual packages will be listed in a tree structure under the original package on the **Packages** tab.



20. To view the **AdminStudio Automated Application Converter Log** report, select the top level node of the conversion run log (such as `Log started Monday, June 21, 2010...`) on the **Results** tab and do one of the following:

    - Click the **Results** button on the toolbar.
    - Select **View Report** from the shortcut menu.
    - Select **View Report** on the **Tools** menu.
    - Press Ctrl+R.

    See AdminStudio Automated Application Converter Log Report for more information.

21. Continue with the steps in Testing Packages and Importing Converted Packages into the Application Catalog.

About Automated Application Converter Project Files

All of the selections that you make on wizard panels or in the Automated Application Converter interface are saved in an XML-based project file: **ProjectName.aacx**. You can also choose to modify project settings by editing this XML file.

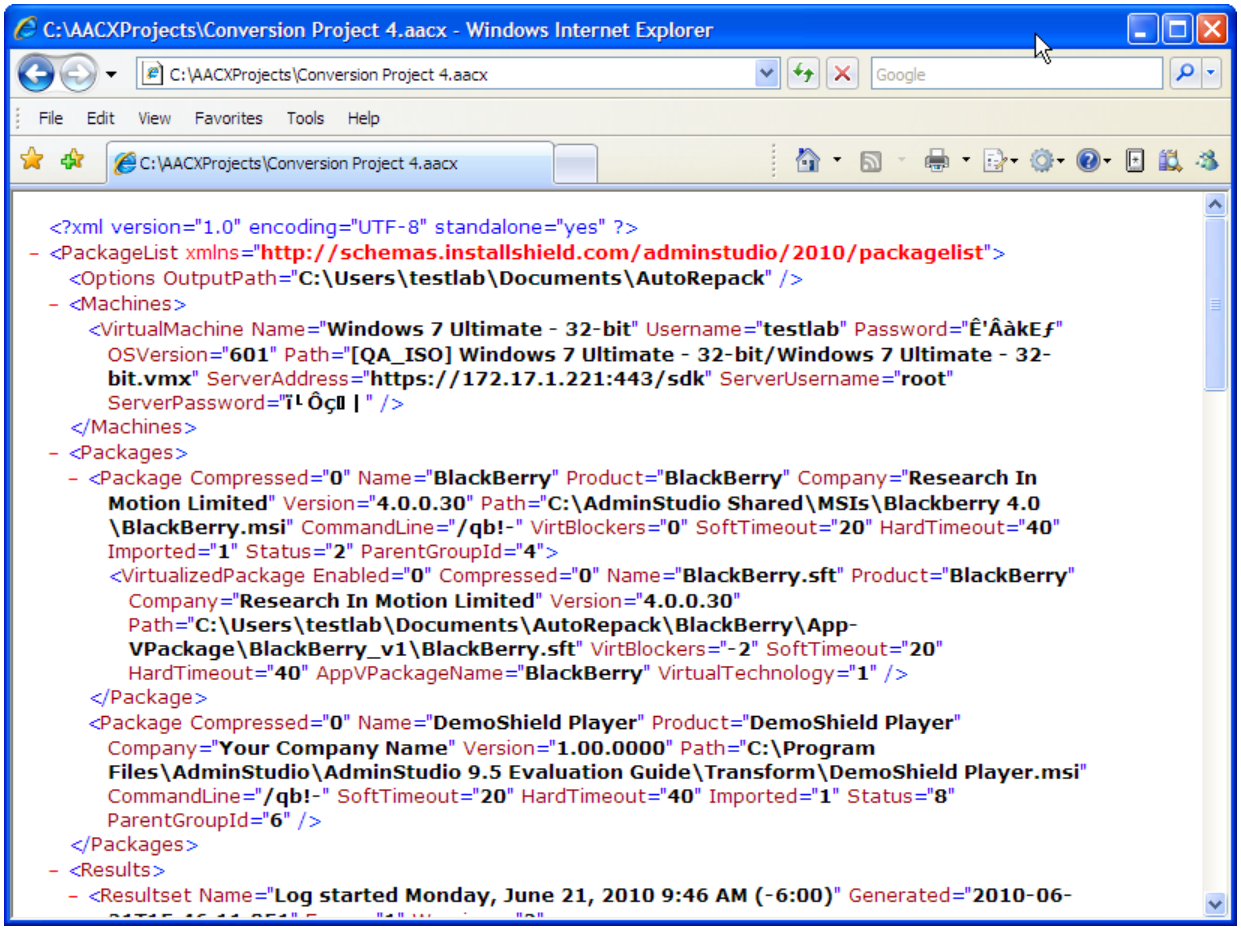


Figure 10-13: Sample Project File

Note • *To both launch the Automated Application Converter and open a project, you can double-click a project file in Windows Explorer.*

As shown in the following example, each project file is enclosed within a <PackageList> element, and the major sub-elements of a project file are <Options>, <Machines>, <Packages>, and <Results>. All of the settings specified in the Automated Application Converter interface appear in this file.

Table 10-11 • Elements Comprising an Automated Application Converter Project File

The following table describes the major elements of a project file:

Table 10-12 • Major Elements of an Automated Application Converter Project File

Element	Description
PackageList	The root element of an Automated Application Converter project file is the <PackageList> element: `<PackageList xmlns="http://schemas.installshield.com/adminstudio/2010/packagelist">` The PackageList element identifies the location of the XML namespace used by the application. XML namespaces provide a method to avoid element name conflicts.
Options	The <Options> element of a project file identifies the output location of the converted packages and identifies the currently selected output formats: `<Options OutputPath="C:\Users\testlab\Documents\AutoRepack" Msi="1" Citrix="1" />`
Machines	The <Machines> element contains multiple <VirtualMachine> elements, which identify the virtual machines that you have added to the project: `<Machines>` `  <VirtualMachine Name="Windows 7 Enterprise - 32-bit" Username="testlab" Password="Ê&` `  <VirtualMachine Name="Windows XP" Username="testlab" Password="Ê'ÂàkEƒ" Path="[` `</Machines>`
Packages	The <Packages> element contains multiple <Package> elements, which identify the packages that you have added to the project: `<Packages>` `  <Package Compressed="0" Name="LicModInj" Product="LicModInj" Company="Your` `  <VirtualizedPackage Enabled="0" Compressed="0" Name="LicModInj.sft" Pro` `  <ErrorVirtualizedPackage Enabled="0" Compressed="0" Name="LicModInj.prof` `  </Package>` `  <Package Compressed="0" Name="MathPlot" Product="MathPlot" Company="Install` `  <Package Compressed="0" Name="BlackBerry" Product="BlackBerry" Company="Res` `  <VirtualizedPackage Enabled="0" Compressed="0" Name="BlackBerry.sft" Pr` `  <VirtualizedPackage Enabled="0" Compressed="0" Name="BlackBerry.profile'` `  </Package>` `</Packages>` Each <Package> element can have multiple <RepackagedPackage>, <VirtualizedPackage>, and <ErrorVirtualizedPackage> elements.

Table 10-12 • Major Elements of an Automated Application Converter Project File

Element	Description
Results	The <Results> element contains multiple <Resultset> elements, each of which contains information on a conversion run: <Results> <Resultset Name="Log started Friday, June 11, 2010 2:56 PM (-6:00)" Generated=" <Machines> <UseMachine Name="Windows 7 Ultimate - 32-bit" Path="[QA_ISO] Windows 7 <UseMachine Name="Windows 7 Ultimate - 64-bit" Path="[QA_ISO] Windows 7 </Machines> <Packages> <UsePackage Name="InstallShield MSIDiff" Path="C:\Program Files\AdminSt <UsePackage Name="LicModInj" Path="C:\Program Files\AdminStudio\9.5\Qui <UsePackage Name="MathPlot" Path="C:\Program Files\AdminStudio\9.5\Quic </Packages> <Messages> <LogItem Id="4300" Flags="4" Message="Processing packages..." Time="2 </Messages> </Result> <Result Name="LicModInj" Generated="2010-06-11T20:56:02.285" Warnings="7" C <Messages> <LogItem Id="4336" Flags="2" Message="Package LicModInj will be dir <LogItem Id="4345" Message="Virtualizing package..." Time="2010-06- <LogItem Id="4347" Message="Converting to Microsoft App-V." Time="2 </Messages> </Result> </Resultset> </Results> • Each <Resultset> element of a <Results> element includes information on <Machines>, <Packages>, <Messages>, and multiple <Result> elements for that run. • Each <Result> element of a <Resultset> element contains information on the conversion run for an individual package.

Using Automated Application Converter in Evaluation Mode

When using the Automated Application Converter in Evaluation mode, you can only use one virtual machine and convert up to three packages during one repackaging/virtualization conversion run. Even if more than one virtual machine is selected, only one will be used, and even if more than three packages are selected, only three will be processed.

Managing Virtual Machines

The Automated Application Converter supports automated repackaging on virtual machines from the following platforms:

- Microsoft Hyper-V Server

- VMware ESX or ESXi Server
- VMware Workstation 6.5 or later

You can use the Virtual Machine Import Wizard to add "clean" virtual machines to the **Machines** tab of the Automated Application Converter, making them available for use during automated repackaging, conversion to App-V 5.0 format using the App-V Sequencer, and testing of App-V 5.0 packages.

Information about managing virtual machines is presented in the following sections:

- Virtual Machine System Requirements
- Preparing Your Virtual Machines for Use With the Automated Application Converter
- VMware VIX API Requirement on the AdminStudio Machine
- Adding Virtual Machines Using the Virtual Machine Import Wizard
- Editing Virtual Machine Properties on the Machines Tab

Virtual Machine System Requirements

Automated Application Converter performs automated repackaging on virtual machines. This section lists the virtual machine platform and virtual machine image system requirements.

- Supported Virtual Machine Platforms
- VMware Requirements
- Microsoft Hyper-V Server Requirements
- Virtual Machine Image Requirements

Supported Virtual Machine Platforms

The Automated Application Converter supports automated repackaging on virtual machines from the following platforms:

- VMware ESX/ESXi Server, Version 3.5 Update 3 or later
- VMware Workstation 6.5 or later
- Microsoft Hyper-V Server 2008 R2 or later

VMware Requirements

As described above, Automated Application Converter supports automated repackaging on VMware ESX/ESXi Server and VMware Workstation.

- VMware VIX API Requirement
- VMware ESX/ESXi Server Permission Requirements

VMware VIX API Requirement

In order for Automated Application Converter to perform automated repackaging, it needs to communicate with the virtualization technology that you are using. If you are using VMware virtualization technology (VMware ESX or ESXi Server or a local VMware Workstation), the VMware VIX API needs to be installed on the same machine as the Automated Application Converter. You can do this by either installing VMware Workstation on that machine or by downloading and installing the VMware VIX API from the following location:

http://www.vmware.com/support/developer/vix-api

***Note** • When using VMware Workstation, it is recommended that you install VMware Workstation on the same machine as Automated Application Converter so that Automated Application Converter will use the version of the VIX API that was designed for that specific version of VMware Workstation. Although it is likely that newer versions of the VIX API will also work, it seems that the best approach is for Automated Application Converter to use the version of the VIX API that was bundled with your version of VMware Workstation.*

VMware ESX/ESXi Server Permission Requirements

If you plan to use a VMware ESX/ESXi Server in conjunction with Automated Application Converter, make sure that the account that you use to log in to this server has the permissions/roles needed to automatically open a VM using VMware VIX API. The account needs to either have an administrator role assigned or, at least, have the following three roles assigned:

- All Privileges/Virtual Machine/State/Create Snapshot
- All Privileges/Virtual Machine/State/Delete Snapshot
- All Privileges/Virtual Machine/Interaction/Console Interaction

If the login account does not have these permissions/roles, Automated Application Converter will be unable to automatically boot up a virtual machine on that server.

Microsoft Hyper-V Server Requirements

As described above, Automated Application Converter supports automated repackaging on Microsoft Hyper-V Server. When preparing a Hyper-V Server for use with Automated Application Converter, make sure that the following conditions are met:

- **Configuration tools**—Verify that the Hyper-V configuration tools are installed on the Hyper-V server machine. These tools can be installed using the Microsoft Hyper-V Management Console.
- **Connection**—Verify that you can successfully connect to the Hyper-V Server from the machine where AdminStudio Automated Application Converter is installed.
- **Permissions**—Make sure that the Hyper-V Server user has the permissions required to perform operations on the Hyper-V machines.
- **Configuration settings**—Connecting to a WMI namespace on a remote computer running Windows Vista or Windows Server 2008 may require changes to configuration settings. Check the following configuration settings on the AdminStudio machine as well as on the Hyper-V Server machine:
  - Windows Firewall Settings
  - User Account Control (UAC) Settings

- DCOM Settings
- Common Information Model Object Manager (CIMOM) Settings

Note • *For detailed information, see Connecting to WMI Remotely at:*

http://msdn.microsoft.com/en-us/library/aa822854(VS.85).aspx

Virtual Machine Image Requirements

Automated Application Converter uses virtual machines to perform automated repackaging. These virtual machines have the following requirements:

Virtual Machine System Requirements

When creating a virtual machine image that will be hosted on one of the virtual machine platforms listed above, the recommended minimum requirements should meet those required by the applications you are trying to repackage. Since you repackage on the target deployment platform, the virtual machine image should closely resemble the target deployment environment.

Preparing Your Virtual Machines for Use With the Automated Application Converter

You need to prepare each virtual machine that you are going to use with the Automated Application Converter to perform automated repackaging by running the Virtual Machine Preparation setup and by creating a snapshot. For instructions, see Preparing Your Virtual Machines for Use With the Automated Application Converter.

Preparing Your Virtual Machines for Use With the Automated Application Converter

Information about preparing virtual machines for use with Automated Application Converter are presented in the following topics:

- Preparing Virtual Machines
- Running the Virtual Machine Preparation Setup
- Taking a Snapshot
- VMware-Specific Snapshot Configuration Option

Preparing Virtual Machines

Automated Application Converter uses virtual machine snapshots to perform repackaging, to perform conversion to App-V 5.0 format using the App-V 5.0 Sequencer, and to test App-V 5.0 virtual packages.

- Preparing a Snapshot for Repackaging
- Preparing a Snapshot for App-V 5.0 Conversion Using the App-V 5.0 Sequencer
- Preparing a Snapshot for App-V 5.0 Testing Using the App-V 5.0 Client

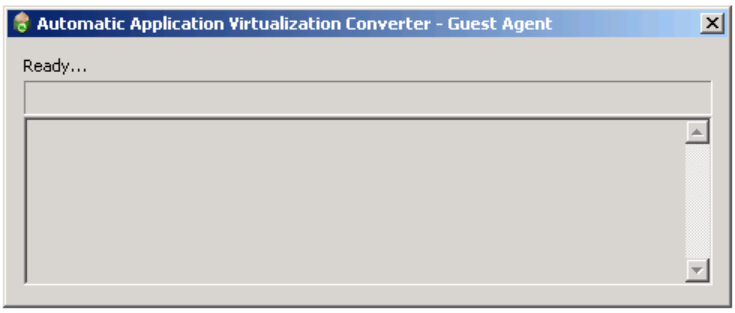
You can add multiple virtual machines to Automated Application Converter and each of those virtual machines can have multiple snapshots.

Preparing a Snapshot for Repackaging

To prepare a virtual machine snapshot for use by Automated Application Converter to perform automated repackaging, perform the following steps:

Task ***To prepare a snapshot for repackaging:***

1. Launch the virtual machine and run the Virtual Machine Preparation setup, as described in Running the Virtual Machine Preparation Setup.
2. At the end of the Virtual Machine Preparation setup, you will be prompted to restart the virtual machine. Restart the virtual machine and verify that you are automatically logged in and that **GuestAgent.exe** is launched:



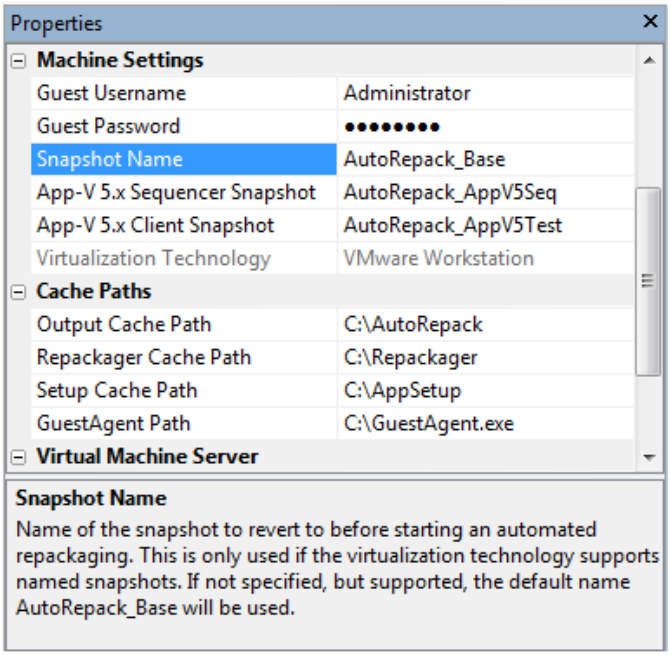
Note *• The Guest Agent (**GuestAgent.exe**) is a tool that is launched on a virtual image that enables the Automated Application Converter to manipulate the virtual machine in ways that may be unsupported by its automation APIs. In particular, this enables launching and monitoring the AdminStudio Repackager in an automated fashion.*

3. Shut down the virtual machine.
4. Take a snapshot, as described in Taking a Snapshot. If your virtualization technology supports named snapshots, name the snapshot **AutoRepack_Base**, which is the default name that the Automated Application Converter will be looking for when performing repackaging.

Note *• If you assign a snapshot name other than **AutoRepack_Base**, after you add the virtual machine to the Automated Application Converter, you need to enter that snapshot name in the **Snapshot Name** field in the **Properties** window of the **Machines** tab for that virtual machine.*

5. If the virtual machine containing this snapshot is not already added to Automated Application Converter, proceed with the steps in Adding Virtual Machines Using the Virtual Machine Import Wizard.
6. Open the **Machines** tab of Automated Application Converter and select the virtual machine that contains this snapshot.

7. In the **Properties** window under **Machine Settings**, enter the name of this snapshot in the **Snapshot Name** field. If no name is entered, the default value of **AutoRepack_Base** will be used.

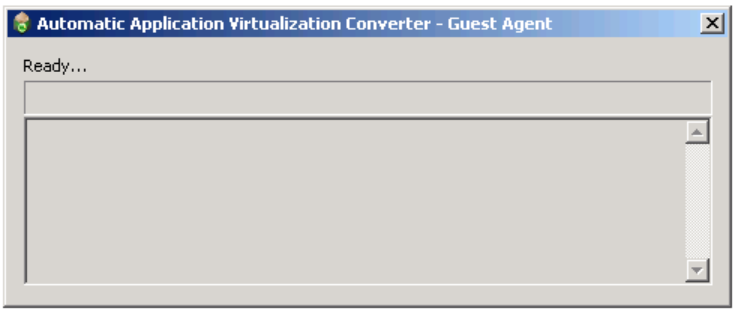


Preparing a Snapshot for App-V 5.0 Conversion Using the App-V 5.0 Sequencer

To prepare a virtual machine snapshot for use by Automated Application Converter to perform automated conversion to App-V 5.0 format using the App-V 5.0 Sequencer, perform the following steps:

Task ***To prepare a snapshot for conversion to App-V 5.0 format using the App-V 5.0 Sequencer:***

1. Launch the virtual machine and run the Virtual Machine Preparation setup, as described in Running the Virtual Machine Preparation Setup.
2. At the end of the Virtual Machine Preparation setup, you will be prompted to restart the virtual machine. Restart the virtual machine and verify that you are automatically logged in and that **GuestAgent.exe** is launched:



Note • *The Guest Agent (**GuestAgent.exe**) is a tool that is launched on a virtual image that enables the Automated Application Converter to manipulate the virtual machine in ways that may be unsupported by its*

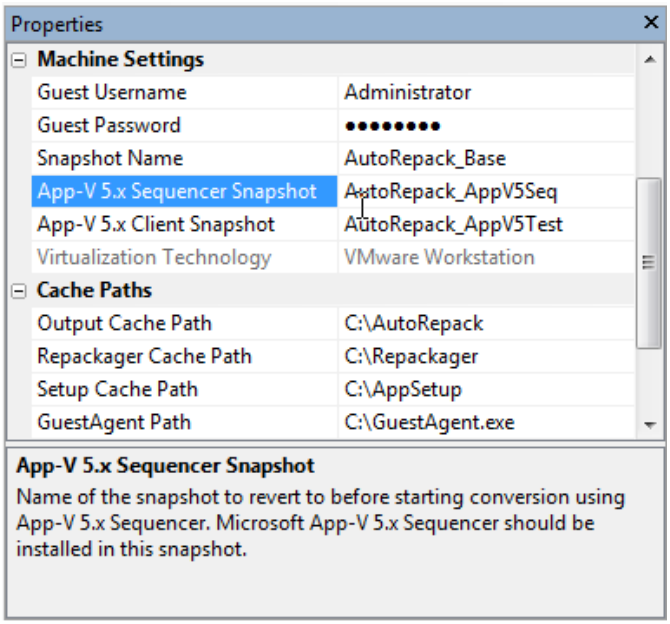
automation APIs. In particular, this enables launching and monitoring the Microsoft App-V 5.0 Sequencer in an automated fashion.

3. Make sure that this snapshot meets the following requirements:

Requirement	Description
Operating System	Windows 7 SP1 or later The following updates are also required for computers running the following operating systems: ● **Windows 7 or Windows 7 SP1 (32-bit or 64-bit)** —Download and install KB2533623: http://go.microsoft.com/fwlink/?LinkId=286100 ● **Windows Server 2008 R2 SP1**—Download and install KB2533623: http://go.microsoft.com/fwlink/?LinkId=286102
PowerShell	Windows PowerShell 3.0: http://www.microsoft.com/en-us/download/details.aspx?id=34595
.NET	Microsoft .NET Framework 4 (Full Package): http://www.microsoft.com/en-us/download/details.aspx?id=17718

***Note** • These prerequisites are already installed for computers that run Windows 8 and Windows Server 2012.*

4. Run the Microsoft App-V 5.0 Sequencer installer (which you received when you purchased Microsoft App-V 5.0).
5. Shut down the virtual machine.
6. Take a snapshot, as described in Taking a Snapshot. If your virtualization technology supports named snapshots, give the snapshot a name that indicates its purpose, such as **AutoRepack_AppV5Seq**.
7. If the virtual machine containing this snapshot is not already added to Automated Application Converter, proceed with the steps in Adding Virtual Machines Using the Virtual Machine Import Wizard.
8. Open the **Machines** tab of Automated Application Converter and select the virtual machine that contains this snapshot.
9. In the **Properties** window under **Machine Settings**, enter the name of this snapshot in the **App-V 5.x Sequencer Snapshot** field.



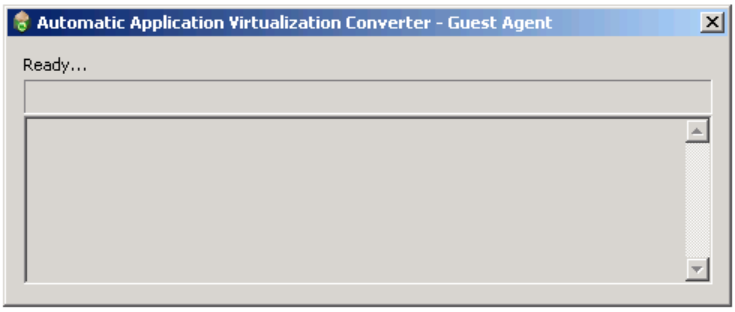
Preparing a Snapshot for App-V 5.0 Testing Using the App-V 5.0 Client

To prepare a virtual machine snapshot for use by Automated Application Converter to perform testing of App-V 5.0 packages, perform the following steps:

Note • *It is not necessary to create a snapshot for App-V 4.x package testing; you will have the option of choosing to install the App-V 4.x client at the time of testing.*

Task ***To prepare a snapshot for testing of App-V 5.0 packages:***

1. Launch the virtual machine and run the Virtual Machine Preparation setup, as described in Running the Virtual Machine Preparation Setup.
2. At the end of the Virtual Machine Preparation setup, you will be prompted to restart the virtual machine. Restart the virtual machine and verify that you are automatically logged in and that **GuestAgent.exe** is launched:



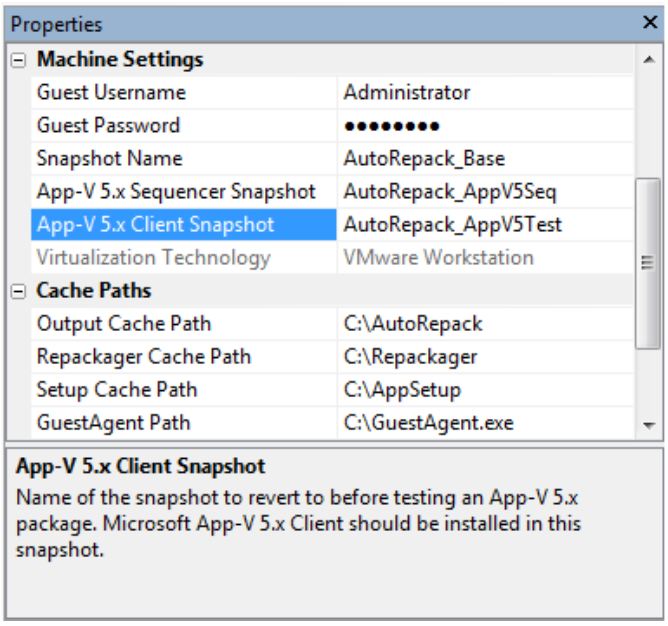
***Note** • The Guest Agent (**GuestAgent.exe**) is a tool that is launched on a virtual image that enables the Automated Application Converter to manipulate the virtual machine in ways that may be unsupported by its automation APIs. In particular, this enables launching and monitoring the Microsoft App-V 5.0 Client in an automated fashion.*

3. Make sure that this snapshot meets the following requirements:

Requirement	Description
Operating System	Windows 7 SP1 or later If you are using Windows 7 or Windows 7 SP1 (32-bit or 64-bit), download and install KB2533623: http://go.microsoft.com/fwlink/?LinkId=286100
PowerShell	Windows PowerShell 3.0: http://www.microsoft.com/en-us/download/details.aspx?id=34595
.NET	Microsoft .NET Framework 4 (Full Package): http://www.microsoft.com/en-us/download/details.aspx?id=17718

***Note** • These prerequisites are already installed for computers that run Windows 8 and Windows Server 2012.*

4. Run the Microsoft App-V 5.0 Client installer (which you received when you purchased Microsoft App-V 5.0).
5. Shut down the virtual machine.
6. Take a snapshot, as described in Taking a Snapshot. If your virtualization technology supports named snapshots, give the snapshot a name that indicates its purpose, such as **AutoRepack_AppV5Test**.
7. If the virtual machine containing this snapshot is not already added to Automated Application Converter, proceed with the steps in Adding Virtual Machines Using the Virtual Machine Import Wizard. When you add this machine, make sure that you set its **Purpose** property to either **Any** or **Testing**. If this machine's **Purpose** property is set to **Repackaging**, this machine will not be available when performing testing.
8. Open the **Machines** tab of Automated Application Converter and select the virtual machine that contains this snapshot.
9. In the **Properties** window under **Machine Settings**, enter the name of this snapshot in the **App-V 5.x Client Snapshot** field.



Running the Virtual Machine Preparation Setup

On each virtual machine that you are going to use to perform automated repackaging, you need to run the Virtual Machine Preparation setup, an application that will enable automatic login. When you install AdminStudio, you will find the Virtual Machine Preparation setup in the following location:

```
C:\Program Files\AdminStudio\2016\Repackager\VirtualMachinePrep\VMCfg.exe
```

You need to run this application one time on all of the virtual machines that you are going to use with the Automated Application Converter.

Note • *If you do not run the Virtual Machine Preparation setup on the virtual machines you want to use, the Automated Application Converter will be unable to connect to them.*

Taking a Snapshot

After you have run the Virtual Machine Preparation setup on a virtual machine, you need to shut it down and create a snapshot. This enables the Automated Application Converter to revert the virtual image to a clean state after each repackaging run.

Note • *If you do not take a snapshot of the virtual image, the Automated Application Converter will be unable to revert the image to a clean state after completing a repackaging run. Therefore, while the first repackage on the virtual machine would be on a clean image, all subsequent repackaging runs would be run on a "dirty" virtual image.*

Links to instructions on how to create a snapshot of a virtual machine are presented in the following table:

Table 10-13 • Instructions for Taking a Snapshot of a Virtual Machine

Platform	Link
VMware Workstation	***To take a snapshot:*** 1. Open VMware Workstation. 2. On the **VM** menu, point to **Snapshot** and click **Take Snapshot**. 3. Name the snapshot **AutoRepack_Base**. 4. You can optionally add a description to record notes about the virtual machine state captured in the snapshot. 5. Click **OK**.
VMware ESX or ESXi Server	To take a snapshot on the VMware ESX or ESXi server, perform the following steps: ***To take a snapshot:*** 1. Open the VMware infrastructure client. 2. On the **Inventory** menu, point to **Virtual Machine** and **Snapshot**, and then click **Take Snapshot**. 3. Name the snapshot **AutoRepack_Base**. 4. You can optionally add a description to record notes about the virtual machine state captured in the snapshot. 5. Click **OK**. ***Note*** • *For more information, see the VMware Knowledge Base article entitled Understanding virtual machine snapshots in VMware ESX:* *http://kb.vmware.com/kb/1015180*

VMware-Specific Snapshot Configuration Option

When configuring a VMware Workstation or VMware ESX/ESXi Server image, there is a setting that controls what VMware does with a virtual machine when it is powered off. In VMware Workstation, the option is set on the **Options** tab of the **Virtual Machine Settings** dialog box:

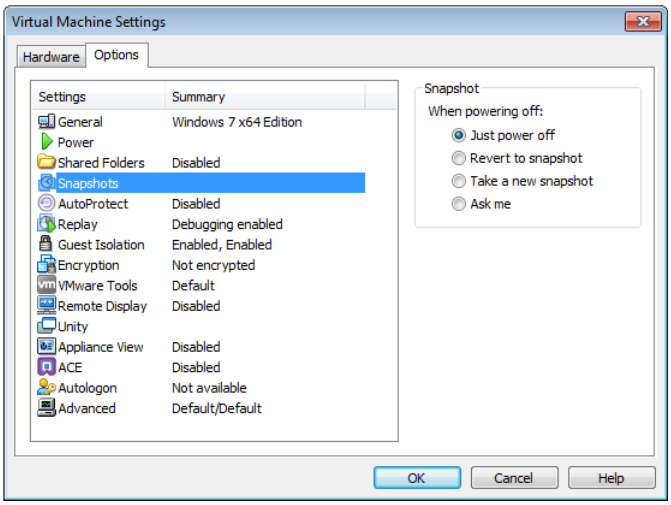


Figure 10-14: Snapshots Options on VMware Workstation Virtual Machine Settings Dialog Box

It is recommended that you set the **Snapshot** / **When powering off** option to **Just power off**. Do not select the **Ask me** option; selecting this option would block the use of this virtual image by Automated Application Converter until the prompt is dismissed by the user.

VMware VIX API Requirement on the AdminStudio Machine

In order for Automated Application Converter to perform automated repackaging, it needs to communicate with the virtualization technology that you are using. If you are using VMware virtualization technology (VMware ESX or ESXi Server or a local VMware Workstation), the VMware VIX API needs to be installed on the same machine as the Automated Application Converter. You can do this by either installing VMware Workstation on that machine or by downloading and installing the VMware VIX API from the following location:

http://www.vmware.com/support/developer/vix-api

Note • *When using VMware Workstation, it is recommended that you install VMware Workstation on the same machine as Automated Application Converter so that Automated Application Converter will use the version of the VIX API that was designed for that specific version of VMware Workstation. Although it is likely that newer versions of the VIX API will also work, it seems that the best approach is for Automated Application Converter to use the version of the VIX API that was bundled with your version of VMware Workstation.*

Adding Virtual Machines Using the Virtual Machine Import Wizard

You can add one or multiple virtual machines to the Automated Application Converter to use to perform automated repackaging during conversion to virtual packages.

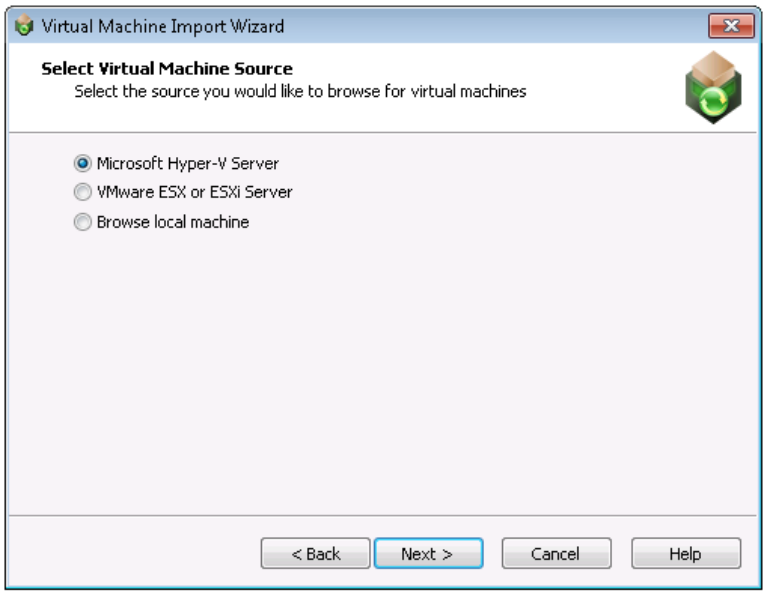
You have the option of selecting just one virtual machine to use for all repackaging, or selecting an operating system group of multiple virtual machines that can be used simultaneously to speed up the repackaging of multiple setups.

If you have specified a group of multiple virtual machines, a package in the conversion list is assigned to each virtual machine. Then, when a virtual machine finishes repackaging a package, it is reverted to its clean snapshot image, and then starts repackaging the next package in the list.

To add virtual machines to the **Machines** tab using the Virtual Machine Import Wizard, perform the following steps.

Task ***To add virtual machines:***

1. Open the **Machines** tab of the Automated Application Converter.
2. Click **Add Machine**. The **Welcome** panel of the **Virtual Machine Import Wizard** opens.
3. Click **Next**. The **Select Virtual Machine Source** panel opens, prompting you to select the type of virtual machine that you are adding.

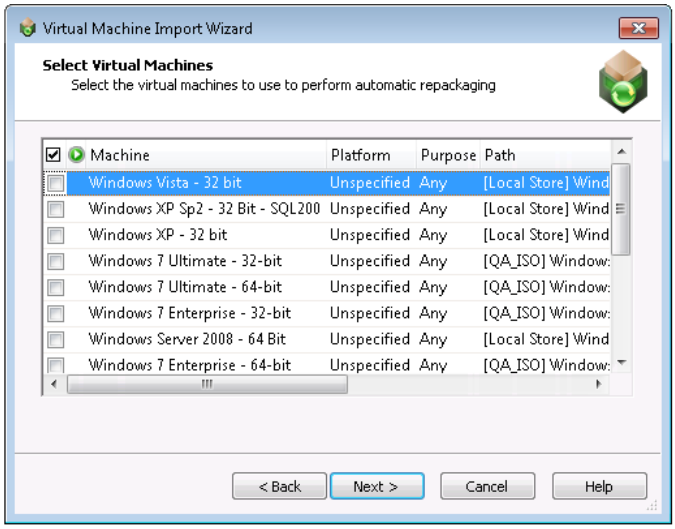


4. Select one of the following options and click **Next**.
   - **Microsoft Hyper-V Server**—Select this option to add a virtual image from a Microsoft Hyper-V Server.
   - **VMware ESX or ESXi Server**—Select this option to add a virtual image from a VMware ESX or ESXi Server.
   - **Browse local machine**—Select this option to add a virtual image from a local installation of VMware Workstation

5. Based upon your selection on the **Select Virtual Machine Source** panel, enter the following information:

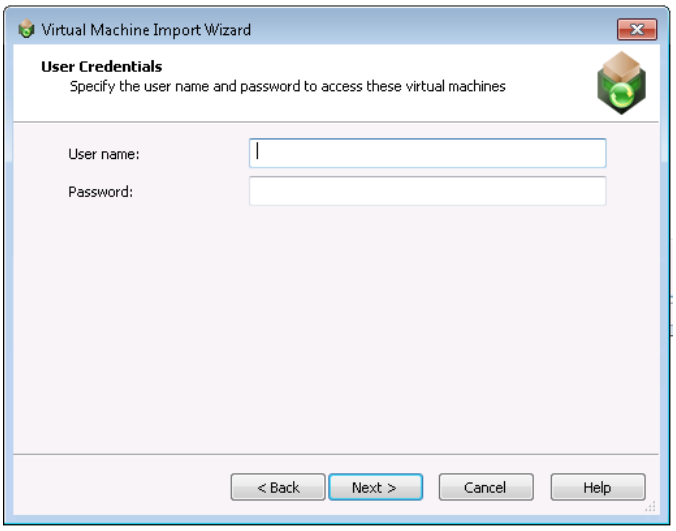
Virtual Machine Source	Steps to Take
Microsoft Hyper-V Server	On the **Select Virtual Machines from a Microsoft Hyper-V Server** panel, enter the following information: • **Server Name**—Enter the server name of the Microsoft Hyper-V Server that you want to connect to. • **Authentication**—Select **Windows Authentication** if you want to use the credentials of the logged in user to login to the Hyper-V Server. Select **Server Authentication** if you want to connect to the Hyper-V Server using the specified **User name** and **Password**.
VMware ESX or ESXi Server	On the **Select Virtual Machines from VMware ESX or ESXi Server** panel, enter the following information: • **Server Name**—Enter the name of the VMware ESX or ESXi server. • **User name**—Enter the login ID for the VMware ESX or ESXi server. • **Password**—Enter the password for the VMware ESX or ESXi server.
Browse local machine	On the **Select Virtual Machines** panel, do one of the following: ***To add an individual virtual machine:*** 1. Click **Browse Files**. The **Select Virtual Machine Image File** dialog box opens. 2. Select the virtual machine image you want to add to the project and click **Open**. ***To add all of the virtual machines in a specific directory:*** 1. Click **Browse Folders**. The **Browse for Folder** dialog box opens. 2. Select a directory that contains the virtual machine images that you want to add to your project and click **OK**.

When you have finished this step, the virtual machines will be listed (but not selected) on the **Select Virtual Machines** panel.



6. On the **Select Virtual Machines** panel, select the virtual machine images that you want to use to perform automated repackaging.
7. For each selected image, click in the **Platform** column and identify its platform.
8. By default, virtual machines that you add to the **Machines** tab will be available for use for both automated repackaging of packages and for testing packages. However, if you want to specify that a virtual machine should be used for only repackaging or for only testing, click in the **Purpose** column of that virtual machine and select one of the following options:
   - **Repackaging**—Virtual machine will only be used to perform automated repackaging.
   - **Testing**—Virtual machine will only be used to test packages. You test a package by right-clicking on it on the **Packages** tab and selecting **Launch Package for Testing** from the shortcut menu. You will then be prompted to install and run that package on a virtual machine.
   - **Any**—Make this virtual machine available for use during both automated repackaging and package testing.

   ***Note** • The **Launch Package for Testing** functionality will primarily be useful to test converted packages. However, if a problem occurs during conversion, it is also possible to use this function to install and launch the source package for testing.*
9. Click **Next**. The **User Credentials** panel opens, prompting you to specify the login credentials to use to access the selected virtual machines.



10. Enter the user credentials and click **Next**. The Virtual Machine Import Wizard Complete panel opens.

11. Click **Finish** to close the wizard and add the selected virtual machines to your project.

Editing Virtual Machine Properties on the Machines Tab

By default, the list of machines on the **Machines** tab lists the **Machine**, **Platform**, **Purpose**, and **Path** columns. Additional properties can be viewed and edited in the **Properties** window.

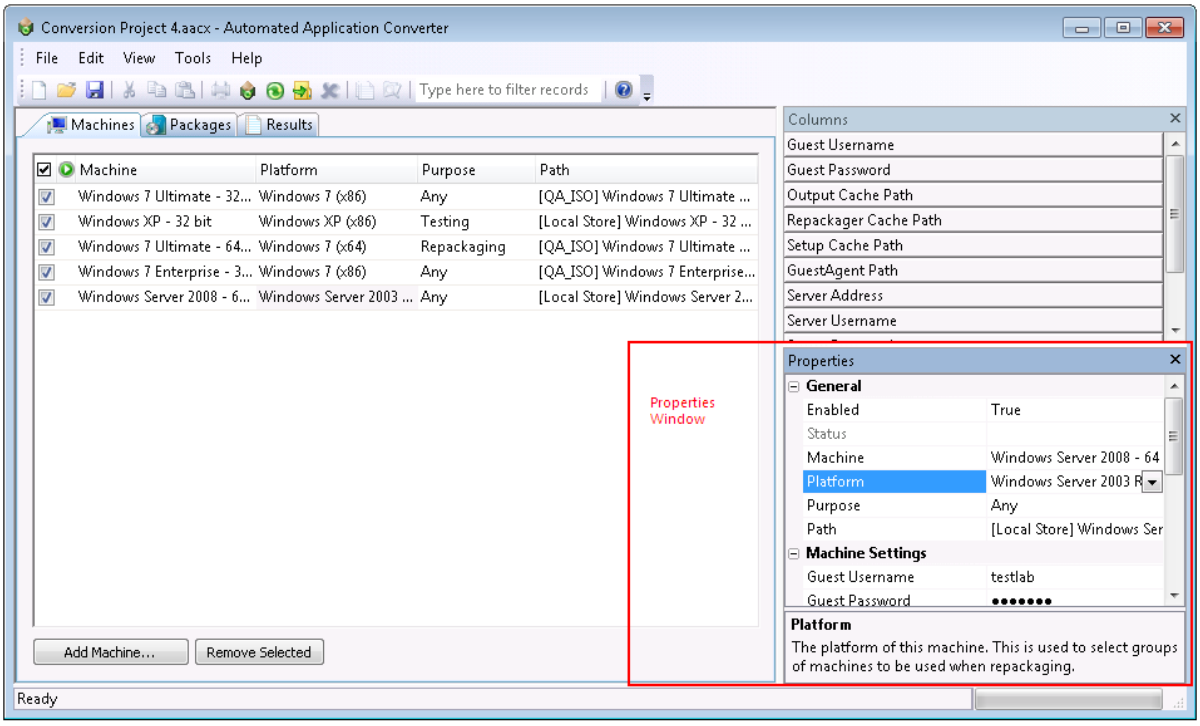


Figure 10-15: Properties Window on the Machines Tab

To edit the properties of a virtual machine, perform the following steps:

Task ***To edit a virtual machine's properties:***

1. Open the **Machines** tab.
2. Select a virtual machine in the list.
3. Click in the list or in the **Properties** window to edit the following properties:

Property	Description
Enabled	Set to **True** to enable the machine or **False** to disable it. When enabled, it is available for use by Automated Application Converter.
Status	Lists a status to indicate whether the machine is idle, is in use, or has suffered an unrecoverable error in the last attempt to use it.
Machine	Name of the virtual machine.
Platform	Field that identifies the operating system platform of the virtual machine. When you select a virtual machine to add to the Automated Application Converter, you need to manually identify the operating system platform either on the **Select Virtual Machines** panel or by clicking in this field on the **Machines** tab and making a selection from the list. When you perform a conversion run, you are given the opportunity (on the **Automated Repackaging on Virtual Machines** panel) to either select a specific platform to use for the repackaging of the selected packages, or to select **Any Platform**, meaning that all of the selected virtual machines will be used for repackaging.

Property	Description
Purpose	By default, virtual machines that you add to the **Packages** tab will be available for use for both automated repackaging of packages and for testing packages. However, if you want to specify that a virtual machine should be used for only repackaging or for only testing, click in the **Purpose** column of that virtual machine and select one of the following options: • **Repackaging**—Virtual machine will only be used to perform automated repackaging. • **Testing**—Virtual machine will only be used to test packages. You test a package by right-clicking on it on the **Packages** tab and selecting **Launch Package for Testing** from the shortcut menu. You will then be prompted to install and run that package on a virtual machine. • **Any**—Make this virtual machine available for use during both automated repackaging and package testing. This is the default value.  ***Important*** *• If the* ***Purpose*** *column is not listed in the* ***Machines*** *list, you can edit the* ***Purpose*** *value in the Properties window.*  ***Note*** *• The* ***Launch Package for Testing*** *functionality will primarily be useful to test converted packages. However, if a problem occurs during conversion, it is also possible to use this function to install and launch the source package for testing.*
Path	Path on the server or file system to this virtual machine image file is located.
Guest Username	The user name to use to login to this virtual machine.
Guest Password	The password to use to login to this virtual machine.
Snapshot Name	Name of the snapshot to revert to before starting an automated repackaging session. This is only used if the virtualization technology supports named snapshots. If this value is not specified, but named snapshots are supported on the virtualization technology, the default name of **AutoRepack_Base** will be used.

Property	Description
App-V 5.x Sequencer Snapshot	Enter the name of the snapshot to revert to before starting conversion using the App-V 5.x Sequencer. ***Important*** *• If you do not specify a snapshot name and then attempt to perform conversion using the* ***App-V 5.x with Sequencer*** *package creation method, you will receive the following error message and the conversion will fail.* ***Error: No snapshot name was specified for App-V 5.x Sequencer conversion. Please specify this for at least one machine in the Machines tab and retry.*** ***Important*** *• Both the Microsoft App-V 5.x Sequencer and the Virtual Machine Preparation client must be installed on this snapshot. For more information, see Preparing a Snapshot for App-V 5.0 Conversion Using the App-V 5.0 Sequencer.*
App-V 5.x Client Snapshot	Enter the name of the snapshot to revert to before testing an App-V 5.x package. This snapshot will be used if the user right-clicks on this App-V 5.0 virtual package on the **Packages** tab of Automated Application Converter and selects **Launch Package for Testing** from the shortcut menu. ***Note*** *• If you do not specify a snapshot name and then attempt to test an App-V 5.x package by selecting* ***Launch Package for Testing*** *from the shortcut menu, the following error will appear in the output window:* ***Error: No snapshot name was specified for testing with App-V 5.x Client. Please specify a snapshot name in the Machines tab and retry.*** ***Important*** *• Both the Microsoft App-V 5.x client and the Virtual Machine Preparation client must be installed on this snapshot. For more information, see Preparing a Snapshot for App-V 5.0 Testing Using the App-V 5.0 Client.*
Virtualization Technology	The virtualization technology powering this virtual machine.
Output Cache Path	Specify the location for the repackaged output on the virtual machine. By default, this value is **C:\AutoRepack**.
Repackager Cache Path	Specify the location where Repackager will be installed on the virtual machine. By default, this value is **C:\Repackager**.
Setup Cache Path	Specify the location where the package will be copied to on the virtual machine. By default, this value is **C:\AppSetup**.

Property	Description
GuestAgent Path	Specify the location where the **GuestAgent.exe** file will be installed on the virtual machine. By default, this value is **C:\GuestAgent.exe**.
Server Address	The address of the virtual machine server on which this virtual machine is found. This may be a host name or a URL.
Server Username	The user name of the account used to access the virtual machine server.
Server Password	The password of the account used to access the virtual machine server.
Add Machine	Click to launch the Virtual Machine Import Wizard, which you can use to add virtual machines to the **Machines** tab.
Remove Selected	Click to remove the selected virtual machine from this list. ***Note** • A virtual machine is selected for removal when you click on it and it becomes highlighted, not by selecting the virtual machine's check box. Use the **Ctrl** key to select multiple machines.*

Connecting to Active Virtual Machines

When the Automated Application Converter is connected to a virtual machine and it is performing repackaging, you can use Remote Desktop to open that virtual machine directly from the Automated Application Converter interface to check on the progress of the repackaging run.

Task ***To open a virtual machine from the Automated Application Converter interface:***

1. Add virtual machines to your project file, as described in Adding Virtual Machines Using the Virtual Machine Import Wizard.
2. Begin a conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard.
3. Open the **Machines** tab or the **Packages** tab.
   - On the **Machines** tab, right-click on a machine that is currently performing repackaging. The machine will have a status of Running (), which means that the Automated Application Converter has connected to the virtual machine and the **GuestAgent.exe** is running.
   - On the **Packages** tab, right-click on a package that is currently being repackaged on a virtual machine. The package will have a status of Running ().
4. On the shortcut menu, select **Connect to Machine**. The virtual machine opens in a Remote Desktop window.

***Tip** • If you have selected a package that has a status of Running but which does not require repackaging, the **Connect to Machine** selection will be disabled.*

Managing Packages to Convert

You can use the **Package Import Wizard** to add packages to your Automated Application Converter project for conversion.

You can also modify package properties on the **Packages** tab.

- Adding Packages from an AdminStudio Application Catalog
- Adding Packages from a Local Machine or Network
- Editing Package Properties on the Packages Tab

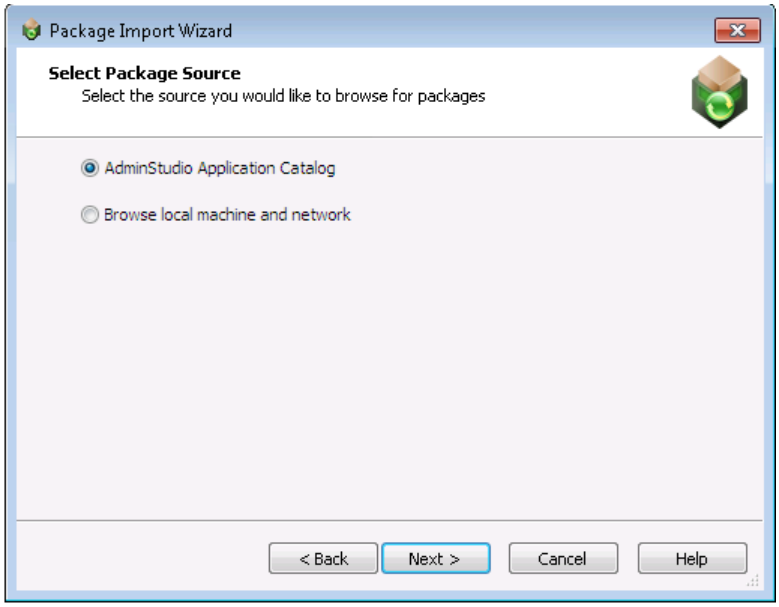
Adding Packages from an AdminStudio Application Catalog

To add packages from an AdminStudio Application Catalog to Automated Application Converter so that you can convert them to virtual applications, perform the following steps:

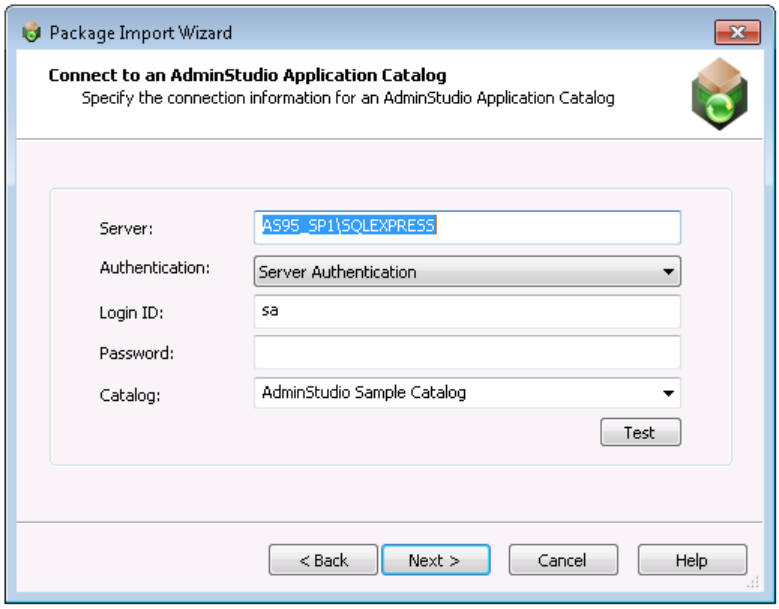
***Tip** • To select packages from Microsoft Configuration Manager to convert to virtual applications, first import those packages into the Application Catalog, as described in Importing From Microsoft System Center Configuration Manager.*

Task ***To add packages from an AdminStudio Application Catalog:***

1. Launch the Automated Application Converter.
2. Add one or more virtual machines, as described in Adding Virtual Machines Using the Virtual Machine Import Wizard.
3. Open the **Packages** tab.
4. Click **Add Packages**. The **Package Import Wizard** opens.
5. Click **Next**. The **Select Package Source** panel opens.

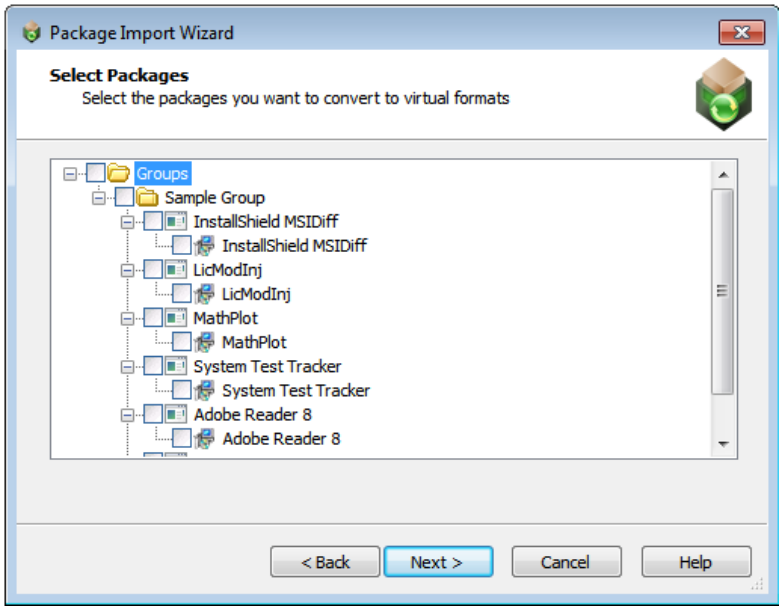


6. Select **AdminStudio Application Catalog** and click **Next**. The **Connect to an AdminStudio Application Catalog** panel opens.

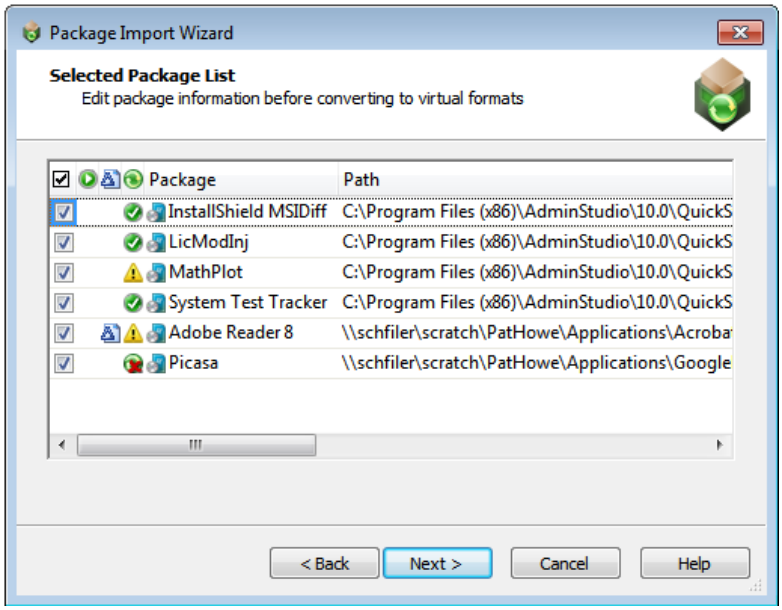


7. In the **Server** field, enter the name of the Server that you want to connect to.
8. From the **Authentication** list, select one of the following options:
   - **Windows Authentication**—Choose this option if you want to use Windows network authentication (your network login ID) to log into this Application Catalog.
   - **Server Authentication**—Choose this option if you want to use server login identification to log into this Application Catalogs server. Then enter the appropriate **Login ID/User name** and **Password**.
9. Enter the name of the existing AdminStudio Application Catalog database that you want to connect to in the **Catalog** field.

10. Click **Next**. The **Select Packages** panel opens, listing all of the packages found in the Application Catalog, but with none of them selected.



11. Select the packages that you want to add to this project and click **Next**. The **Selected Package List** panel opens.



An icon in the Virtualization Readiness column identifies whether the package requires repackaging prior to conversion to a virtual application:

Icon	Meaning	Description
	**Ready**	Package is ready to virtualize; no repackaging is required.  ***Note*** *• If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required.* *An example of an unsupported table is the* ***IniFile*** *table, which changes files on the target machine in ways that cannot be statically determined.*
	**Requires repackaging**	Package must be repackaged before it can be successfully virtualized.
	**Virtualization not supported**	Automated Application Converter has determined that virtualization is not supported due to one of the following issues: • Package contains DLL surrogates. • Package installs boot services. • Package contains OS integrated files. • Package relies on a system-level driver. • Package's .sft file name is over 56 characters in length.  ***Important*** *• Packages with a status of* ***Virtualization not supported*** *will not be virtualized. In order to virtualize the package, you must first override the status and change it to* ***Ready to Virtualize*** *or* ***Requires Repackaging****.*  ***Note*** *• For more information, see Application Virtualization Compatibility Tests.*
	**Virtualization not recommended**	Automated Application Converter has determined that this package is not recommended for virtualization due to one of the following issues: • Package does not contain a shortcut. • Package includes a custom shell extension. • Package utilizes ClickOnce technology. S  ***Note*** *• For more information, see Application Virtualization Compatibility Tests.*

Icon	Meaning	Description
	Unknown	The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.

***Note** • If you want to override this setting, click in the Virtualization Readiness column and make a selection from the list.*

12. If a transform file (**.mst**) is located in the same directory as the selected Windows Installer package, one of the following icons is listed in the Transform column:

    - One transform is being added with this package.
    - Multiple transforms are being added with this package.

    If multiple transforms are associated with this package, you should click the browse button in the **Transform** column to open the **MST** dialog box and specify which transform files you want to add and the order that you want the transforms applied. For more information, see MST Dialog Box.

***Note** • You can also edit the listed transform files by clicking the browse button in the **Transform** field in the **Properties** window of the **Packages** tab after you have added the packages.*

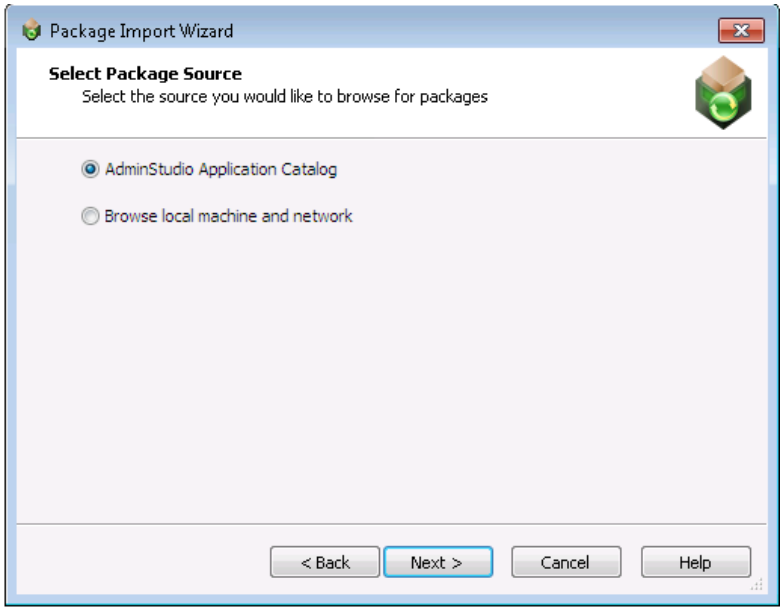
13. Make sure that the packages that you want to convert are selected and click **Next**. The **Package Import Wizard Complete** panel opens.
14. Click **Finish** to close the wizard and add the selected packages to your project.
15. To proceed with the conversion, see Performing a Conversion Using the Application Conversion Wizard.

Adding Packages from a Local Machine or Network

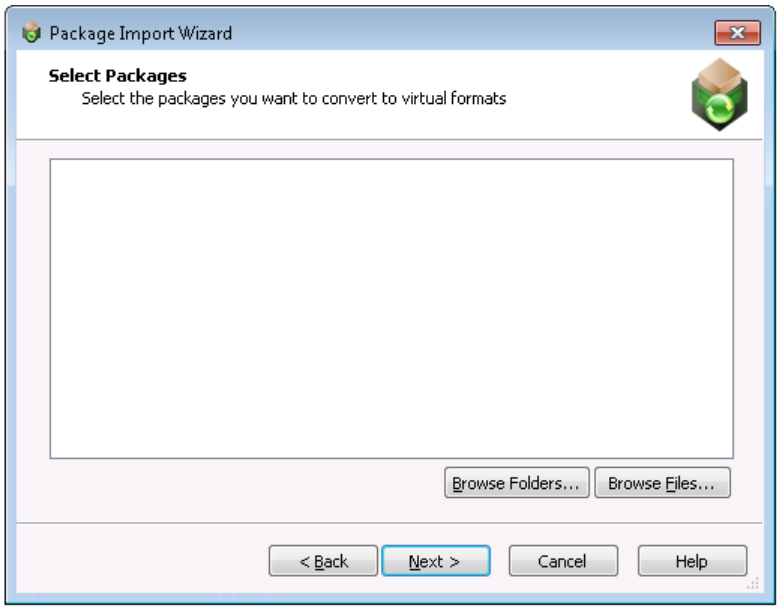
To add packages from a a local machine or network to Automated Application Converter so that you can convert them to virtual applications, perform the following steps:

Task ***To select packages from a local machine or network:***

1. Launch the Automated Application Converter.
2. Add one or more virtual machines, as described in Adding Virtual Machines Using the Virtual Machine Import Wizard.
3. Open the **Packages** tab.
4. Click **Add Packages**. The **Package Import Wizard** opens.
5. Click **Next**. The **Select Package Source** panel opens.



6. Select **Browse local machine and network** and click **Next**. The **Select Packages** panel opens with no packages listed.



7. If you want to select one package to add, perform the following steps:

   a. Click **Browse Files**. The **Select Package Installation File** dialog box opens, prompting you to select the package you want to convert.

   b. Select the installation file (**.msi or .exe**) or installation script (***.vbs**, ***.bat**, ***.cmd**, or ***.ps1**) you want to convert and click **Open**.The Automated Application Converter adds the selected package to the list on the **Select Packages** panel.

   Note • *You can use installation scripts to run more complex installation scenarios.*

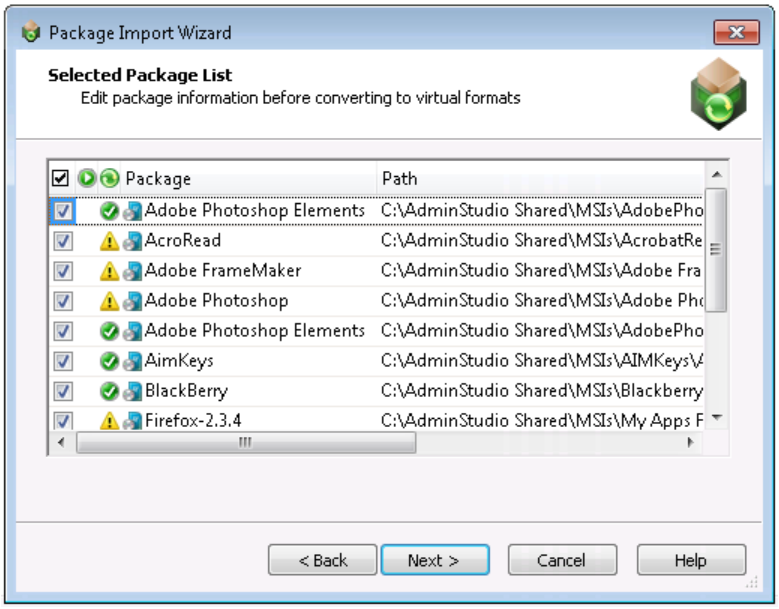
If you want to select a directory of packages to add, perform the following steps:

a. Click **Browse Folders.** The **Browse for Folder** dialog box opens, prompting you to select the directory containing the packages you want to convert.

b. Select the directory that contains the installation files (**.msi or .exe**) and/or installation scripts (***.vbs**, ***.bat**, ***.cmd**, or ***.ps1**) you want to convert and click **Open**. The Automated Application Converter searches the selected directory and its subdirectories to locate the installation files and/or scripts and adds them to the list on the **Select Packages** panel.

Important • *The Automated Application Converter uses specific rules to determine which packages in the selected directory and its subdirectories would be added to the list on the* ***Select Packages*** *panel, and which of those files are automatically selected. See Automated Application Converter's Selection Rules When Adding Packages from a Directory for more information.*

8. On the **Select Packages** panel, click **Next**. The **Selected Package List** panel opens.



9. On the **Selected Package List** panel, an icon in the Virtualization Readiness column identifies whether the package requires repackaging prior to conversion to a virtual application:

Icon	Meaning	Description
	Ready	Package is ready to virtualize; no repackaging is required. ***Note*** • *If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required.* *An example of an unsupported table is the* ***IniFile*** *table, which changes files on the target machine in ways that cannot be statically determined.*

Icon	Meaning	Description
	**Requires repackaging**	Package must be repackaged before it can be successfully virtualized.
	**Virtualization not supported**	Automated Application Converter has determined that virtualization is not supported due to one of the following issues: • Package contains DLL surrogates. • Package installs boot services. • Package contains OS integrated files. • Package relies on a system-level driver. • Package's .sft file name is over 56 characters in length.  ***Important*** *• Packages with a status of* ***Virtualization not supported*** *will not be virtualized. In order to virtualize the package, you must first override the status and change it to* ***Ready to Virtualize*** *or* ***Requires Repackaging****.*  ***Note*** *• For more information, see Application Virtualization Compatibility Tests.*
	**Virtualization not recommended**	Automated Application Converter has determined that this package is not recommended for virtualization due to one of the following issues: • Package does not contain a shortcut. • Package includes a custom shell extension. • Package utilizes ClickOnce technology.  ***Note*** *• For more information, see Application Virtualization Compatibility Tests.*
	**Unknown**	The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.

Note *• If you want to override this setting, click in the Virtualization Readiness column and make a selection from the list.*

10. Make sure that the packages that you want to convert are selected and click **Next**. The **Package Import Wizard Complete** panel opens.
11. Click **Finish** to close the wizard and add the selected packages to the project.
12. To proceed with the conversion, see Performing a Conversion Using the Application Conversion Wizard.

Editing Package Properties on the Packages Tab

By default, the list of packages on the **Packages** tab lists the **Package**, **Path**, and **Command Line** properties. Additional properties can be viewed and edited in the **Properties** window.

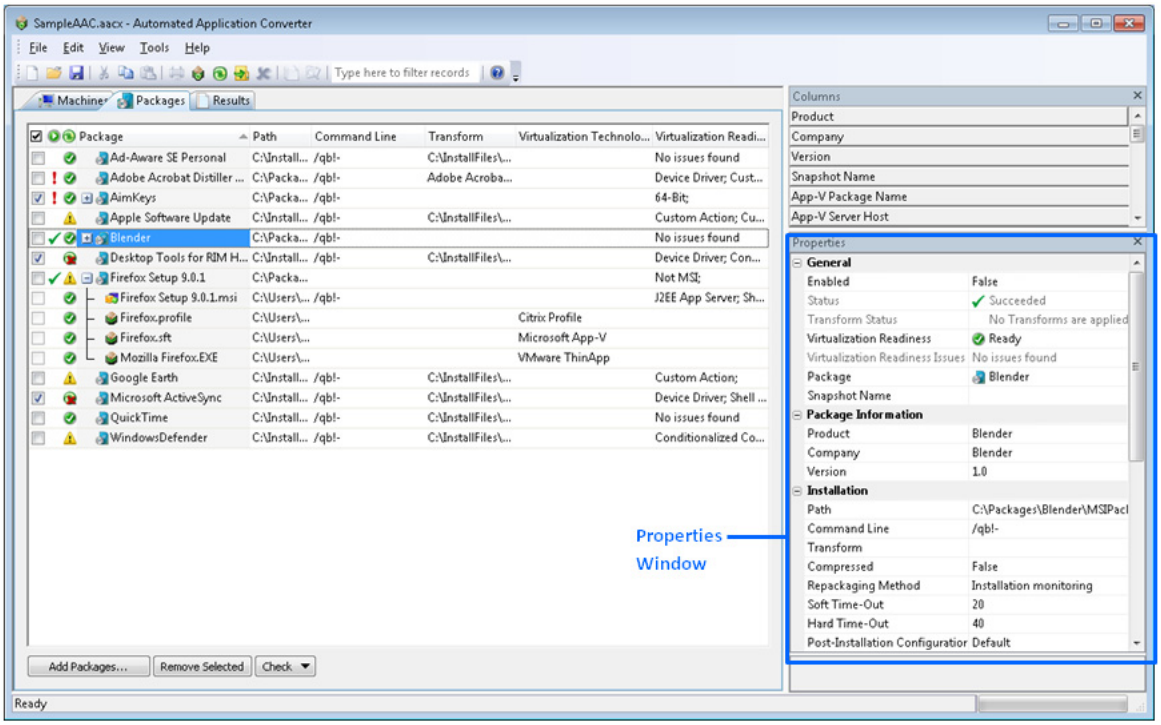


Figure 10-16: Properties Window on the Packages Tab

The properties that you may want to edit depend upon the virtual format you are converting to:

- Setting General Package Properties
- Setting Package Properties for Conversion to App-V Format

Setting General Package Properties

Before you use Automated Application Converter to convert a Windows Installer package to a virtual package, you may want to adjust the following property settings on the package:

- Specifying a Package's Repackaging Snapshot
- Editing the Installation Command Line
- Specifying a Package's Compression Setting
- Selecting the Repackaging Method
- Specifying Time Out Settings
- Enabling Manual Installation During Repackaging
- Enabling Pre-Installation and Post-Installation Configuration

Note • *Prior to using the Application Conversion Wizard to convert a package to a virtual package, you also need to prepare a virtual machine to use in the conversion as described in Preparing Your Virtual Machines for Use With the Automated Application Converter.*

Specifying a Package's Repackaging Snapshot

When you initiate the conversion of a package and repackaging is required, Automatic Application Converter will do the following to determine which snapshot on the selected virtual machine to use:

- **Snapshot Name provided**—If a snapshot name is entered in the virtual machine's **Snapshot Name** property on the **Machines** tab, Automated Application Converter will attempt to launch that snapshot.
- **Snapshot Name not provided**—If no snapshot name is entered in the virtual machine's **Snapshot Name** property on the **Machines** tab, Automated Application Converter will attempt to launch a snapshot named `AutoRepack_Base`.

If you want to convert an individual package using a different snapshot, you need to enter the snapshot name in the package's **Snapshot Name** property on the **Packages** tab.

Task ***To specify a package's repackaging snapshot:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Machine Settings**, enter a snapshot name in the **Snapshot Name** field.

Editing the Installation Command Line

When you add a package to the **Packages** tab, the command line parameters that are needed to silently install this package are entered in the package's **Command Line** property. By default, the **Command Line** property's value is:

```
/qb!-
```

If you would like to edit this command line, perform the following steps.

Task ***To specify a package's installation command line:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, edit the parameters in the **Command Line** field.

Specifying a Package's Compression Setting

You can specify whether a package is compressed by making a selection in the package's **Compressed** property on the **Packages** tab.

If a package is compressed, only the single installation file will be copied to the virtual machine for repackaging. If a package is not compressed, the entire folder tree, including the selected package file, will be copied to the virtual machine.

To specify a package's compression setting, perform the following steps:

Task ***To specify a package's compression setting:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the **Compressed** property to one of the following values:
   - **False**—Package is not compressed. The entire folder tree, including the selected package file, will be copied to the virtual machine.
   - **True**—Package is compressed. Only the single installation file will be copied to the virtual machine for repackaging.

Selecting the Repackaging Method

You can specify the repackaging method that you want to use when performing repackaging of this package by making a selection in the package's **Repackaging Method** property on the **Packages** tab.

To specify a package's repackaging method setting, perform the following steps:

Task ***To specify a package's repackaging method setting:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the **Repackaging Method** property to one of the following values:
   - **Installation monitoring**—Repackager monitors system changes as a package is installed, and that data is converted into a Windows Installer package.
   - **Single-step snapshot**—Repackager first takes an initial system snapshot, then runs the installation, and then takes a second snapshot to create the script file that can be converted into a Windows Installer package.

Note • *For more information, see Repackaging Methods.*

Specifying Time Out Settings

You can specify the length of time during the package installation portion of repackaging that you want to permit to elapse before you are notified (**Soft Time-Out** property) or the length of time before Automated Application Converter considers the process to be a failure (**Hard Time-Out** property) on the **Packages** tab.

To specify a package's time out settings, perform the following steps:

Task ***To specify a package's time out settings:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the following properties:
   a. **Soft Time-Out**—Set this property to the number of minutes that you want to allot for the package to install before the user would be notified. After this time period elapses, the user will be notified, just in case there are pending dialogs for the user to dismiss or if some other user interaction is required. The default value is `20`.
   b. **Hard Time-Out**—Set this property to the number of minutes that you want to allot for the package to install before it is considered a failure. If this time period elapses, Automated Application Converter would consider the installation a failure and would move to the next package. The default value is `40`.

Enabling Manual Installation During Repackaging

Rather than have Automated Application Converter automatically perform silent package installation on the virtual machine during repackaging, you can choose to perform this installation manually. Manual installation can be used for more complex installations such as installations that require user input or installations which consist of more than one executable file. You can specify manual installation of a package by setting the package's **Manual Install** property on the **Packages** tab.

Important • *The **Manual Install** property is ignored during App-V 5.0 conversion using the Microsoft App-V Sequencer.*

To specify manual installation of a package, the following steps:

Task ***To specify manual installation of a package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the Manual Install property to one of the following values:
   - **Disabled**—Disable manual installation.
   - **Enabled**—Enable manual installation.

Documenting Interactive Repackaging Steps Using the Microsoft Step Recorder Tool

You can use the Microsoft Steps Recorder documentation tool with Automated Application Converter to automatically record the step-by-step actions that you take on the virtual machine during repackaging. This information, which is saved in a web archive (**.mht**) file, includes a text description of where you clicked on each screen, along with a screen capture for each click.

This feature may be useful when you are attempting to repackage a complex installer which requires user interaction on the virtual machine that Automated Application Converter launches to perform repackaging.

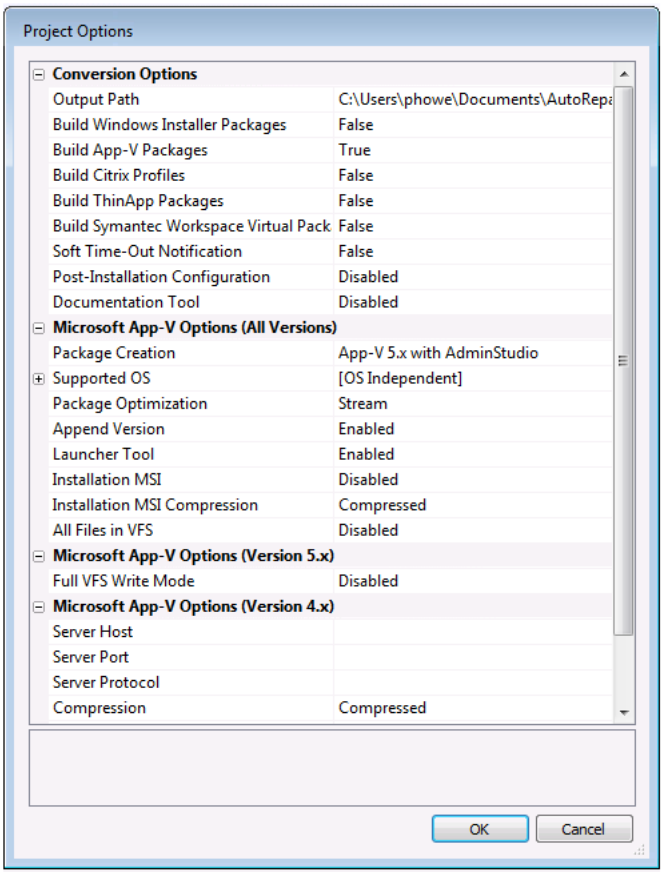
Note • *If repackaging is performed silently, without user interaction, no steps are recorded and no web archive file is created.*

Enabling the Documentation Tool Globally

To enable the Microsoft Steps Recorder documentation tool for all packages, perform the following steps:

Task ***To enable the Microsoft Steps Recorder documentation tool for all packages:***

1. On the **Tools** menu, click Options. The **Project Options** dialog box opens.



2. Under **Conversion Options**, set **Documentation Tool** to **Enabled**.
3. Click **OK**.

Enabling the Documentation Tool for an Individual Package

To enable the Microsoft Steps Recorder documentation tool for an individual package, perform the following steps:

Task ***To enable the documentation tool for a package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the **Documentation Tool** property to **Enabled**.

Note • *If the* ***Documentation Tool*** *is set to* ***Default****, this package will use the* ***Documentation Tool*** *setting that is defined on the* ***Project Options*** *dialog box.*

Reviewing the Recorded Web Archive File

After you have repackaged a package using Automated Application Converter which required you to interact with the repackaging process on the virtual machine, a web archive file will be created. This recorded web archive file will be copied to the following directories:

```
AutoRepack/Repackaged
AutoRepack/MSI Virtual
AutoRepack/VirtualFormatPackage
```

Note • *The location of the* `AutoRepack` *directory is specified on the* ***Project Options*** *dialog box in the* ***Output Path*** *field under* ***Conversion Options****.*

To review this recorded web archive file, perform the following steps:

Task ***To review a web archive file:***

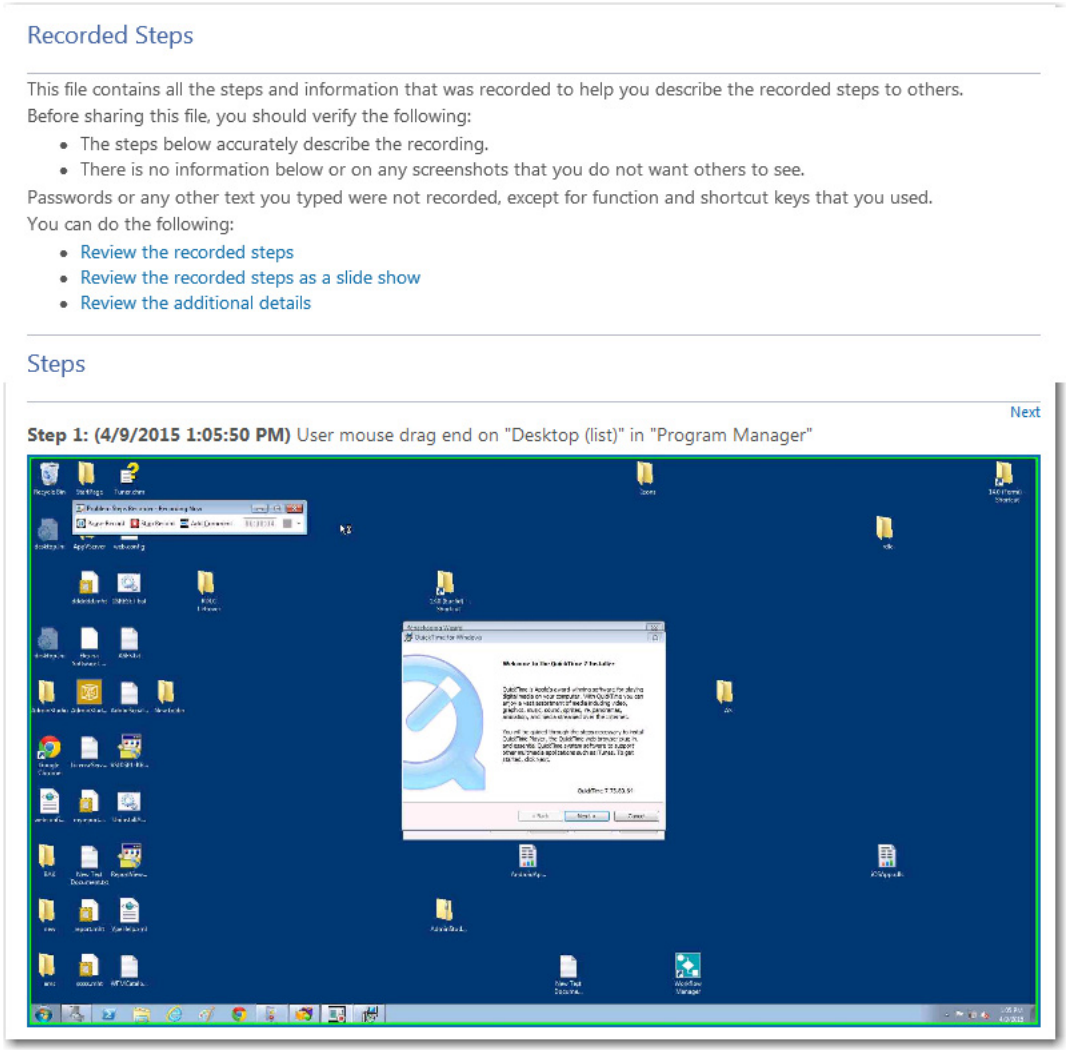
1. Open the appropriate directory and locate the following web archive (**.mht**) file:

   *InstallerName*_Recording_*YYYYMMDD_TIME*.mht

   For example:

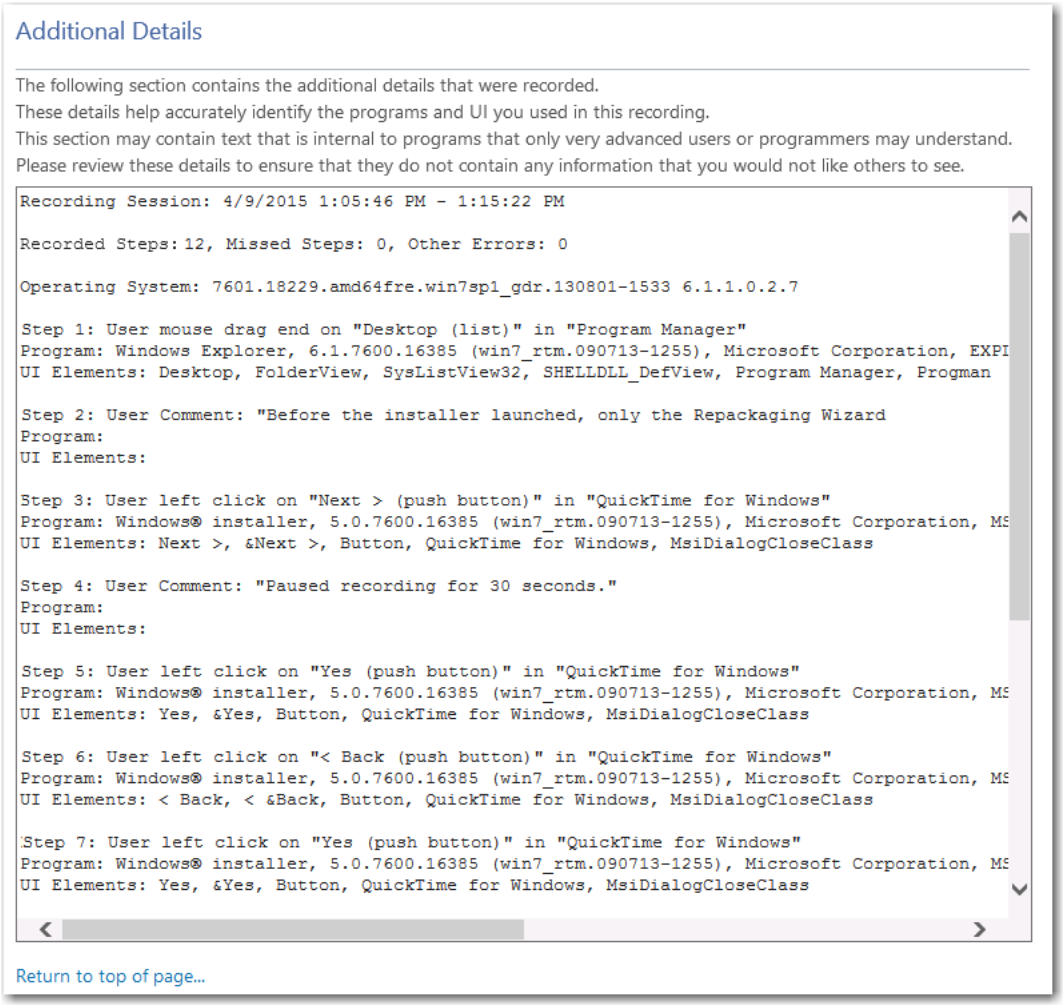
   QuickTime_Recording_20150409_1015.mht

2. Double-click the file to open it. The file opens in a browser window.
3. In the **Recorded Steps** section, scroll down to view all of the steps that you performed during repackaging along with screen captures of each step.



Tip • *If you want to view all of the screens as a slide show instead of scrolling through them, click* ***Review the recorded steps as a slide show****.*

4. Review the information in the **Additional Details** area, which contains a text description of the steps that were taken, along with information that is internal to the application for which repackaging was performed.



Enabling Pre-Installation and Post-Installation Configuration

You can instruct Automated Application Converter to pause during repackaging to enable you to manually perform configuration steps either prior to package installation on the virtual machine or after installation.

- Enabling Pre-Installation Configuration
- Enabling Post-Installation Configuration

Enabling Pre-Installation Configuration

When converting some packages, you may want to perform some manual configuration steps prior to installing that package during the repackaging process. This could be useful when a particular dependency, such as Java runtime, needs to be installed and should not be captured as part of the application capture process.

To enable pre-installation configuration of a package, the following steps:

Task ***To enable pre-installation configuration:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the **Pre-Installation Configuration** property to one of the following values:
   - **Disabled**—Disable pre-installation configuration.
   - **Enabled**—Enable pre-installation configuration.

Enabling Post-Installation Configuration

When converting some packages, you may want to perform some manual configuration steps just after the package is installed on the virtual machine during the repackaging process but before it is converted to the target formats. For example, you may want to manually launch the application and perform some "first use" selection steps.

Important • *The* ***Post-Installation Configuration*** *property is ignored during App-V 5.0 conversion using the Microsoft App-V Sequencer.*

To enable post-installation configuration of a package, the following steps:

Task ***To enable post-installation configuration:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Installation**, set the **Post-Installation Configuration** property to one of the following values:
   - **Default**—Use the project-level behavior that is specified through the **Post-Installation Configuration** field on the **Project Options** dialog box. This is the default value.
   - **Disabled**—Disable post-installation configuration. The repackaging process does not pause after installing the product.
   - **Enabled**—Enable post-installation configuration. The repackaging process pauses after the installation of the product to allow you to launch the product and set up various application settings such as update settings and file associations. You can also perform other system configuration tasks. Once you are done with configuration, you can click a button to have the repackaging proceed with the capture and convert process.

     Important • *If you select the* ***Enabled*** *option, ensure that the value that you enter for the* ***Hard Time-Out*** *setting allows enough time to configure the application.*

Setting Package Properties for Conversion to App-V Format

Before you use Automated Application Converter to convert a Windows Installer package to an App-V 4.x or 5.x package, you may want to adjust the following property settings on the package:

- Overriding the Name of the App-V Package
- Selecting the App-V Conversion Method
- Specifying the App-V Package's Primary Application Directory
- Specifying the App-V Package's Supported Operating Systems
- Specifying How to Optimize the App-V Package
- Specifying Whether to Append the Version Number to the App-V Package File Name
- Specifying the Diagnostic Tools to Include With the App-V Package
- Choosing to Expand the App-V 5.0 Package Before Sequencing
- Entering Comments for an App-V Package
- Setting the App-V 4.x Package's Server Location
- Specifying the App-V Package's Root Folder Name
- Enabling Dynamic Suiting for an App-V 4.x Package
- Specifying an App-V 4.x Package's Compression Setting
- Designating an App-V Package as an Upgrade
- Specifying an App-V 4.x Package's Client Runtime Drive
- Setting an App-V Package's VFS Options

Overriding the Name of the App-V Package

By default, the App-V package is given the name of its Windows Installer package (which is displayed in the **Product** field under **Package Information** in the **Properties** window).

For example, if virtual package contains multiple applications, you could specify a name that identifies the entire package. For example, **Microsoft Office** could be used to identify a package that contains Microsoft Word and Microsoft Excel applications that run in the same virtual environment.

To override the default name of an App-V package, perform the following steps:

Task ***To override the name of an App-V package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, enter a new name in the **Name** field (a maximum of 64 characters).

Selecting the App-V Conversion Method

When using Automated Application Converter to convert a Windows Installer package to App-V format, you have the option of converting it to either an App-V 4.x or 5.0 package. You can also choose whether to use AdminStudio's virtual converter or the Microsoft App-V Sequencer to convert a package to App-V 5.0 format. You make these specifications by setting the **Package Creation** property.

To set the **Package Creation** property, perform the following steps:

Task ***To specify a package's App-V conversion method:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, set the **Package Creation** property to one of the following values:
   - **Default**—Use the method that is selected in the **Package Creation** field on the **Project Options** dialog box. This is the default value.

     Note • *For more information, see Setting Default Project Properties.*
   - **App-V 4.6 with AdminStudio**—When converting this package to App-V format, use AdminStudio to convert it to an App-V 4.6 package.
   - **App-V 5.x with AdminStudio**—When converting this package to App-V format, use AdminStudio to convert it to an App-V 5.x package.
   - **App-V 5.x with Sequencer**—When converting this package to App-V format, use Microsoft Sequencer to convert it to an App-V 5.x package.

Note • *For more information, see Comparison of the App-V 5.0 Conversion Methods,*

Specifying the App-V Package's Primary Application Directory

You can specify the App-V package's primary application directory on the package's **Properties** window.

To specify an App-V package's supported operating systems, perform the following steps:

Task ***To specify an App-V package's primary application directory:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, set the **Primary Application Directory** property to one of the following values:

- **App-V 5.x conversions using the Sequencer**—Specify the absolute folder path to the expected main installation location of the package to be converted. If no value is specified, then the App-V 5.0 package will be created with all files in the virtual file system (VFS) folder.

  Important • *When you use the* ***App-V 5.x with Sequencer*** *option, it is highly recommended that you enter a value for the* ***Primary Application Directory*** *property. If you do not, then all of the converted files will end up in the virtual file system (VFS) folder.*

- **App-V 4.x or 5.x conversions using AdminStudio**—Specify the main installation directory which will be used to set up the root/mount folder mapping.

  For example, for Yahoo Messenger, AdminStudio automatically detects **C:\Program Files\Yahoo!** as the primary installation directory. However, you may prefer that the primary installation directory be C**:\Program Files\Yahoo!\Messenger**, because this directory is more correct for Messenger.

  In this case, you can enter this new path in the **Primary Application Directory** property field, and it will be honored by the AdminStudio converter as long as this path exists in the Windows Installer Package. If it does not exist, then AdminStudio will fall back to use the directory it found during automatic detection.

  Note • *When using the* ***App-V 4.x/5.x with AdminStudio*** *package creation options, this field is optional.*

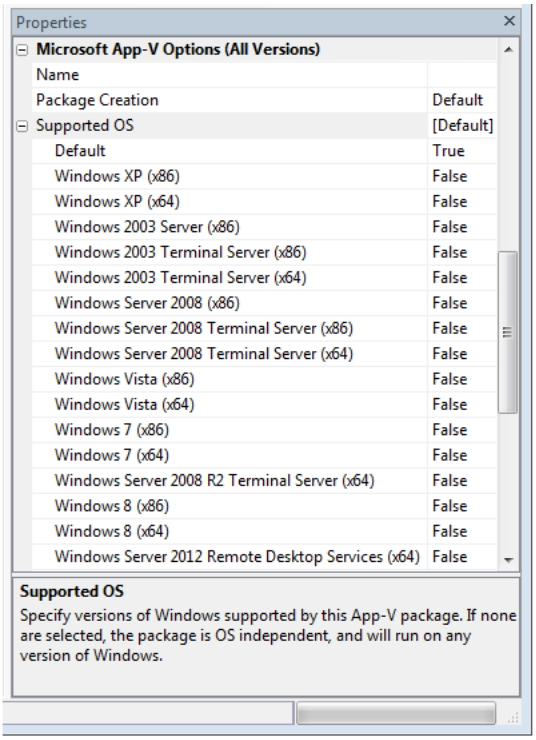
Specifying the App-V Package's Supported Operating Systems

You can specify the operating systems that the App-V package will support by editing the **Supported OS** property on the package's **Properties** window.

To specify an App-V package's supported operating systems, perform the following steps:

Task ***To specify an App-V package's supported operating systems:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, expand the **Supported OS** property to display the available operating systems.



3. Make the following selections:

   - **To accept default values**—To accept the default values for **Supported OS** that are set on the **Project Options** dialog box, set **Default** to **True**. When you make this selection, all operating systems and **OS Independent** will automatically switch to **False**, and the word `[Default]` will be listed next to **Supported OS**.
   - **If the App-V package is operating-system-dependent** (meaning that it only supports some of the listed operating systems), select **True** next to the supported operating systems. If any of the listed operating systems are set to **True**, the value for **Default** and for **Supported OS** will automatically switch to **False**, and the selected operating systems will be listed in brackets next to **Supported OS**.
   - **If the App-V package is operating-system-independent** (meaning that it supports all listed operating systems), set **OS Independent** to **True**. When you make this selection, all operating systems and **Default** will automatically switch to **False**, and `[OS Independent]` will be listed next to **Supported OS**.

Important • *When setting the **Supported OS** property for App-V 5.0 packages, keep in mind that the packages are limited to the supported operating systems of the App-V 5.0 client:*

- *Windows 7 and later*
- *Windows Server 2008 R2 and later*

Specifying How to Optimize the App-V Package

You can use the **Package Optimization** property to control the performance and network traffic associated with running an App-V package. The package optimization option you select determines how quickly the App-V package will launch, and how often additional functionality will need to be streamed to the client while the App-V package is being used.

The files in an App-V package can be grouped into two feature blocks:

- **Feature block 1**—Feature block 1 must contain the core functionality of the App-V package that is necessary to launch the application. At application launch, all of the files in feature block 1 are streamed to the client in one unit.
- **Feature block 2**—Feature block 2 can contain additional functionality of the App-V package that is not necessary to launch the application. While the App-V package is being used, the files in feature block 2 can be streamed in small packets on an as-needed basis.

By setting the **Package Optimization** property, you can either choose to include all App-V package files in feature block 1 (**Offline** option), to improve launch speed, you can choose to group the files into two feature blocks: feature block 1 and feature block 2 (**Stream** option).

To specify an App-V package's optimization settings, perform the following steps:

Task ***To specify an App-V package's optimization settings:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, set the Package Optimization property to one of the following values:
   - **Default**—Use the method that is selected in the **Package Optimization** field on the **Project Options** dialog box. This is the default value.
   - **Offline**—When the package is optimized for offline use, the entire package is included in feature block 1. If you choose this option, all files in the App-V package will be included in feature block 1 and will be streamed to the client at start up in one file before the application launches. After that, no more streaming is done. All files are stored in the App-V cache, which means that the application is available for use even when the machine is not connected to the App-V server. Select this option if you want to enable users to use the App-V package when not connected to the App-V server and if you want to eliminate network traffic when the App-V package is being used.

     Note • *When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent application use.*
   - **Stream**—When the package is optimized for streaming use, only the shortcut targets which are included in feature block 1 are streamed to the client at start up. Feature block 2 can contain additional functionality of the App-V package that is not necessary to launch the application. While the App-V package is being used, the files in feature block 2 are streamed in small packets on an as-needed basis. This option provides a relatively quick launch time while limiting network traffic during application use.

     Note • *When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent use of the application.*

Specifying Whether to Append the Version Number to the App-V Package File Name

You can use the **Append Version** property to specify whether to want to append the package version number to the App-V package file name.

Task ***To specify whether to append the version number to the App-V package file name:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, set the **Append Version** property to one of the following values:
   - **Enabled**—Append the package version to the SFT file name.
   - **Disabled**—Leave the package version off of the SFT file name.
   - **Default**—Use the setting that is defined on the **Project Options** dialog box.

Specifying the Diagnostic Tools to Include With the App-V Package

You can choose to include the following diagnostic tools with your App-V package:

- **Launcher Tool**—The App-V Package Launcher can be used to quickly publish the App-V package to the local machine for testing. This tool is available for both App-V 4.x and 5.x packages. You can use the App-V package Launcher to test a newly built App-V package before moving it to a deployment server.
- **File System Diagnostic**—The Windows Command Prompt tool enables you to look at the file system for the application while it is running in its virtual environment. You can use it to investigate the file system and launch other tools within the virtual environment context. This tool is only available for App-V 4.x packages.
- **Registry System Diagnostic**—The Registry Editor tool enables you to look at the registry for the application while it is running in its virtual environment. This tool is only available for App-V 4.x packages.

You can use the App-V Package Launcher to test a newly built App-V package before moving it to a deployment server. And if, during testing, you received an error message stating that the application cannot load a DLL, you could use the **File System Diagnostic** and **Registry System Diagnostic** tools to troubleshoot the problem.

Tip • *Because the App-V 5.x Application Launcher has a built-in Windows Command Prompt tool, it is not necessary to include the* ***File System Diagnostic*** *or* ***Registry System Diagnostic*** *tools with App-V 5.x packages.*

To specify which diagnostic tools to include with an App-V package, perform the following steps:

Task ***To specify the diagnostic tools to include with an App-V package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, set the **Launcher Tool** property to one of the following values:
   - **Enabled**—Include the App-V Package Launcher when you build an App-V package.

- **Disabled**—Do not include the App-V Application Launcher when you build an App-V package.
- **Default**—Use the setting on the **Project Options** dialog box.

3. In the **Properties** window, under **Microsoft App-V Options (Version 4.x)**, set the **File System Diagnostic** property to one of the following values:
   - **Enabled**—Include the Windows Command Prompt application with your App-V package so that you can browse the virtual file system at runtime from within the virtual environment. If this option is selected, a file named **Virtual File System.osd** will be created in the App-V Package folder, which can be used to display the files and folders within the virtual environment. You can use **Virtual File System.osd** to view the existing files and folders on the computer plus the files and folders for the virtual package. A shortcut to the command prompt will be added to the App-V package.
   - **Disabled**—Do not include the Windows Command Prompt application with your App-V package.
   - **Default**—Use the setting on the **Project Options** dialog box.
4. In the **Properties** window, under **Microsoft App-V Options (Version 4.x)**, set the **Registry System Diagnostic** property to one of the following values:
   - **Enabled**—Include the Registry Editor (**regedit.exe**) with your App-V package so that you can browse the registry at runtime from within the virtual environment. If this option is selected, a file named **Virtual Registry.osd** will be created in the App-V Package folder, which can be used to display the registry within the virtual environment. You can use **Virtual Registry.osd** to view the existing registry on the computer plus the registry for the virtual package. A shortcut to the registry option will be added to the App-V package.
   - **Disabled**—Do not include the Registry Editor (**regedit.exe**) application with your App-V package.
   - **Default**—Use the setting on the **Project Options** dialog box.

Choosing to Expand the App-V 5.0 Package Before Sequencing

You can use the **Expand App-V Package** property to specify whether to want to expand an existing App-V 5.x package on the system before performing sequencing. This is useful for specifying middleware and dependency App-V packages such as Java runtime.

Note • *This option is only used when* ***App-V 5.x with Sequencer*** *is the chosen package conversion method.*

Task ***To choose to expand an App-V 5.0 package before sequencing:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (Version 5.x)**, click the browse button next to the **Expand App-V Package** property and select the existing App-V package to expand on the system before performing the sequencing.

Entering Comments for an App-V Package

You can use the **Comments** property to specify text for the App-V package comments/description section.

***Note** • This setting is ignored when using the **App-V 5.x with Sequencer** package conversion method.*

Task ***To enter comments for an App-V package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, enter a brief description of the App-V package. This text will appear in the App-V package comments/description section.

Setting the App-V 4.x Package's Server Location

To set the server location for an App-V 4.x package, perform the following steps:

Task ***To set the server location for an App-V 4.x package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (Version 4.x)**, specify the following properties:

Property	Description
Server Host	Specify the host—the virtual application server or the load balancer in front of a group of virtual application servers that stream the App-V package to the Application Virtualization Client. You can either specify a static host name or IP address, or you can enter **%SFT_SOFTGRIDSERVER%** to indicate an environment variable. ***Note** • If you enter **%SFT_SOFTGRIDSERVER%**, you must set up the SFT_SOFTGRIDSERVER system environment variable on each Application Virtualization Client. The value of this environment variable should be the name or IP address of the host.* *When you assign the variable on a client system, any Application Virtualization Client session that is running on the system must be closed and reopened; otherwise, the session is not aware of the new application source.*
Server Port	Specify the port on which the virtual application server or the load balancer listens for Application Virtualization Client requests for the package. The default port is 554.
Server Path	Specify the relative path on the virtual application server where the software package is stored and from which it will be streamed. ***Note** • This information is required to create a package if the **.sft** file will be stored in a subdirectory of `CONTENT`; otherwise, this information is not required.*

Property	Description
Server Protocol	Select the protocol that you want to use to stream the sequenced application package from the virtual application server to an Application Virtualization Client. Available options are: • **RTSP**—The real-time streaming protocol streams the App-V package. This is the default option. • **RTSPS**—The real-time streaming protocol with transport layer security streams the App-V package. • **FILE**—The App-V package are streamed from a file share. • **HTTP**—The hypertext transport protocol streams the App-V package. • **HTTPS**—The secure hypertext transport protocol streams the App-V package.

Specifying the App-V Package's Root Folder Name

You can use the **Root Folder Name** property to override the unique 8.3 root folder name for a product and version. During run time, the Application Virtualization Client mounts the package's file system to the App-V virtual drive; the Q drive is the default. The long and short names of the root folder must be unique because two packages with the same root folder name cannot be deployed simultaneously.

To specify the **Root Folder Name** property, perform the following steps:

Task ***To specify the Root Folder Name property:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (Version 4.x)**, specify the root folder of the App-V package's file system in the **Root Folder Name** property.

Enabling Dynamic Suiting for an App-V 4.x Package

You can use the **Dynamic Suites** property to enable dynamic suiting for an App-V package.

The point of application virtualization is to minimize the system dependencies that an application has on the underlying physical system. Many applications have common system dependencies on plug-ins or middleware, such as Adobe Reader or ODBC drivers.

Dynamic Suite Composition (DSC) is a Microsoft Application Virtualization feature that enables applications to be virtualized separately from the plug-ins and middleware applications that they rely on, while still enabling them to communicate with those plug-ins and middleware applications within the virtual environment. The primary App-V package and the dependency App-V packages in the dynamic suite will run and interact with one another as if they were all installed locally on a computer. You would only need to deploy common system components once on each client, making them available for use by many App-V packages, rather than to include them with each of the App-V packages that are dependent upon them. This reduces redundancy in the local App-V cache and simplifies the construction and testing of the primary App-V packages.

To enable dynamic suiting for an App-V package, perform the following steps:

Task ***To enable dynamic suiting:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (Version 4.x)**, locate the **Dynamic Suites** property and enter a semicolon-delimited list of OSD or SFT files to be dynamically suited with this package, or click the ellipsis button (...) and select the OSD or SFT files to be suited. If a file must be present for this package to work properly, append the following to the file name:

   :MANDATORY

Specifying an App-V 4.x Package's Compression Setting

You can use the **Compression** property to specify whether to compress the data files in this App-V package.

Task ***To specify whether to compress an App-V 4.x package:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (Version 4.x)**, set the **Compression** property to one of the following options:
   - **Compressed**—Compress the App-V package.
   - **Uncompressed**—Do not compress the App-V package.
   - **Default**—Use the **Compression** property option that is selected on the **Project Options** dialog box.

Designating an App-V Package as an Upgrade

You can use the Upgrade Package property to indicate that this App-V package is an upgrade to a previous package. To do this, you select the previous App-V package.

Note • *This setting is ignored when using the* ***App-V 5.x with Sequencer*** *package conversion method.*

To designate an App-V package as an upgrade, perform the following steps:

Task ***To designate an App-V package as an upgrade:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, locate the **Upgrade Package** property.
3. If this package is an upgrade package that should update an earlier version of the application, click the browse button (...) browse to the earlier version.

Specifying an App-V 4.x Package's Client Runtime Drive

You can use the **Runtime Drive** property to specify an App-V 4.x package's client runtime drive.

Task ***To specify an App-V package's client runtime drive:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, enter the App-V client runtime drive in the **Runtime Drive** field.

   If you do not enter a value, one of the following values will be used:

   - **If a value is set on the Project Options dialog box**, that value will be used.
   - **If no value is set on the Project Options dialog box**, the default value of `Q:\` will be used.

Setting an App-V Package's VFS Options

You can use the **All Files in VFS** property to specify whether the App-V package's files should exist in Windows retargetable folders within the virtual file system (VFS) folder of the App-V package.

Task ***To set an App-V package's VFS options:***

1. On the **Packages** tab, select the package you want to edit. Package properties are displayed in the **Properties** window.
2. In the **Properties** window, under **Microsoft App-V Options (All Versions)**, set the **All Files in VFS** property to one of the following options:

   - **Disabled**—All of the files that correspond with the main installation directory of the application will be put in the root folder of the App-V package's file system. This method adheres to Microsoft App-V best practices. This is the default setting.
   - **Enabled**—All of the files in the package will be put into Windows retargetable folders within the VFS (virtual file system) folder of the App-V package. This option overrides the effect of specifying a value for **Primary Application Directory**.

     Note • *This option is generally not recommended, but there may be applications for which it is necessary. For example, if a virtualized application does not work as expected, and if it is possible that the application cannot find one of its files because it is searching in a hard-coded path, you may want to select the* ***Enabled*** *option.*

About Repackaging Windows Installer Packages

As a general rule, Windows Installer setups should not be repackaged. Instead, they should either be edited in InstallShield Editor, or, as Microsoft recommends, by creating a transform.

However, some IT organizations may elect to repackage Windows Installer packages in order to simplify them, which should make them more reliable and less likely to violate the organization's and Microsoft's recommended best practices. You can use the Automated Application Converter to automatically repackage a group of Windows Installer packages by selecting the **Windows Installer Packages (*.msi)** option on the **Select Output Formats** panel of the Application Conversion Project Wizard and the Application Conversion Wizard.

If you choose to repackage a Windows Installer package, you need to keep in mind that you may no longer be able to:

- Directly deploy vendor-provided patches for this package, OR
- Use any vendor-provided automatic updating service for this package.

Therefore, you should only consider repackaging a Windows Installer package if your IT staff is also willing to invest resources into periodically repackaging that application's vendor patches into an updated Windows Installer package.

Note • *Tightly-controlled organizations probably would not want to have automatically-updating software, so the inability to use an automatic updating service may not be of concern to them.*

Using the Application Conversion Wizard to Perform Automated Package Conversion

Before you can perform conversion using the Application Conversion Wizard, you need to have already added virtual machines and packages to Automated Application Converter, as described in the following tasks:

- Adding Virtual Machines Using the Virtual Machine Import Wizard
- Adding Packages from an AdminStudio Application Catalog
- Adding Packages from a Local Machine or Network

This section explains how to use the Application Conversion Wizard to perform a conversion run using selected packages and virtual machines that you have already added to Automated Application Converter:

- Performing a Conversion Using the Application Conversion Wizard
- Viewing Conversion Results

Note • *You also have the option of adding virtual machines, adding packages, and performing conversion during the same wizard run by using the* ***Application Conversion Project Wizard****, as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion.*

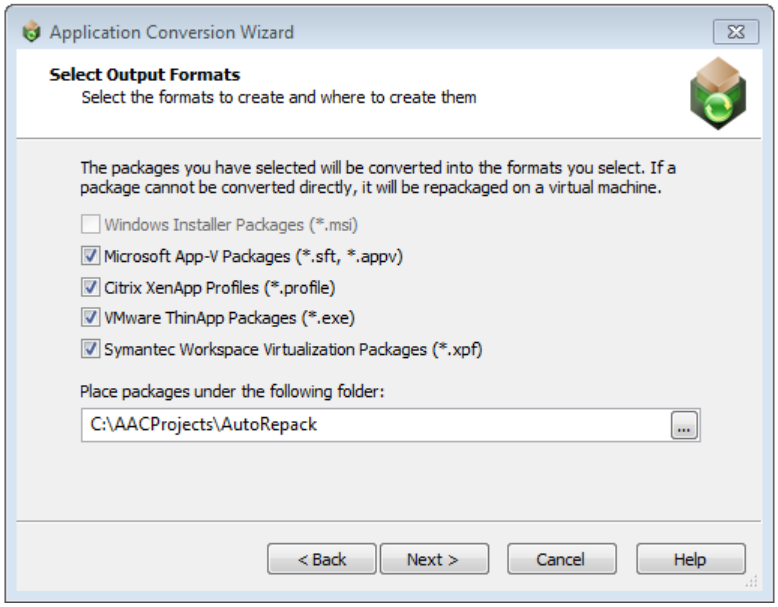
Performing a Conversion Using the Application Conversion Wizard

To use the Application Conversion Wizard to perform a conversion run using the selected packages and virtual machines, perform the following steps.

Task ***To perform a conversion using the Application Conversion Wizard:***

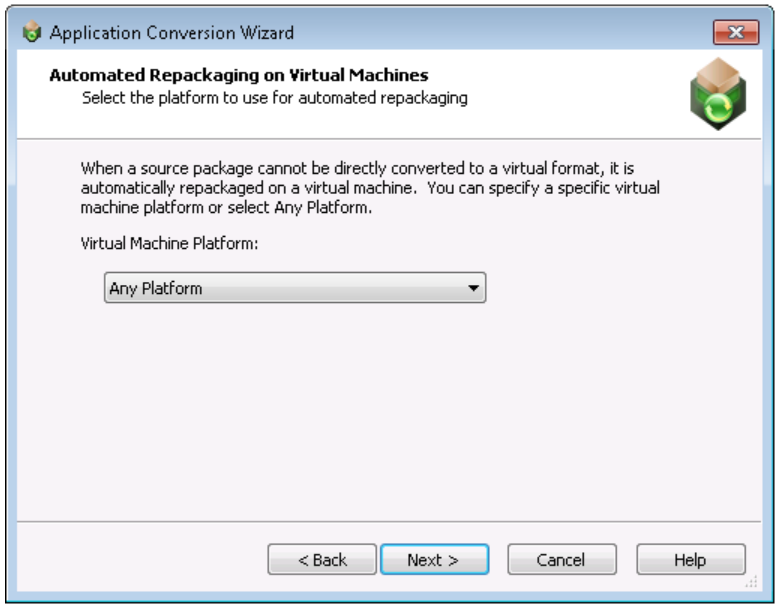
1. Select virtual machines to use for automated repackaging, as described in Adding Virtual Machines Using the Virtual Machine Import Wizard.
2. Select packages to convert to virtual applications or to repackage, as described in Adding Packages from an AdminStudio Application Catalog or Adding Packages from a Local Machine or Network.
3. Set package properties as described in Setting General Package Properties and Setting Package Properties for Conversion to App-V Format.

   Important • *When converting to App-V format, you need to first indicate the App-V version you want to convert to and the conversion method you want to use by setting the* ***Package Creation*** *property to one of the following values (as described in Selecting the App-V Conversion Method): App-V 4.6 with AdminStudio, App-V 5.x with AdminStudio, or App-V 5.x with Sequencer.*
4. On the **Tools** menu, select **Application Conversion Wizard**. The **Application Conversion Wizard Welcome** panel opens.
5. Click **Next**. The **Select Output Formats** panel opens.



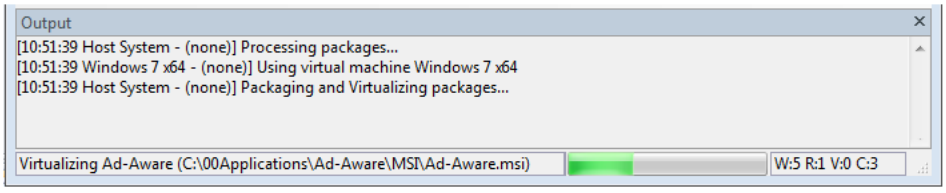
6. Select one or more of the following output formats:
   - Windows Installer Packages (*.msi)
   - Microsoft App-V Packages (*.sft)
   - Citrix XenApp Profiles (*.profile)
   - VMware ThinApp Packages (*.exe)
   - Symantec Workspace Virtualization Packages (*.xpf)

7. In the **Place packages under the following folder** field, specify the directory where you want to save the output packages.
8. Click **Next**. The **Automated Repackaging on Virtual Machines** panel opens.



9. From the **Virtual Machine Platform** list, select one of the following:
   - **Any Platform**—The Automated Application Converter will use any of the virtual machines that you have selected on the **Machines** tab to perform automated repackaging, regardless of platform.
   - **OS Platform**—If you select a specific operating system, the Automated Application Converter will use only those virtual machines that you have selected on the **Machines** tab that are of the selected operating system to perform automated repackaging.

   Important • *When you select a virtual machine to add to the Automated Application Converter, you need to manually identify the operating system platform either on the **Select Virtual Machines** panel or by clicking in the **Platform** field on the **Machines** tab and making a selection from the list.*
10. Click **Next**. The **Application Conversion Wizard Complete** panel opens.
11. Click **Finish** to close the wizard and begin converting the selected packages using the selected virtual machines. As conversion proceeds, there are several progress indicators at the bottom of the screen:



The following information is listed:

- **Messages**—Messages are listed in the **Output** window

- **Current file**—The name of the current file being processed is listed in the lower left.
- **Progress bar**—A progress bar is displayed at the bottom of the screen.
- **Count**—The count of packages in each of the following categories is displayed at the lower right:
  - **W:5**—Number of packages that are **W**aiting to be processed.
  - **R:1**—Number of packages that are being **R**epackaged.
  - **V:0**—Number of packages that are being converted or **V**irtualized into MSI and/or virtual packages.
  - **C:3**—Number of applications that have finished processing, including **C**ompleted and failed applications.

12. Proceed with Viewing Conversion Results.

***Note** • If you have selected multiple virtual machines, the Automated Application Converter will attempt to connect to the first virtual machine in the list. If it successfully connects, conversion will proceed on that machine. If it fails to connect, it will move on to the next machine in the list.*

Viewing Conversion Results

To view the conversion results on the **Results** tab and in the AdminStudio Automated Application Converter Log report, perform the following steps:

Task ***To view conversion results:***

1. Perform conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard.

2. Open the **Results** tab.

3. For each listed package, view the information in the **Errors**, **Warnings**, and Results Icons ( ) columns, as described in Results Tab.

4. Select the top level node of a conversion run log (such as `Log started Monday, June 21, 2010...`).

5. Do one of the following:

- Click the **Results** button on the toolbar.
- Select **View Report** from the shortcut menu.
- Select **View Report** on the **Tools** menu.
- Press Ctrl+R.

The AdminStudio Automated Application Converter Log report opens. See AdminStudio Automated Application Converter Log Report for more information.

6. Open the **Packages** tab.

7. In the tree, locate one of the source packages that you converted and click the plus sign to expand the listing. The converted packages in the formats you selected are listed.
8. Continue with the steps in Testing Packages and Importing Converted Packages into the Application Catalog.

Testing Packages

After you use Automated Application Converter to create a package, you can test it prior to deployment. You can test any of the following package types:

- **Virtual package**—A virtual package that was converted from a Windows Installer package using the Automated Application Converter.
- **Repackaged MSI package**—A repackaged Windows Installer package that was converted from a source Windows Installer package using the Automated Application Converter.
- **Source package**—A source Windows Installer package that you have added to the **Packages** tab.

Information about testing packages is organized into the following topics:

- Testing App-V Packages
- Testing VMware ThinApp Packages
- Testing Citrix XenApp Packages
- Testing Symantec Workspace Packages
- Testing Repackaged and Source Windows Installer Packages

Testing App-V Packages

By default. when you build an App-V package, the App-V Application Launcher utility (**AppVLauncher.exe**) is placed in the same folder as the App-V package. The App-V Application Launcher is a convenient testing tool that makes it possible for you to reliably and accurately test your App-V packages before deployment on an App-V Server.

Figure 10-17: App-V Application Launcher Utility

If you do not want to include the launcher with an individual App-V package, set the package's **Launcher Tool** property to **Disabled**. You can set the default value for this property on the **Project Options** dialog box.

For information on performing both automated and manual testing of App-V packages, see the following topics:

- Performing Automated Testing of App-V Packages
- Performing Manual Testing of App-V Packages

Performing Automated Testing of App-V Packages

You can choose to launch an App-V package for testing on a virtual machine directly from Automated Application Converter.

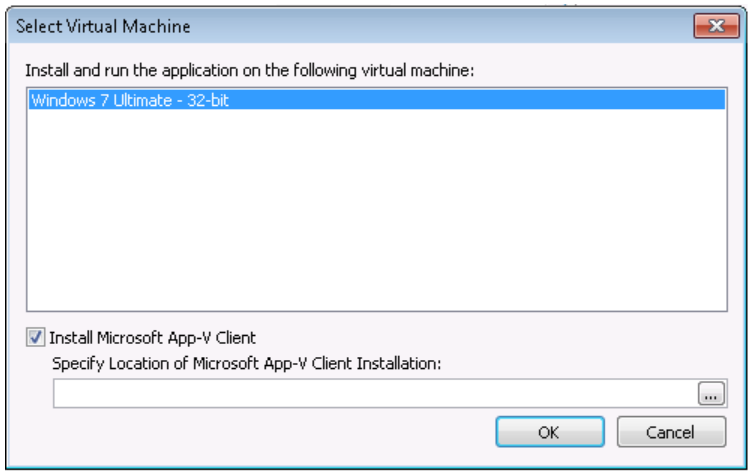
- Performing Automated Testing of an App-V 4.x Package
- Performing Automated Testing of an App-V 5.x Package

Performing Automated Testing of an App-V 4.x Package

You can choose to launch an App-V 4.x package for testing on a virtual machine directly from Automated Application Converter.

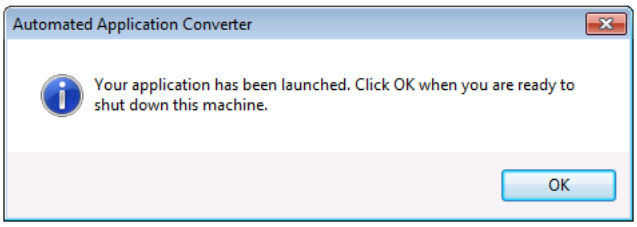
Task ***To launch an App-V package for testing on a virtual machine:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Launch the virtual machine that you want to use for testing.
3. On the **Packages** tab, right-click on an App-V 4.x package and select **Launch Package for Testing** from the shortcut menu. The **Select Virtual Machine** dialog box opens, prompting you to select the virtual machine that you want to use to test the selected package.



4. Select a virtual machine from the list.
5. If the Microsoft App-V 4.x client is not yet installed on the selected virtual machine, select the **Install Microsoft App-V Client** option and browse to the location of the Microsoft App-V 4.x Client installation file. Make sure that it is in a location that is accessible to the virtual machine.
6. Click **OK**. The following will occur:
   - The Automated Application Converter will connect to the selected virtual machine.
   - The virtual machine will reboot to the snapshot listed on the **Machines** tab in the **Snapshot Name** property of the selected virtual machine.

- The Guest Agent will launch, and progress messages will be displayed.
- The App-V 4.x package and launcher will be copied to the virtual machine.
- If the **Install Microsoft App-V Client** option was selected on the **Select Virtual Machine** dialog box, the App-V client will be installed.
- The App-V package will launch, and the following message will be displayed:



7. Test the application to determine whether it is operating properly.
8. When you have completed testing, click the **OK** button on the Automated Application Converter message dialog box to shut down the virtual machine. After you click OK, the following message will be displayed in the Automated Application Converter **Output** window:

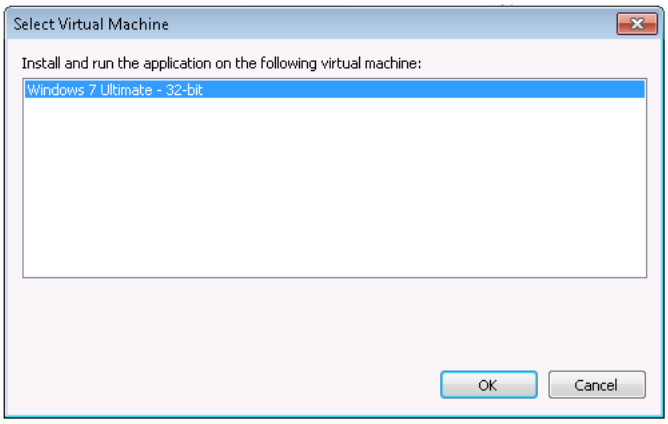
```
[10:54:58 Windows7 - MyApp.sft] Done running application. Shutting down machine..
```

Performing Automated Testing of an App-V 5.x Package

You can choose to launch an App-V 5.x package for testing on a virtual machine directly from Automated Application Converter.

Task ***To launch an App-V 5.x package for testing on a virtual machine:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Launch the virtual machine that you want to use for testing.
3. On the **Packages** tab, right-click on an App-V package and select **Launch Package for Testing** from the shortcut menu. The **Select Virtual Machine** dialog box opens, prompting you to select the virtual machine that you want to use to test the selected package.



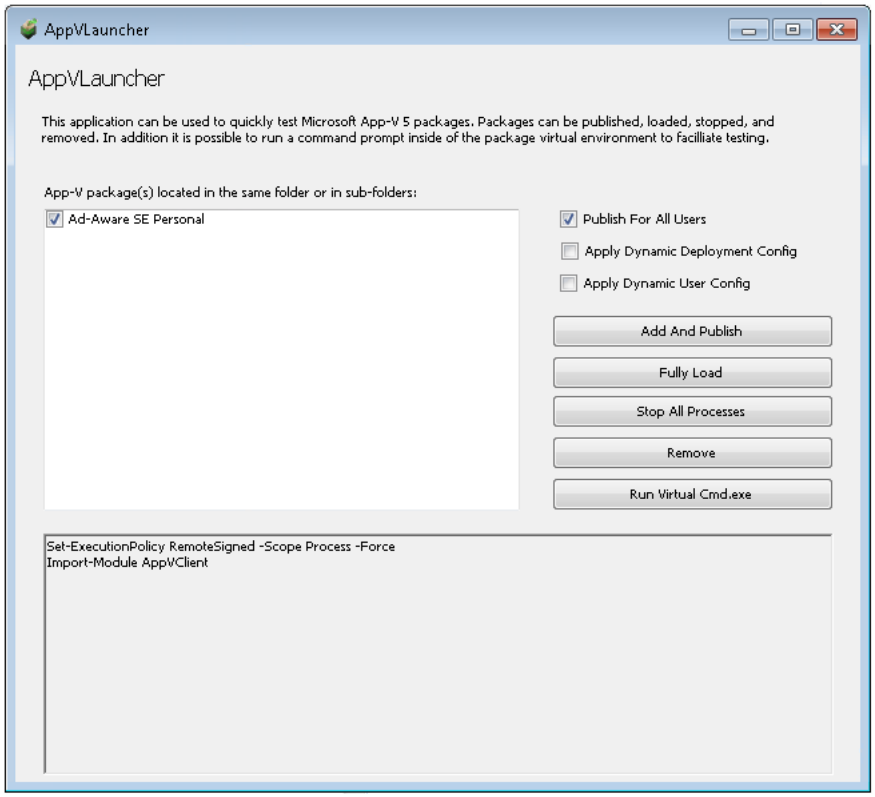
4. Select a virtual machine from the list.

Important • *If you are testing an App-V 5.x package, the Microsoft App-V 5.x client must already be installed on the virtual machine.*

5. Click **OK**. The following will occur:

   - The Automated Application Converter will connect to the selected virtual machine.
   - The virtual machine will reboot to the snapshot listed on the **Machines** tab in the **App-V 5.x Client Snapshot** property of the selected virtual machine.
   - The Guest Agent will launch, and progress messages will be displayed.
   - The App-V package and launcher will be copied to the virtual machine.
   - The following message will be displayed:

   - The App-V 5.x Application Launcher will open, and will list the App-V packages located in the folder that was copied to the virtual machine:



6. In the App-V package list, select the App-V packages that you want to test.
7. Click the **Add and Publish** button to publish this package to the App-V client so that it can be tested. All of the entry points into the package will be published, including shortcuts and file type extensions, among others.
8. On the **Start** menu, click the shortcut for this application to launch it.
9. Test the application to determine whether it is operating properly.
10. When you are finished testing the application, click the **Remove** button to un-publish the application.

    In some instances, you may receive an error message stating that a process is still running. If you get an error, click the **Stop All Processes** button to kill all processes.
11. When you have completed testing, click the **OK** button on the Automated Application Converter message dialog box to shut down the virtual machine. After you click **OK**, the following message will be displayed in the Automated Application Converter **Output** window:

    ```
    [10:54:58 Windows7 - MyApp.appv] Done running application. Shutting down machine..
    ```

Performing Manual Testing of App-V Packages

You can manually test an App-V package by copying the package and launcher to a machine where the appropriate App-V client is installed and then opening the App-V Application Launcher.

- Performing Manual Testing of an App-V 4.x Package
- Performing Manual Testing of an App-V 5.x Package

Performing Manual Testing of an App-V 4.x Package

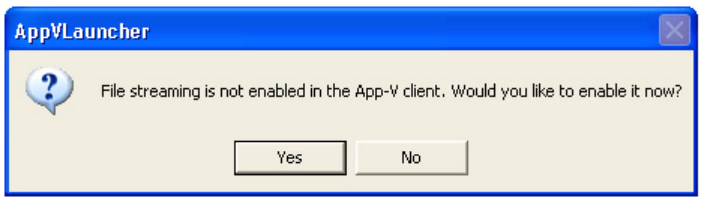
You can manually test an App-V 4.x package by copying the package and launcher to a machine where the appropriate App-V 4.x client is installed and then opening the App-V 4.x Application Launcher.

Task ***To manually test an App-V 4.x package:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Locate the folder containing the App-V 4.x package and copy the entire folder to a virtual machine where the appropriate App-V 4.x client is installed.

   Tip • *A quick way to jump to the folder containing an App-V package is to right-click on the package on the Automated Application Converter* ***Packages*** *tab and then select* ***Explore*** *from the shortcut menu.*
3. Double-click on the App-V 4.x Application Launcher utility (**AppVLauncher.exe**). The App-V 4.x Application Launcher will attempt to launch that application.
   - **If an App-V 4.x package has only one target defined** (that is, if the App-V 4.x package has only one **.osd** file), the App-V Application Launcher starts the App-V package.
   - **If the App-V 4.x package has more than one target defined** (that is, if the App-V 4.x package has two or more **.osd** files), the App-V Application Launcher displays a dialog box that lists each target, and it lets you select the one that you want to launch.

     
     Select the application you want to test and click **Launch**.
4. If App-V file streaming in the App-V Client is not enabled, you will be prompted to enable it:

5. Click **Yes**. The App-V package will open

***Note** • The first time that you use the App-V Application Launcher to run an application in an App-V package, the entire package is published to that machine; this includes all of the package's shortcuts and file extension associations in the package. If you then use the App-V Application Launcher to run any application in the App-V package again, the App-V Application Launcher unpublishes the package (and its shortcuts and file extension associations) before republishing the package.*

***Note** • Also note that the **AppVLauncher.exe** file requires elevation. If you want to be able to test your App-V package in a locked-down environment where end users will not have elevated privileges, you may want to use the App-V Application Launcher once to launch and publish your App-V package with elevated privileges. Once you have done that, you can use the published shortcuts and file extension associations to start your application.*

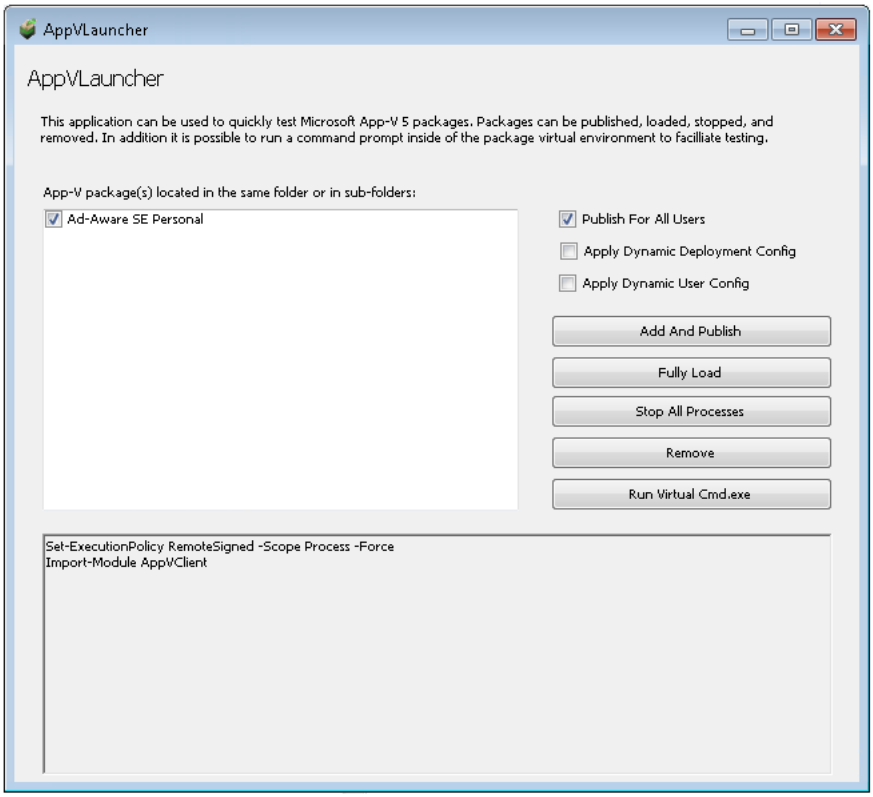
Performing Manual Testing of an App-V 5.x Package

You can manually test an App-V 5.x package by copying the package and launcher to a machine where the App-V 5.x Client is installed and then opening the App-V Application Launcher.

Task ***To manually test an App-V 5.x package:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Locate the folder containing the App-V 5.x package and copy the entire folder to a virtual machine where the App-V 5.x Client is installed.

   ***Tip** • A quick way to jump to the folder containing an App-V package is to right-click on the package on the Automated Application Converter **Packages** tab and then select **Explore** from the shortcut menu.*
3. Double-click on the App-V Application Launcher utility (**AppVLauncher.exe**). The **App-V 5.x Launcher** dialog box opens and lists the available packages in the same folder or subfolders:



4. Select the package that you want to launch and then click **Add and Publish**. All of the integration points with the system such as shortcuts and file type associations will be created. After the package is published to the App-V 5.x Client, it is ready to launch.
5. Optionally, click **Fully Load** to locally cache all of the App-V package's files (which is similar to setting a package's **Package Optimization** setting to **Offline**).
6. Click the shortcut to open the package.
7. When you are finished testing, either exit the application or click **Stop All Processes.**
8. To remove or "uninstall" the package, click **Remove**.
9. If you want to run a command line within the virtual environment, click **Run Virtual Cmd.exe**.

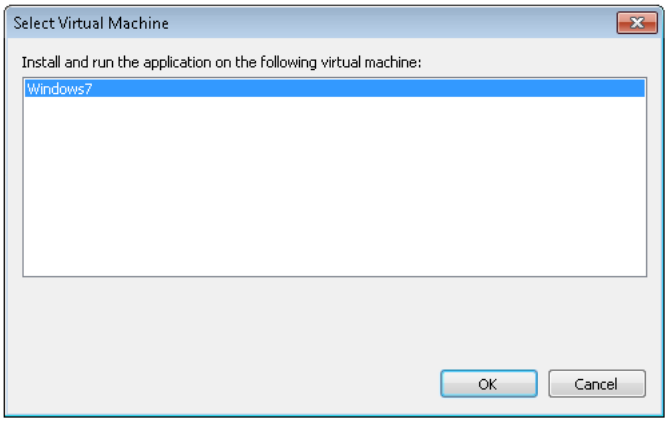
Testing VMware ThinApp Packages

You can choose to launch a VMware ThinApp package for testing on a virtual machine directly from Automated Application Converter.

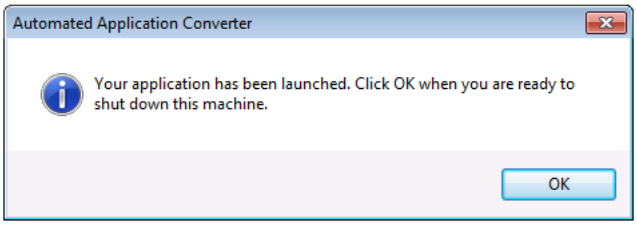
Task ***To launch a VMware ThinApp package for testing:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Launch the virtual machine that you want to use for testing.

3. On the **Packages** tab, right-click on a VMware ThinApp package and select **Launch Package for Testing** from the shortcut menu. The **Select Virtual Machine** dialog box opens, prompting you to select the virtual machine that you want to use to test the selected package.



4. Select a virtual machine from the list that has VMware ThinApp installed on it.
5. Click **OK**. The following will occur:
   - The Automated Application Converter will connect to the selected virtual machine.
   - The virtual machine will reboot to the snapshot listed on the **Machines** tab in the **Snapshot Name** property of the selected virtual machine.
   - The Guest Agent will launch, and progress messages will be displayed.
   - The VMware ThinApp package will be copied to the virtual machine.
   - The VMware ThinApp package will launch, and the following message will be displayed:



6. Test the application to determine whether it is operating properly.
7. When you have completed testing, click the **OK** button on the Automated Application Converter message dialog box to shut down the virtual machine. After you click OK, the following message will be displayed in the Automated Application Converter Output window:

```
[10:48:25 Windows7 - MyApp.exe] Done running application. Shutting down machine.
```

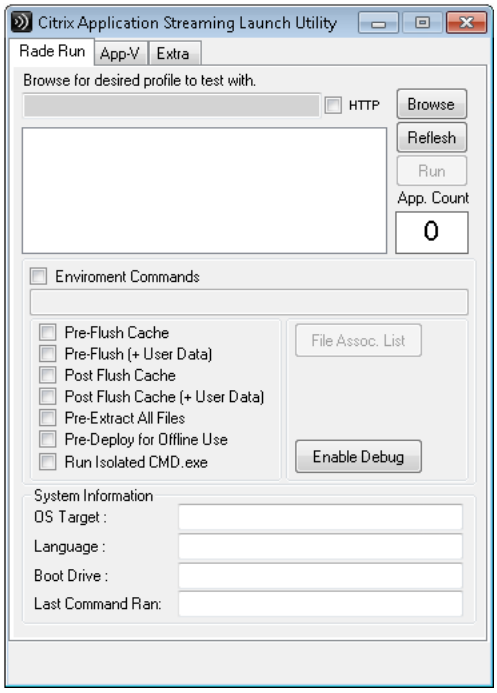
Testing Citrix XenApp Packages

Before you deploy a Citrix XenApp package on a XenApp server, you can test it using the **Citrix Application Streaming Launch Utility**. To test Citrix XenApp packages prior to deployment, perform the following steps:

Task ***To test Citrix XenApp packages:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Copy the entire folder containing the Citrix package to a virtual machine where the **Citrix Offline Plugin** and the **Citrix Application Streaming Launch Utility** have been installed.

   Tip • *For installation instructions for these two utilities, see Application Streaming Launch Tool in the Citrix Knowledge Center.*
3. Launch the **Citrix Application Streaming Launch Utility**.



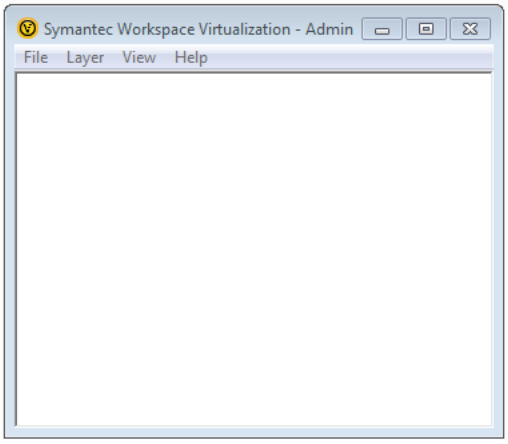
4. Click **Browse** and select the **.profile** file that you want to test. The application is listed in the box.
5. Select the application in the list and click **Run**. The application launches.
6. Perform testing.

Testing Symantec Workspace Packages

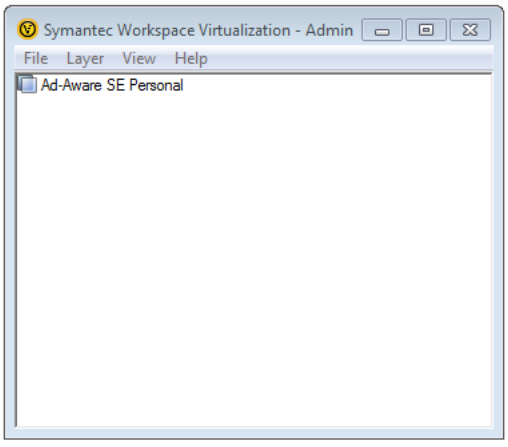
Before you deploy a Symantec Workspace package, you can test it using the **Symantec Workspace Virtualization Admin** client. To manually test a Symantec Workspace package, perform the following steps:

Task ***To test a Symantec Workspace package:***

1. Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
2. Copy the Symantec Workspace **.xpf** file to a clean virtual machine where the **Symantec Workspace Virtualization Admin** client is installed.
3. Open the **Symantec Workspace Virtualization Admin** client. The application opens.



4. Select **Import Layer** on the **File** menu. A dialog box opens and prompts you to select a Symantec Workspace package.
5. Select the Symantec Workspace **.xpf** file that you want to test. The Symantec Workspace package is imported and is now listed in the Symantec Workspace Virtualization Client list.



6. On the Symantec Workspace Virtualization Admin client, right-click on the application name in the list and select **Activate** from the shortcut menu. A product shortcut is added to your Start menu/screen, and the name of the package is now listed in bold.
7. Launch the package by selecting its shortcut on the Start menu/screen.
8. Perform testing.

Testing Repackaged and Source Windows Installer Packages

Edition •

You can choose to launch a Windows Installer package for testing on a virtual machine directly from Automated Application Converter. You can test both of the following types of Windows Installer packages:

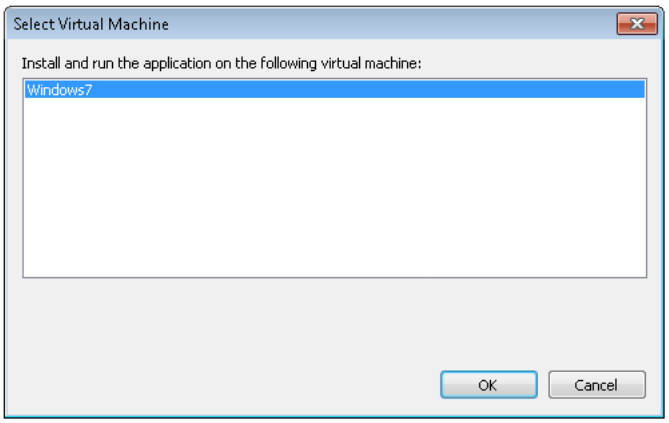
- **Repackaged MSI package**—A repackaged Windows Installer package that was converted from a source Windows Installer package using the Automated Application Converter.
- **Source package**—A source Windows Installer package that you have added to the **Packages** tab.

To test a Windows Installer package, perform the following steps:

Task

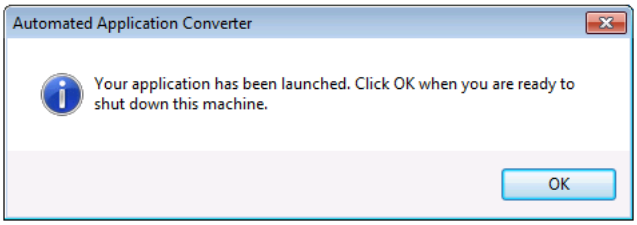
To launch a Windows Installer package for testing:

1. Do one of the following:
   - Perform package conversion as described in Using the Application Conversion Project Wizard to Perform an End-to-End Conversion or Performing a Conversion Using the Application Conversion Wizard. Converted packages are listed under their source package.
   - Add a Windows Installer package to the Packages tab, as described in Adding Packages from an AdminStudio Application Catalog or Adding Packages from a Local Machine or Network.
2. Launch the virtual machine that you want to use for testing.
3. On the **Packages** tab, right-click on a Windows Installer package and select **Launch Package for Testing** from the shortcut menu. The **Select Virtual Machine** dialog box opens, prompting you to select the virtual machine that you want to use to test the selected package.



4. Select a virtual machine from the list and click **OK**. The following will occur:
   - The Automated Application Converter will connect to the selected virtual machine.
   - The virtual machine will reboot to the snapshot listed on the **Machines** tab in the **Snapshot Name** property of the selected virtual machine.

- The Guest Agent will launch, and progress messages will be displayed.
- The Windows Installer package will be copied to the virtual machine.
- The Windows Installer package will launch, and the following message will be displayed:



5. Test the application to determine whether it is operating properly.
6. When you have completed testing, click the **OK** button on the Automated Application Converter message dialog box to shut down the virtual machine. After you click OK, the following message will be displayed in the Automated Application Converter Output window:

```
[10:48:25 Windows7 - MyApp.msi] Done running application. Shutting down machine.
```

Importing Converted Packages into the Application Catalog

After you convert packages to virtual packages or repackaged Windows Installer packages, your next step is to import those packages into the Application Catalog so that you can perform testing and then distribute them to your desired distribution system.

You can import these packages one at a time or you can import all of the packages in a specified directory. For detailed instructions, see the following help topics:

- Importing a Single Package File
- Importing a Folder of Multiple Applications

Publishing Converted Packages to a Distribution System

You can use the Distribution Wizard to publish an application or group of applications from the Application Catalog to a distribution system. The following distribution systems and package types are supported:

Table 10-14 • Supported Package Types Per Distribution System

Distribution System	Supported Package Types
System Center 2012 Configuration Manager	• Windows Installer packages • App-V (4.x and 5.0) packages

Table 10-14 • Supported Package Types Per Distribution System

Distribution System	Supported Package Types
Citrix XenApp Server	• Citrix XenApp profiles • App-V 4.x packages
Symantec Altiris Management Server	• Windows Installer packages • Symantec Workspace virtual packages • VMware ThinApp packages

Important • *When publishing applications to one of these distribution systems, the selected applications' supported packages will be published. However, if an application contains packages of other deployment types, those packages will be ignored.*

For more information, see Distributing Applications Using the Distribution Wizard.

Note • *You can also distribute an individual Windows Installer or App-V 4.x package to System Center 2007 Configuration Manager using the Package Distribution Wizard, as described in Publishing Packages to Microsoft System Center Configuration Manager.*

Setting Default Project Properties

You can specify project-wide default values for individual package properties on the **Project Options** dialog box, which is opened by selecting **Options** on the **Tools** menu.

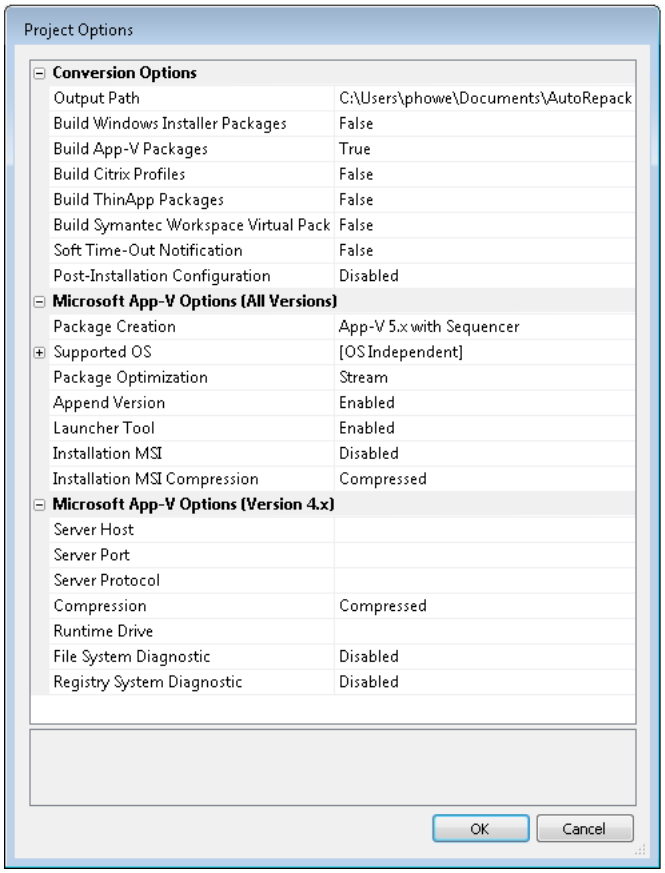


Figure 10-18: Project Options Dialog Box

When packages are added to the **Packages** tab, they will inherit the property values defined on the **Project Options** dialog box. However, properties for individual packages can be overridden in the package's **Properties** window on the **Packages** tab, as described in Editing Package Properties on the Packages Tab.

The default properties that are set on the **Project Options** dialog box include:

- **Output path**—You can specify the default output location for converted packages.
- **Default output formats**—You can specify the default package conversion types (App-V, Citrix XenApp, VMware ThinApp, Symantec Workspace, Windows Installer) for the conversion wizards:
  - **Application Conversion Project Wizard**—Packages will be converted to each of the specified formats.
  - **Application Conversion Wizard**—The specified formats will be selected, by default, on the **Select Output Formats** panel.
- **App-V version and method**—You can specify the default App-V conversion method: App-V 4.6 with AdminStudio, App-V 5.x with AdminStudio, or App-V 5.x with Sequencer.

To specify project-wide default values for individual package properties, perform the following steps:

Task ***To set default project properties:***

1. On the **Tools** menu, select **Options**. The **Project Options** dialog box opens.

   The **Project Options** dialog box includes properties that are grouped into the following sections:

   - Conversion Options
   - Microsoft App-V Options (All Versions)
   - Microsoft App-V Options (Version 4.x)

2. Set project options as described in Project Options Dialog Box.
3. Click **OK** to save your selections.

Tip *• You can also specify global default settings for any App-V virtual setting in the* ***ISVirtualPackage*** *table by editing the* ***settings.xml*** *file. For more information, see Specifying Global Default Virtual Conversion Settings.*

Capturing Virtualization Context

Sometimes it is necessary to repackage a Windows Installer package before you can successfully virtualize it (as described in Virtualization Conversion Error Messages).

When some Windows Installer packages are repackaged, some of their data (such as files or registry entries) are excluded according to the normal Repackager exclusion settings. For example, files destined for the **\Windows\Installer** folder are typically excluded. However, this type of information is occasionally necessary for a small set of applications which use Windows Installer APIs to determine whether they have been successfully or completely installed.

In order to get these settings into the generated virtual packages, when Repackager builds a Windows Installer package, it produces two **.msi** files: **packagename.msi** and **packagename.context.msi**, with **packagename.context.msi** containing the additional settings.

Figure 10-19: Repackaged Output: application.msi and application.context.msi

Repackager then converts the combined content of the main **.msi** and the **context.msi** into the desired virtual package.

Important *• If you are not converting a package to a virtual package, you can ignore its* ***.context.msi*** *file.*

Note *• Context data is not displayed in the Repackager interface when viewing captured Files/Registry details.*

How is the Context Data Configured

Context data is configured in a settings file in the **AdminStudio Shared** folder called **isrepackager.context.ini**. It is identical in syntax to the familiar **isrepackager.ini** file which is used for exclusion settings. Data that matches the settings in the **context.ini** file is captured—not into the main application **.msi** file, but rather into a separate **context.msi** file. When creating a virtual package, Repackager combines the data in both the main **.msi** file and the **.context.msi** file to produce the final virtual package.

Reference

This section describes each of the user interface elements and Wizard panels that you might encounter when using the Automated Application Converter. The help topics in this Reference section are the same detailed documentation that is displayed when you press the F1 key or click the **Help** button while working in a dialog box.

Reference information is organized into the following sections:

Table 10-15 • Organization of Automated Application Converter Reference Section

Section	Description
Automated Application Converter User Interface	Contains information about the main Automated Application Converter interface, including tabs, menus, and the toolbar.
Wizards	Contains a panel-by-panel reference for each Wizard in the Automated Application Converter.
Dialog Boxes	Provides specific help for each dialog box in the Automated Application Converter.
Command Line Support	Explains how to run the Automated Application Converter project file via command line.
Specifying Global Default Virtual Conversion Settings	Explains how to set global default settings for any App-V virtual setting in the **ISVirtualPackage** table by editing the **settings.xml** file.

Automated Application Converter User Interface

Information on the Automated Application Converter user interface is presented in the following sections:

- Packages Tab
- Machines Tab
- Results Tab
- Menus & Toolbar Buttons
- Output Window
- Column Selector and Properties Windows
- AdminStudio Automated Application Converter Log Report

- Using List Features

Packages Tab

On the **Packages** tab, you select the packages that you want to virtualize/repackage. On this tab, you can also set package properties and view package status.

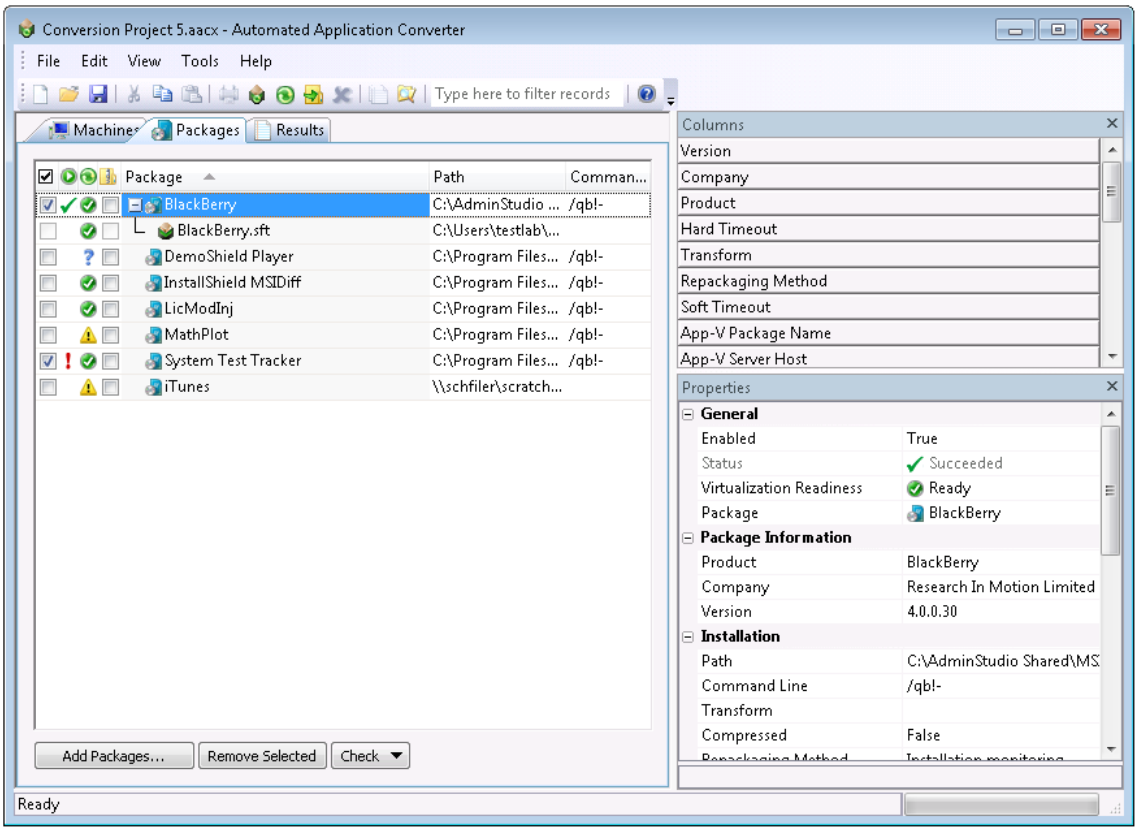

Figure 10-20: Packages Tab

This section includes the following information about the **Packages** tab:

- Adding Packages to the List
- Viewing Package Information on the Packages Tab
- Packages Tab Properties
- Icons Used on the Packages Tab
- Shortcut Menu Commands on Packages Tab

Adding Packages to the List

You add packages to this list using the Package Import Wizard or the Application Conversion Project Wizard. For instructions, see the following topics:

- Adding Packages from an AdminStudio Application Catalog

- Adding Packages from a Local Machine or Network

Viewing Package Information on the Packages Tab

By default, the **Packages** tab lists the **Status**, **Virtualization Readiness**, **Path**, and **Command Line** columns for each selected package. Additional columns of information can be viewed by selecting one of the fields in the Column Selector area and dragging it onto the list. Also, the values for these fields for the selected package can be viewed in the **Properties** window.

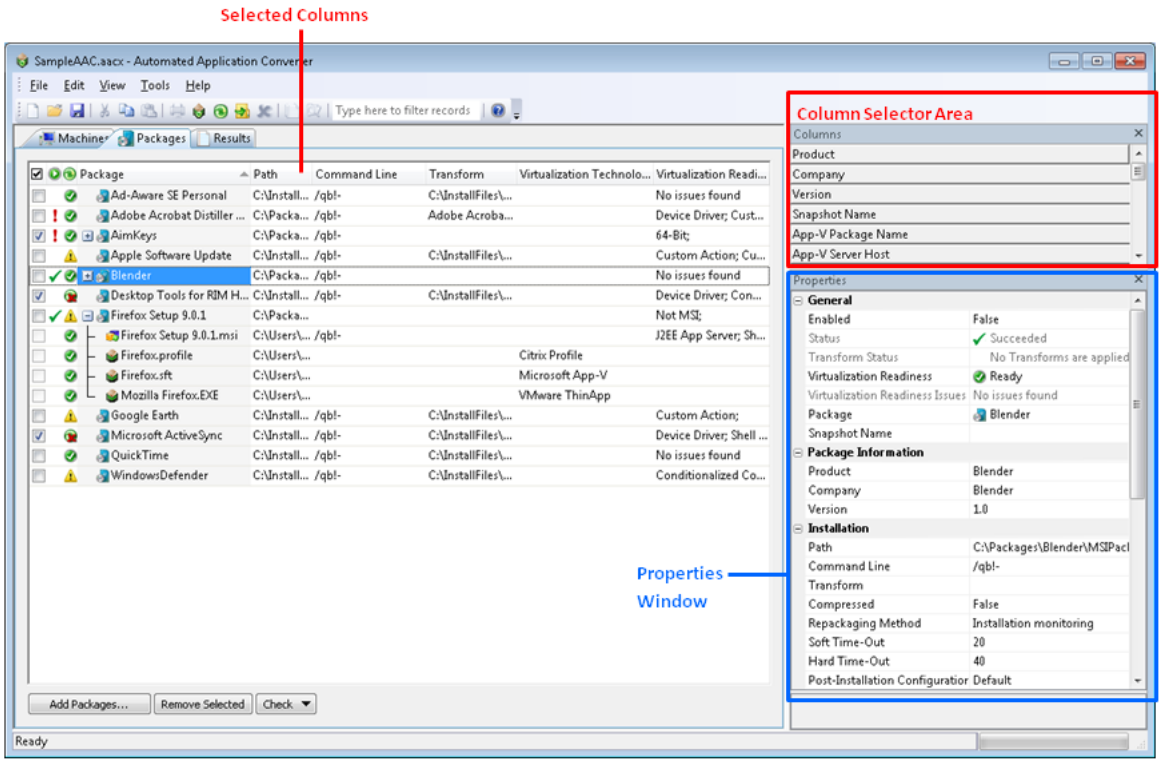

Figure 10-21: Column Selector Area on the Packages Tab

Note • *You can sort these lists, change the columns that are displayed, change the column order, resize the columns, and group these lists by a specific column. See Using List Features for more information.*

Packages Tab Properties

The **Packages** tab includes the following categories of properties, most of which can be edited in the package list or in the Properties Window:

- General
- Package Information
- Installation
- Microsoft App-V Options (All Versions)

- Microsoft App-V Options (Version 5.x)
- Microsoft App-V Options (Version 4.x)
- Packages Tab Buttons

General

The **General** category includes the following properties:

Table 10-16 • Packages Tab / General Category of Properties Window

Property	Description
Enabled ☑	To select a package for conversion, click the check box in this column of the list. ***Note*** • *This column corresponds with the* ***Enabled*** *field under* ***General*** *in the Properties window, which can be set to either* ***True*** *or* ***False****.*
Status	Displays an icon to indicate the status of the package when it is being repackaged or virtualized, that the process has completed, or that the Automated Application Converter encountered an error during the process. See Icons Used on the Packages Tab.
Transform Status	Indicates whether any transforms are associated with the listed Windows Installer package. Automated Application Converter automatically adds all of the **.mst** files located in the same directory as the selected **.msi** file. If a transform is associated with the selected package, one of the following two icons are displayed in this column: • One transform is being added with this package. • Multiple transforms are being added with this package. If multiple transforms are associated with this package, you should click the browse button in the **Transform** column (or the browse button in the **Transform** field in the **Properties** window) to open the **MST** dialog box and specify which transform files you want to add and the order that you want the transforms applied. For more information, see MST Dialog Box.

Table 10-16 • Packages Tab / General Category of Properties Window

Property	Description
Virtualization Readiness 	When you add a package to the **Packages** tab, the Automated Application Converter does a quick check to identify that package's virtualization readiness status and assigns it one of the following icons: • **Ready**  —Package is ready to virtualize; no repackaging is required. If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required. An example of an unsupported table is the **IniFile** table, which changes files on the target machine in ways that cannot be statically determined. • **Requires repackaging**  —Package must be repackaged before it can be successfully virtualized. • **Virtualization not supported**  —Automated Application Converter has determined that virtualization is not supported. • **Virtualization not recommended**  —Automated Application Converter has determined that this package is not recommended for virtualization. • **Unknown**  —The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.  ***Note*** • *You can click on the icon in this column to override the Virtualization Readiness status that was automatically assigned to this package by the Automated Application Converter.* *Packages with a status of* ***Virtualization not supported*** *will not be virtualized. In order to virtualize that package, you must first override the status and change it to* ***Ready*** *or* ***Requires repackaging****.*
Virtualization Readiness Issues	This read-only setting lists the issues that were found for this package. This is used to make the virtualization readiness recommendation.
Package	Lists the name of the package, as determined by the value in the **Product** property under **Package Information**. This is used as part of the output path for repackaged or virtualized results. It is also used in reports to refer to this package. If the package has been repackaged or converted to a virtual package, those output files are also listed below the source file in a tree structure, with an icon identifying the file type. See Icons Used on the Packages Tab.
Snapshot Name	Specify an override snapshot name to use instead of the snapshot that the machine is configured to use.

Package Information

The **Package Information** category includes the following properties:

Table 10-17 • Packages Tab / Package Information Category of Properties Window

Property	Description
Product	Name of the package as provided by the company who manufactured it.
Company	Name of the company who manufactured this package.
Version	Version of the package.
Virtualization Technology	Indicates the virtualization format of the virtual package. Options are: • Microsoft App-V • Citrix XenApp • VMware ThinApp • Symantec Workspace • Windows Installer Package  ***Note*** • *This property is only displayed when a virtual package or repackaged Windows Installer package is selected under its original package.*

Installation

The **Installation** category includes the following properties:

Table 10-18 • Packages Tab / Installation Category of Properties Window

Property	Description
Path	When a parent package is selected, this property lists the location from where the package was selected locally or from where it was originally imported into the AdminStudio Application Catalog. If a child virtual package is selected, this property lists the location of the virtual package.  ***Note*** • *It is recommended that you use a UNC path when importing packages into the Application Catalog.* *If you are adding packages from an AdminStudio Application Catalog installed on a machine other than the machine where the Automated Application Converter is installed, make sure that the package source path listed here is accessible to the Automated Application Converter machine. If it is also accessible to the virtual machines, repackaging can be performed more quickly.*

Table 10-18 • Packages Tab / Installation Category of Properties Window

Property	Description
Command Line	Editable field that lists the command line parameters that will be used to run this installation silently during repackaging.
Transform	This field can contain a semicolon-delimited list of transforms used to modify or install a Windows Installer package silently. To add a transform to this list, click the Browse button to open the **MST** dialog box. For more information, see MST Dialog Box. ***Note*** • *If the transform file is located in the same directory as the* ***.msi*** *file, only the* ***.mst*** *file name is listed in the* ***Transform*** *field. If you have added a transform file from another directory, the full path is listed in this field.*
Compressed	Indicates the compressed status of the package: • **False**—Indicates that the source **.msi** or **.exe** file is uncompressed. If this package is repackaged, the Automated Application Converter will copy all of the files in the same folder as the installation file to the virtual machine. • **True**—Indicates that the source **.msi** or **.exe** file is compressed. If this package is repackaged, the Automated Application Converter will copy only this single installation file to the virtual machine.
Repackaging Method	Indicates the repackaging method that will be used to repackage this package: • **Installation monitoring**—Repackager monitors system changes as a package is installed, and that data is converted into a Windows Installer package. • **Single-step snapshot**—Repackager first takes an initial system snapshot, then runs the installation, and then takes a second snapshot to create the script file that can be converted into a Windows Installer package.
Soft Time-Out	Number of minutes allotted for the package to install before the user would be notified. After this time period elapses, the user will be notified, just in case there are pending dialogs for the user to dismiss or if some other user interaction is required. The default value is 20.
Hard Time-Out	Number of minutes allotted for the package to install before it is considered a failure. If this time period elapses, the Automated Application Converter would consider the installation a failure and would move to the next package. The default value is 40.

Table 10-18 • Packages Tab / Installation Category of Properties Window

Property	Description
Pre-Installation Configuration	Indicate whether to allow manual configuration of the machine before beginning the capture process. This can be useful when a particular dependency, such as Java runtime, needs to be installed and should not be captured as part of the application capture process. Available options are: • **Disabled**—Disable pre-installation configuration. • **Enabled**—Enable pre-installation configuration.
Post-Installation Configuration	Indicate whether you want to enable configuration of the application after it is installed on the virtual machine but before it is converted into the target formats. Available options are: • **Default**—Use the project-level behavior that is specified through the **Post-Installation Configuration** field on the **Project Options** dialog box. This is the default value. • **Disabled**—Disable post-installation configuration. The repackaging process does not pause after installing the product. • **Enabled**—Enable post-installation configuration. The repackaging process pauses after the installation of the product to allow you to launch the product and set up various application settings such as update settings and file associations. You can also perform other system configuration tasks. Once you are done with configuration, you can click a button to have the repackaging proceed with the capture and convert process.  ***Important*** • *If you select the* ***Enabled*** *option, ensure that the value that you enter for the* ***Hard Time-Out*** *setting allows enough time to configure the application.*  ***Note*** • *This option is ignored when performing conversion to App-V 5.0 using the Microsoft App-V 5.0 Sequencer.*
Manual Install	Indicate whether you want to manually perform the application installation tasks. Manual installation can be used for more complex installations. Available options are: • **Disabled**—Disable manual installation. • **Enabled**—Enable manual installation.  ***Important*** • *This option is ignored during App-V 5.0 conversion using the Microsoft Sequencer.*

Table 10-18 • Packages Tab / Installation Category of Properties Window

Property	Description
Documentation Tool	Indicate whether you want to enable or disable the documentation tool during repackaging. Available options are: • **Disabled**—Disable the documentation tool. This is the default value. • **Enabled**—Enable the documentation tool. • **Default**—Use the project-level behavior that is specified through the **Documentation Tools** field on the **Project Options** dialog box. This is the default value.  ***Note*** • *For more information on the documentation tool, see Documenting Repackaging Steps Using the Microsoft Step Recorder Tool.*

Microsoft App-V Options (All Versions)

The **Microsoft App-V Options (All Versions)** category includes the following properties:

Table 10-19 • Packages Tab / Microsoft App-V Options (All Versions) Category of Properties Window

Property	Description
Name	Enter a name (a maximum of 64 characters) to override the name of the App-V package. By default, this matches the value of the **Product** property under **Package Information**.  ***Tip*** • *If your virtual package contains multiple applications, you can specify the name that identifies the entire package. For example,* ***Microsoft Office*** *could be used to identify a package that contains Microsoft Word and Microsoft Excel applications that run in the same virtual environment.*
Comments	Enter a short description of the App-V package.  ***Note*** • *This setting is optional.*
Package Creation	Select one of the following options to identify an App-V conversion method: • **Default**—Use the method that is selected in the **Package Creation** field on the **Project Options** dialog box. This is the default value. • **App-V 4.6 with AdminStudio**—When converting this package to App-V format, use AdminStudio to convert it to an App-V 4.6 package. • **App-V 5.x with AdminStudio**—When converting this package to App-V format, use AdminStudio to convert it to an App-V 5.x package. • **App-V 5.x with Sequencer**—When converting this package to App-V format, use Microsoft Sequencer to convert it to an App-V 5.x package.

Table 10-19 • Packages Tab / Microsoft App-V Options (All Versions) Category of Properties Window

Property	Description
Primary Application Directory	Enter one of the following: • **App-V 5.x conversions using the Sequencer**—Specify the absolute folder path to the expected main installation location of the package to be converted. If no value is specified, then the App-V 5.0 package will be created with all files in the virtual file system (VFS) folder. • **App-V 4.x or 5.x conversions using AdminStudio**—Specify the main installation directory which will be used to set up the root/mount folder mapping. For example, for Yahoo Messenger, AdminStudio automatically detects **C:\Program Files\Yahoo!** as the primary installation directory. However, you may prefer that the primary installation directory be C**:\Program Files\Yahoo!\Messenger**, because this directory is more correct for Messenger. In this case, you can enter this new path in the **Primary Application Directory** property field, and it will be honored by the AdminStudio converter as long as this path exists in the Windows Installer Package. If it does not exist, then AdminStudio will fall back to use the directory it found during automatic detection.  ***Important*** • *When you use the* ***App-V 5.x with Sequencer*** *option, it is highly recommended that you enter a value for the* ***Primary Application Directory*** *property. If you do not, then all of the converted files will end up in the virtual file system (VFS) folder.*  ***Note*** • *When using the* ***App-V 4.x/5.x with AdminStudio*** *package creation options, this field is optional.*

Table 10-19 • Packages Tab / Microsoft App-V Options (All Versions) Category of Properties Window

Property	Description
Supported OS	Use to specify the operating systems that the App-V package will support: • **To accept default values**—To accept the default values for **Supported OS** that are set on the **Project Options** dialog box, set **Default** to **True**. When you make this selection, all operating systems and **OS Independent** will automatically switch to **False**, and the word `[Default]` will be listed next to **Supported OS**. • **If the App-V package is operating-system-dependent** (meaning that it only supports some of the listed operating systems), select **True** next to the supported operating systems. If any of the listed operating systems are set to **True**, the value for **Default** and for **Supported OS** will automatically switch to **False**, and the selected operating systems will be listed in brackets next to **Supported OS**. • **If the App-V package is operating-system-independent** (meaning that it supports all listed operating systems), set **OS Independent** to **True**. When you make this selection, all operating systems and **Default** will automatically switch to **False**, and `[OS Independent]` will be listed next to **Supported OS**.  ***Important*** • *When setting the **Supported OS** property for App-V 5.0 packages, keep in mind that the packages are limited to the supported operating systems of the App-V 5.0 client:* • *Windows 7 and later* • *Windows Server 2008 R2 and later*

Table 10-19 • Packages Tab / Microsoft App-V Options (All Versions) Category of Properties Window

Property	Description
Package Optimization	Specify how to optimize the package: • **Default**—Use the method that is selected in the **Package Optimization** field on the **Project Options** dialog box. This is the default value. • **Offline**—When the package is optimized for offline use, the entire package is included in feature block 1 and will be streamed to the client at start up in one file before the application launches. After that, no more streaming is done. All files are stored in the App-V cache, which means that the application is available for use even when the machine is not connected to the App-V server. Select this option if you want to enable users to use the App-V package when not connected to the App-V server and if you want to eliminate network traffic when the App-V package is being used. • **Stream**—When the package is optimized for streaming use, only the shortcut targets which are included in feature block 1 are streamed to the client at start up. Feature block 2 can contain additional functionality of the App-V package that is not necessary to launch the application. While the App-V package is being used, the files in feature block 2 are streamed in small packets on an as-needed basis. This option provides a relatively quick launch time while limiting network traffic during application use.  ***Note*** • *When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent application use.*
Append Version	Specify the default App-V versioning value. Available options are: • **Enabled**—Append the package version to the SFT file name. • **Disabled**—Leave the package version off of the SFT file name. • **Default**—Use the setting that is defined on the **Project Options** dialog box.
Launcher Tool	Set this option to **Enabled** to include the App-V Application Launcher when you build an App-V package. You can use the App-V Application Launcher to test a newly built App-V package before moving it to a deployment server.  ***Note*** • *The default for the **Launcher Tool** property is set on the **Project Options** dialog box.*
Upgrade Package	If this package is an upgrade package that should update an earlier version of the application, click the ellipsis button (...) in this setting and browse to the earlier version.

Table 10-19 • Packages Tab / Microsoft App-V Options (All Versions) Category of Properties Window

Property	Description
All Files in VFS	Specify whether the files should exist in Windows retargetable folders within the virtual file system (VFS) folder of the App-V package. Available options are: • **Disabled**—All of the files that correspond with the main installation directory of the application will be put in the root folder of the App-V package's file system. This method adheres to Microsoft App-V best practices. This is the default setting. • **Enabled**—All of the files in the package will be put into Windows retargetable folders within the VFS (virtual file system) folder of the App-V package. This option overrides the effect of specifying a value for **Primary Application Directory**.  ***Note*** • *The **Enabled** option is generally not recommended, but there may be applications for which it is necessary. For example, if a virtualized application does not work as expected, and if it is possible that the application cannot find one of its files because it is searching in a hard-coded path, you may want to select the **Enabled** option.*

Microsoft App-V Options (Version 5.x)

The **Microsoft App-V Options (Version 5.x)** category includes the following properties:

Table 10-20 • Packages Tab / Microsoft App-V Options (Version 5.x) Category of Properties Window

Property	Description
Expand App-V Package	Use this option to expand an existing App-V 5.x package on the system before performing the sequencing. This is useful for specifying middleware and dependency App-V packages such as Java runtime. Click the browse button and select the App-V package to expand.
Named Objects Interaction	Specify **Enabled** to enable all named objects to interact with the local system. The default setting is **Disabled** to keep these objects isolated from the local system. Named objects include application's events and mutexes among other things. This is an advanced setting that typically does not need to be changed from the default. It is only compatible with the **App-V 5.x with AdminStudio** approach for package creation.
COM Objects Interaction	Specify **Enabled** to allow programs on the local system to interact with all COM objects present in the virtual package. The default setting is **Disabled** in order to isolate all COM objects of the virtual package. This is an advanced setting that typically does not need to be changed from the default. It is only compatible with the **App-V 5.x with AdminStudio** approach for package creation.

Table 10-20 • Packages Tab / Microsoft App-V Options (Version 5.x) Category of Properties Window

Property	Description
Full VFS Write Mode	Set this option to **Enabled** to give the virtual application full write permissions to its VFS (virtual file system) files and folders. ***Note*** • *The* ***Full VFS Write Mode*** *feature was introduced in App-V 5.0 SP2 HotFix 4.*

Microsoft App-V Options (Version 4.x)

The **Microsoft App-V Options (Version 4.x)** category includes the following properties:

Table 10-21 • Packages Tab / Microsoft App-V Options (Version 4.x) Category of Properties Window

Properties	Description
Server Host	Specify the host—the virtual application server or the load balancer in front of a group of virtual application servers that stream the App-V package to the Application Virtualization Client. You can either specify a static host name or IP address, or you can enter **%SFT_SOFTGRIDSERVER%** to indicate an environment variable. ***Note*** • *If you enter* ***%SFT_SOFTGRIDSERVER%****, you must set up the SFT_SOFTGRIDSERVER system environment variable on each Application Virtualization Client. The value of this environment variable should be the name or IP address of the host.* *When you assign the variable on a client system, any Application Virtualization Client session that is running on the system must be closed and reopened; otherwise, the session is not aware of the new application source.*
Server Port	Specify the port on which the virtual application server or the load balancer listens for Application Virtualization Client requests for the package. The default port is 554.
Server Path	Specify the relative path on the virtual application server where the software package is stored and from which it will be streamed. ***Note*** • *This information is required to create a package if the* ***.sft*** *file will be stored in a subdirectory of* `CONTENT`; *otherwise, this information is not required.*

Table 10-21 • Packages Tab / Microsoft App-V Options (Version 4.x) Category of Properties Window

Properties	Description
Server Protocol	Select the protocol that you want to use to stream the sequenced application package from the virtual application server to an Application Virtualization Client. Available options are: • **RTSP**—The real-time streaming protocol streams the App-V package. This is the default option. • **RTSPS**—The real-time streaming protocol with transport layer security streams the App-V package. • **FILE**—The App-V package are streamed from a file share. • **HTTP**—The hypertext transport protocol streams the App-V package. • **HTTPS**—The secure hypertext transport protocol streams the App-V package.
Root Folder Name	Specify the root folder of the App-V package's file system. During run time, the Application Virtualization Client mounts the package's file system to the App-V virtual drive; the Q drive is the default. The long and short names of the root folder must be unique because two packages with the same root folder name cannot be deployed simultaneously.
Dynamic Suites	Enter a semicolon-delimited list of OSD or SFT files to be dynamically suited with this package, or click the ellipsis button (...) and select the OSD or SFT files to be suited. If a file must be present for this package to work properly, append the following to the file name: **:MANDATORY**
Compression	Specify whether to compress this App-V package by selecting one of the following options: • **Compressed**—Compress the App-V package. • **Uncompressed**—Do not compress the App-V package. • **Default**—Use the **Compression** property option that is selected on the **Project Options** dialog box.
Runtime Drive	Enter the App-V client runtime drive. If you do not enter a value, one of the following values will be used: • **If a value is set on the Project Options dialog box**, that value will be used. • **If no value is set on the Project Options dialog box**, the default value of `Q:\` will be used.

Table 10-21 • Packages Tab / Microsoft App-V Options (Version 4.x) Category of Properties Window

Properties	Description
File System Diagnostic	Set this property to **Enabled** if you want to include the Windows Command Prompt application when you build an App-V package so that you can browse the virtual file system at runtime from within the virtual environment. If this property is set to **Enabled**, a file named **Virtual File System.osd** will be created in the App-V Package folder, which can be used to display the files and folders within the virtual environment. You can use **Virtual File System.osd** to view the existing files and folders on the computer plus the files and folders for the virtual package.  ***Note*** • *The default value for the* ***File System Diagnostic*** *property is set on the* ***Project Options*** *dialog box.*
Registry System Diagnostic	Set this property to **Enabled** if you want to include the Registry Editor (**regedit.exe**) when you build an App-V package so that you can browse the registry at runtime from within the virtual environment. If this property is set to **Enabled**, a file named **Virtual Registry.osd** will be created in the App-V Package folder, which can be used to display the registry within the virtual environment. You can use **Virtual Registry.osd** to view the existing registry on the computer plus the registry for the virtual package.  ***Note*** • *The default value for the* ***Registry System Diagnostic*** *property is set on the* ***Project Options*** *dialog box.*

Packages Tab Buttons

The **Packages** tab includes the following buttons:

Table 10-22 • Packages Tab Buttons

Property	Description
Add Packages	Click this button to launch the Package Import Wizard, which you can use to add packages to the **Packages** tab.
Remove Selected	Click this button to remove the selected package from this list. You can also click the Delete key.  ***Note*** • *A package is selected for removal when you click on it and it becomes highlighted, not by selecting the package's check box. Use the* ***Ctrl*** *key to select multiple packages.*

Icons Used on the Packages Tab

The following icons are used to display package status on the **Packages** tab:

Table 10-23 • Select Packages Panel

Column	Icon	Description
Status 		Package is in the process of being repackaged.
		Package has been successfully repackaged.
		Repackaging has failed.
		Package is waiting in line to be repackaged or to be virtualized.
		A soft timeout has occurred, meaning that the package's **Soft Timeout** time period has elapsed. This could occur because the package is very large and is taking an unusually long time to repackage, or because you have set the **Soft Timeout** value too low, or because the installer is waiting for some kind of user input (meaning that the installation was not silent).
		The last conversion run of this package was cancelled.
Package		Identifies the source package (**.msi** or **.exe** file).
		Identifies the repackaged **.msi** file.
		Identifies the virtual application that was successfully created.

Table 10-23 • Select Packages Panel

Column	Icon	Description
Virtualization Readiness		**Ready** Package is ready to virtualize; no repackaging is required. ***Note*** *• If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required. An example of an unsupported table is the* ***IniFile*** *table, which changes files on the target machine in ways that cannot be statically determined.*
		Requires repackaging Package must be repackaged before it can be successfully virtualized.
		Undetermined The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.
		Virtualization not supported Automated Application Converter has determined that virtualization is not supported due to one of the following issues (described in Application Virtualization Compatibility Tests): • Package contains DLL surrogates. • Package installs boot services. • Package contains OS integrated files. • Package relies on a system-level driver. • Package's .sft file name is over 56 characters in length. ***Important*** *• Packages with a status of* ***Virtualization not supported*** *will not be virtualized. In order to virtualize the package, you must first override the status and change it to* ***Ready*** *or* ***Requires repackaging****.*
		Virtualization not recommended Automated Application Converter has determined that this package is not recommended for virtualization due to one of the following issues (described in Application Virtualization Compatibility Tests): • Package does not contain a shortcut. • Package includes a custom shell extension. • Package utilizes ClickOnce technology.

Shortcut Menu Commands on Packages Tab

When you right-click an item in the **Package** list on the **Packages** tab, the following commands are available on the shortcut menu:

Table 10-24 • Shortcut Menu Commands on Packages Tab

Command	Description
Explore	Open the directory that contains the selected file.
Remove	Permanently removed the selected packages from the project.
Test Virtualization Readiness	Select to test the selected package for virtualization readiness. The possible results are: • —Package is ready to virtualize; no repackaging is required. If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required. An example of an unsupported table is the **IniFile** table, which changes files on the target machine in ways that cannot be statically determined. • —Package must be repackaged before it can be successfully virtualized. • —The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.
Launch Package for Testing	Select to install and run the selected application on a virtual machine. See Testing Packages.
Connect to Machine	When the Running icon is displayed in the **Status** column, indicating that the package is in the process of being repackaged, you can select **Connect to Machine** from the shortcut menu to connect to the virtual machine via Remote Desktop on which this package is being repackaged.
Package Import Wizard	Select this option to launch the Package Import Wizard to import packages to this project.

Machines Tab

On the **Machines** tab of the Automated Application Converter, you add a list of clean virtual machine images to use during automated repackaging.

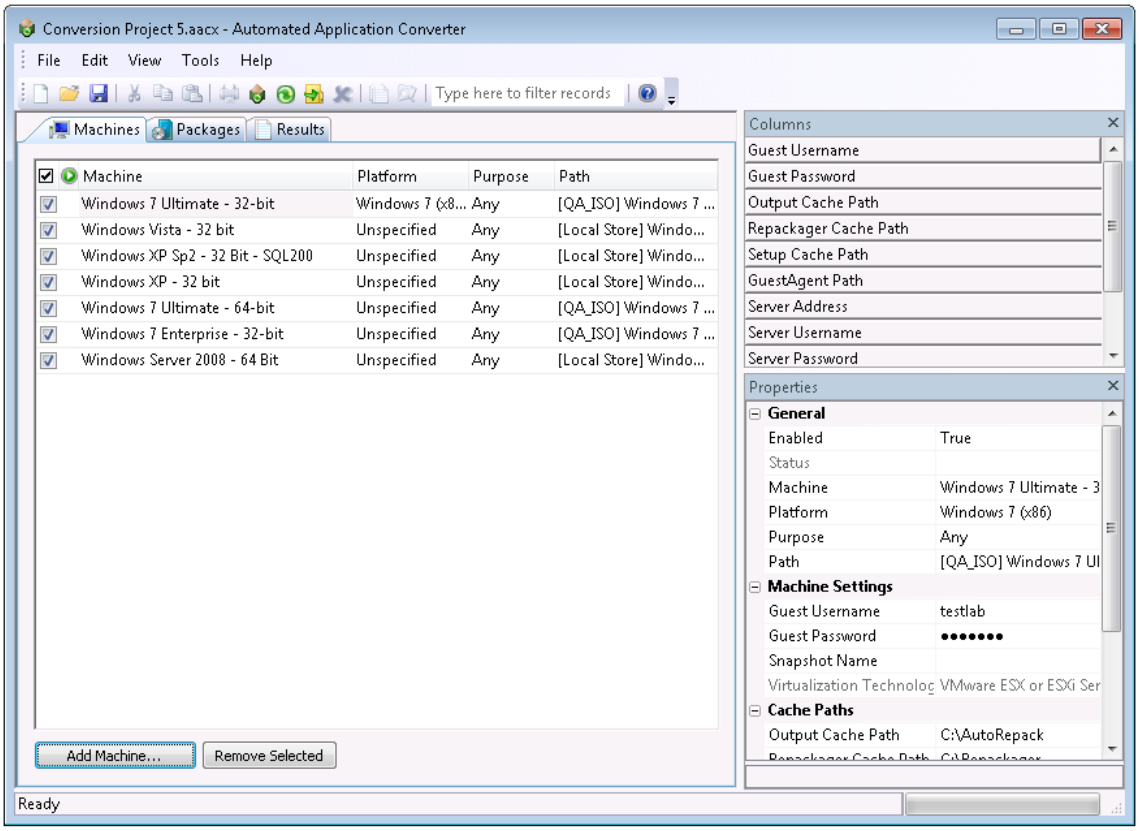

Figure 10-22: Machines Tab

This section includes the following information about the **Machines** tab:

- Adding Virtual Machines to the List
- Viewing Virtual Machine Information on the Machines Tab
- Machines Tab Properties
- Shortcut Menu Commands on Machines Tab

Adding Virtual Machines to the List

To add a virtual machine to the list, click **Add Machine** to open the Virtual Machine Import Wizard, as described in Adding Virtual Machines Using the Virtual Machine Import Wizard. You will then be prompted for login information and other relevant data required to prepare the machine.

Note • *Before you add a machine to this list, you need to perform the steps listed in Preparing Your Virtual Machines for Use With the Automated Application Converter to enable automatic login and to create a clean snapshot.*

To perform repackaging, you have the option of selecting one virtual machine or multiple virtual machines (that can be used simultaneously to speed up the repackaging of multiple setups). You can also specify that you want to use only virtual machines of a specific operating system platform.

When each virtual machine finishes repackaging a package, it is reverted to its clean snapshot image, and then starts repackaging the next package in the list.

Viewing Virtual Machine Information on the Machines Tab

By default, the **Machines** tab lists the **Status**, **Machine**, **Platform**, **Purpose**, and **Path** columns for each machine. Additional columns of information can be viewed by selecting one of the fields in the **Column** selector area and dragging it onto the list. Also, the properties for these **Columns** for the selected machine can be viewed in the **Properties** window when that column is selected in the **Column** selector area.

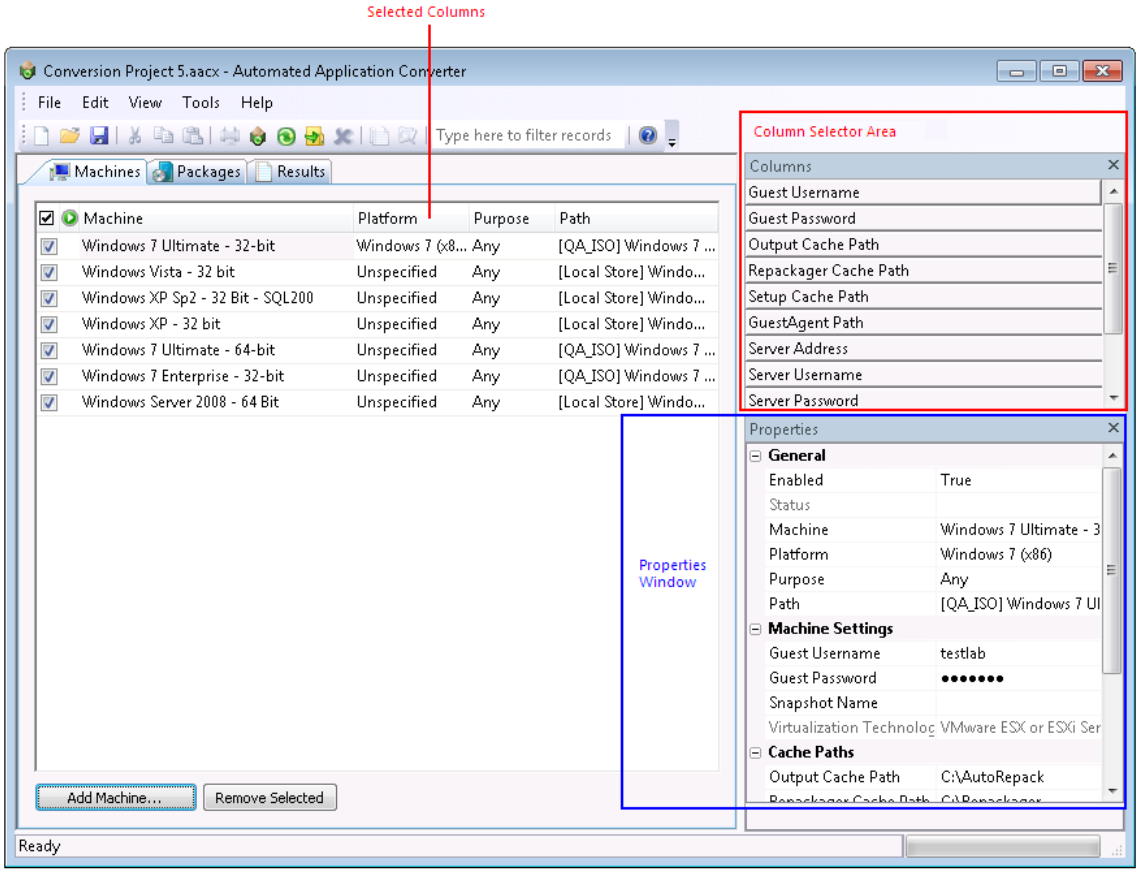

Figure 10-23: Column Selector Area on the Machines Tab

Note • *You can sort this list, change the columns that are displayed, change the column order, resize the columns, and group the list by a specific column. See Using List Features for more information.*

Machines Tab Properties

The **Machines** tab includes the following properties and information:

Table 10-25 • Machines Tab

Property	Description	
☑	Selection column. To select a virtual machine to use for automated repackaging, click the check box in this column.	
Status 	The icon displayed in this column indicates the status of the virtual machine:	
		Virtual machine is in use.
		The Automated Application Converter encountered an error when attempting to connect to this virtual machine. or when rolling back to a snapshot on this virtual machine.
		The Automated Application Converter is waiting for the virtual machine to boot up.
	(No icon)	Virtual machine is not currently in use.
		The last conversion run on this virtual machine was cancelled.
Machine	Name of the virtual machine image.	
Platform	Field that identifies the operating system platform of the virtual machine. When you select a virtual machine to add to the Automated Application Converter, you need to manually identify the operating system platform either on the **Select Virtual Machines** panel or by clicking in this field on the **Machines** tab and making a selection from the list. When you perform a conversion run, you are given the opportunity (on the **Automated Repackaging on Virtual Machines** panel) to either select a specific platform to use for the repackaging of the selected packages, or to select **Any Platform**, meaning that all of the selected virtual machines will be used for repackaging.	
Path	Path on the server or file system to the virtual machine image file.	

Table 10-25 • Machines Tab (cont.)

Property	Description
Purpose	By default, virtual machines that you add to the **Packages** tab will be available for use for both automated repackaging of packages and for testing packages. However, if you want to specify that a virtual machine should be used for only repackaging or for only testing, click in the **Purpose** column of that virtual machine and select one of the following options: • **Repackaging**—Virtual machine will only be used to perform automated repackaging. • **Testing**—Virtual machine will only be used to test packages. You test a package by right-clicking on it on the **Packages** tab and selecting **Launch Package for Testing** from the shortcut menu. You will then be prompted to install and run that package on a virtual machine. • **Any**—Make this virtual machine available for use during both automated repackaging and package testing. This is the default value.  ***Important*** • *If the **Purpose** column is not listed in the **Machines** list, you can select it in the **Columns** area and drag it to the list, or you can edit the **Purpose** value in the Properties window.*  ***Note*** • *The **Launch Package for Testing** functionality will primarily be useful to test converted packages. However, if a problem occurs during conversion, it is also possible to use this function to install and launch the source package for testing.*
Guest Username	The user name to use to login to this virtual machine.
Guest Password	The password to use to login to this virtual machine.
Output Cache Path	Specify the location for the repackaged output on the virtual machine. By default, this value is **C:\AutoRepack**.
Repackager Cache Path	Specify the location where Repackager will be installed on the virtual machine. By default, this value is **C:\Repackager**.
Setup Cache Path	Specify the location where the package will be copied to on the virtual machine. By default, this value is **C:\AppSetup**.
GuestAgent Path	Specify the location where the **GuestAgent.exe** file will be installed on the virtual machine. By default, this value is **C:\GuestAgent.exe**.
Server Address	The address of the virtual machine server on which this virtual machine is found. This may be a host name or a URL.
Server Username	The user name of the account used to access the virtual machine server.

Table 10-25 • Machines Tab (cont.)

Property	Description
Server Password	The password of the account used to access the virtual machine server.
Snapshot Name	Name of the snapshot to revert to before starting an automated repackaging session. This is only used if the virtualization technology supports named snapshots. If this value is not specified, but named snapshots are supported on the virtualization technology, the default name of **AutoRepack_Base** will be used.
Virtualization Technology	The virtualization technology powering this virtual machine.
App-V 5.x Sequencer Snapshot	Enter the name of the snapshot to revert to before starting conversion using the App-V 5.x Sequencer. ***Important*** • *Both the Microsoft App-V 5.x Sequencer and the Virtual Machine Preparation client must be installed on this snapshot. For more information, see Preparing a Snapshot for App-V 5.0 Conversion Using the App-V 5.0 Sequencer.*
App-V 5.x Client Snapshot	Enter the name of the snapshot to revert to before testing an App-V 5.x package. This snapshot will be used if the user right-clicks on this App-V 5.0 virtual package on the **Packages** tab of Automated Application Converter and selects **Launch Package for Testing** from the shortcut menu. ***Important*** • *Both the Microsoft App-V 5.x client and the Virtual Machine Preparation client must be installed on this snapshot. For more information, see Preparing a Snapshot for App-V 5.0 Testing Using the App-V 5.0 Client.*
Add Machine	Click to launch the Virtual Machine Import Wizard, which you can use to add virtual machines to the **Machines** tab.
Remove Selected	Click to remove the selected virtual machine from this list. ***Note*** • *A virtual machine is selected for removal when you click on it and it becomes highlighted, not by selecting the virtual machine's check box. Use the **Ctrl** key to select multiple machines.*

Shortcut Menu Commands on Machines Tab

When you right-click on an item in the **Machines** list on the **Machines** tab, the following commands are available on the shortcut menu:

Table 10-26 • Shortcut Menu Commands on Machines Tab

Command	Description
Connect to Machine	When the Running icon is displayed in the **Status** column, indicating that this virtual machine is currently being used to perform repackaging, you can select **Connect to Machine** from the shortcut menu to connect to this virtual machine via Remote Desktop.
Remove	Select to remove the selected machine from this project.
Machine Import Wizard	Select to add virtual machines to this project using the Virtual Machine Import Wizard.

Results Tab

On the **Results** tab, the results of each virtualization conversion run for this project are listed.

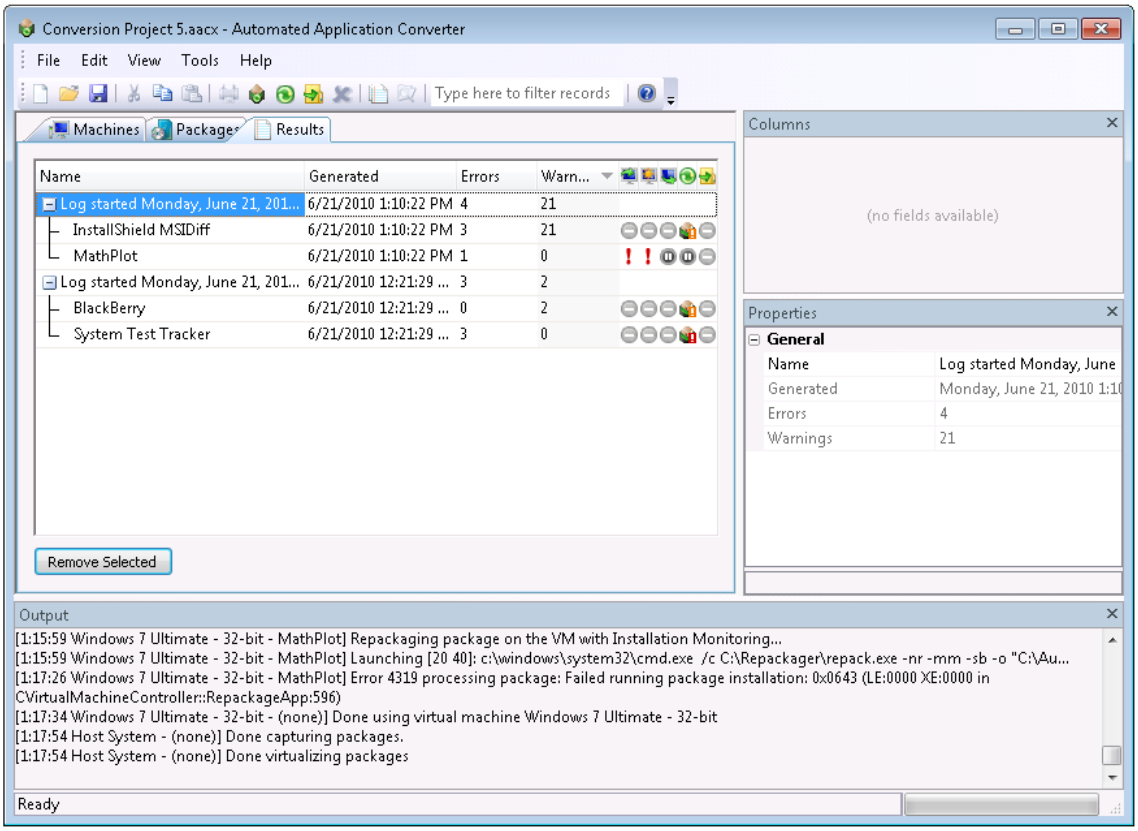

Figure 10-24: Results Tab

This section includes the following information about the **Results** tab:

- Results Tab Properties
- Icons Used on the Results Tab
- Shortcut Menu Commands on Results Tab

Results Tab Properties

The **Results** tab includes the following properties and information:

Table 10-27 • Results Tab

Property	Description
Name	List of logged results for each run of this project. The log is identified by the date and time it was started, and the packages that were part of this run are listed in a tree structure under the log title. Click the plus sign to expand the listing.
Generated	Date and time the conversion of each package began.
Errors	The number of errors generated for each package in this run is listed in this column next to each package. The cumulative sum of all errors generated for all of the packages in the run is listed in this column next to the parent Log row.
Warnings	The number of warnings generated for each package in this run is listed in this column next to each package. The cumulative sum of all warnings generated for all of the packages in the run is listed in this column next to the parent Log row.
Results Icons 	Icons in these columns indicate the status of each of the steps of the repackaging and conversion process. See Icons Used on the Results Tab for detailed information.

Icons Used on the Results Tab

The following icons are used on the **Results** tab:

Table 10-28 • Icons Used on Results Tab

Column	Icon	Description
Copy In 		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) was successfully performed.
Repackage 		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) was successfully performed, but warnings were encountered. View the results AdminStudio Automated Application Converter Log Report for detailed information on these warnings.
Copy Out 		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) failed. • **Copy In**—Error could have been caused by not being able to connect to the virtual machine. • **Repackage**—Error means that repackaging has failed. • **Copy Out**—Error could mean that you ran out of hard drive space at the package source location or that there is a permission problem preventing you from writing to the selected directory. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) was skipped. Possible reasons that the operation was skipped could be: • **Repackaging not required**—Because repackaging was not required, these three operations were not required. • **Could not connect to virtual machine**—The Automated Application Converter could not successfully connect to the virtual machine, so therefore the **Repackage** and **Copy Out** operations were skipped.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) is currently being performed.
		Operation (copying to virtual machine, repackaging, or copying from virtual machine back to source location) is still being performed even though a warning was generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		Operation was cancelled.

Table 10-28 • Icons Used on Results Tab (cont.)

Column	Icon	Description
Conversion Column		Package was converted to a virtual application successfully.
		Package was converted to a virtual application, but warnings were generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		Package was converted to a virtual application, but errors were generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		The Automated Application Converter was unable to convert this package to a virtual application.
		Conversion is in progress.
		Conversion is in progress, but a warning has been generated. View the results AdminStudio Automated Application Converter Log Report for detailed information on the errors encountered.
		An error was generated when converting one of the virtual formats which caused it to fail. However, the conversion to another one of the selected virtual formats continues.
		Conversion was cancelled.

Shortcut Menu Commands on Results Tab

When you right-click on a log node on the **Results** tab, the following commands are available on the shortcut menu:

Table 10-29 • Shortcut Menu Commands on Results Tab

Command	Description
View Report	Select to view the AdminStudio Automated Application Converter Log Report for the selected run.
Explore	Select to open the directory where the selected log file is located.
Remove	Select to delete the selected log file.

Note • *If you have right-clicked on a child node under the parent Log node, the shortcut menu is disabled.*

Menus & Toolbar Buttons

The Automated Application Converter user interface includes the following menus, commands, and toolbar icons:

Table 10-30 • Automated Application Converter Menus and Commands

Menu	Command	Icon	Description
File	**New**		Click to open a new Automated Application Converter project file.
	Open...		Click to open an existing Automated Application Converter project file.
	Save		Click to save the open Automated Application Converter project file.
	Save As...		Click to save the open Automated Application Converter project file in a new location or using a different name.
	Recently Opened Items		Lists the most recently used list of Automated Application Converter projects. Click to open.
	Exit		Click to exit the Automated Application Converter.
Edit	**Copy**		Copy selected text. You can then paste it in an external program such as Notepad or Microsoft Word.
	Select All		Select all of the Packages, Machines, or Results in the list.
	Select None		Unselect all selected items.
View	**Toolbars**		Select one of the following options: • **Standard**—Toggles the display of the toolbar. • **Customize** —Select to customize which menu commands are displayed on the toolbar.
	Windows		Toggle the display of the **Columns** selector area, the **Properties** window and the **Output** window.
	Status Bar		Toggles the display of the status bar at the bottom of the interface.

Table 10-30 • Automated Application Converter Menus and Commands (cont.)

Menu	Command	Icon	Description
Tools	**Project Wizard....**		Click to open the Application Conversion Project Wizard, which guides you step-by-step through the entire virtualization process: adding virtual machines, adding packages, and virtualizing applications.
	Application Conversion Wizard...		Click to open the Application Conversion Wizard, which you can use to select the virtualization format you want to convert to and to perform conversion of the selected packages on the selected virtual machines.
	Explore		Open the directory containing the selected package.
	View Report		After selecting the top level node of a conversion run log on the **Results** tab (`Log started Monday, April 01, 2010...`), click this to open the AdminStudio Automated Application Converter Log report. See AdminStudio Automated Application Converter Log Report for more information.
	Test Virtualization Readiness		Click to test the selected package for virtualization readiness. The possible results are: •  —Package is ready to virtualize; no repackaging is required. If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required. An example of an unsupported table is the **IniFile** table, which changes files on the target machine in ways that cannot be statically determined. •  —Package must be repackaged before it can be successfully virtualized. •  —The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.
	Cancel Virtualization		Cancel current conversion run.

Table 10-30 • Automated Application Converter Menus and Commands (cont.)

Menu	Command	Icon	Description
Help	**Contents**		Launches the Help Library, displaying the **Contents** tab.
	Index		Launches the Help Library, displaying the **Index** tab.
	Search		Launches the Help Library, displaying the **Search** tab.
	About the Automated Application Converter		Displays the **About the Automated Application Converter** dialog box.

Output Window

When a virtualization run is performed, the output messages and results are displayed in the Output Window. There is also additional progress indicators displayed near the Output window:

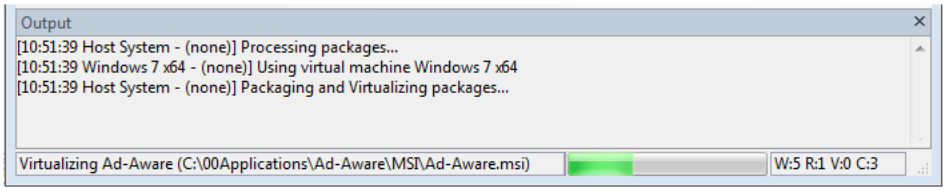

Figure 10-25: Output Window

The following information is listed:

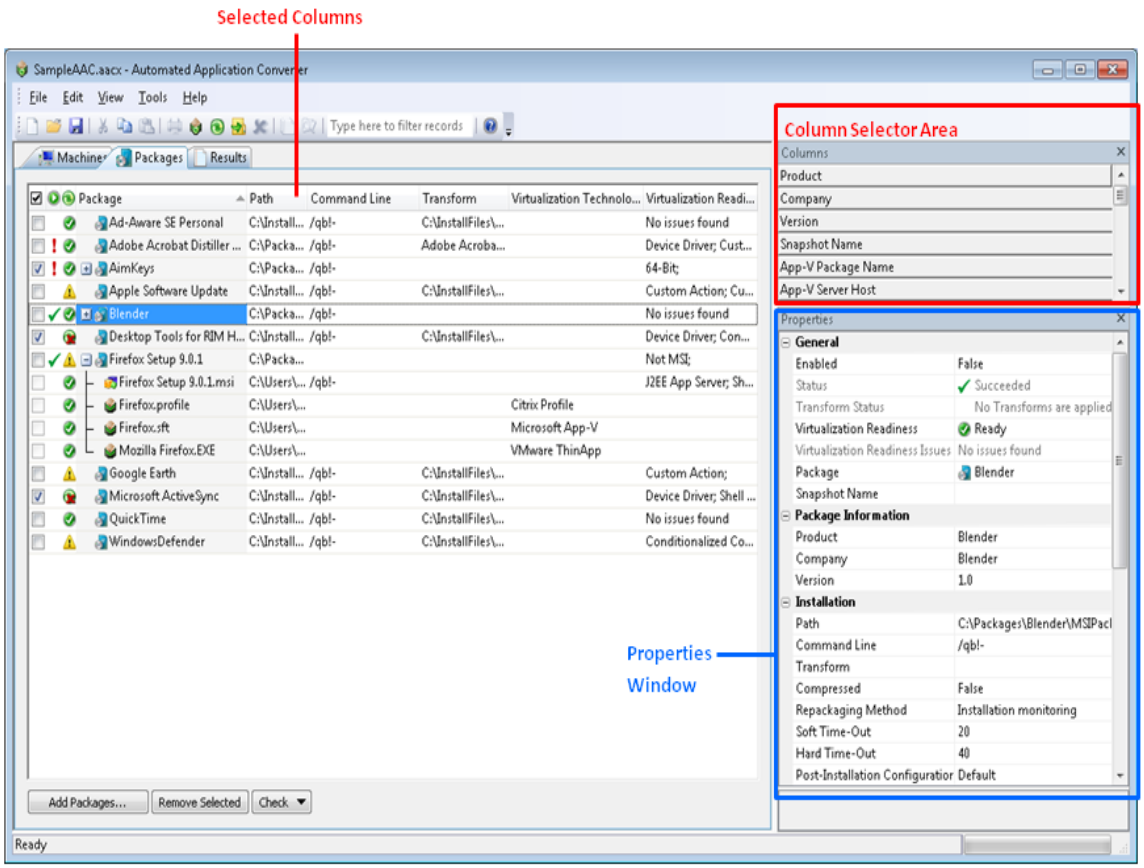
- **Messages**—Messages are listed in the **Output** window
- **Current file**—The name of the current file being processed is listed in the lower left.
- **Progress bar**—A progress bar is displayed at the bottom of the screen.
- **Count**—The count of packages in each of the following categories is displayed at the lower right:
  - **W:5**—Number of packages that are **W**aiting to be processed.
  - **R:1**—Number of packages that are being **R**epackaged.
  - **V:0**—Number of packages that are being converted or **V**irtualized into MSI and/or virtual packages.
  - **C:3**—Number of applications that have finished processing, including **C**ompleted and failed applications.

You can copy the results in the Output window and paste them in an outside location, such as Notepad or Microsoft Word.

All of the messages and results listed in the Output window can also be viewed in the AdminStudio Automated Application Converter Log report. See AdminStudio Automated Application Converter Log Report.

Column Selector and Properties Windows

By default, the **Packages** and **Machines** tabs list several columns of information. However, additional columns of information can be viewed by selecting one of the fields in the **Column Selector** area and dragging it onto the list. Also, the values for these fields for the selected package or machine can be viewed in the **Properties** window.



A description of each of these properties can be found in Packages Tab and Machines Tab.

Note • *You can sort the lists on the **Package** and **Machines** tabs, change the columns that are displayed, change the column order, resize the columns, and group the lists by a specific column. See Using List Features for more information.*

AdminStudio Automated Application Converter Log Report

The AdminStudio Automated Application Converter Log is an HTML report you can view that lists the following information for each conversion run:

- **Machines**—List of the virtual machines used in the conversion run.
- **Packages**—List of the packages that included in this conversion run. The packages are linked to the Package Conversion Messages section of the report for that package.
- **Log Results / General Messages**—Start time, number of errors and warnings generated, and general processing messages.

- **Log Results / Package Conversion Messages**—Conversion messages for each package that the Automated Application Converter attempted to convert.

The following is an example of an AdminStudio Automated Application Converter Log report:

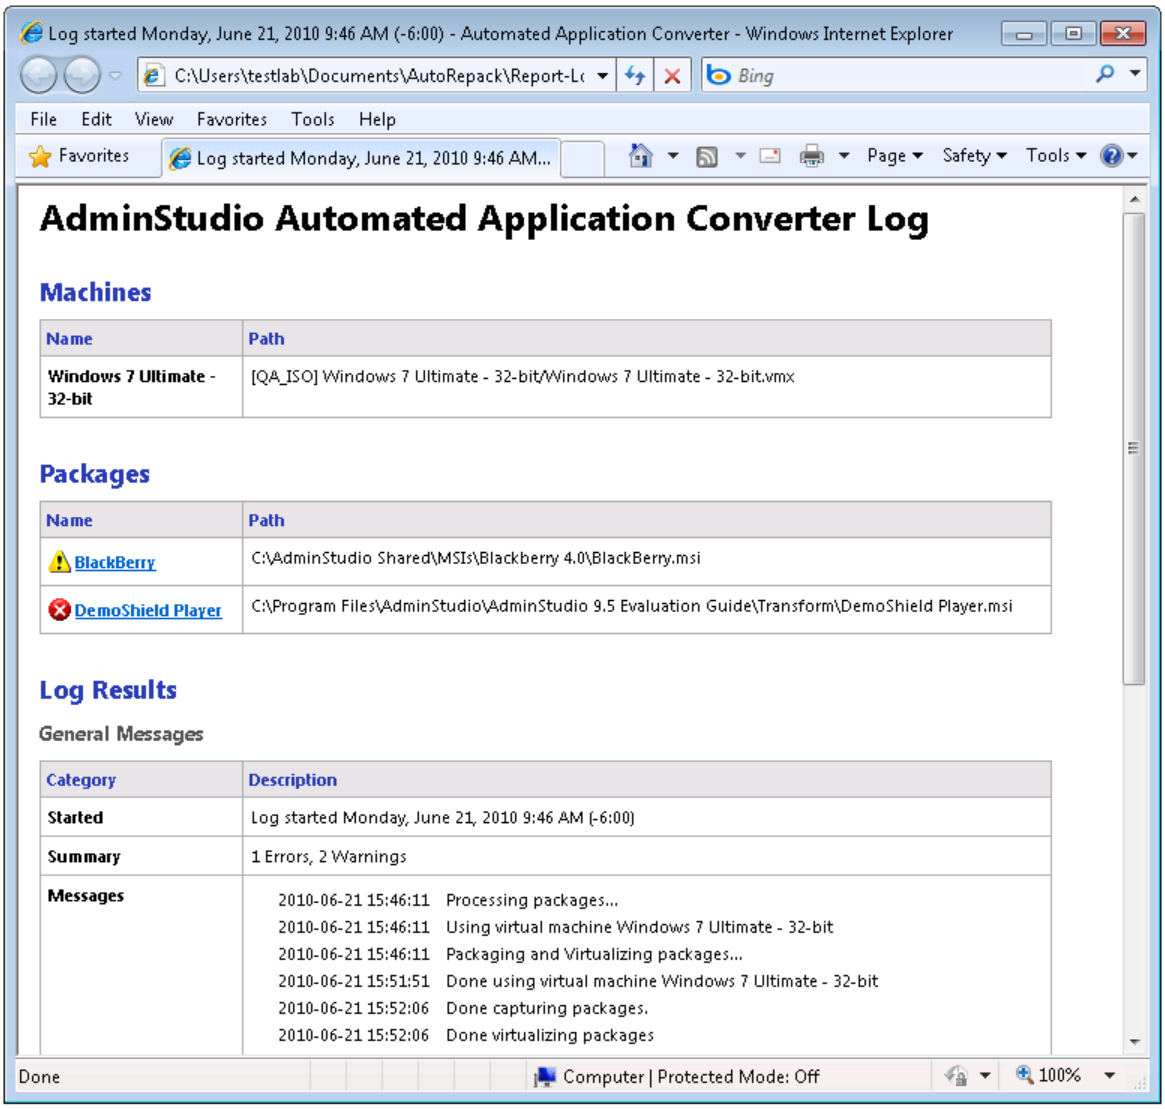


Figure 10-26: AdminStudio Automated Application Converter Log Report

Viewing an AdminStudio Automated Application Converter Log Report

To view an AdminStudio Automated Application Converter Log report, perform the following steps:

Task ***To view an AdminStudio Automated Application Converter Log report:***

1. Open the **Results** tab.
2. Select the top level node of a conversion run log (`Log started Monday, June 21, 2010...`), and do one of the following:

- Click **View Report** on the **Tools** menu.
- Select **View Report** from the shortcut menu.
- Click the **Reports** icon on the toolbar.
- Press Ctrl+R.

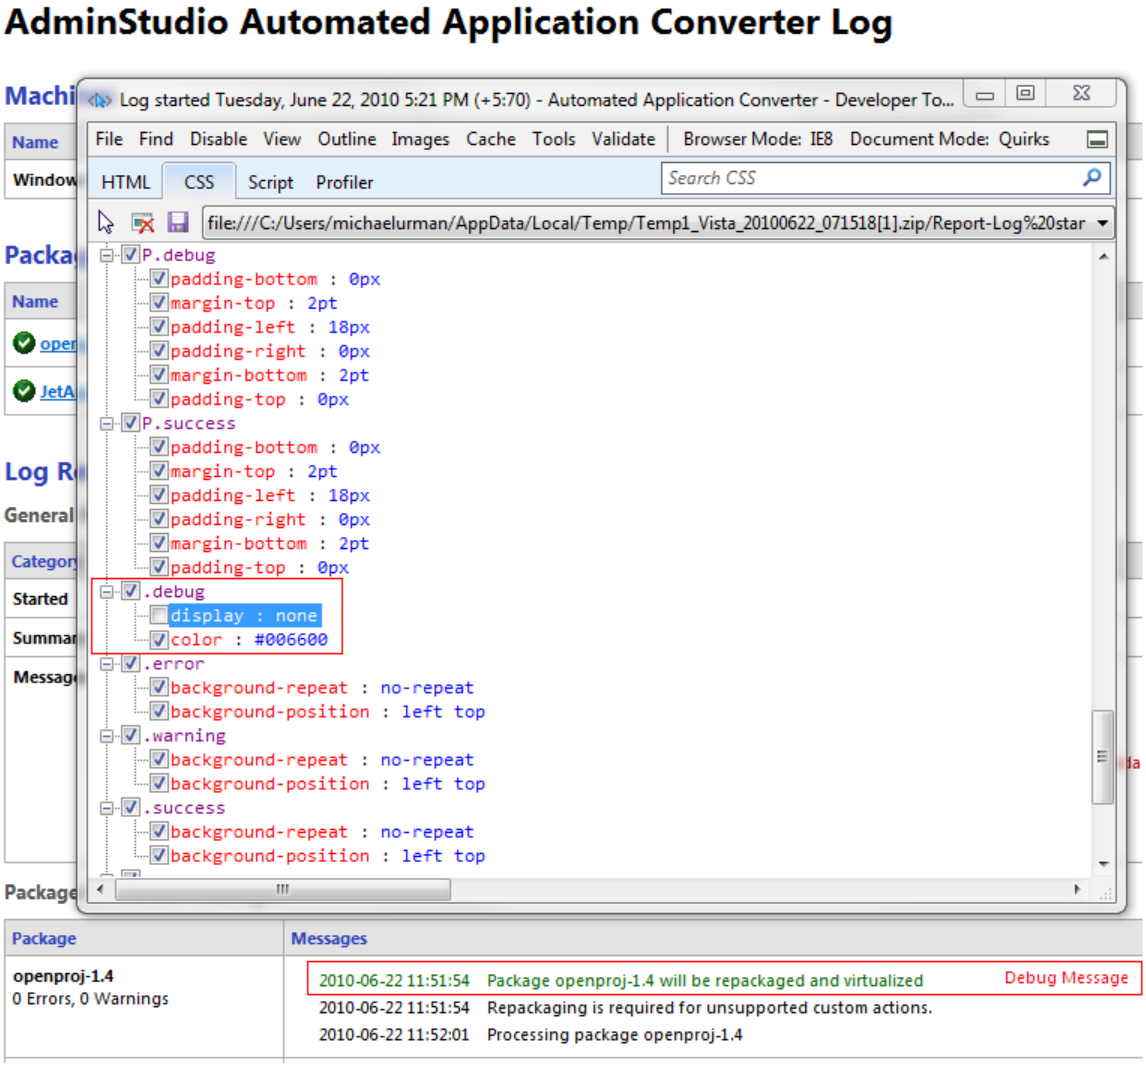
The report opens in a new browser window.

Viewing Debug Messages

By default, debug messages that occur during a conversion run are saved in the log report, but the display of those debug messages is turned off. However, if you are using Microsoft Internet Explorer 8 as your default browser, you can choose to view those debug messages by performing the following steps:

Task ***Viewing debug messages in an Automated Application Converter Log Report:***

1. Open an Automated Application Converter Log Report as described in Viewing an AdminStudio Automated Application Converter Log Report.
2. Press F12. The **Developer Tools** window opens.
3. Click on the **CSS** tab. The CSS file for the log report opens, displaying checkmarks next to each class and each property.
4. Scroll down to locate the following class: `.debug` (not `P.debug`).
5. Clear the selection of the `display : none` property, as shown below:



6. Return to the log report window. The debug messages are now displayed in green.

Using List Features

All of the lists displayed in the Automated Application Converter user interface—including the lists shown on Wizard panels—implement the same list features, which allow you to group a list by any column, sort a list by any column, resize list columns, change which columns are displayed, and change column order.

- Sorting Lists
- Changing Which List Columns Are Displayed
- Changing Column Order
- Resizing List Columns
- Grouping Lists

Sorting Lists

You can sort lists by any column by clicking on the header of the column you want to sort by or by right-clicking on a column header and making a selection from the shortcut menu.

Task ***To sort a list by a column heading:***

1. Open the **Machines**, **Packages**, or **Results** tab.
2. To sort by a column heading, click on the column heading to toggle through the three sort order states, which are identified by a visual indicator:
   - **Sorted in ascending order**—When the column is sorted in ascending order, an up arrow is displayed in the header row.
   - **Sorted in descending order**—When the column is sorted in descending order, a down arrow is displayed in the header row.
   - **Not sorted**—When the column is not sorted (meaning that the list is either sorted by another column or is just listed in the default order that the records appear in the database), no arrow is displayed.

   Tip *• Another way to do this is to right-click on the column header of the column you want to sort, and then select* ***Sort Ascending*** *or* ***Sort Descending*** *from the shortcut menu.*
3. To sort just the children of the top level items (not the top level items), right-click on the column header of the column you want to sort by, and then select **Sort Children** from the shortcut menu.

Changing Which List Columns Are Displayed

To improve readability or clarity, you can choose to remove a column from a list. When you remove a column from a list, you are just turning off the display of that column, not deleting the data that was in that column. You can restore a removed column to the list at any time.

Adding/Restoring a Column to a List

To restore the display of a hidden column to a list, perform the following steps.

Task ***To restore the display of a deleted column to a list:***

1. To restore the display of a deleted column to a list, right-click anywhere in the heading row.
2. Point to **Columns** in the shortcut menu. A list of all of the available columns for this list is displayed.
3. Select the name of the column that you want to restore to the list.

Tip *• To add a column to the list, you can also click and drag a column header from the* ***Column Selector*** *area to the header row of the list.*

Removing a Column from a List

To remove a column from a list, perform the following steps.

Task ***To remove a column from a list:***

1. To remove a column from a list, right-click anywhere in the heading row.
2. Point to **Columns** in the shortcut menu. A list of all of the available columns for this list is displayed, with those that are currently selected for display indicated by a check mark.
3. Select the name of the column to clear the selection.

   The column is now hidden.

   Note • *To remove a column to the list, you can also click and drag a column header from the header row of the list to the* ***Column Selector*** *area.*

Changing Column Order

To help compare the values of columns, you can click and drag to change the order of columns in a list.

Task ***To change column order:***

1. Click on the column header of the column you wish to relocate.
2. While holding the mouse button down, drag the column header on top of the rule between two columns.
3. When the red arrows appear, release the mouse button to perform the move.

Resizing List Columns

To improve the readability of the values in a column of a list, you can click and drag to resize a column.

Task ***To resize a column:***

1. Position your cursor at the right side of the column header of the column that you want to resize and click. After you click, the cursor turns into a double-arrow icon:
2. While holding the mouse button down, drag the edge of the column left or right until it is the desired width.

Grouping Lists

This section explains how to group a list by a column, ungroup a list, and create subgroupings.

- Grouping an Ungrouped List
- Ungrouping a List

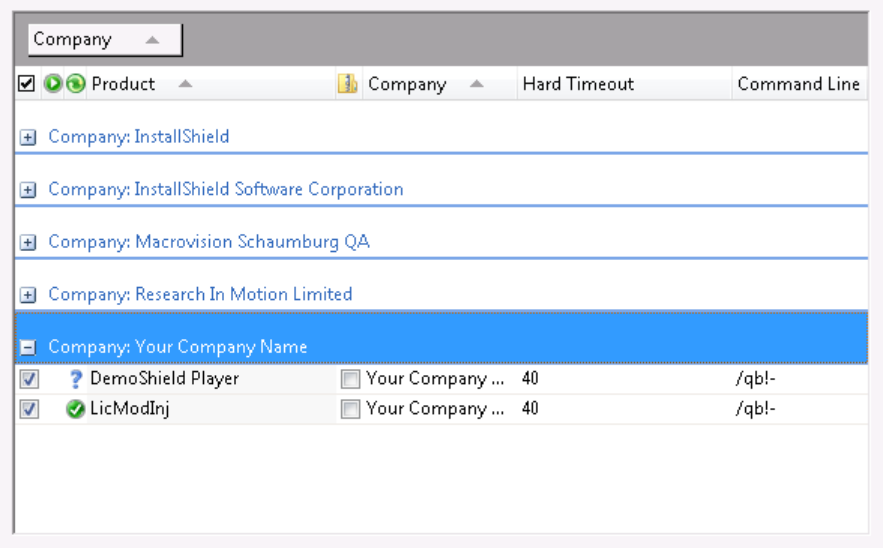
Grouping an Ungrouped List

If a list is not grouped by a column, no Group By Box is displayed.

To group by a column, perform the following steps.

Task ***To group a list by a column heading:***

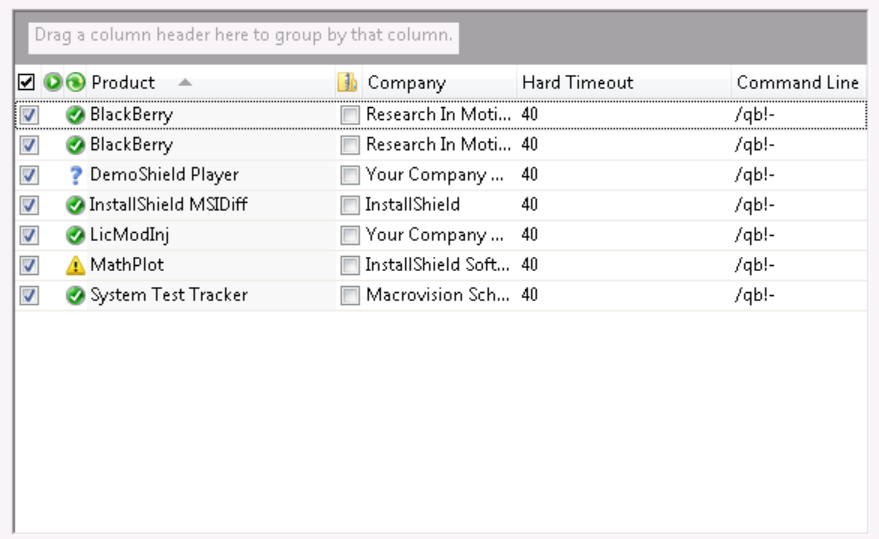
1. Right-click on the column header that you want to group by and select **Group By [Column Name]** from the shortcut menu.



When you group by a column header, the following occurs:

- The name of the column header that you have chosen now appears in the Group By Box.
- The name of the column header that you selected and each of its values (in the format of `Column Name: Value`) is now listed in a bar at the left of the list, with all records associated with that value of that column grouped underneath that bar.
- One group (bar) appears for each of the values of the selected column. Click the plus sign to expand the list.

2. To display the Group By box without performing any grouping, select **Show Group Header** from the shortcut menu. The text `Drag a column header here to group by that column.` is displayed in the **Group By** box:



Note • *When the Group By box is displayed, you can perform grouping by dragging a column header to the Group By box.*

Ungrouping a List

Perform the following steps to ungroup a list.

Task ***To ungroup a list or change a list's Group By column:***

1. Click on the name of the column header in the Group By Box and drag it back to the header row in the list to the location where you want the column to be displayed.

   Tip • *Another way to do this is to right-click on the column header name and clearing the* ***Group By [Column Name]*** *selection on the shortcut menu.*

   The list is now ungrouped.

2. If you want to choose another column to use to group the list by, follow the steps listed above under Grouping an Ungrouped List.

Wizards

The Application Conversion Project Wizard guides you step-by-step through the entire virtualization process: adding virtual machines, adding packages, and virtualizing packages. You can also choose to perform each of these tasks separately by using one of the other three wizards that are provided:

Table 10-31 • Automated Application Converter Wizards

If you want to ...	Use this wizard ...	Description and Purpose
Add packages	**Package Import Wizard**	Add packages from an AdminStudio Application Catalog or from a local or network file system.
Add virtual machines	**Virtual Machine Import Wizard**	Add virtual machines to use to perform automated repackaging of Windows Installer packages.
Virtualize packages	**Application Conversion Wizard**	Virtualize packages to the virtual formats you specify.

You also use wizards to add packages and virtual machines to Automated Application Converter:

- To add packages to the **Packages** tab, use the Package Import Wizard.
- To add virtual machines to the **Machines** tab, use the Virtual Machine Import Wizard.

Application Conversion Project Wizard

When using the Automated Application Converter to perform batch conversion to virtual packages, there are three main procedures that you perform:

- **Step 1: Select packages**—Select packages to virtualize and/or repackage.
- **Step 2: Select machines**—Select the virtual machines that you want to use during automated repackaging.
- **Step 3: Select formats and perform conversion**—Select the virtualization formats you want to convert to and perform the conversion.

You can use the **Application Conversion Project Wizard** to perform all three of these steps in one guided procedure.

You can launch the Application Conversion Project Wizard in one of two ways:

- **Creating a new project upon product launch**—The **Open Project** panel opens automatically when you launch the Automated Application Converter or when you select **New Project** on the **File** menu.
- **Creating a new project after product launch**—Select **Project Wizard** on the **Tools** menu or when you click the Project Wizard  icon on the toolbar, or select **New Project** on the **File** menu.

The Application Conversion Project Wizard includes the following panels:

- Open Project Panel

- Application Conversion Project Wizard Welcome
- Select Package Source
- Connect to an AdminStudio Application Catalog
- Select Packages
- Selected Package List
- Select Virtual Machine Source
- Select Virtual Machines from a Microsoft Hyper-V Server
- Select Virtual Machines from a VMware ESX or ESXi Server
- Select Virtual Machines
- User Credentials
- Initial Configuration Complete
- Select Output Formats
- Automated Repackaging on Virtual Machines
- Application Conversion Project Wizard Complete Panel

Automated Application Converter's Other Wizards

Each of the Automated Application Converter's other three wizards—Virtual Machine Import Wizard, Package Import Wizard, and Application Conversion Wizard—consist of a subset of the panels included in the Application Conversion Project Wizard. The following table lists the panels in each of these three wizards.

Table 10-32 • Breakdown of Panels in the Automated Application Converter Wizards

Panel Name	Application Conversion Project Wizard	Package Import Wizard	Virtual Machine Import Wizard	Application Conversion Wizard
Select Package Source	X	X		
Connect to an AdminStudio Application Catalog	X	X		
Select Packages	X	X		
Selected Package List	X	X		
Select Virtual Machine Source	X		X	
Select Virtual Machines from a Microsoft Hyper-V Server	X		X	
Select Virtual Machines from a VMware ESX or ESXi Server	X		X	

Table 10-32 • Breakdown of Panels in the Automated Application Converter Wizards

Panel Name	Application Conversion Project Wizard	Package Import Wizard	Virtual Machine Import Wizard	Application Conversion Wizard
Select Virtual Machines	X		X	
User Credentials	X		X	
Initial Configuration Complete	X			
Select Output Formats	X			X
Automated Repackaging on Virtual Machines	X			X

Open Project Panel

The **Open Project** panel opens automatically when you launch the Automated Application Converter or when you select **New Project** on the **File** menu.

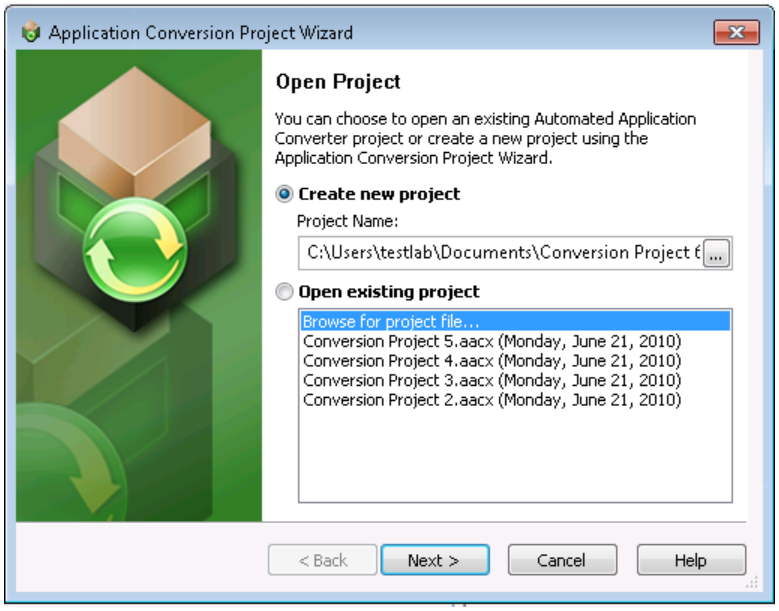


Figure 10-27: Open Project Panel

You have the following options:

- **Create a new project**—If you select the **Create a new project** option, click **Next** to continue with the wizard. You will be prompted to name and save the project when you begin conversion or exit the Automated Application Converter.
- **Select an existing project**—If you select an existing project from the list, click **Finish** to open the project.

Application Conversion Project Wizard Welcome

The **Application Conversion Project Wizard Welcome** panel opens when you select **Project Wizard** on the **Tools** menu or when you click the Project Wizard icon on the toolbar.

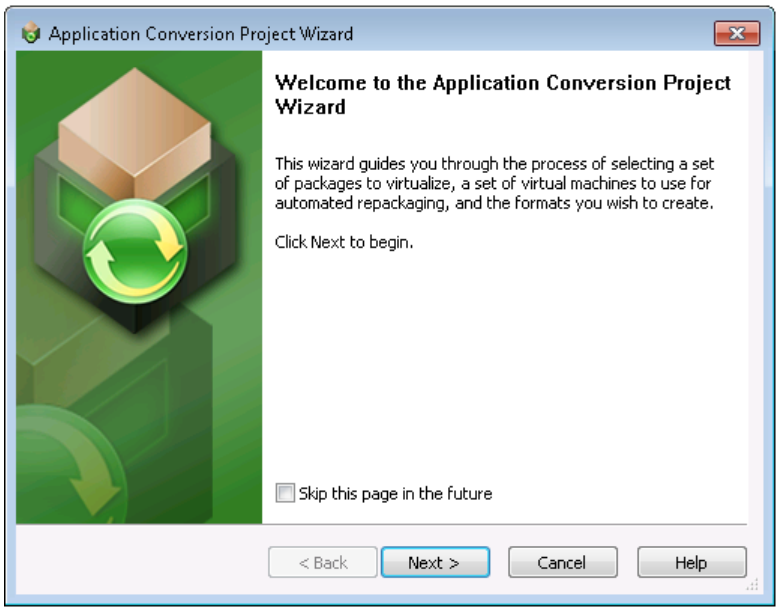

Figure 10-28: Application Conversion Project Wizard Welcome Panel

If you would prefer to perform each of these steps separately, you can instead use the following wizards:

Table 10-33 • Automated Application Converter Wizards

Wizard	Description
Virtual Machine Import Wizard	Use to add virtual machines to your project which can be used to perform automated repackaging into Windows Installer packages.
Package Import Wizard	Use to select packages from an AdminStudio Application Catalog or from a file system to virtualize.
Application Conversion Wizard	Use to select the virtualization format you want to convert to and to perform the conversion.

Select Package Source

On the **Select Package Source** panel, you select the source that contains the packages that you want to virtualize and/or repackage.

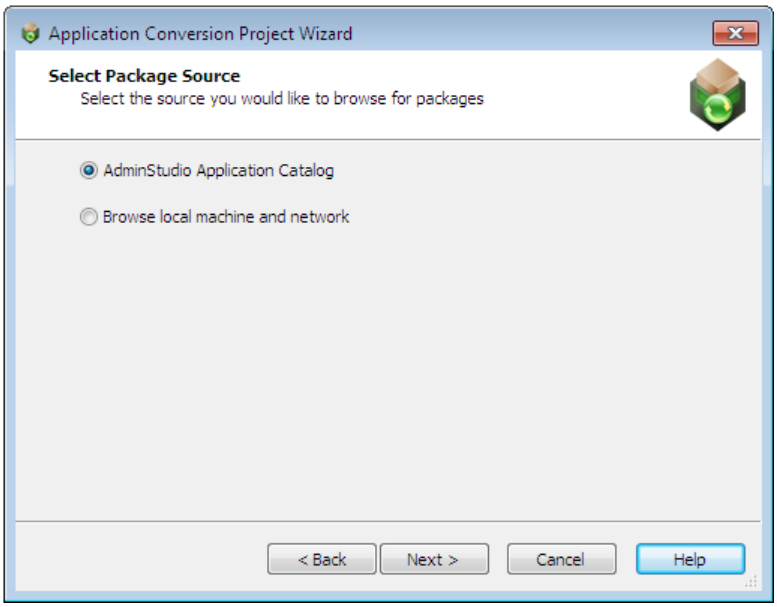

Figure 10-29: Select Package Source Panel

Tip • *To select packages from Microsoft Configuration Manager to convert to virtual applications, first import those packages into the Application Catalog, as described in Importing From Microsoft System Center Configuration Manager.*

The **Select Package Source** panel includes the following options:

Table 10-34 • Select Package Source Panel

Option	Description
AdminStudio Application Catalog	Select this option to connect to an AdminStudio Application Catalog and add all of the installations in that catalog to the list of packages to convert. If you select this option, the Connect to an AdminStudio Application Catalog panel opens, prompting you to login to an Application Catalog.
Browse local machine and network	Select this option to browse a local or network machine to add installations to the list of packages to convert. If you select this option, the Selected Package List panel opens, where you are prompted to select an installation file or a directory of installation files to add to the list of packages to convert.

Connect to an AdminStudio Application Catalog

On the **Connect to an AdminStudio Application Catalog** panel, which opens if you select **AdminStudio Application Catalog** on the **Select Package Source** panel, you enter connection information to connect to an AdminStudio Application Catalog SQL database.

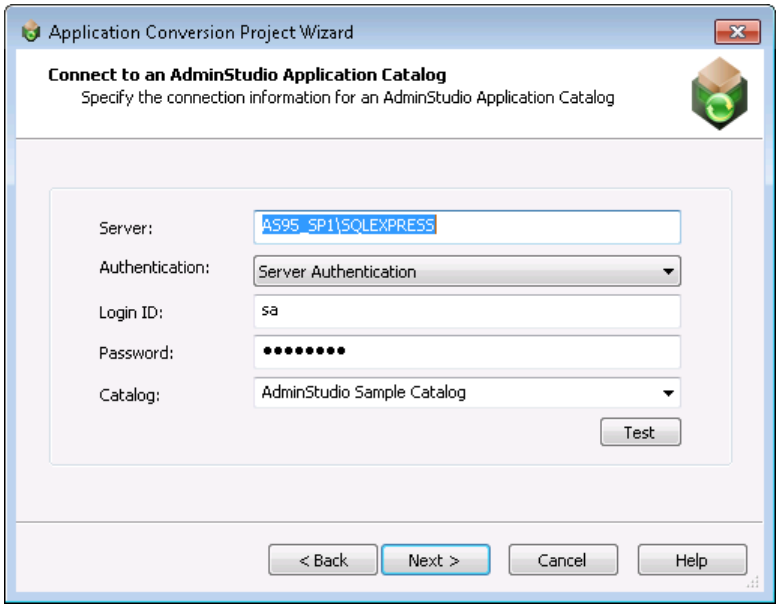

Figure 10-30: Connect to an AdminStudio Application Catalog Panel

On the **Connect to an AdminStudio Application Catalog** panel, enter the following information:

Table 10-35 • Connect to an AdminStudio Application Catalog Panel

Option	Description
Server	Enter the name of the SQL Server that you want to connect to.
Authentication	Choose one of the following options: • **Server Authentication**—Choose this option if you want to use SQL Server login identification to log into this Application Catalog. Then enter the appropriate **Login ID** and **Password**. • **Windows Authentication**—Choose this option if you want to use Windows network authentication (your network login ID) to log into this Application Catalog. ***Note*** • *After you successfully connect to an Application Catalog, the next time you open this panel, those previously-entered values (except the **Password**) will pre-populate this panel.*
Catalog	Enter the name of the existing AdminStudio Application Catalog database that you want to connect to

Select Packages

The contents of the **Select Packages** panel depends upon the selection you made on the **Select Package Source** panel:

- **Browse local machine and network**—If you selected this option on the **Select Package Source** panel, there are no packages listed on the **Select Packages** panel. You need to click **Browse Folders** or **Browse Files** to select packages to convert. The **Browse For Folder** or **Select Package Installation File** dialog box would open. See Automated Application Converter's Selection Rules When Adding Packages from a Directory for more information.

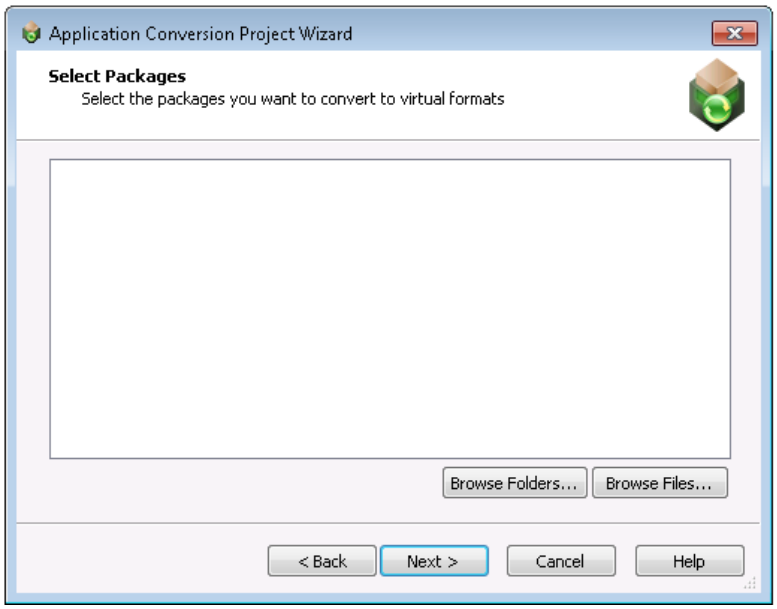

Figure 10-31: Select Packages Panel / No Packages Listed

- **AdminStudio Application Catalog**—If you selected the A**dminStudio Application Catalog** option on the **Select Package Source** panel, the **Select Packages** panel lists all of the packages in the connected package source, in a tree format.

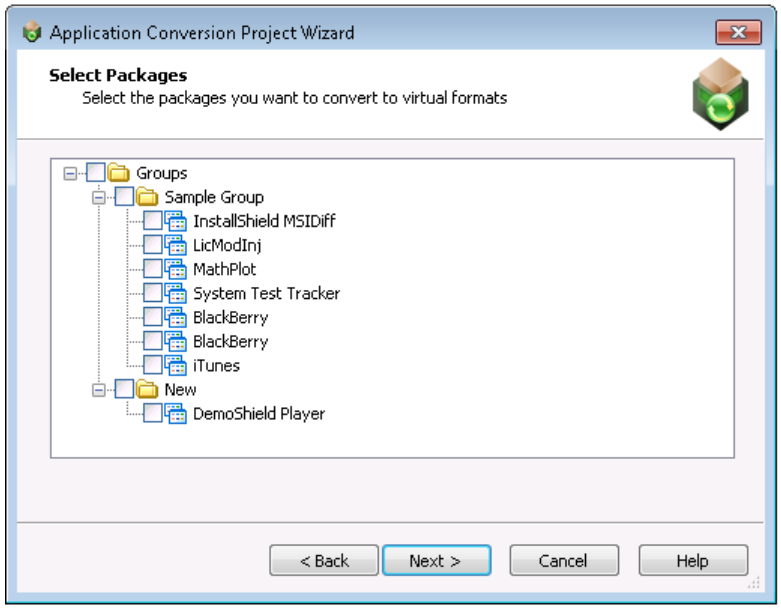

Figure 10-32: Select Packages Panel / Packages Listed

Select the packages that you want to convert and click **Next** to continue.

Selected Package List

The **Selected Package List** panel lists all of the packages you selected on the Select Packages panel.

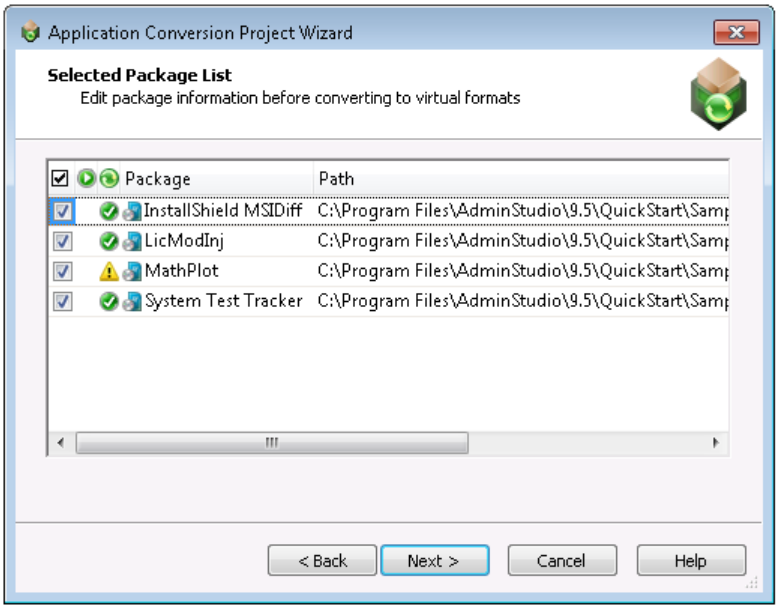

Figure 10-33: Selected Package List Panel

The **Selected Package List** panel includes the following options:

Table 10-36 • Selected Package List Panel

Option	Description
☑	Selection column. To select a package for conversion, click the check box in this column.
Status	Indicates the status of the package. On this panel, no status is indicated, but when this column is shown on the **Packages** tab, status will be indicated by an icon. See Packages Tab for more information.
Transforms	Indicates whether any transforms are associated with the listed Windows Installer package. Automated Application Converter automatically adds all of the **.mst** files located in the same directory as the selected **.msi** file. If a transform is associated with the selected package, one of the following two icons is displayed in this column: • One transform is being added with this package. • Multiple transforms are being added with this package. You may need to specify the order that you want these transforms to be applied. See Packages Tab and MST Dialog Box for more information.

Table 10-36 • Selected Package List Panel (cont.)

Option	Description
Virtualization Readiness 	When you add a package to the **Selected Packages List** panel, the Automated Application Converter does a quick check to identify that package's virtualization readiness: whether the package can be virtualized directly or whether it requires repackaging before virtualization. An icon is displayed in this column to indicate the virtualization readiness: You can click on the icon in this column to override the Virtualization readiness status that was automatically been assigned to this package by the Automated Application Converter. The choices are: • **Ready** —Package is ready to virtualize; no repackaging is required. • **Requires repackaging** —Package must be repackaged before it can be successfully virtualized. • **Virtualization not supported** —Automated Application Converter has determined that virtualization is not supported. • **Virtualization not recommended** —Automated Application Converter has determined that this package is not recommended for virtualization. • **Unknown** —The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.  ***Important*** • *Packages with a status of* ***Virtualization not supported*** *will not be virtualized. In order to virtualize the package, you must first override the status and change it to* ***Ready*** *or* ***Requires repackaging****.*  ***Note*** • *You can click on the icon in this column to override the Virtualization readiness status that has automatically been assigned to this package.*
Package	Lists the name of the Windows Installer file or legacy installation file that you have added to the **Select Packages** panel.

Table 10-36 • Selected Package List Panel (cont.)

Option	Description
Path	Lists the path from where the package was selected locally or from where it was originally imported into the AdminStudio Application Catalog. ***Note*** • *It is recommended that you use UNC path when importing packages into the Application Catalog.* ***Note*** • *If you are adding packages from an AdminStudio Application Catalog installed on a machine other than the machine where the Automated Application Converter is installed, make sure that the package source path listed here is accessible to the Automated Application Converter machine.*
Command Line	Editable field that lists the command line parameters required to run this installation silently.

For descriptions of additional columns that are viewable on the Selected Packages List panel, see Packages Tab Properties. (The information that is viewable in the various columns on the Selected Package List panel is same information that is viewable on the Packages tab.)

For information on how to view additional columns in the list, see Changing Which List Columns Are Displayed.

Automated Application Converter's Selection Rules When Adding Packages from a Directory

Instead of adding packages from an AdminStudio Application Catalog, you can choose to add a directory of packages from your local machine or network by doing the following:

- On the **Select Package Source** panel, select **Browse local machine and network** and click **Next**. The **Select Packages** panel opens.
- On the **Select Packages** panel, click **Browse Folders** and select a directory that contains multiple Windows Installer files (**.msi**), installation script files (**.vbs**, **.bat**, **.cmd**, **.ps1**), and/or legacy setups (**.exe**).

When adding packages from a directory, it is recommended that you organize the packages you want to convert in one root directory, with each package in its own first level subdirectory, such as:

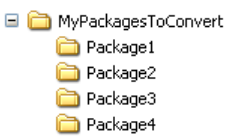

Figure 10-34: Recommended Directory Structure When Adding Packages from a Directory

When you click the **Browse Folders** button and select a folder (such as **MyPackagesToConvert**), the Automated Application Converter scans that folder's first-level subfolders (such as **Package1**, **Package2**, **Package3**, etc.) and uses specific rules to determine which packages it will add to the list on the **Select Packages** panel and which of those packages will be selected:

- **All .msi, .exe, and script files are added to the list**—All **.msi** files, **.exe** files, and script files in the first-level subfolders are added to the list.
- **Only some of the packages are selected**—The Automated Application Converter uses the following rules to determine which of the packages that it adds to the list are selected:
  - **.msi** files are always selected.
  - **.exe** files are only selected if there are no .msi files in that folder.
  - Script files are only selected if there are neither **.msi** files nor **.exe** files in that folder.
- **If a first-level subfolder does not contain any .msi, .exe, or script files, its subfolders are scanned** —If a first-level subfolder does not contain any **.msi**, **.exe**, or script files, the Automated Application Converter will scan its child subfolders to locate package files. However, if a first-level subfolder does contain an **.msi**, **.exe**, or script file, its subfolders are not scanned.

The following table demonstrates these rules:

Table 10-37 • Automated Application Converter's Selection Rules When Adding Packages from a Directory

If the root subdirectory contains...	What are added to the list? Which are selected?	Continue to search subdirectories?
MSI files only	☑ MSIs (added and selected)	No
MSI files and EXE or script files	☑ MSIs (added and selected) ☐ EXEs (added, not selected) ☐ Scripts (added, not selected)	No
EXE files only	☑ EXEs (added and selected)	No
EXE and script files	☑ EXEs (added and selected) ☐ Scripts (added, not selected)	No
Script files only	☑ Scripts (added and selected)	No
None of the above	None	Yes

The following diagram gives a visual representation of these rules in action:

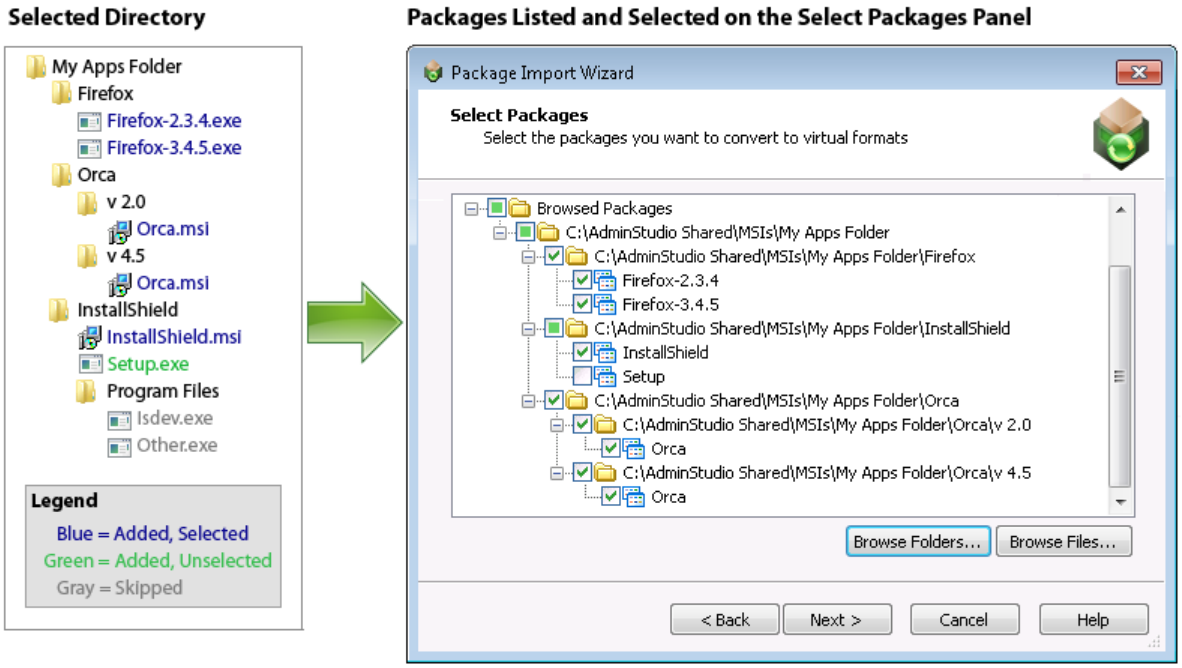

Figure 10-35: Example of How Packages are Added to List When a Directory is Selected

Select Virtual Machine Source

On the **Select Virtual Machine Source** panel, you select the source location of the virtual machines you want to use with the Automated Application Converter to perform automated repackaging.

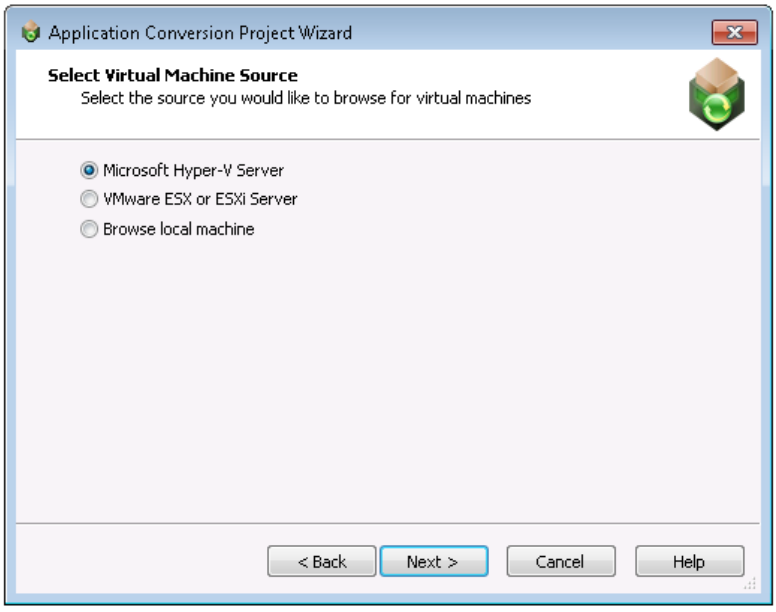

Figure 10-36: Select Virtual Machine Source Panel

Note • *If none of the packages selected on the* ***Selected Package List*** *panel require repackaging in order to be converted into a virtual package, the* ***Select Virtual Machine Source*** *panel will not be displayed. Instead, the* ***Initial Configuration Complete*** *panel will open.*

On the **Select Virtual Machine Source** panel, select one of the following options:

Table 10-38 • Select Virtual Machine Source Panel

Option	Description
Microsoft Hyper-V Server	Select this option to connect to a Microsoft Hyper-V Server. You will then be prompted for login information on the Select Virtual Machines from a Microsoft Hyper-V Server panel.
VMware ESX or ESXi Server	Select this option to connect to a VMware ESX or ESXi Server. You will then be prompted for login information on the Select Virtual Machines from a VMware ESX or ESXi Server panel.
Browse local machine	Select this option to connect to a VMware Workstation virtual image installed locally. The Select Virtual Machines opens, where will be prompted to select either a VMware Workstation image or directory of images.

Select Virtual Machines from a Microsoft Hyper-V Server

On the **Select Virtual Machines from a Microsoft Hyper-V Server** panel, you enter a server name and the login information to connect to a Microsoft Hyper-V Server.

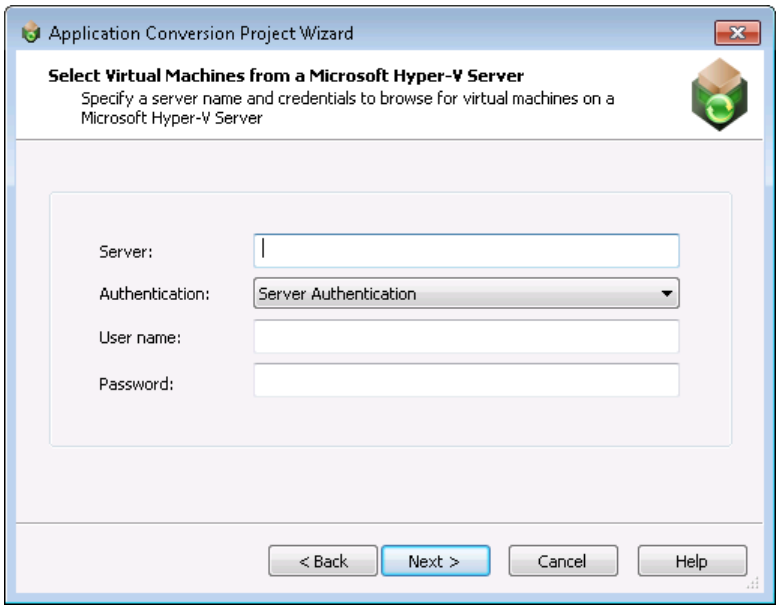

Figure 10-37: Select Virtual Machines from a Microsoft Hyper-V Server Panel

On the **Select Virtual Machines from a Microsoft Hyper-V Server** panel, enter the following information:

Table 10-39 • Select Virtual Machines from a Microsoft Hyper-V Server

Option	Description
Server Name	Enter the server name of the Microsoft Hyper-V Server that you want to connect to.
Authentication	Select one of the following options: • **Server Authentication**—Select this option if you want to connect to the Hyper-V Server using a **User name** and **Password** that you specify. • **Windows Authentication**—Select this option to use the credentials of the logged in user to login to the Hyper-V Server.

Select Virtual Machines from a VMware ESX or ESXi Server

On the **Select Virtual Machines from a VMware ESX or ESXi Server** panel, you enter a server name and the login information to connect to a VMware ESX or ESXi Server.

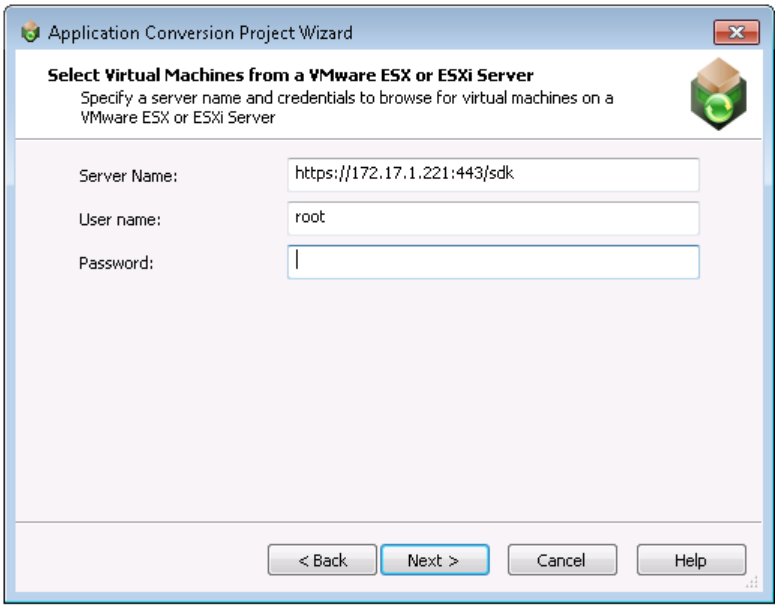

Figure 10-38: Select Virtual Machines from a VMware ESX or ESXi Server Panel

On the **Select Virtual Machines from a VMware ESX or ESXi Server** panel, enter the following information:

Table 10-40 • Select Virtual Machines from a VMware ESX or ESXi Server Panel

Option	Description
Server Name	Enter the name of the VMware ESX or ESXi server you want to connect to.
User name	Enter the login ID for the VMware ESX or ESXi server.

Table 10-40 • Select Virtual Machines from a VMware ESX or ESXi Server Panel

Option	Description
Password	Enter the password for the VMware ESX or ESXi server.

Select Virtual Machines

The contents of the **Select Virtual Machines** panel depends upon the selection you made on the **Select Virtual Machine Source** panel:

- **Browse local machine**—If you selected this option, there are no virtual machines listed on the **Select Virtual Machines** panel. You need to click **Browse Folders** or **Browse Files** to select virtual images. The Browse for Folder Dialog Box or Select Virtual Machine Image File Dialog Box would open.

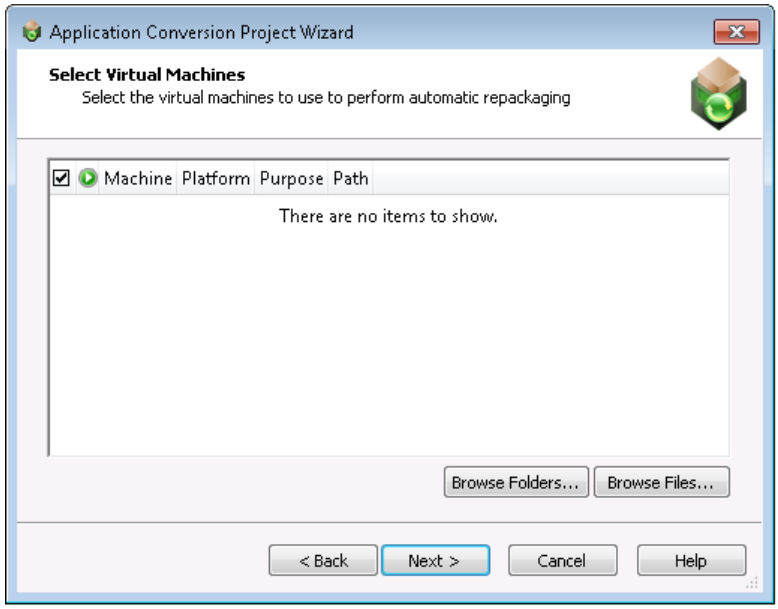

Figure 10-39: Select Virtual Machines Panel / No Machines Listed

- **Microsoft Hyper-V Server** or **VMware ESX or ESXi Server**—If you selected either of these options on the **Select Virtual Machine Source** panel, and have connected to the server, the **Select Virtual Machines** panel lists all of the virtual machines found on the selected server, but does not automatically select all of them.

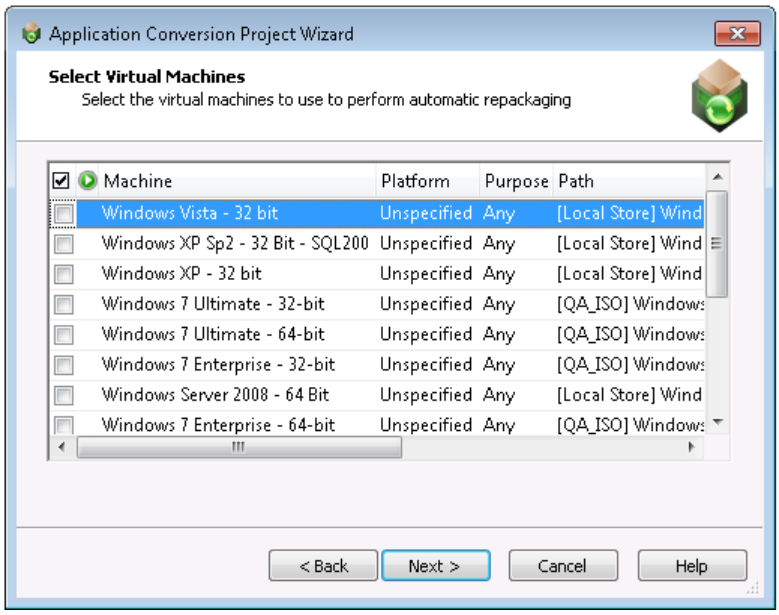

Figure 10-40: Select Virtual Machines Panel / Machines Listed

The **Select Virtual Machines** panel includes the following options:

Table 10-41 • Select Virtual Machines Panel

Option	Description
☑	Selection column. To select a virtual machine to use for automated repackaging, click the check box in this column.
Status	Indicates the status of the virtual machine. On the **Select Virtual Machines** panel, no status is indicated, but when this column is shown on the **Machines** tab, status will be indicated by an icon. See Machines Tab for more information.
Machine	Name of the virtual machine image.
Platform	Identifies the operating system platform of the virtual machine. When you select a virtual machine to add to the Automated Application Converter, you need to manually identify the operating system platform either on the **Select Virtual Machines** panel or by clicking in this field on the **Machines** tab and making a selection from the list. When you perform a conversion run, you are given the opportunity (on the **Automated Repackaging on Virtual Machines** panel) to either select a specific platform to use for the repackaging of the selected packages, or to select **Any Platform**, meaning that all of the selected virtual machines will be used for repackaging.
Path	Path to the virtual machine on the virtual machine server or your local machine.

User Credentials

On the **User Credentials** panel, enter the user name and password to use to access the virtual machines you selected on the **Select Virtual Machines** panel.

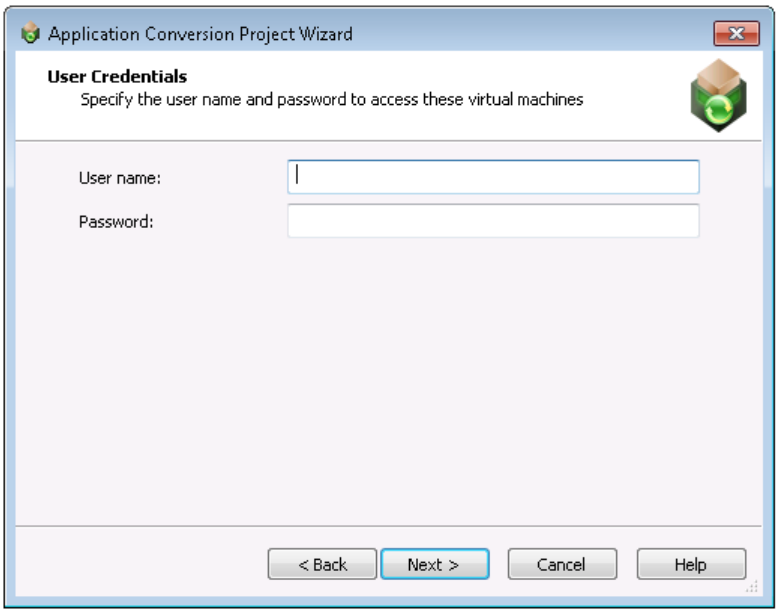

Figure 10-41: User Credentials Panel

The **User Credentials** panel includes the following options:

Table 10-42 • User Credentials Panel

Option	Description
User name	Enter the user name to use to access the virtual machines you selected on the **Select Virtual Machines** panel.
Password	Enter the password to use to access the virtual machines you selected on the **Select Virtual Machines** panel.

Important • *If the virtual machines you selected do not all use the same login credentials, you can add the appropriate credentials in the* ***Guest Username*** *and* ***Guest Password*** *properties on the Machines Tab after you have added the virtual machine.*

Initial Configuration Complete

The **Initial Configuration Complete** panel lists the packages and machines you have selected to add to your project. You can choose to either begin conversion or to close the wizard so that you can perform additional configuration of these packages and machines prior to conversion.

- **Virtualize packages with detected settings**—Select this option if you want to begin conversion of the selected packages using the selected virtual machines using the current settings.

- **Close wizard to configure packages and machines**—Select this option if you want to close this wizard and perform additional configuration of these packages and virtual machines on the **Packages** and **Machines** tabs prior to beginning conversion.

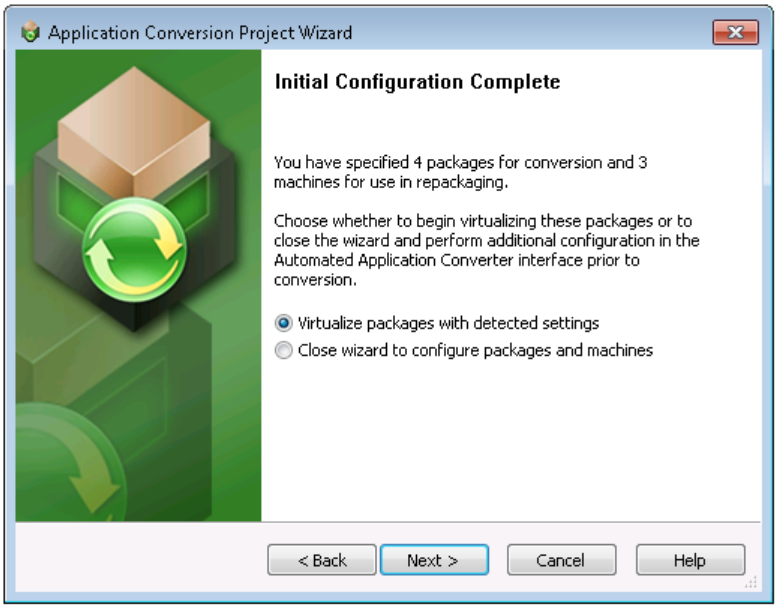

Figure 10-42: Initial Configuration Complete Panel

Select Output Formats

On the **Select Output Formats** panel, select the output formats you want to create and the output location for the packages.

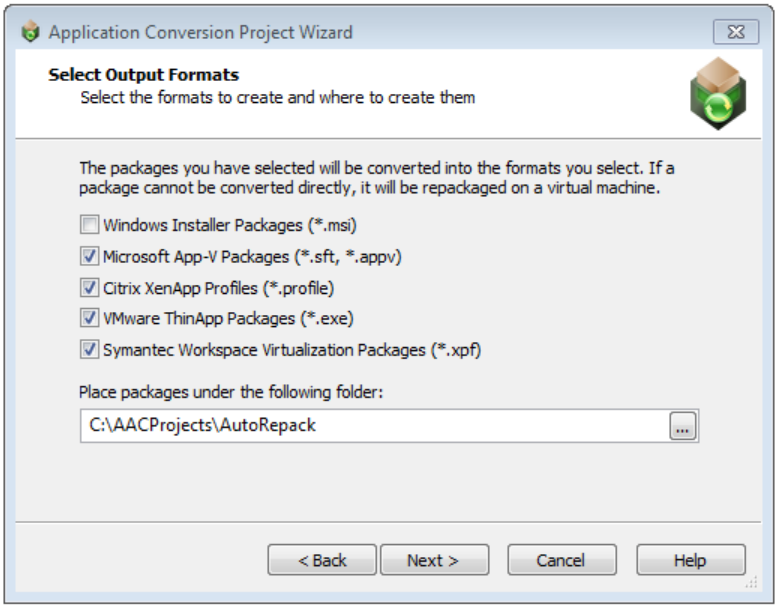

Figure 10-43: Select Output Formats Panel

The **Select Output Formats** panel includes the following options:

Table 10-43 • Select Output Formats Panel

Option	Description
Windows Installer Packages (*.msi)	Select this option to repackage the selected packages into Windows Installer packages (.msi).
Microsoft App-V Packages (*.sft)	Select this option to convert the selected packages to Microsoft App-V packages.
Citrix XenApp Profiles (*.profile)	Select this option to convert the selected packages to Citrix XenApp profiles.
VMware ThinApp Packages (*.exe)	Select this option to convert the selected packages to VMware ThinApp packages.
Symantec Workspace Virtualization Packages (*.xpf)	Select this option to convert the selected packages to Symantec Workspace virtual packages.
Place packages under the following folder	Select the location where you want to store the package output.

Automated Repackaging on Virtual Machines

On the **Automated Repackaging on Virtual Machines** panel, you specify which operating system platform you want to use to perform automated repackaging

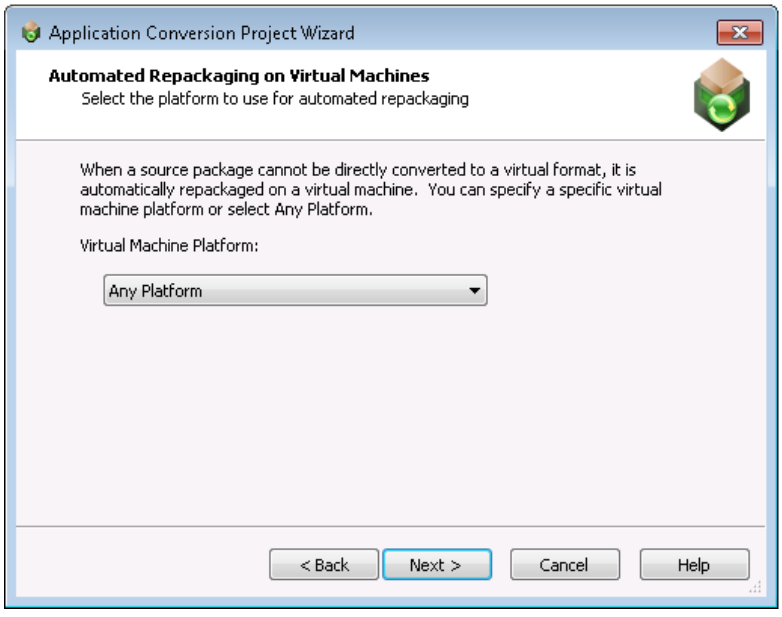

Figure 10-44: Automated Repacking on Virtual Machines Panel

On the **Automated Repackaging on Virtual Machines** panel, select one of the following options:

Table 10-44 •

Option	Description
Any Platform	The Automated Application Converter will use any of the virtual machines that you have selected on the **Machines** tab to perform automated repackaging, regardless of platform.
OS Platform	If you select a specific operating system, the Automated Application Converter will use only those virtual machines that you have selected on the **Machines** tab that are of the selected operating system to perform automated repackaging. ***Note*** *• When you select a virtual machine to add to the Automated Application Converter, you need to manually identify the operating system platform either on the* ***Select Virtual Machines*** *panel or by clicking in the* ***Platform*** *field on the* ***Machines*** *tab and making a selection from the list.*

Application Conversion Project Wizard Complete Panel

The **Application Conversion Project Wizard Complete** panel lists the virtual formats that your selected packages will be converted to, and the operating system platform of the virtual machine that will be used to perform repackaging if repackaging is required during conversion.

Click **Finish** to close the wizard and begin converting your packages.

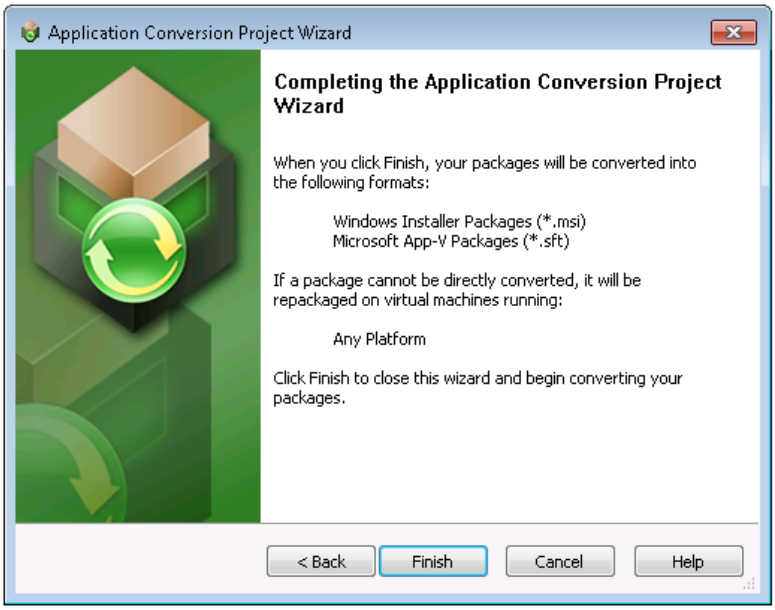

Figure 10-45: Application Conversion Project Wizard Complete Panel

Package Import Wizard

You can use the Package Import Wizard to select packages to convert to virtual formats. You can select packages from a specified AdminStudio Application Catalog or from the file system of a local or network machine.

The Package Import Wizard, which is launched by clicking the **Add Packages** button on the Automated Application Converter **Packages** tab, consists of the following panels:

- Package Import Wizard Welcome
- Select Package Source
- Connect to an AdminStudio Application Catalog
- Select Packages
- Selected Package List
- Package Import Wizard Complete

Note • *The main panels of the Package Import Wizard are also included in the end-to-end Application Conversion Project Wizard.*

Package Import Wizard Welcome

You can use the Package Import Wizard to select packages to convert to virtual formats. You can select packages from a specified AdminStudio Application Catalog or from the file system of a local or network machine.

After you have added the packages, you can use the Virtual Machine Import Wizard to add virtual machines to use for automated repackaging, and then begin a conversion run using the Application Conversion Wizard.

Click **Next** to begin.

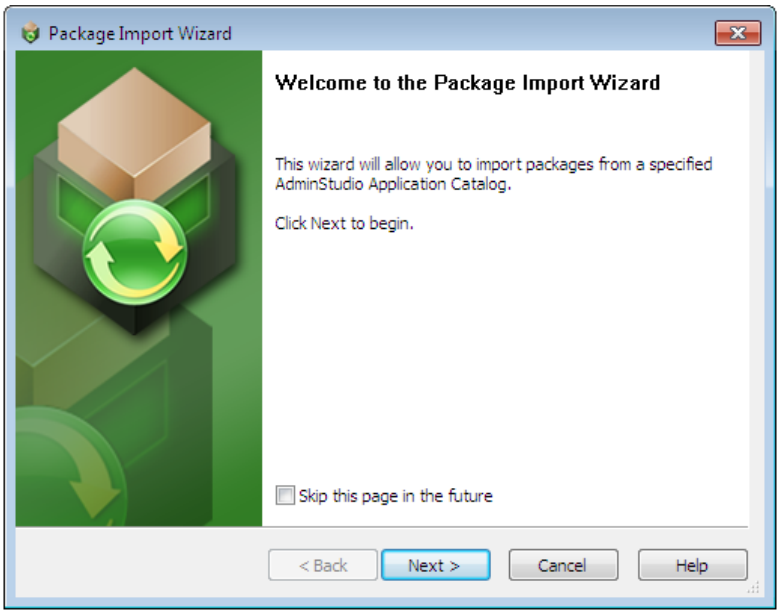

Figure 10-46: Package Import Wizard Welcome Panel

Package Import Wizard Complete

The **Package Import Wizard Complete** panel lists the number of packages you have added to your project for repackaging and virtualization. Click **Finish** to close the wizard and add these packages to your project.

To convert these packages to virtual applications, use the Application Conversion Wizard.

Figure 10-47: Package Import Wizard Complete Panel

Virtual Machine Import Wizard

The **Virtual Machine Import Wizard**, which you use to add virtual machines to the **Machines** tab, consists of the following panels:

- Virtual Machine Import Wizard Welcome
- Select Virtual Machine Source
- Select Virtual Machines from a Microsoft Hyper-V Server
- Select Virtual Machines from a VMware ESX or ESXi Server
- Select Virtual Machines
- User Credentials
- Virtual Machine Import Wizard Complete

Note • *The main panels of the Virtual Machine Import Wizard are also included in the end-to-end Application Conversion Project Wizard.*

Virtual Machine Import Wizard Welcome

You can use the **Virtual Machine Import Wizard** to select virtual machines to use for automated repackaging. You can use virtual machines from a Microsoft Hyper-V Server, a VMware ESX or ESXi Server, or a local VMware Workstation.

After you have added the virtual machines, you can use the Package Import Wizard to add packages to convert, and then begin a conversion run using the Application Conversion Wizard.

Click **Next** to begin.

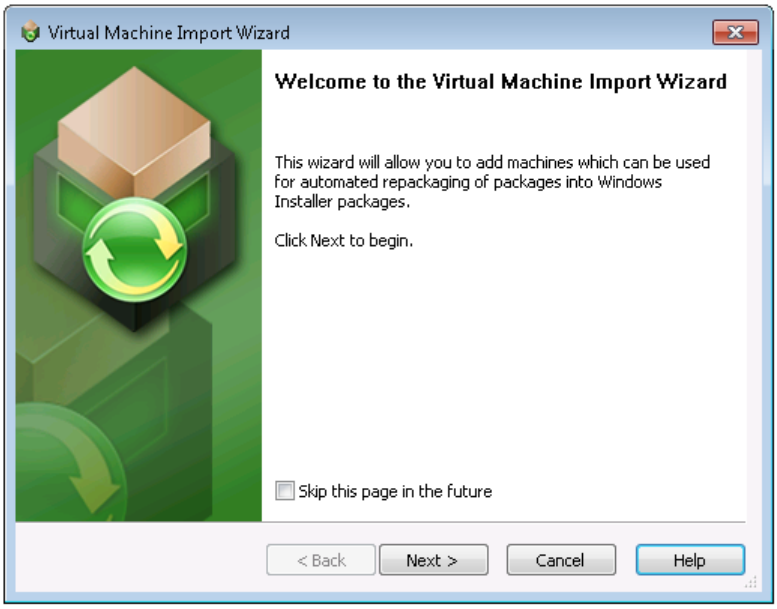

Figure 10-48: Virtual Machine Import Wizard Welcome Panel

Virtual Machine Import Wizard Complete

The **Virtual Machine Import Wizard Complete** panel lists the number of virtual machines you have added to your project for use in automated repackaging.

Click **Finish** to close the wizard and add these virtual machines.

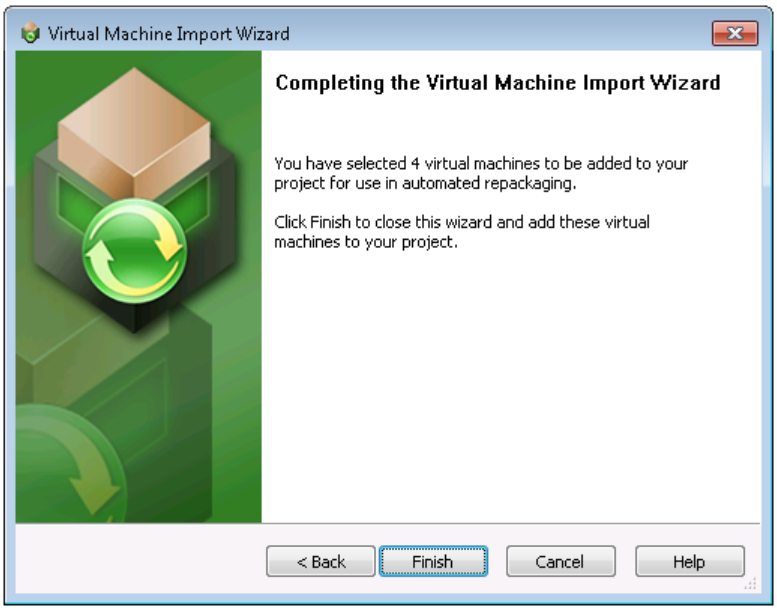

Figure 10-49: Virtual Machine Import Wizard Complete Panel

Application Conversion Wizard

The Application Conversion Wizard consists of the following panels:

- Application Conversion Wizard Welcome
- Select Output Formats
- Automated Repackaging on Virtual Machines
- Application Conversion Wizard Complete

Note • *The main panels of the Application Conversion Wizard are also included in the end-to-end Application Conversion Project Wizard.*

Application Conversion Wizard Welcome

You can use the **Application Conversion Wizard** to convert selected packages to virtual applications after you have used the Virtual Machine Import Wizard to add virtual machines to the project to use for automated repackaging and used the Package Import Wizard to add the packages you want to convert.

Click **Next** to begin.

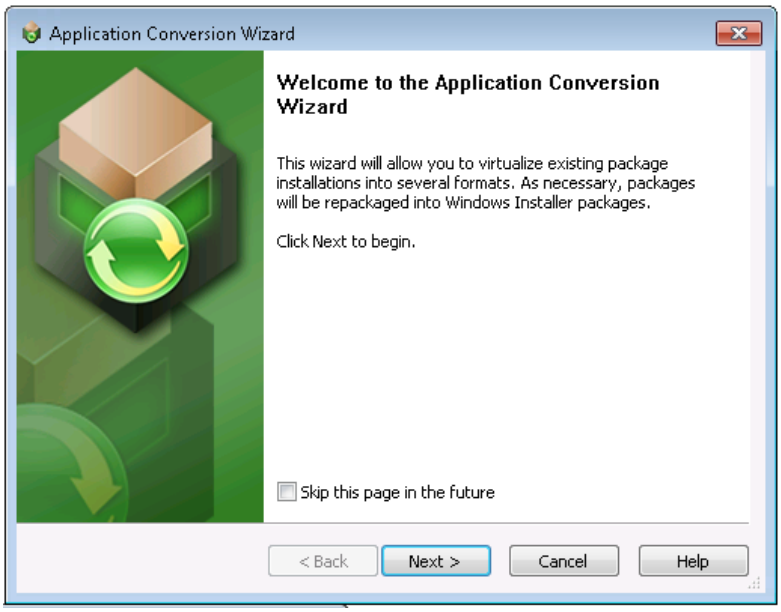

Figure 10-50: Application Conversion Wizard Welcome Panel

Application Conversion Wizard Complete

The **Application Conversion Wizard Complete** panel lists the virtual formats that your selected packages will be converted to, and the operating system platform of the virtual machine that will be used to perform repackaging if repackaging is required during conversion.

Click **Finish** to close the wizard and begin converting your packages.

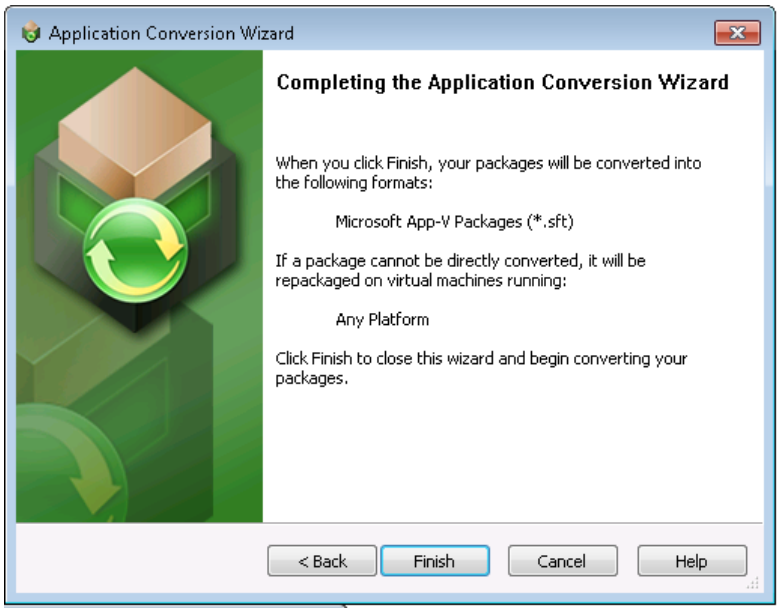

Figure 10-51: Application Conversion Wizard Complete Panel

Dialog Boxes

The Automated Application Converter provides the following dialog boxes:

- Browse for Folder Dialog Box
- Guest Agent
- Open Dialog Box
- Project Options Dialog Box
- Select Package Installation File Dialog Box
- Select Transform Dialog Box
- Select Virtual Machine Dialog Box
- Select Virtual Machine Image File Dialog Box

About Automated Application Converter

The About AdminStudio dialog box can be opened by selecting About AdminStudio from the Help menu. This dialog box displays information about the product, including the full version number (essential if you need technical support). If you have not registered AdminStudio, click the Register button to connect to the InstallShield website to begin the Product Registration process. Registering your product offers you expert technical support, new product announcements and special offers, plus notification of product upgrades.

App-V 5.x Application Launcher

You can use the **App-V 5.x Application Launcher** to launch App-V 5.x packages for testing.

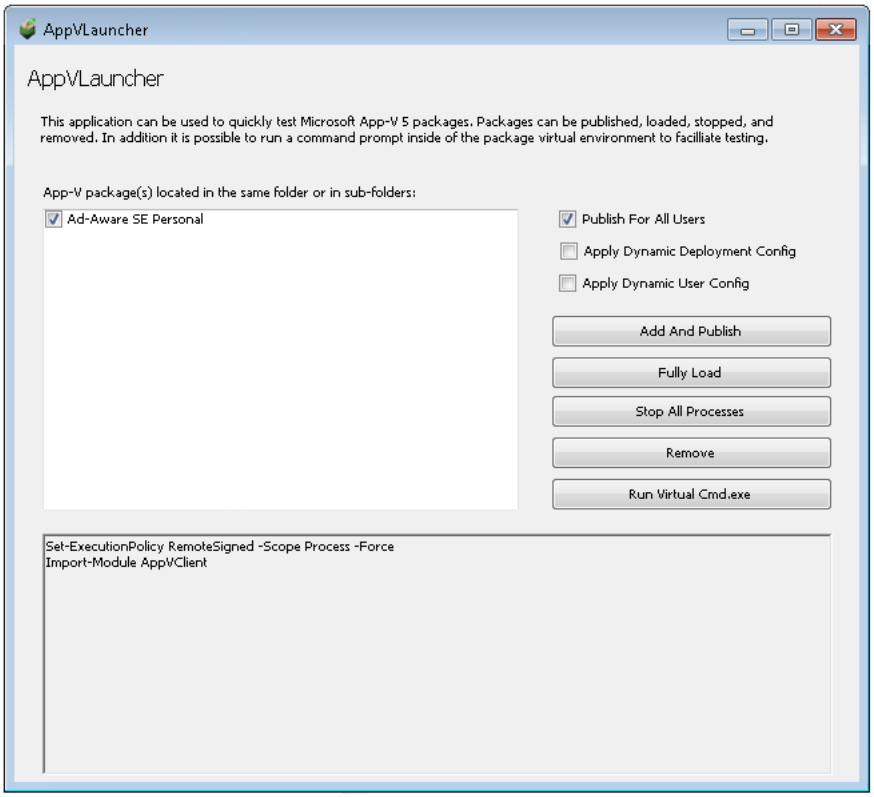

Figure 10-52: App-V 5.x Application Launcher

You open the App-V 5.x Application Launcher by double-clicking on the **AppVLauncher.exe** file located in the same directory as an App-V 5.x package. See Performing Manual Testing of an App-V 5.x Package.

The **App-V 5.x Launcher** includes the following options and buttons:

Table 10-45 • App-V 5.x Launcher Options and Buttons

Option	Description
App-V package list	List of all of the App-V packages located either in the same directory as the **AppVLauncher.exe** file or in a subdirectory of that directory. Select the App-V package(s) that you want to test.
Publish For All Users	Select this option to make the package available to all users on the system. If this option is not selected, then only the currently logged in user will have access to it.
Apply Dynamic Deployment Config	Select this option if you have made customizations to the deployment configuration file that is located next to the App-V package. Changes in this file apply to all users and therefore the **Publish For All Users** option should be used in conjunction.
Apply Dynamic User Config	Select this option if you have made customizations to the deployment configuration file that is located next to the App-V package. Changes in this file apply to all users and therefore the **Publish For All Users** option should be used in conjunction.

Table 10-45 • App-V 5.x Launcher Options and Buttons

Option	Description
Add And Publish	Click to publish this App-V package to the App-V Client so that it can be tested. After this is done, all of the entry points into the package will be published. This includes shortcuts and file type extensions, among others.
Fully Load	Click to load the entire package content into the App-V client. If this is not done, and the package has not been designed to fully load automatically, then the package files are loaded on demand.
Stop All Processes	Click to terminate any running processes originating from the selected App-V package(s). All processes must be stopped in order to perform some operations such as removal.
Remove	Click to un-publish the App-V package.
Run Virtual Cmd.exe	Click to open a command window within the virtual environment. This can be used to run other commands from within the virtual environment for testing purposes.
Output window	List of the informational, progress, and error messages. This includes the PowerShell commands run to perform the selected actions.

Browse for Folder Dialog Box

On the **Browse for Folder** dialog box, select the directory containing the packages to convert.

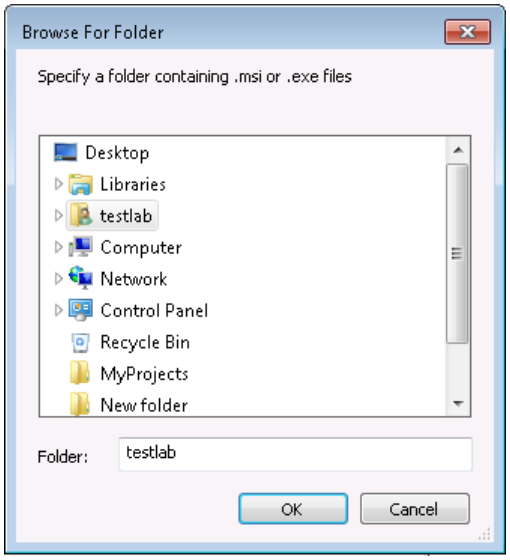

Figure 10-53: Browse for Folder Dialog Box

Select the directory that contains the Windows Installer files (**.msi**) and/or legacy package files (**.exe**) you want to convert and click **Open**. the Automated Application Converter searches the selected directory and its subdirectories to locate **.msi** and **.exe** files and adds them to the list on the **Select Packages** panel.

Important • *The Automated Application Converter uses specific rules to determine which packages in the selected directory and its subdirectories are added to the list on the* ***Select Packages*** *panel, and which of those files are automatically selected. See Automated Application Converter's Selection Rules When Adding Packages from a Directory for more information.*

Guest Agent

The Guest Agent (**GuestAgent.exe**) is a tool that is launched on a virtual image that enables the Automated Application Converter to manipulate the virtual machine in ways that may be unsupported by its automation APIs. In particular, this enables launching and monitoring the AdminStudio Repackager in an automated fashion.

Figure 10-54: Guest Agent Interface

Open Dialog Box

The **Open** dialog box opens when you select **Open** on the **File** menu or when you select the **Open existing project** option on the **Open Project** panel of the Application Conversion Project Wizard and then select **Browse for project file...** from the list.

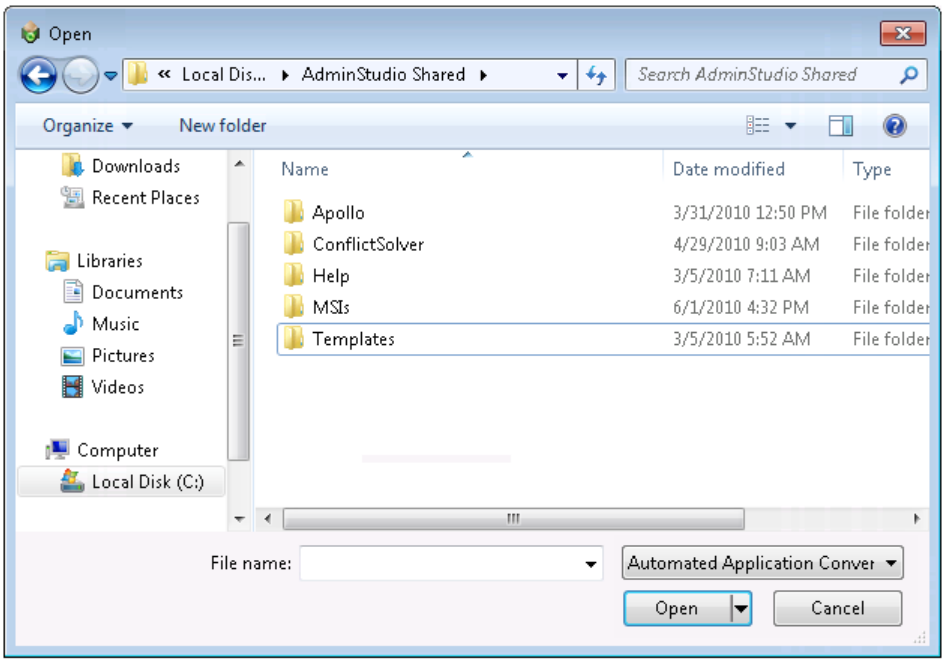

Figure 10-55: Open Dialog Box

Select an Automated Application Converter project file (***.aacx**) and click **Open** to open the file.

MST Dialog Box

The **MST** dialog box, which opens when you click the Browse ... button in the **Transform** field in the **Properties** window of the **Packages** tab, lists the transforms that are associated with the selected Windows Installer package. Automated Application Converter automatically lists all of the **.mst** files located in the same directory as the selected **.msi** file.

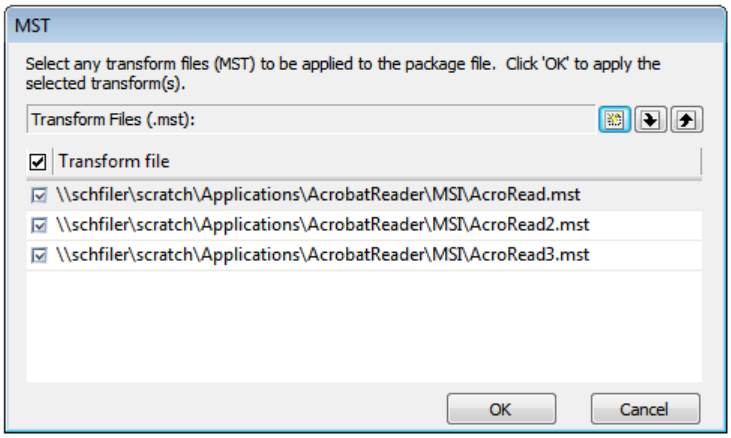

Figure 10-56: MST Dialog Box

Note • *You can also open the **MST** dialog box by clicking the Browse button in the **Transform** column of the package listing on the **Packages** tab, or by clicking the Browse button on the **Transform** column of the **Selected Package List** panel of the Package Import Wizard or the Application Conversion Project Wizard.*

On the **MST** dialog box, specify how transforms should be handled for the selected Windows Installer package:

- **Select transforms**—Select the transform (**.mst**) files that you want to import along with the Windows Installer package. If you do not want to import a selected **.mst** file, clear the selection.
- **Add additional transforms**—To add additional transforms that are not located in the same directory as the selected Windows Installer package, click the New button ( ) and browse to the location of the transform. If the package requires multiple transforms, you can repeat the procedure as necessary.
- **Order transforms**—If more than one transform is listed, use the up and down arrows to order the list of transforms in the order you want them applied.

Project Options Dialog Box

On the **Project Options** dialog box, which is opened by selecting **Options** on the **Tools** menu, you can specify project-wide default options.

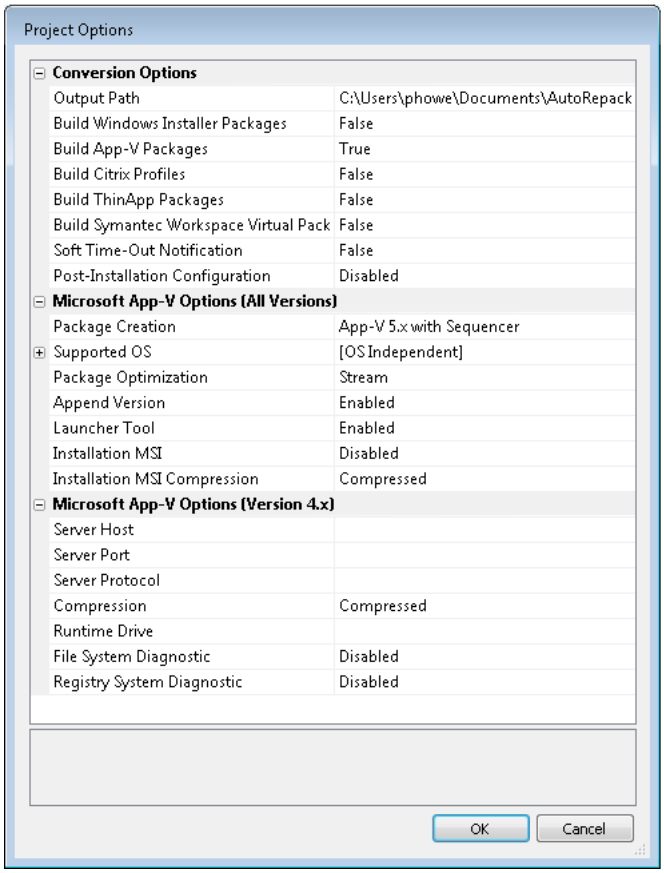

Figure 10-57: Project Options Dialog Box

The **Project Options** dialog box includes properties that are grouped into the following sections:

- Conversion Options
- Microsoft App-V Options (All Versions)
- Microsoft App-V Options (Version 4.x)

Conversion Options

The **Conversion Options** group on the **Project Options** dialog box includes the following options:

Table 10-46 • Conversion Options Group on the Project Options Dialog Box

Option	Description
Output Path	Specify the default location that will populate the **Place packages under the following folder** field on the **Select Output Formats** panel of the Application Conversion Project Wizard and Application Conversion Wizard.
Build Windows Installer Packages **Build App-V Packages** **Build Citrix Profiles** **Build ThinApp Packages** **Build Symantec Workspace Virtualization Packages**	If this option is set to **True**, the output format will be selected by default on the **Select Output Formats** panel of the of the Application Conversion Project Wizard and Application Conversion Wizard. If it is set to **False**, the output format will not be selected by default.
Soft Time-Out Notification	Set this option to **True** if you want AdminStudio to automatically send you an email notification when a soft time-out is encountered while using Automated Application Converter to repackage an application on a virtual machine. ***Note*** • *To enable email notification, you need to configure your SMTP notification settings on the* ***Notification Settings*** *tab of the AdminStudio* ***Options*** *dialog box.*

Table 10-46 • Conversion Options Group on the Project Options Dialog Box

Option	Description
Post-Installation Configuration	Indicate whether you want to enable configuration of the application after it is installed on the virtual machine but before it is converted into the target formats. Available options are: • **Disabled**—Disable post-installation configuration. The repackaging process does not pause after installing the product. This is the default value. • **Enabled**—Enable post-installation configuration. The repackaging process pauses after the installation of the product to allow you to launch the product and set up various application settings such as update settings and file associations. You can also perform other system configuration tasks. Once you are done with configuration, you can click a button to have the repackaging proceed with the capture and convert process. To override this behavior on an individual package basis, use the Post-Installation Configuration field in the Properties window for a specific package.  ***Important*** • *If you select the Enabled option, ensure that the value that you enter for the Hard Time-Out setting for each individual package allows enough time to configure the application.*

Microsoft App-V Options (All Versions)

The **Microsoft App-V Options (All Versions)** group on the **Project Options** dialog box includes the following options:

Table 10-47 • Microsoft App-V Options (All Versions) Group on the Project Options Dialog Box

Option	Description
Package Creation	Select one of these options to identify the default App-V version (4.6 or 5.x) and conversion method (AdminStudio or App-V Sequencer) for App-V package conversion: • **App-V 4.6 with AdminStudio**—Convert to App-V 4.6 format using AdminStudio. • **App-V 5.x with AdminStudio**—Convert to App-V 5.0 format using AdminStudio. • **App-V 5.x with Sequencer**—Convert to App-V 5.0 format using the Microsoft App-V 5.0 Sequencer.  ***Note*** *• The* ***App-V 5.x with Sequencer*** *option requires that the virtual machine have Microsoft Sequencer Version 5.x pre-installed. For more information, see Preparing a Snapshot for App-V 5.0 Conversion Using the App-V 5.0 Sequencer.*  ***Note*** *• This setting can be overridden on a per-package basis by changing the* ***Package Creation*** *property for a package on the* ***Packages*** *tab.*

Table 10-47 • Microsoft App-V Options (All Versions) Group on the Project Options Dialog Box

Option	Description
Supported OS	Use the **Supported OS** setting and its subsettings to specify the default supported operating systems for App-V packages generated by Automated Application Converter: • **To specify that App-V packages are operating-system-dependent** (meaning that the App-V packages will only support some of the listed operating systems), select **True** next to the supported operating systems. If any of the listed operating systems are set to **True**, the value for **OS Independent** will automatically switch to **False**, and the selected operating systems will be listed in brackets next to **Supported OS**. • **To specify that App-V packages are operating-system-independent** (meaning that the App-V packages will support all listed operating systems), set **OS Independent** to **True**. When you make this selection, all operating systems will automatically switch to **False**.  ***Important*** *• You can override these default settings for an individual App-V package by setting the* ***Supported OS*** *property on that package's* ***Packages*** *tab.*  ***Important*** *• When setting the* ***Supported OS*** *property for App-V 5.0 packages, keep in mind that the packages are limited to the supported operating systems of the App-V 5.0 client:* • *Windows 7 and later* • *Windows Server 2008 R2 and later*

Table 10-47 • Microsoft App-V Options (All Versions) Group on the Project Options Dialog Box

Option	Description
Package Optimization	Specify how to optimize the package: • **Offline**—When the package is optimized for offline use, the entire package is included in feature block 1 and will be streamed to the client at start up in one file before the application launches. After that, no more streaming is done. All files are stored in the App-V cache, which means that the application is available for use even when the machine is not connected to the App-V server. Select this option if you want to enable users to use the App-V package when not connected to the App-V server and if you want to eliminate network traffic when the App-V package is being used. • **Stream**—When the package is optimized for streaming use, only the shortcut targets which are included in feature block 1 are streamed to the client at start up. Feature block 2 can contain additional functionality of the App-V package that is not necessary to launch the application. While the App-V package is being used, the files in feature block 2 are streamed in small packets on an as-needed basis. This option provides a relatively quick launch time while limiting network traffic during application use.  ***Note*** • *When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent application use.*
Append Version	Specify the default App-V versioning value. Available options are: • **Enabled**—Append the package version to the SFT file name. • **Disabled**—Leave the package version off of the SFT file name.
Launcher Tool	Set this option to **Enabled** to include the App-V Application Launcher when you build an App-V package. You can use the App-V Application Launcher to test a newly built App-V package before moving it to a deployment server.  ***Note*** • *The default value for the **Launcher Tool** option is **Enabled**.*  ***Note*** • *You can override this default setting for an individual package by setting the **Launcher Tool** property on the package's **Properties** window of the **Packages** tab.*
Installation MSI	Specify whether to create a Windows Installer package wrapper to install the App-V package: • **Enabled**—Create a Windows Installer package wrapper to install the App-V package. • **Disabled**—Do not create a wrapper.

Table 10-47 • Microsoft App-V Options (All Versions) Group on the Project Options Dialog Box

Option	Description
Installation MSI Compression	Specify whether to compress the Windows Installer package wrapper. • **Compressed**—Compress the Windows Installer package wrapper. • **Uncompressed**—Do not compress the wrapper.  ***Note*** *• This option is not available when the* ***Package Conversion*** *option is set to* ***App-V 5.x with Sequencer****. In this case, the Windows Installer package wrapper is always uncompressed.*

Microsoft App-V Options (Version 4.x)

The **Microsoft App-V Options (Version 4.x)** group on the **Project Options** dialog box includes the following options:

Table 10-48 • Microsoft App-V Options (Version 4.x) Group on the Project Options Dialog Box

Option	Description
Server Host	Specify the host—the virtual application server or the load balancer in front of a group of virtual application servers that stream the App-V package to the Application Virtualization Client. You can either specify a static host name or IP address, or you can enter **%SFT_SOFTGRIDSERVER%** to indicate an environment variable.  ***Note*** *• If you enter* ***%SFT_SOFTGRIDSERVER%****, you must set up the SFT_SOFTGRIDSERVER system environment variable on each Application Virtualization Client. The value of this environment variable should be the name or IP address of the host.* *When you assign the variable on a client system, any Application Virtualization Client session that is running on the system must be closed and reopened; otherwise, the session is not aware of the new application source.*
Server Port	Specify the port on which the virtual application server or the load balancer listens for Application Virtualization Client requests for the package. The default port is 554.

Table 10-48 • Microsoft App-V Options (Version 4.x) Group on the Project Options Dialog Box

Option	Description
Server Protocol	Select the protocol that you want to use to stream the sequenced application package from the virtual application server to an Application Virtualization Client. Available options are: • **RTSP**—The real-time streaming protocol streams the App-V package. This is the default option. • **RTSPS**—The real-time streaming protocol with transport layer security streams the App-V package. • **FILE**—The App-V package are streamed from a file share. • **HTTP**—The hypertext transport protocol streams the App-V package. • **HTTPS**—The secure hypertext transport protocol streams the App-V package.
Compression	Specify whether to compress the App-V package: • **Compressed**—Compress the App-V package. • **Uncompressed**—Do not compress the App-V package.
Runtime Drive	Specify the App-V client runtime drive. If no value is set, the default value of `Q:\` will be used.
File System Diagnostic	Set this property to **Enabled** if you want to include the Windows Command Prompt application when you build an App-V packages so that you can browse the virtual file system at runtime from within the virtual environment. If this property is set to **Enabled**, a file named **Virtual File System.osd** will be created in the App-V Package folder, which can be used to display the files and folders within the virtual environment. You can use **Virtual File System.osd** to view the existing files and folders on the computer plus the files and folders for the virtual package.  ***Note*** • *The default value for the **File System Diagnostic** option is **Disabled**.*  ***Note*** • *You can override this default setting for an individual package by setting the **File System Diagnostic** property on the package's **Properties** window of the **Packages** tab.*

Table 10-48 • Microsoft App-V Options (Version 4.x) Group on the Project Options Dialog Box

Option	Description
Registry System Diagnostic	Set this property to **Enabled** if you want to include the Registry Editor (**regedit.exe**) when you build an App-V package so that you can browse the registry at runtime from within the virtual environment. If this property is set to **Enabled**, a file named **Virtual Registry.osd** will be created in the App-V Package folder, which can be used to display the registry within the virtual environment. You can use **Virtual Registry.osd** to view the existing registry on the computer plus the registry for the virtual package. ***Note*** • *The default value for the **Registry System Diagnostic** option is **Disabled**.* ***Note*** • *You can override this default setting for an individual package by setting the **Registry System Diagnostic** property on the package's **Properties** window of the **Packages** tab.*

Select Package Installation File Dialog Box

On the **Select Package Installation File** dialog box, select the installation file (**.msi or .exe**) or installation script (***.vbs**, ***.bat**, ***.cmd**, or ***.ps1**) that you want to add to your project for conversion to a virtual application.

Note • *You can use installation scripts to run more complex installation scenarios.*

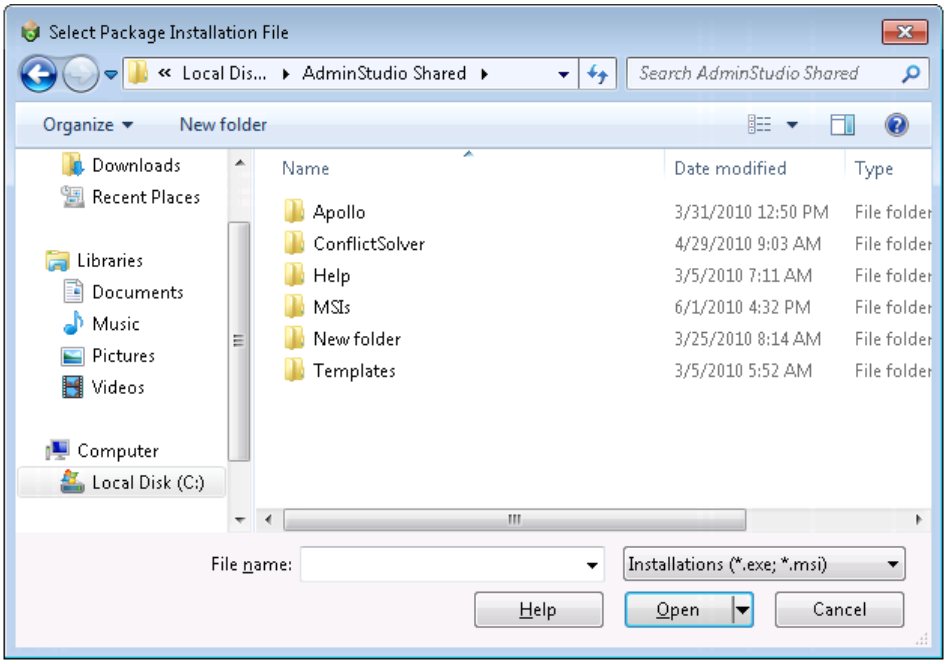

Figure 10-58: Select Package Installation File Dialog Box

Select Transform Dialog Box

On the **Select Transform** dialog box, which opens when you click in the **Transform** column/property on the **Packages** tab, you can select a transform file (**.mst**) to modify or install a Windows Installer package silently.

Note *• While the* ***Transform*** *property on the* ***Packages*** *tab can contain a semicolon-delimited list of transforms, when you browse to the transform file location using the* ***Select Transform*** *dialog box, you are only able to select one transform file. To include multiple transforms with a package, rather than browsing to the transform file location, you need to manually edit the* ***Transform*** *property on the* ***Packages*** *tab to enter multiple transform files, separated by a semicolon.*

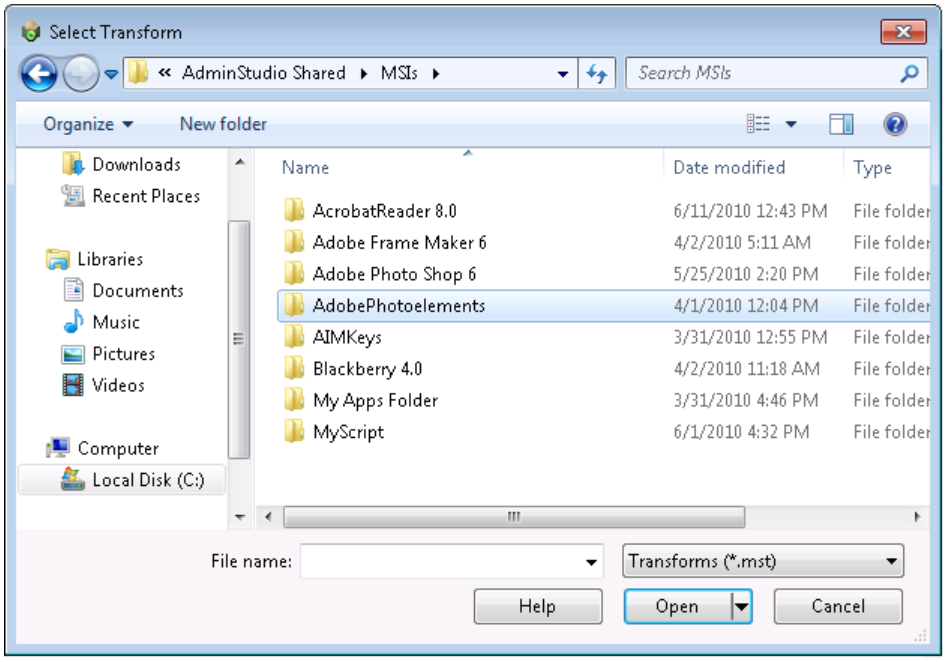

Figure 10-59: Select Transform Dialog Box

Select Virtual Machine Dialog Box

On the **Select Virtual Machine** dialog box, which opens when you right-click on a package on the **Packages** tab and then select **Launch Package for Testing** from the shortcut menu, you select the virtual machine that you want to use to test the selected package.

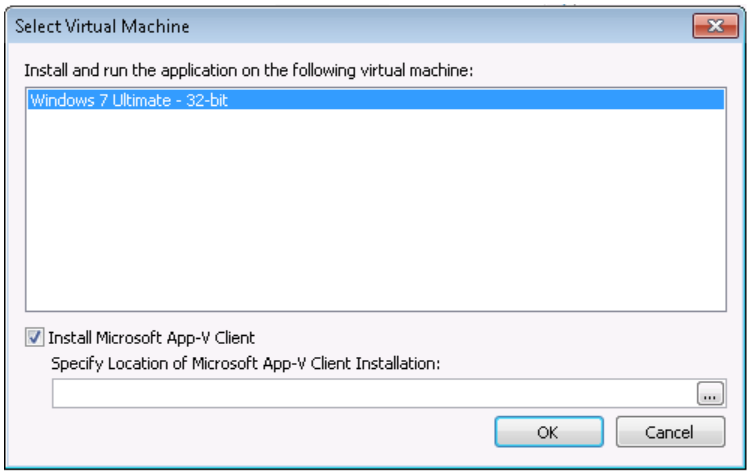

Figure 10-60: Select Virtual Machine Dialog Box

The following options are available:

Table 10-49 • Select Virtual Machine Dialog Box

Option	Description
Install and run the application on the following virtual machine	Select the virtual machine that you would like to use the test the selected package.
Install Microsoft App-V Client	If you are testing an App-V package, select this option to instruct the Automated Application Converter to install the App-V client on the selected virtual machine.
Specify Location of Microsoft App-V Client Installation	If you have selected the **Install Microsoft App-V Client** option, specify the location of the App-V client installation. Make sure that Automated Application Converter machine has access to the specified location.

Select Virtual Machine Image File Dialog Box

When you click **Browse Files** on the **Select Virtual Machines** panel, the **Select Virtual Machine Image File** dialog box opens, prompting you to select a VMware Workstation virtual machine image.

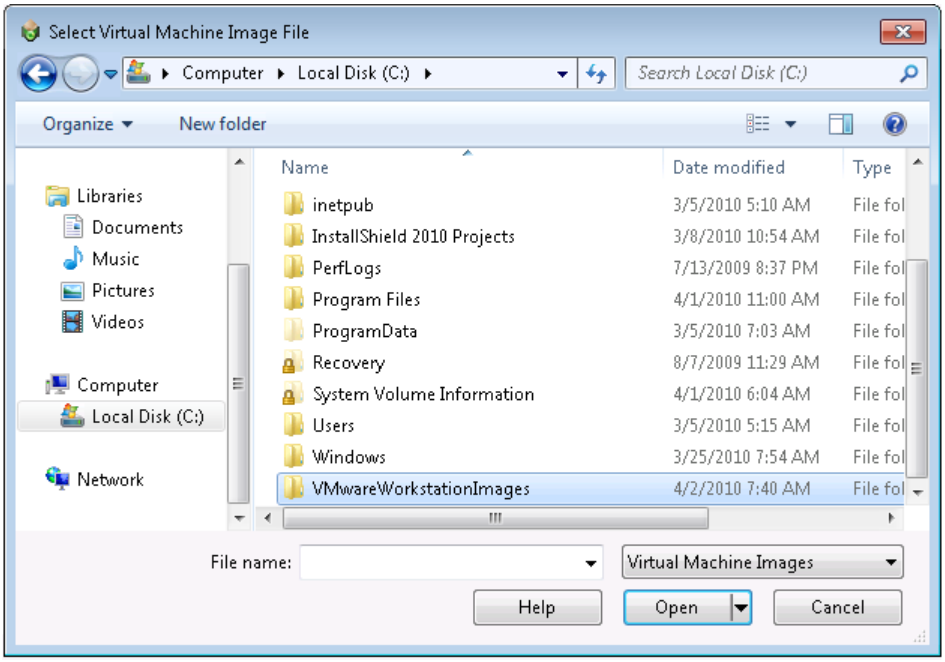

Figure 10-61: Select Virtual Machine Image File Dialog Box

Command Line Support

You can choose to run an Automated Application Converter project file via command line using the following command:

```
aacx.exe projectname.aacx
```

where `projectname.aacx` is the project file to load and execute. Results are displayed in console mode.

You can also use the following command line parameters to override project file settings:

Table 10-50 • Command Line Parameters

Parameter	Description
/create	Use the `/create` parameter to indicate the virtual formats to create, such as: `aacx.exe /create formattype projectname.aacx` where *formattype* can be any of the following (case-insensitive): `AppV` `Citrix` `ThinApp` `MSI` `xpf` and *projectname.aacx* is the project file to load and execute. For example, to create an App-V package, enter: `aacx.exe` **`/create AppV`** `myproject.aacx` Multiple create commands can be specified in the same command line. For example, to create all virtual formats, enter: `aacx.exe` **`/create`** `AppV` **`/create`** `Citrix` **`/create`** `ThinApp myproject.aacx`  ***Note*** • *Settings made using the* `/create` *parameter override the selections you made on the* ***Select Output Formats*** *panel, which are saved in the project file.*
/help **/?**	To view command line help, enter either of the following: `aacx.exe /?` `aacx.exe /help`
/log	To create a unicode text file to contain output messages, enter the `/log` parameter followed by an output file name: `aacx.exe /log output.txt myproject.aacx`  ***Note*** • *These are the same output messages that would appear in the Output window when using the Automated Application Converter interface,*

Table 10-50 • Command Line Parameters (cont.)

Parameter	Description
/options	To specify an alternate **options.ini** file for repackaging with Automated Application Converter, enter the `/options` parameter followed by the path to the **options.ini** file that you want to use, such as: `/options C:\options.ini` Using this option enables you to specify a different **options.ini** file when repackaging with Automated Application Converter than the **options.ini** file that you use when performing standard repackaging with Repackager (which could have custom options in it). The specified **options.ini** file will be copied to the guest image during repackaging and will overwrite the default Repackager **options.ini** file.
/outdir	To override the output directory for built and converted packages that was set in the project file on the **Select Output Formats** wizard panel, use the `/outdir` parameter: `aacx.exe /outdir "C:\output\aacxoutput" myproject.aacx` where **C:\output\aacxoutput** is the name of the directory that will contain the output.
/report	To specify the name of the HTML report that is generated after conversion, use the `/report` parameter: `aacx.exe /report reportname.html myproject.aacx`
/showreport	To specify the name of the HTML report that is generated after conversion and to automatically display that report, use the `/showreport` parameter: `aacx.exe /showreport reportname.html myproject.aacx`
/vmplatform	To specify the platform to use when performing automated repackaging, overriding the VMs selected in the project file, use the `/vmplatform` parameter: `aacx.exe /vmplatform platformvalue proj.aacx` where *platformvalue* is constructed from a version integer using the formula of `MajorVersion * 100 + MinorVersion` of the operating system (such as **600** for Windows Vista), followed optionally by **s** (for server) and/or **x64** (for 64-bit). Examples are below.

Windows Vista 32-bit	`aacx.exe /vmplatform` **600** `myproject.aacx`
Windows Vista 64-bit	`aacx.exe /vmplatform` **600x64** `myproject.aacx`
Windows Server 2008 R2 64-bit	`aacx.exe /vmplatform` **601sx64** `myproject.aacx`
All enabled machines	`aacx.exe /vmplatform` **any** `myproject.aacx`

Note • *The version integer described above is similar to the Windows Installer VersionNT property. See Operating System Property Values on the MSDN website.*

Specifying Global Default Virtual Conversion Settings

In addition to the settings that can be specified on the Project Options Dialog Box, a default value can be specified for any virtual conversion setting that would normally be stored in the `ISVirtualPackage` table by editing the **settings.xml** file. The global value is used if no project-specific value is found.

To configure these global default values, locate the **settings.xml** file installed with InstallShield Editor and AdminStudio Repackager, and then find the `<Properties>` subelement of the `<Virtualization>` element:

```
<Virtualization>
    <Properties>
        <Property Name="AppVRuntimeDrive" Value="G:" />
        <Property Name="AppVServerURLPath" Value="%PackageName%_v%PackageVersion%" />
    </Properties>
</Virtualization>
```

To define a default value for any of the properties in the `ISVirtualPackage` table, create a `<Property>` in the `<Properties>` element and set a value. In the examples above, the `AppVRunTimeDrive` property is set to a default value of `G:`, and the `AppVServerURLPath` property is set to a default value of `%PackageName%_v%PackageVersion%`.

The following three replaceable parameters are only valid for the `AppVServerURLPath` property:

- **%PackageName%**—Name of the virtual package (which normally corresponds to the MSI `ProductName`).
- **%PackageVersion%**—Version number. (Each new upgrade increments this number.)
- **%PackageVersionedName%**—This is the `%PackageName%` for version one packages, and `%PackageName%_v%PackageVersion%` otherwise.

Virtual Converter Table Documentation for Microsoft App-V and VMware ThinApp

The following documentation lists settings that you can use to customize your conversion process.

- **Per package**—You can use InstallShield to directly edit the `ISVirtualPackage` table to modify the settings referenced below. You could also use the App-V, ThinApp, or Citrix XenApp Assistants user interface to modify the settings.
- **Per Automated Application Converter project**—You can specify a limited set of options in Automated Application Converter's **Project Options** dialog box, but you cannot edit tables directly.
- **Globally for any conversion**—You could edit the **Settings.xml** file to specify default values for many of the settings that can be specified in the `ISVirtualPackage` table.

The table settings that you can edit to customize your conversion process are organized into the following sections:

- General Settings
- Microsoft App-V Settings
- VMWare ThinApp Settings

General Settings

The following settings are applicable to all virtual technologies.

- ISVirtualPackage Table
- ISVirtualRelease Table
- Miscellaneous Virtual Conversion Settings

ISVirtualPackage Table

The `ISVirtualPackage` table is the main table that stores package-wide conversion settings. To edit this table, open the package in InstallShield and open the Direct Editor view. Also, if you make selections in the InstallShield Assistants, it will modify the settings in this table.

If you want to modify these settings globally, you need to edit the **Settings.xml** file, as described in Editing the Settings.xml File.

Table 10-51 • General Settings in ISVirtualPackage Table

Setting Name	Setting Value	Meaning
Provider	Semicolon separated list of Thinstall, AppV, and Citrix	Indicates virtual technologies to which to convert MSI packages.
MSIFile0, MSIFile1, etc	Absolute path to MSI	Indicates other MSI packages to suite together with the current one into one package.
VirtualPackageBuildOutputFolder	Absolute path to a directory	Instead of creating the converted virtual applications in a folder next to the source MSI, put them in a new folder under this specified location - this overrides the global redirect option in settings.xml.

ISVirtualRelease Table

The `ISVirtualRelease` table stores the relationship between InstallShield project releases and the virtual package type you want to build. This table is only relevant when you are editing an InstallShield Basic MSI project (not when you are editing an MSI package in the DirectEdit mode). If you make the relevant selections in the Assistants, it will modify the settings in this table.

Note • *The settings in this table cannot be specified in the Settings.xml file.*

Table 10-52 • General Settings in ISVirtualRelease Table

ISRelease_	ISProductConfiguration_	Name	Value	Meaning
`Key to ISRelease`	Key to `ISProductConfiguration`	`BuildVirtualPackage`	1	Build virtual package when associated release is built

Table 10-52 • General Settings in ISVirtualRelease Table

ISRelease_	ISProductConfiguration_	Name	Value	Meaning
`Key to ISRelease`	Key to `ISProductConfiguration`	`Provider`	Semicolon separated list of Thinstall, AppV, and Citrix	Indicates virtual technologies to which to convert MSI packages

Miscellaneous Virtual Conversion Settings

You can edit the following XML file to modify global settings that also govern the creation of virtual packages.

Table 10-53 • Miscellaneous Settings

Location	Name	Value	Meaning
`System\Msi.xml`	`IgnoreTables`	MSI table names	Control whether an error or warning is flagged for certain tables during conversion
`System\Msi.xml`	`IgnoreCustomActions`	MSI custom action names	List of custom actions that can safely be ignored during virtual conversion
`System\Msi.xml`	`PropertyDefaults`	MSI property names with given values	Default values to use for certain MSI properties rather than flagging them as warnings
`Support\0409\settings.xml`	`GlobalBuildRedirectFolder`	Absolute directory path	Instead of creating the converted virtual applications in a folder next to the source MSI, put them in a new folder under this specified location

Microsoft App-V Settings

The **ISVirtualPackage** table is the main table that stores package-wide App-V conversion settings. To edit this table, open the package in InstallShield and open the Direct Editor view. Also, if you make selections in the InstallShield Assistants, it will modify the settings in this table.

Note • *If you want to modify the setting in the* `ISVirtualPackage` *table globally, you can edit the* `Settings.xml` *file, as described in* *Editing the Settings.xml File*

The other tables listed here (directory, file, registry, shortcut) store App-V conversion settings related to a particular item in the package, such as a particular shortcut, file, registry entry, or directory.

Note • *The settings in these four tables cannot be specified in the* `Settings.xml` *file.*

- *ISVirtualPackage Table*
- *ISVirtualDirectory Table*
- *ISVirtualFile Table*
- *ISVirtualRegistry Table*
- *ISVirtualShortcut Table*

ISVirtualPackage Table

The following are App-V settings in the ISVirtualPackage table.

Table 10-54 • App-V Settings in ISVirtualPackage Table

Name	Value	Default	Meaning
`AppVName`		Same as name of MSI	Specify package name
`AppVServerURLHost`			Server location of SFT file
`AppVServerURLPort`			Server location of SFT file
`AppVServerURLProtocol`	RTSP, RTSPS, FILE, HTTP, or HTTPS		Protocol to use to access SFT file location
`AppVRootFolderName`		8.3 name based on product name and version	Specify root folder name
`AppVComments`			SFT file comments
`AppVOS`	Bitwise or of flags representing OS	0	0 indicates OS independent. Otherwise, here is the OS list starting with bit 1: WinXP, WinXP64, Win2003Svr, Win2003TS, Win2003TS64, Win2008Svr, Win2008TS, Win2008TS64, WinVista, WinVista64, Win7, Win764, Win2008R2TS64

Table 10-54 • App-V Settings in ISVirtualPackage Table

Name	Value	Default	Meaning
`AppVDSC0`, `AppVDSC1`, etc.	Absolute path to OSD or SFT file [: MANDATORY]		Dynamic Suite Composition settings
`AppVNoCompression`	1	0	Compression setting - default is compressed
`AppVPackageOptimization`	Offline or Stream	Stream	Only the shortcut targets are put in feature block 1 (FB1) if Stream is selected. Otherwise the entire package is put in FB1.
`AppVUpgrade`	1	0	Enables creation of an upgrade package
`AppVUpgradePreviousPackage`			Absolute path to SFT from previous package that will be upgraded.
`AppVUpgradeLatest`	1	0	Will locate the most recently built App-V package based on modified timestamp on SFT files found in appropriately named sub-folders next to the MSI file.
`AppVUpgradeAppendPackageVersion`	1	1	Package version will be appended to the end of the SFT file name
`AppVDiagFileSystem`	1	0	Include File System Diagnostic tool - a shortcut is included to run cmd.exe from the physical System32 folder. This cmd.exe and any programs launched from it will have access to the virtual environment of the package
`AppVDiagRegistry`	1	0	Include Registry System Diagnostic tool - a shortcut is included to run regedit.exe from the physical Windows folder. It will have access to the virtual environment.

Table 10-54 • App-V Settings in ISVirtualPackage Table

Name	Value	Default	Meaning
AppVTestLauncher	1	1	AppVLauncher.exe is copied next to the newly built App-V package. This tool can be used to easily test deploy App-V packages.
BuildMSI	1	0	Create a wrapper MSI file that can be used to deploy the App-V package
AppVMsiWrapperCompress	1	0	Compression setting for wrapper MSI
AppVPrereq	1	0	Set this option to include App-V client setup as a setup prerequisite for the wrapper MSI. It will be necessary to obtain a redistributable copy of the App-V client setup to use this feature.
APPVLOADING	1	0	Set this option to not include the SFT file in the wrapper MSI. The SFT file will be streamed from the server location specified in the OSD and manifest files.
AppVNoSpacesInFileNames	1		Will replace spaces in the SFT, OSD, and Icon file names with '_'.
AppVSpaceReplacementString	Some string		Use together with setting AppVNoSpacesInFileNames property to 1. Any spaces in SFT, OSD, and Icon file names will be replaced by the string specified in the value of this property. If the string 'EMPTYSTRING' is used, then spaces will just be removed.
AppVRuntimeDrive	Drive letter such as M:	Q:	App-V client drive to use

ISVirtualDirectory Table

The following are App-V settings in the ISVirtualDirectory table.

Table 10-55 • App-V Settings in ISVirtualDirectory Table

Directory_	Name	Value	Meaning
Key into Directory table	AppVUserData	1	If set, then treat this directory as user data. If unspecified, then default algorithm is used to determine whether to mark directory as user data or application data.
Key into Directory table	AppVOverride	1	Override directory contents during upgrade

ISVirtualFile Table

The following are App-V settings in the ISVirtualFile table.

Table 10-56 • App-V Settings ISVirtualFile Table

File_	Name	Value	Meaning
Key into File table	AppVUserData	1	If set, then treat this file as user data. If unspecified, then default algorithm is used to determine whether to mark file as user data or application data.
Key into File table	AppVOverride	1	Override file during upgrade

ISVirtualRegistry Table

The following are App-V settings in the ISVirtualRegistry table.

Table 10-57 • App-V Settings in ISVirtualRegistry Table

Registry_	Name	Value	Meaning
Key into Registry table	AppVOverride	1	If set, virtual application will only see the registry key contents in the virtual package and no child keys that may be present on the physical machine. Otherwise, virtual application will see only values in the virtual package, but will see child keys present on the physical machine, if they are not also present in the virtual package.

ISVirtualShortcut Table

The following are App-V settings in the ISVirtualShortcut table.

Table 10-58 • App-V Settings in ISVirtualShortcut Table

Shortcut_	Name	Value	Meaning
Key into Shortcut table	AppVApplication	0	A value of zero indicates that this shortcut will not be included in the converted App-V package.

VMWare ThinApp Settings

The ISVirtualPackage table is the main table that stores package-wide ThinApp conversion settings. To edit this table, open the package in InstallShield and open the Direct Editor view. Also, if you make selections in the Assistants, it will modify the settings in this table.

Note • *If you want to modify the setting in the ISVirtualPackage table globally, you can edit the Settings.xml file, as described in Editing the Settings.xml File*

The other tables listed here (directory, file, registry, shortcut) store ThinApp conversion settings related to a particular item in the package, such as a particular shortcut, file, registry entry, or directory.

Note • *The settings in these four tables cannot be specified in the Settings.xml file.*

- ISVirtualPackage Table
- ISVirtualDirectory Table
- ISVirtualRegistry Table
- ISVirtualShortcut Table

ISVirtualPackage Table

The following are ThinApp settings in the ISVirtualPackage table.

Table 10-59 • ThinApp Settings in ISVirtualPackage Table

Name	Value	Default	Meaning
`ThinRemoveSandboxOnExit`	1	0	Determines if sandbox is deleted when application exits
`ThinSandboxRemovableDisk`	1	0	Determines whether write operations to removable disks go to the disks or to sandbox

Table 10-59 • ThinApp Settings in ISVirtualPackage Table

Name	Value	Default	Meaning
ThinSandboxNetworkDrives	1	0	Determines whether write operations to network drive go to network drive or to sandbox
ThinSandboxName			Name of directory that stores the sandbox
ThinActiveDirectory	1	0	Restrict access based on AD groups
ThinPermittedGroups	Semicolon separated AD group names		Only users belonging in the specified local or domain groups will be able to run the application
ThinAccessDeniedMsg			Message to display when access is denied
BuildMSI	1	0	Build a MSI that will install and register ThinApp package
ThinDisableTracing	1	0	Disable ThinApp tracing
ThinCompessionType	None/Fast	None	Compression setting
ThinDirectoryIsolationMode	Merged, WriteCopy, or Full	WriteCopy	Controls whether write operations are directed to the sandbox or physical drive
OptionalAppLinks	Semicolon separated list of absolute paths to ThinApp package EXE or DAT files		Used to establish optional AppLink relationship between ThinApp packages
RequiredAppLinks	Semicolon separated list of absolute paths to ThinApp package EXE or DAT files		Used to establish required AppLink relationship between ThinApp packages
AppSyncURL			HTTP, HTTPS, or File URL to web server that hosts application updates
AppSyncUpdatedMessage			Message to display to user upon update
AppSyncUpdateFrequency	Minutes (m), hours (h), days (d), and 0		The frequency with which to check for updates

Table 10-59 • ThinApp Settings in ISVirtualPackage Table

Name	Value	Default	Meaning
AppSyncClearSandboxOnUpdate	1	0	Determines whether to clear sandbox after update
AppSyncExpirePeriod	Minutes (m), hours (h), days (d), and never		Number of days before application will stop working due to not being able to connect to server
AppSyncWarningPeriod	Minutes (m), hours (h), and days (d)		Start of warning period. After this ThinApp will check for an update each time the application starts
AppSyncWarningFrequency	Minutes (m), hours (h), and days (d)		Frequency of warnings to the user during the warning period
AppSyncExpireMessage			Message user sees when application cannot be run because it has failed to contact the server for the duration of the expiration period
AppSyncWarningMessage			Message user sees when application has not been able to contact the server for the duration of the warning period
ThinDiagCmd	1	0	Include File System Diagnostic tool
ThinDiagReg	1	0	Include Registry System Diagnostic tool

ISVirtualDirectory Table

The following are ThinApp settings in the ISVirtualDirectory table.

Table 10-60 • ThinApp Settings in ISVirtualDirectory Table

Directory_	Name	Value	Meaning
Key to Directory table	ThinIsolation	1 for default, 2 for Full, 4 for WriteCopy, and 8 for Merged	Sets isolation setting for a directory. Default setting is default (use overall package isolation setting)

ISVirtualRegistry Table

The following are ThinApp settings in the ISVirtualRegistry table.

Table 10-61 • ThinApp Settings in ISVirtualRegistry Table

Registry_	Name	Value	Meaning
Key to Registry table	ThinIsolation	1 for default, 2 for Full, 4 for WriteCopy, and 8 for Merged	Sets isolation setting for a registry key. Default setting is default (use overall package isolation setting)

ISVirtualShortcut Table

The following are ThinApp settings in the ISVirtualShortcut table.

Table 10-62 • ThinApp Settings in ISVirtualShortcut Table

Shortcut_	Name	Value	Meaning
Key into Shortcut table	`ThinIsolation`	0	A value of zero indicates that this shortcut will not be included in the converted ThinApp package.

Additional Settings

You can edit the following configuration files to further customize the conversion process of a ThinApp package.

Table 10-63 • Additional ThinApp Settings

Location	Name	Value	Meaning
`System\Thinstall.xml`	`AlwaysBuildDatFile`	true/false	Always put the application payload in a DAT file - even with only one shortcut
`System\Thinstall.xml`	`PreserveMostPackageIniSettings`	true/false	Start with existing package.ini file from previous build instead of from template package.ini. This has the potential of preserving many user customizations made directly to package.ini file.
`System\Thinstall.xml`	`CreateBuildBatFile`	true/false	Copy a template BAT file into the Interim folder that can be used to rebuild the ThinApp package without running the full MSI conversion virtual build process

Table 10-63 • Additional ThinApp Settings

Location	Name	Value	Meaning
System\Package.ini			Template package.ini file used in the virtual build process that can be customized somewhat
System\Thinapp.bat			Template BAT file that can be used to build ThinApp package directly without running full virtual build process

Editing the Settings.xml File

To edit the **Settings.xml** file, add a property element for each setting in the `Virtualization/Properties` section of the file. You can find the **Settings.xml** file in the following directory:

```
C:\Program Files\AdminStudio\2016\Repackager\Support\0409
```

Edit the following section of the file:

```
<Virtualization>
...
    <Properties>
        <!--Use this section to provide a global default for any setting
        that is found in the ISVirtualPackage table-->
        <!--<Property Name="AppVRuntimeDrive" Value="G:"/>-->
        <!--<Property Name="AppVServerURLPath" Value="%PackageName%_v%PackageVersion%" />-->
    </Properties>
</Virtualization>
```

Troubleshooting

This section includes information to help you resolve typical problems that you might encounter when using the Automated Application Converter. The following sections are included:

- First Things to Check
- Problems and Solutions
- Best Practices for Optimal Performance
- How to Test a Virtual Machine
- Resolving Problems Connecting to a Hyper-V Image
- Automated Application Converter Error Messages
- Virtualization Conversion Error Messages

First Things to Check

If you encounter a problem when performing package conversion, first scan this table to review of list of the most likely causes for conversion failure.

Table 10-64 • Most Likely Causes of Errors

Cause of Error	Resolution
Did not run the Virtual Machine Preparation Tool	On each virtual machine that you are going to use to perform automated repackaging, you need to run the Virtual Machine Preparation Tool, an application that will enable automatic login. See Preparing Your Virtual Machines for Use With the Automated Application Converter. ***Important*** *• If you do not run the Virtual Machine Preparation Tool on the virtual machines you want to use, the Automated Application Converter will be unable to connect to them.*
Did not install VMware VIX API	If you are using VMware virtualization technology (VMware ESX or ESXi Server or a local VMware Workstation 6.5 or later), you need to have the VMware VIX API installed on the same machine as the Automated Application Converter. See VMware VIX API Requirement on the AdminStudio Machine.
Snapshot does not exist on the virtual image	After you run the Virtual Machine Preparation Tool on a virtual machine, you need to shut it down and create a snapshot. This enables the Automated Application Converter to revert the virtual image to a clean state after each repackaging run. See Taking a Snapshot. ***Important*** *• If a snapshot does not exist on the virtual machine, not only will repackaging on that virtual machine fail, but you will also be unable to use that virtual machine to perform testing (as described in Testing Packages).*
Name of Snapshot on virtual image is not identified properly	If your virtualization technology supports named snapshots, you should name the snapshot **AutoRepack_Base**, which is the default name that the Automated Application Converter will be looking for. If you assign a snapshot name other than **AutoRepack_Base**, after you add the virtual machine to the Automated Application Converter, you need to specify that snapshot name in the **Snapshot Name** property in the **Properties** window of the **Machines** tab for that machine. See Editing Virtual Machine Properties on the Machines Tab. ***Important*** *• If the snapshot on the virtual machine is not identified properly in the Automated Application Converter, not only will repackaging on that virtual machine fail, but you will also be unable to use that virtual machine to perform testing (as described in Testing Packages).*

Table 10-64 • Most Likely Causes of Errors

Cause of Error	Resolution
ThinApp client is not installed	If you choose to build ThinApp applications, AdminStudio will convert the package installation into a format compatible with ThinApp. However, the ThinApp build process requires the availability of certain ThinApp tools. As a prerequisite to building a ThinApp application from AdminStudio, you must have installed ThinApp and accepted any and all license agreements. For more information, see ThinApp on the VMware website.
Password of the virtual image has changed	When you add a virtual image to a project, you are prompted for the user name and password to logon to that machine. If you entered an incorrect password or if the password has recently changed, you need to edit that machine's **Guest Password** property on the **Machines** tab. See Editing Virtual Machine Properties on the Machines Tab.
Virtual machine is corrupted, or cannot be launched	If the Automated Application Converter is attempting to connect to a virtual machine that is corrupt or cannot be launched, conversion will fail. To make sure that your virtual machines are in proper working order, attempt to launch them manually (outside of the Automated Application Converter) using the configuration tool of the virtual technology.
Virtual machine does not have network connectivity	In order for the Automated Application Converter to use a virtual machine, the virtual machine must have connectivity to your network. From the host machine, try to manually browse to the C drive of the virtual machine by entering the following address: `\\virtual_machine_name\C$`
Repackaging is taking a very long period of time	If the repackaging of a package is taking a very long period of time, you may want to verify that the value for that package's **Compressed** property is correct. If a package is in a directory that contains many other applications, and its **Compressed** property is set to **True**, the Automated Application Converter knows that only that one file needs to be copied to the virtual machine for repackaging. However, if the **Compressed** property set is set to **False**, there is no way to determine which of the files in that directory belong to the package, so all of the files in the directory must be copied to the virtual machine before repackaging can start. See Editing Package Properties on the Packages Tab.  ***Tip*** • *It is recommended that each package be placed in its own directory to avoid problems such as this one.*

Problems and Solutions

The following chart lists some typical problems that you might encounter when using the Automated Application Converter and some suggested solutions.

Table 10-65 • Solutions to Common Problems

Problem	Possible Causes	Solution
Cannot connect to a virtual machine	Virtual machine has not been prepared.	Verify that the Virtual Machine Preparation Setup (**VMCfg.exe**) was run on the virtual machine to enable automatic login. See Running the Virtual Machine Preparation Setup for instructions. ***Tip*** *• A quick way to determine if the Virtual Machine Preparation Tool has been run on a virtual image is the presence of the* ***GuestAgent.exe*** *file on the root of the* ***C:*** *drive.*
	Specified **Guest Username** or **Guest Password** property is not specified correctly.	When you add a virtual machine to the Automated Application Converter, you specify the **User name** and **Password** on the **User Credentials** panel. If you entered an incorrect value or if one of these values has changed, you will be unable to connect to the virtual machine. Open the **Machines** tab and verify that the values in the **Guest Username** and **Guest Password** properties for the virtual machine are correct. ***Note*** *• When using a domain account, do not include the domain name in the* ***Guest Username*** *property.*
Cannot connect to a Windows 7 or Windows Server 2008 virtual machine	User Account Control (UAC) settings on a Windows 7 or Windows Server 2008 virtual machine could be causing problems during auto-login.	Make sure that you run the Virtual Machine Preparation Setup on the virtual machine to disable UAC. See Running the Virtual Machine Preparation Setup.

Table 10-65 • Solutions to Common Problems (cont.)

Problem	Possible Causes	Solution
Unable to add packages from an AdminStudio Application Catalog	User does not have required login and/or view permissions on the Application Catalog.	Try to manually view packages in an AdminStudio Application Catalog to see if you have the required view permissions. Use AdminStudio Application Manager to view the packages in the Application Catalog. Also, if using an AdminStudio Application Catalog with the Software Repository, make sure you have view permission to the Software Repository location of that Application Catalog.
Cannot connect to an AdminStudio Application Catalog	There are connection issues between domains due to user name.	Try to manually connect to the Application Catalog to make sure that you are using the correct credentials or that there are no other networking issues.
Unable to publish packages to an AdminStudio Application Catalog	User does not have required permission to import/publish packages.	Try to manually publish and/or import a package to an AdminStudio Application Catalog to see if you have the required permissions: Use AdminStudio Application Manager Import Wizard to manually import a package into the Application Catalog. This enables you to determine if you have import permission. Also, if using an AdminStudio Application Catalog with the Software Repository, make sure you have write permission to the Software Repository location of that Application Catalog.
Cannot connect to a Microsoft Hyper-V Server	DCOM configuration settings need to be adjusted.	Adjust the DCOM settings, as described in this MSDN article, Connecting to WMI on a Remote Computer: http://msdn.microsoft.com/en-us/library/aa389290%28VS.85%29.aspx

Table 10-65 • Solutions to Common Problems (cont.)

Problem	Possible Causes	Solution
Copy errors are generated during package conversion	User does not have permission to the **Output Path** location specified in the Automated Application Converter.	To make sure that you have permission to the Automated Application Converter output directory, perform the following steps:  ***To specify Output Path directory:*** **1.** Open the Automated Application Converter. **2.** Select **Options** on the **Tools** menu. The **Project Options** dialog box opens. **3.** Locate the **Output Path** setting under **Conversion Options**. By default, the path is **C:\Users\[UserName]\Documents\AutoRepack**. **4.** Browse to that location using Windows Explorer to and attempt to copy a file to that location. **5.** If you are unable to copy a file to that location, change the **Output Path** to a location that you do have write permission on.
Package status changes to soft or hard timeout	The installation is requesting user input.	In order for the Automated Application Converter to perform automated repackaging, packages must support silent installation mode and the silent installation mode command line parameters must be specified in the **Command Line** property for each package. To resolve this problem, open the **Packages** tab and make sure that the package's **Command Line** property contains the command line parameters to run the installation silently.  ***Note*** • *The Automated Application Converter automatically populates the **Command Line** property for Windows Installer (**.msi**) packages that you add to the project. However, for non-MSI packages, you must manually enter the **Command Line** property.* If the **Command Line** property is specified, but you are still receiving a timeout error, you may want to try to manually run the installation using the command line parameters to make sure that the installation is not requesting any user input.

Table 10-65 • Solutions to Common Problems (cont.)

Problem	Possible Causes	Solution
App-V application does not launch	VM does not have App-V client installed	If you are able to connect to the virtual machine, but the App-V package will not launch, make sure that the App-V client is installed on the virtual machine. Also, make sure that App-V file streaming is enabled on the virtual machine.  ***Note*** • *When you select* ***Launch Package for Testing****, you are prompted to* ***Install the Microsoft App-V Clien****t on the* ***Select Virtual Machine*** *panel. See Testing Packages.*
Cannot build a ThinApp package	ThinApp application is not installed.	To create a ThinApp application, you are required to have ThinApp installed on the same machine as the Automated Application Converter.
Cannot connect to Hyper-V server	Hyper-V configuration tools are not installed.	Make sure that the Hyper-V configuration tools are installed on the Hyper-V Server's Hyper-V Microsoft Management Console.
Virtualization Readiness status of a package is "Unknown" (?)	Location of source files is no longer accessible.	When you originally added the package to your Automated Application Converter project, you were able to access the source files, but now the source files are either no longer there or you no longer have permission to access them.

Table 10-65 • Solutions to Common Problems (cont.)

Problem	Possible Causes	Solution
Repackaging is taking a long time	It is taking a long time to copy the files required for repackaging to the virtual machine and back to the host machine.	Try to copy the files manually from the host machine to the virtual machine to attempt to identify the cause of the delay. For VMware, try switching the **Network connection** setting between **Bridged** and **NAT** on the virtual machine to see if it helps to improve the copy speed.
	The package's **Compressed** property setting is incorrect.	If a package is in a directory that contains many other applications, and its **Compressed** property is set to **True**, the Automated Application Converter knows that only that one file needs to be copied to the virtual machine for repackaging. However, if the **Compressed** property set is set to **False**, there is no way to determine which of the files in that directory belong to the package, so all of the files in the directory must be copied to the virtual machine before repackaging can start. See Editing Package Properties on the Packages Tab. ***Tip*** • *It is recommended that each package be placed in its own directory to avoid problems such as this one.*

Table 10-65 • Solutions to Common Problems (cont.)

Problem	Possible Causes	Solution
Cannot connect to a VMware virtual machine	The latest version of the VMware VIX API is not installed on the same machine as the Automated Application Converter.	If you are using VMware virtualization technology (VMware ESX or ESXi Server or a local VMware Workstation 6.5 or later), you need to have the VMware VIX API installed on the same machine as the Automated Application Converter. See VMware VIX API Requirement on the AdminStudio Machine.
	You are using VMware Workstation 7.01, but the **wrapper-config.txt** file does not identify Workstation 7.0.1	If running VMware Workstation 7.0.1, verify that the VIX **wrapper-config.txt** contains the following line that identifies a Workstation 7.0.1. For example: `# Workstation 7.0.1` `ws 9vmdb 7.0.1 Workstation-7.0.0` `player 9 vmdb 3.0.1 workstation-7.0.0`
	You are attempting to connect to a VMware ESX and a VMware Workstation image at the same time.	When performing repackaging on a VMware virtual machine using the Automated Application Converter, you should connect to either a VMware ESX/ESXi image or a VMware Workstation image, but not both at the same time.
	VIX API is not working properly on virtual machine.	If the VIX API is not working, verify that **vmrun.exe** works. You can enter **vmrun.exe /?** to get the parameters for this tool. For example, to power up a virtual image on a VMware ESX server, use this command: `C:\Program Files (x86)\VMware\VMware VIX>vmrun -h https://172.17.1.221/sdk -T esx -u root -p hostpassword -gu UserName -gp guestpassword start "[QA_ISO] Windows 7 Ultimate - 32-bit/ Windows 7 Ultimate - 32-bit.vmx"`

Best Practices for Optimal Performance

When setting up the Automated Application Converter to perform automated repackaging and conversion to virtual packages, you should following these best practices:

Table 10-66 • Best Practices

Practice	Description
Machine containing virtual images should be dedicated for use with the Automated Application Converter	Machines that contain the virtual images that you will use with the Automated Application Converter should be dedicated for use with this tool only.
Virtual machine needs adequate resources	Make sure that the machine containing the virtual images has adequate resources.

Table 10-66 • Best Practices

Practice	Description
Each package should be in its own folder	Each package that you add to an Automated Application Converter project should be in an individual folder, especially if they are uncompressed packages.
Manually test a virtual machine before adding it to an Automated Application Converter project	Before adding a virtual machine to your Automated Application Converter project, boot it up manually to make sure it is running properly. Make sure that no message boxes open (such as a `Failure to Start Service` error message) that would require user input.
Windows 7 is recommended	It is recommended that you install the Automated Application Converter on a machine running Windows 7, either 32-bit or 64-bit.
Disable unnecessary devices	On each virtual machine, disable devices that are not required, such as: • CD/DVD drives • USB Controller • Floppy drives • Sound cards
Turn off Windows Update on the virtual machines	To avoid problems with repackaging, turn off Windows Update on the virtual machines.

How to Test a Virtual Machine

If you are having trouble using a virtual machine with the Automated Application Converter, you may want to perform the following steps to manually test that virtual machine to see if it is in working order.

Task ***To manually test a virtual machine:***

1. Connect to the technology provider: Microsoft Hyper-V Server, VMware ESX or ESXi Server, or VMware Workstation 6.5 or later.
2. Use Remote Desktop to connect to the virtual machine you want to test.
3. Launch the virtual machine to make sure that it boots up properly and that you can login using the user name and password you specified when you added the virtual machine to your Automated Application Converter project.

   Tip • *If you discover that you specified an incorrect user name or password, update the* ***Guest Username*** *and* ***Guest Password*** *properties on the* ***Machines*** *tab for this machine.*
4. Check to see if a snapshot exists and that snapshot name is either **AutoRepack_Base** or that you have specified an alternate name in the **Snapshot Name** property on the **Packages** tab for that virtual machine.

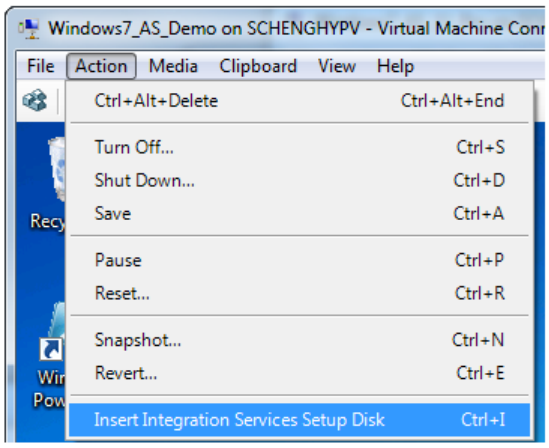
5. Manually copy the **Repackager** folder in the AdminStudio installation directory to the virtual machine to determine if you have write permission on the virtual machine.
6. Manually copy an application to the virtual machine.
7. Launch the Repackaging Wizard and repackage that application.
8. Copy the captured data from the virtual machine to the host machine in the output location specified for that package in the **Path** property on the **Packages** tab to test if you have permission to write to that location.
9. Repeat these steps for each of the virtual machines you are using with your project.

Resolving Problems Connecting to a Hyper-V Image

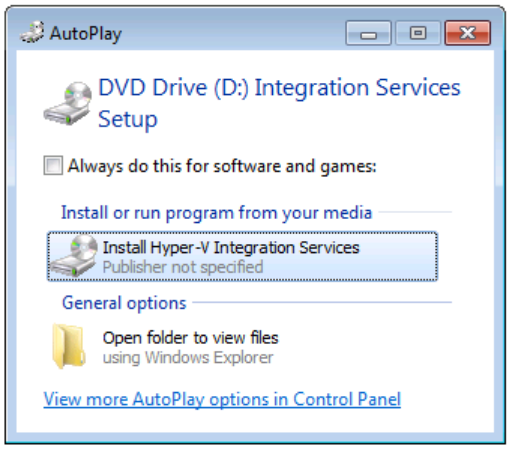
In some instances, Automated Application Converter may encounter a problem connecting to a Hyper-V image because it is failing to obtain an IP address from the Hyper-V Server. To resolve this issue, perform these steps:

Task ***To obtain IP address from Hyper-V Server:***

1. Open the image using the Hyper-V Console.
2. On the **Action** menu, select **Insert Integration Services Setup Disk**.



You will then be prompted to install the latest version of the Hyper-V Integration Services:



3. Click **Install Hyper-V Integration Services**.
4. When the installation of the Hyper-V Integration Services has completed, create a new snapshot of the Hyper-V image and name the snapshot **AutoRepack_Base**, which is the default name that the Automated Application Converter will be looking for.
5. Restart the Automated Application Converter process and attempt to connect to this Hyper-V image.

Automated Application Converter Error Messages

This section includes information on how to resolve the following error messages that could be generated by the Automated Application Converter:

- Error -4308: VM failed to start up
- Error -4309: VM failed to shut down
- Error -4310: Failed to connect to VM
- Error -4312: Failed to prepare Repackager
- Error -4313: Failed to access the package
- Error -4314: Failed to copy repackaged output from virtual machine
- Error -4315: Failed to send command to VM
- Error -4316: Failed getting response from VM
- Error -4317: Failed running pre-snapshot
- Error -4318: Failed running post-snapshot
- Error -4319: Failed running package installation
- Error -4320: Failed creating folder on VM
- Error -4333: Preparing command-line...
- Error -4380: Failed to prepare AppV
- Error -4388: Failed preparing for pre-snapshot

- Error -4389: Failed connecting to server
- Error -4390: Failed connecting to image
- Error -4391: Failed to reboot
- Error -4395: Failed to create VM directory
- Error -4409: Failed to delete package cache folder

Debug Messages in the Automated Application Converter Log Report

By default, debug messages that occur during a conversion run are saved in the AdminStudio Automated Application Converter Log report, but the display of those debug messages is turned off. However, if you are using Microsoft Internet Explorer 8 as your default browser, you can choose to view those debug messages. See Viewing Debug Messages for instructions.

Error -4308: VM failed to start up

The following table documents this message:

Table 10-67 • Error -4308: VM failed to start up

Category	Description
Message:	`Error -4308 controlling virtual machine: VM failed to start up`
Cause:	Automated Application Converter is unable to access this VMware virtual machine due to a failure to login to the virtual machine server or into the guest virtual machine.
Resolution:	Open the **Machines** tab and verify that the following properties are set correctly for this virtual machine: • **Machine Settings**—Verify the **Guest Username** and **Guest Password** properties. • **Virtual Machine Server**—Verify the **Server Username** and **Server Password** properties.

Error -4309: VM failed to shut down

The following table documents this message:

Table 10-68 • Error -4309: VM failed to shut down

Category	Description
Message:	`Error -4309 controlling virtual machine: VM failed to shut down`
Cause:	Automated Application Converter is unable to access this machine virtual machine in order to shut it down.

Table 10-68 • Error -4309: VM failed to shut down

Category	Description
Resolution:	Open the **Machines** tab and verify that the following properties are set correctly for this virtual machine: • **Machine Settings**—Verify the **Guest Username** and **Guest Password** properties. • **Virtual Machine Server**—Verify the **Server Username** and **Server Password** properties.

Error -4310: Failed to connect to VM

The following table documents this message:

Table 10-69 • Error -4310: Failed to connect to VM

Category	Description
Message:	`Error -4310 controlling virtual machine: Failed to connect to VM`
Cause:	This error could be caused by the following reasons: • Virtual machine was unexpectedly shut down early. • Operating system on the virtual machine does not launch. • The Guest Agent is not running on the virtual machine. • Permissions to the virtual machine are incorrect. • Virtual machine **AutoRepack_Base** snapshot was taken before the machine was powered off.
Resolution:	To resolve this error, try the following: • After you have run the Virtual Machine Preparation Tool on this virtual machine, verify that the snapshot launches, automatically logs into the virtual machine, and that the Guest Agent opens. • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Do not shut down the virtual machine in the middle of using it. • Make sure that you power off the virtual machine before taking the `AutoRepack_Base` snapshot.

Error -4312: Failed to prepare Repackager

The following table documents this message:

Table 10-70 • Error -4312: Failed to prepare Repackager

Category	Description
Message:	`Error -4312 controlling virtual machine: Failed to prepare Repackager`
Cause:	The Automated Application Converter could not read the Repackager source location or could not write to the Repackager cache location.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties under **Machine Settings** on the **Machines** tab for this virtual machine are set correctly. • Verify that the virtual machine's **Repackager Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive.

Error -4313: Failed to access the package

The following table documents this message:

Table 10-71 • Error -4313: Failed to access the package

Category	Description
Message:	`Error -4313 processing package: Failed to access the package`
Cause:	The Automated Application Converter could not read from the package source location or could not write to the package cache location.
Resolution:	To resolve this error, try the following: • Ensure that the host machine has access to the network and is visible to/accessible from the virtual machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • If the package is on a network share, verify that both the host machine and virtual machine have access to that network share. • Verify that the virtual machine's **Setup Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive. • Verify that the package does not already exist as read-only.

Error -4314: Failed to copy repackaged output from virtual machine

The following table documents this message:

Table 10-72 • Error -4314: Failed to copy repackaged output from virtual machine

Category	Description
Message:	`Error -4314 controlling virtual machine: Failed to copy repackaged output from virtual machine`
Cause:	The virtual machine could not read the output cache location, or could not write to the project output location.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the virtual machine's **Output Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive. • If the project **Output Path** is set to a network share, verify that the host machine has access to that network share.

Error -4315: Failed to send command to VM

The following table documents this message:

Table 10-73 • Error -4315: Failed to send command to VM

Category	Description
Message:	`Error -4315 controlling virtual machine: Failed to send command to VM`
Cause:	There was a network error sending a command from the host machine to the Guest Agent on the virtual machine.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the Guest Agent running on the virtual machine has not crashed. • Update the Guest Agent on the virtual machine by running the latest version of the Virtual Machine Preparation Tool (**VMCfg.exe**) and taking a new snapshot.

Error -4316: Failed getting response from VM

The following table documents this message:

Table 10-74 • Error -4316: Failed getting response from VM

Category	Description
Message:	`Error -4316 controlling virtual machine: Failed getting response from VM`
Cause:	The Automated Application Converter did not receive a response from the virtual machine.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the Guest Agent running on the virtual machine has not crashed. • Update the Guest Agent on the virtual machine by running the latest version of the Virtual Machine Preparation Tool (**VMCfg.exe**) and taking a new snapshot.

Error -4317: Failed running pre-snapshot

The following table documents this message:

Table 10-75 • Error -4317: Failed running pre-snapshot

Category	Description
Message:	`Error -4317 processing package: Failed running pre-snapshot`
Cause:	The virtual machine could not create the output cache location or could not run Repackager.
Resolution:	To resolve this error, try the following: • Ensure that the host machine has access to the network and is visible to/accessible from the virtual machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Output Cache Path** and **Repackager Cache Path** properties on the **Machines** tab for this virtual machine are set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive. • Consider changing the **Repackaging Method** property for the package to **Installation monitoring**, which would eliminate the need for a pre-snapshot.

Error -4318: Failed running post-snapshot

The following table documents this message:

Table 10-76 • Error -4318: Failed running post-snapshot

Category	Description
Message:	`Error -4318 processing package: Failed running post-snapshot`
Cause:	The virtual machine could not run Repackager.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Output Cache Path** and **Repackager Cache Path** properties on the **Machines** tab for this virtual machine are set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive. • Consider changing the **Repackaging Method** property for the package to **Installation monitoring**, which would eliminate the need for a post-snapshot.

Error -4319: Failed running package installation

The following table documents this message:

Table 10-77 • Error -4319: Failed running package installation

Category	Description
Message:	`Error -4319 processing package: Failed running package installation`
Cause:	The virtual machine could not run Repackager or the virtual machine could not launch the application.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Setup Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive.

Error -4320: Failed creating folder on VM

The following table documents this message:

Table 10-78 • Error -4320: Failed creating folder on VM

Category	Description
Message:	`Error -4320 processing package: Failed creating folder on VM`
Cause:	Virtual machine was unable to create the Setup Cache folder. ***Note*** • *This error may be related to Error -4313: Failed to access the package.*
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Setup Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive.

Error -4333: Preparing command-line...

The following table documents this message:

Table 10-79 • Error -4333: Preparing command-line...

Category	Description
Message:	`Error -4333 processing package: Preparing command-line...`
Cause:	The virtual machine could not query the associated program for the provided extension.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the package's source file (as specified in the **Setup Cache Path** property on the **Machines** tab) can run when double-clicked on the virtual machine. • If any special tools are required (script engines, etc.) to run the command line, install them on the virtual machine and retake the snapshot.

Error -4380: Failed to prepare AppV

The following table documents this message:

Table 10-80 • Error -4380: Failed to prepare AppV

Category	Description
Message:	`Error -4380 controlling virtual machine: Failed to prepare AppV`
Cause:	The virtual machine was unable to read the App-V client installation sources, or was unable to write to the Setup Cache Path.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify App-V Client installation folder was specified correctly on the Select Virtual Machine Dialog Box. • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Setup Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive.

Error -4388: Failed preparing for pre-snapshot

The following table documents this message:

Table 10-81 • Error -4388: Failed preparing for pre-snapshot

Category	Description
Message:	`Error -4388 processing package: Failed preparing for pre-snapshot`
Cause:	The virtual machine was unable to write to the Output Cache Path.
Resolution:	To resolve this error, try the following: • Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Output Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive.

Error -4389: Failed connecting to server

The following table documents this message:

Table 10-82 • Error -4389: Failed connecting to server

Category	Description
Message:	`Error -4389 controlling virtual machine: Failed connecting to server`
Cause:	The Automated Application Converter was unable to connect to the virtual machine server. The server machine may be unavailable.
Resolution:	To resolve this error, try the following: • Verify that the **Server Address**, **Server Username**, and **Server Password** properties under **Virtual Machine Server** on the **Machines** tab are set correctly for this virtual machine. • Verify that the Hyper-V or VMware ESX/ESXi server is running. • Ensure that the virtual server has access to the network and is visible to/accessible from the host machine (if it is running on a different computer). • If you are using VMware and you received XE values 22002 (55F2) or 22003 (55F3), verify that the VMware VIX API is installed. See VMware VIX API Requirement on the AdminStudio Machine.

Error -4390: Failed connecting to image

The following table documents this message:

Table 10-83 • Error -4390: Failed connecting to image

Category	Description
Message:	`Error -4390 controlling virtual machine: Failed connecting to image`
Cause:	The Automated Application Converter was unable to connect to the virtual machine. The virtual machine may be unavailable or the virtual machine credentials may be incorrect.
Resolution:	To resolve this error, try the following: • Verify that the virtual machine has not been deleted. • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • If you are using VMware ESXi Server and you received an XE value of 0020 (corresponding to a `VIX_E_LICENSE` error), this indicates that you may need to purchase a license for your VMware ESXi Server in order to use it with the Automated Application Converter.

Error -4391: Failed to reboot

The following table documents this message:

Table 10-84 • Error -4391: Failed to reboot

Category	Description
Message:	`Error -4391 controlling virtual machine: Failed to reboot`
Cause:	The Automated Application Converter could not access the virtual machine.
Resolution:	To resolve this error, try the following: • Verify that the **Server Address**, **Server Username**, and **Server Password** properties under **Virtual Machine Server** on the **Machines** tab are set correctly for this virtual machine. • Attempt to launch the virtual machine manually to ensure that it has not become corrupted.

Error -4395: Failed to create VM directory

The following table documents this message:

Table 10-85 • Error -4395: Failed to create VM directory

Category	Description
Message:	`Error -4395 controlling virtual machine: Failed to create VM directory`
Cause:	Virtual machine could not create a directory.
Resolution:	To resolve this error, try the following: • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the virtual machine's **Output Cache Path** property on the **Machines** tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a **C:** drive. • Verify that the package's **Package** field does not include any characters that are invalid for a file name.

Error -4409: Failed to delete package cache folder

The following table documents this message:

Table 10-86 • Error -4409: Failed to delete package cache folder

Category	Description
Message:	`Error -4409 processing package: Failed to delete package cache folder`
Cause:	Virtual machine could not delete a directory. ***Note*** • *This error may be related to Error -4313: Failed to access the package.*
Resolution:	To resolve this error, try the following: • Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly. • Verify that the file or its containing folder is not locked due to being open in Windows Explorer, the Command Window, etc.

Virtualization Conversion Error Messages

When converting a Windows Installer package to a virtual application, error and warning messages are generated. Some of these messages are generic to package virtualization, and others are specific to the virtualization solution you are preparing packages for.

This section includes information on how to resolve error messages that could be generated by during virtualization using the Automated Application Converter, App-V Assistant, VMware ThinApp Assistant, and Citrix Assistant.

Error -9000: Unknown Exception

The following table documents this message:

Table 10-87 • Error -9000: Unknown Exception

Category	Description
Type:	Error
Message:	`An unknown exception occurred.`
Cause:	This is an unexpected internal error.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9001: Unknown COM

The following table documents this message:

Table 10-88 • Error -9001: Unknown COM

Category	Description
Type:	Error
Message:	`Internal error.`
Resolution:	Contact AdminStudio Technical Support.

Error -9002: Error Opening Package

The following table documents this message:

Table 10-89 • Error -9002: Error Opening Package

Category	Description
Type:	Error
Message:	`An error occurred when opening the package.`
Cause:	This is an unexpected internal error when reading the Windows Installer package.
Resolution:	Check to make sure that the package is accessible to the user. If the error persists and the package is on a network share, copy the package locally (to avoid any network connection issues) and try again. If this does not solve the problem, perform these additional investigational steps and then contact AdminStudio Technical Support.

Error -9003: Error Saving Package

The following table documents this message:

Table 10-90 • Error -9003: Error Saving Package

Category	Description
Type:	Error
Message:	`An error occurred when saving the package.`
Cause:	This is an unexpected internal error when trying to save the Citrix profile.

Table 10-90 • Error -9003: Error Saving Package

Category	Description
Resolution:	Check to see if the user has proper access to the location the profile is being built to. If this does not solve the problem, perform these additional investigational steps and then contact AdminStudio Technical Support.

Error -9004: Process Cancelled By User

The following table documents this message:

Table 10-91 • Error -9004: Process Cancelled By User

Category	Description
Type:	Error
Message:	`Process cancelled by user.`
Cause:	The user clicked the **Cancel** button to stop the build.
Resolution:	Restart the build process.

Error -9005: Error Creating Temporary Folder

The following table documents this message:

Table 10-92 • Error -9005: Error Creating Temporary Folder

Category	Description
Type:	Error
Message:	`An error occurred while creating a temporary folder`
Cause:	You encounter this error when the user does not have permission to write to **C:\TMP**, or the drive is out of disk space.
Resolution:	Obtain write access to **C:\TMP**, and free some disk space on the drive, and then rebuild the profile.

Error -9006: Error Decompressing Package

The following table documents this message:

Table 10-93 • Error -9006: Error Decompressing Package

Category	Description
Type:	Error
Message:	`An error occurred while decompressing the package 'PackageName'.`
Cause:	You encounter this error when the package is a compressed Windows Installer package (**.msi**) and errors were generated when AdminStudio attempted to perform an administrative installation to extract the files.
Resolution:	When this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the Windows Installer Help Library to determine the cause of the problem. If you did not receive a return error code from Windows Installer, this error could have been caused by the package not being authored properly. In the Windows Installer package, check to see if the **AdminExecuteSequence** table was defined. If that table is missing, the package cannot be decompressed.

Error -9007: File With Extension Not Found

The following table documents this message:

Table 10-94 • Error -9007: File With Extension Not Found

Category	Description
Type:	Error
Message:	`No file found with the extension 'ComponentKeyName'.`
Cause:	This is an unexpected error that occurred when file extensions were being processed.
Resolution:	Check to make sure that the executable for the file extension exists and that it is set as the key file in its component.

Error -9008: Error Extracting Icon

The following table documents this message:

Table 10-95 • Error -9008: Error Extracting Icon

Category	Description
Type:	Error
Message:	`An error occurred while extracting the icon 'IconKeyName'`
Cause:	This is an unexpected error that occurred when an icon listed in the **Icon** table was being extracted.
Resolution:	Verify that the **Icon** entry in the **Icon** table is valid. If necessary, replace it with a valid icon.

Error -9009: Unknown Provider

The following table documents this message:

Table 10-96 • Error -9009: Unknown Provider

Category	Description
Type:	Error
Message:	`The specified provider is unknown 'ProviderName'.`
Cause:	This is an unexpected internal error.
Resolution:	Invalid data may have been modified via the Direct Editor causing this error. Delete the **Release** you are building, and then create a new one and rebuild.

Error -9010: Invalid Target File Name

The following table documents this message:

Table 10-97 • Error -9010: Invalid Target File Name

Category	Description
Type:	Error
Message:	`The target file name is invalid. 'FileName'`
Cause:	This is an unexpected internal error.

Table 10-97 • Error -9010: Invalid Target File Name

Category	Description
Resolution:	Invalid data may have been modified via the Direct Editor causing this error. Verify the **Name** field on the Citrix Assistant / ThinApp Assistant **Profile Information** page and make sure the name does not contain any invalid file name characters.

Error -9011: Error Reading MSI Table

The following table documents this message:

Table 10-98 • Error -9011: Error Reading MSI Table

Category	Description
Type:	Error
Message:	`Unexpected error reading MSI table 'TableName'`
Cause:	This is an unexpected error that occurred when the specified Windows Installer table was being processed.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9012: Unexpected Error in Method

The following table documents this message:

Table 10-99 • Error -9012: Unexpected Error in Method

Category	Description
Type:	Error
Message:	`Unexpected error in method 'MethodName'`
Cause:	This is an unexpected internal error.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9013: Type Library Not Found

The following table documents this message:

Table 10-100 • Error -9013: Type Library Not Found

Category	Description
Type:	Error
Message:	`Type library not found: 'TypeLibraryName'`
Cause:	You encounter this error when a type library file was not found when trying to extract COM information.
Resolution:	Check to see if the type library file exists in the proper location when building the profile. If this does not resolve the problem, perform these additional investigational steps and then contact AdminStudio Technical Support.

Error -9014: ShellExecute Failed

The following table documents this message:

Table 10-101 • Error -9014: ShellExecute Failed

Category	Description
Type:	Error
Message:	`ShellExecute failed: 'CommandLine'`
Cause:	You encounter this error when the specified command line failed to launch a process.
Resolution:	Check to see if the executable file name shown is a valid file and that the user has the proper access rights to run it. If this does not resolve the problem, perform these additional investigational steps and then contact AdminStudio Technical Support.

Error -9015: Unable to Determine Full Path for Driver

The following table documents this message:

Table 10-102 • Error -9015: Unable to Determine Full Path for Driver

Category	Description
Type:	Warning
Message:	`Unable to determine the full path for driver 'DriverName'`

Table 10-102 • Error -9015: Unable to Determine Full Path for Driver

Category	Description
Cause:	You encounter this error when a driver referenced in the **ODBCDataSource** table is not being installed by the package.
Resolution:	This error can be resolved in one of two ways: **Editing the Windows Installer Package** 1. Edit the package using InstallShield Direct Edit Mode. 2. Navigate to the **ISVirtualPackage** table. 3. Create an entry as follows to identify the full path of the missing driver: **Name**: **<DriverName> Description** **Value**: **Path to Driver** **Manually Installing the Driver** Install the missing driver on your machine and then rebuild the Citrix profile.

Warning -9016: Contents of Table Ignored

The following table documents this message:

Table 10-103 • Warning -9016: Contents of Table Ignored

Category	Description
Type:	Warning
Message:	`Contents of table 'TableName' will be ignored`
Cause:	This error message identifies a known limitation of Citrix conversion.
Resolution:	If the contents of the table is deemed critical, repackage the application, and then rebuild the Citrix profile.

Warning -9017: .NET 1.x Assembly Not Supported

The following table documents this message:

Table 10-104 • Warning -9017: .NET 1.x Assembly Not Supported

Category	Description
Type:	Warning
Message:	`Assembly 'AssemblyName' is a .NET 1.x assembly and will not be converted correctly. Only .NET 2.0/3.0 assemblies are currently supported. You may wish to repackage this package first.`
Cause:	You encounter this error when attempting to convert a package containing a .NET 1.x assembly. Only .NET 2.0/3.0 assemblies are currently supported.
Resolution:	Repackage the application, and then rebuild the Citrix profile.

Warning -9018: Custom Actions Ignored

The following table documents this message:

Table 10-105 • Warning -9018: Custom Actions Ignored

Category	Description
Type:	Warning
Message:	`Custom action 'CustomActionName' will be ignored.`
Cause:	When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile. ***Note*** • *When a custom action that does not modify the system or perform any part of the installation (such as an InstallShield Editor predefined custom action or a Type 19 custom action) is encountered, no message is generated. If a Type 51 custom action is encountered (which sets a property from a formatted text string), it is automatically resolved. If a Type 35 custom action is encountered, it is only resolved if it is referenced in the* ***Directory*** *table.*

Table 10-105 • Warning -9018: Custom Actions Ignored

Category	Description
Resolution:	The resolution that you should perform depends upon the purpose of the custom action: • If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning. • If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue. To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application.  ***To repackage a Windows Installer package to capture custom action functionality:*** **1.** Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project. **2.** Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.

Warning -9019: Conditionalized Components

The following table documents this message:

Table 10-106 • Warning -9019: Conditionalized Components

Category	Description
Type:	Warning
Message:	`There exist one or more conditionalized components which may not be converted correctly`
Cause:	This warning is generated when attempting to convert conditionalized components because conditions on components are not evaluated.
Resolution:	Repackage the application on a machine that has a similar environment to the machines where the profile will be deployed. Then rebuild the Citrix profile. You can also evaluate the conditions on the listed components and remove the components you know are not needed for your target machines. Then rebuild the Citrix profile.

Error -9020: Directory With Null Parent

The following table documents this message:

Table 10-107 • Error -9020: Directory With Null Parent

Category	Description
Type:	Error
Message:	`Directory 'DirectoryName' has a null parent and will be ignored.`
Cause:	This error occurs if a directory table entry (other than `TARGETDIR`) is null.
Resolution:	Evaluate the ThinApp application to see if it works. If it does not work properly, you may want to consider repackaging the package.

Error -9021: Unable to Extract COM Data

The following table documents this message:

Table 10-108 • Error -9021: Unable to Extract COM Data

Category	Description
Type:	Error
Message:	`Unable to extract COM data for 'FileName'`
Cause:	This Windows Installer package has an entry in the **TypeLib** or **SelfReg** table that contains COM data that AdminStudio cannot convert to application data. Depending upon which file cannot be COM extracted, it is possible that this application will still work properly in Citrix XenApp isolation environment if you repackage this Windows Installer package with COM table mapping turned off. COM data is stored in the Windows Registry. So, if you repackage this Windows Installer package, the capture process will be able to obtain all of this data because it captures all modifications to the Registry and does not have to rely on COM extraction.
Resolution:	To resolve this issue, you need to repackage your Windows Installer package with COM table mapping turned off.

Error -9022: Complus Table

The following table documents this message:

Table 10-109 • Error -9022: Complus Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'Complus'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **Complus** table. During the conversion process, the **Complus** table is not read.
Resolution:	The **Complus** table contains information needed to install COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support *installing* COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.

Error -9024: FileSFPCatalog

The following table documents this message:

Table 10-110 • Error -9024: FileSFPCatalog

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'FileSFPCatalog'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **FileSFPCatalog** table. During the conversion process, the **FileSFPCatalog** table is not read.
Resolution:	The **FileSFPCatalog** table associates specified files with the catalog files used by system file protection. If this file is necessary for the function of the application, you need to use Repackager to repackage the application.

Warning -9026: LaunchCondition Table

The following table documents this message:

Table 10-111 • Warning -9026: LaunchCondition Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'LaunchCondition'.`

Table 10-111 • Warning -9026: LaunchCondition Table

Category	Description
Cause:	You encounter this warning when the Windows Installer package that you are converting includes a **LaunchCondition** table. During the conversion process, the **LaunchCondition** table is not read.
Resolution:	The **LaunchCondition** table contains a list of conditions that all must be satisfied for the installation to begin. For example, if an application requires Windows 7 to run, Windows 7 is listed in the **LaunchCondition** table. Because this table is not read, no check is performed. Therefore, when a user on an operating system other than Windows 7 launches this Citrix profile, the application may not function properly. To resolve this issue, perform one of the following tasks: • **Option 1: Set Requirements on the Profile Requirements Page**—If the launch conditions only include operating system, service pack, and language requirements, open this package in the InstallShield Editor Citrix Assistant / ThinApp Assistant, and set those Operating System and Language requirements on the **Profile Requirements** page. Then deploy this application as a Citrix profile. • **Option 2: Determine if Launch Conditions are Met**—Review the launch conditions listed in the table, and determine if the desktops in your enterprise meet those requirements. If all of the desktops meet those requirements, you can deploy this application as a Citrix profile. If the desktops do not meet those requirements (such as having Internet Explorer 6.0 instead of 7.0), upgrade those desktops to meet these requirements, and then deploy this application as a Citrix profile.

Warning -9027: LockPermissions Table

The following table documents this message:

Table 10-112 • Warning -9027: LockPermissions Table

Category	Description
Type	Warning
Message:	`The conversion process does not support data in the MSI table 'LockPermissions'.`
Cause:	You encounter this warning when the Windows Installer package that you are converting includes a **LockPermissions** table. During the conversion process, the **LockPermissions** table is not read.

Table 10-112 • Warning -9027: LockPermissions Table

Category	Description
Resolution:	The **LockPermissions** table is used to secure individual portions of your application (files, registry keys, and created folders) in a locked-down environment. Citrix does not support permissions on files, registry keys, or created folders. You cannot modify permissions on any of the application's ACLs (access control lists). Because users will have full permissions when running this application in the isolation environment, this warning will not result in any problems.

Error -9028: MoveFile Table

The following table documents this message.

Table 10-113 • Error -9028: MoveFile Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'MoveFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **MoveFile** table. During the conversion process, the **MoveFile** table is not read.
Resolution:	This **MoveFile** table contains a list of files to be moved or copied from a specified source directory to a specified destination directory. Because this table is not read, you need to do one of the following to resolve this issue: • **Option 1: Edit the Windows Installer Package**—Open the Windows Installer package in InstallShield Editor and modify it to eliminate the use of the **MoveFile** table by installing additional files in the specified directories. • **Option 2: Repackage the Application**—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package. • **Option 3: Write a Pre-Launch Script**—Write a pre-launch script that performs the file moving operations identified in the **MoveFile** table upon application launch.

Error -9029: MsiDriverPackages Table

The following table documents this message:

Table 10-114 • Error -9029: MsiDriverPackages Table

Category	Description
Type:	Error

Table 10-114 • Error -9029: MsiDriverPackages Table

Category	Description
Message:	`The conversion process does not support data in the MSI table 'MsiDriverPackages'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **MsiDriverPackages** table. During the conversion process, the **MsiDriverPackages** table is not read.
Resolution:	The **MsiDriverPackages** table includes one record for each driver package component in the application. Citrix XenApp does not support any type of driver. For example, when installing a printer, you can install the printer software within the isolation environment, but not the printer drivers. Therefore, to resolve this issue, you need to install any required drivers outside of the isolation environment on the user desktop machines.

Warning -9030: ODBCTranslator Table

The following table documents this message:

Table 10-115 • Warning -9030: ODBCTranslator Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'ODBCTranslator'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ODBCTranslator** table. During the conversion process, the **ODBCTranslator** table is not read.
Resolution:	The **ODBCTranslator** table lists the ODBC translators belonging to the installation. ODBC translators translate one form of raw data into another form that can be used with a specific database type. Ignoring the **ODBCTranslator** table should not prevent your application from functioning properly. However, if it does, you need to use Repackager to repackage the application.

Warning -9031: RemoveFile Table

The following table documents this message:

Table 10-116 • Warning -9031: RemoveFile Table

Category	Description
Type:	Warning

Table 10-116 • Warning -9031: RemoveFile Table

Category	Description
Message:	`The conversion process does not support data in the MSI table 'RemoveFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **RemoveFile** table. During the conversion process, the **RemoveFile** table is not read. This warning is displayed only if the application installation removes files during install (not uninstall).
Resolution:	The **RemoveFile** table contains a list of files to be removed. If this file removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue. However, if the existence of the files listed in the **RemoveFile** table prevents the application from functioning, you need to set the isolation option of the files to **Ignore** so that they are not visible to the isolation environment. The **Ignore** option directs the isolation environment to always look for the file on the system (ignoring the one inside the isolation environment).

Warning -9032: RemoveIniFile Table

The following table documents this message:

Table 10-117 • Warning -9032: RemoveIniFile Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'RemoveIniFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **RemoveIniFile** table. During the conversion process, the **RemoveIniFile** table is not read.
Resolution:	The **RemoveIniFile** table contains the information an application needs to delete from a **.ini** file. If the removal of this entry is necessary for the function of the application, you need to use Repackager to repackage the application.

Warning -9033: RemoveRegistry Table

The following table documents this message:

Table 10-118 • Warning -9033: RemoveRegistry Table

Category	Description
Type:	Warning
Message:	`The conversion process does not support data in the MSI table 'RemoveRegistry'.`

Table 10-118 • Warning -9033: RemoveRegistry Table

Category	Description
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **RemoveRegistry** table. During the conversion process, the **RemoveRegistry** table is not read.
Resolution:	The **RemoveRegistry** table contains the registry information the application needs to delete from the system registry. If this removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue. However, if the existence of the registry keys listed in the **RemoveRegistry** table prevents the application from functioning, you need to set the isolation option of the registry keys to **Ignore** so that they are not visible to the isolation environment. The **Ignore** option directs the isolation environment to always look for the registry key on the system (ignoring the one inside the isolation environment).

Error -9036: ISCEInstall Table

The following table documents this message:

Table 10-119 • Error -9036: ISCEInstall Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISCEInstall'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISCEInstall** table. During the conversion process, the **ISCEInstall** table is not read.
Resolution:	The **ISCEInstall** table is used to install Windows Store mobile apps. The conversion of mobile apps to Citrix XenApp profiles is not supported.

Error -9037: ISComPlusApplication Table

The following table documents this message:

Table 10-120 • Error -9037: ISComPlusApplication Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISComPlusApplication'.`

Table 10-120 • Error -9037: ISComPlusApplication Table

Category	Description
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISComPlusApplication** table. During the conversion process, the **ISComPlusApplication** table is not read.
Resolution:	The **ISComPlusApplication** table contains information about COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support *installing* COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.

Error -9038: ISPalmApp Table

The following table documents this message:

Table 10-121 • Error -9038: ISPalmApp Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISPalmApp'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISPalmApp** table. During the conversion process, the **ISPalmApp** table is not read.
Resolution:	The **ISPalmApp** table is used to install Palm mobile apps. The conversion of mobile apps to Citrix XenApp profiles is not supported.

Error -9039: ISSQLScriptFile Table

The following table documents this message:

Table 10-122 • Error -9039: ISSQLScriptFile Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISSQLScriptFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISSQLScriptFile** table. During the conversion process, the **ISSQLScriptFile** table is not read.

Table 10-122 • Error -9039: ISSQLScriptFile Table

Category	Description
Resolution:	The **ISSQLScriptFile** table lists SQL scripts. When a Windows Installer package is installed, it can run an SQL script to update a database. An application running as a Citrix profile cannot update a database. To resolve this issue, you need to update the database prior to using the converted Citrix profile using one of the following methods: • Use scripts to update the database manually. • Update it by running the Windows Installer installation on one of the machines in your network that has access to that database.

Error -9040: ISVRoot Table

The following table documents this message:

Table 10-123 • Error -9040: ISVRoot Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISVRoot'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISVRoot** table. During the conversion process, the **ISVRoot** table is not read.
Resolution:	The **ISVRoot** table installs a website. An application running as a Citrix profile in an isolation environment cannot create a website. Therefore, creating Citrix profiles for applications that create websites during installation is not supported.

Error -9041: ISXmlFile Table

The following table documents this message:

Table 10-124 • Error -9041: ISXmlFile Table

Category	Description
Type:	Error
Message:	`The conversion process does not support data in the MSI table 'ISXmlFile'.`
Cause:	You encounter this error when the Windows Installer package that you are converting includes a **ISXmlFile** table. During the conversion process, the **ISXmlFile** table is not read.

Table 10-124 • Error -9041: ISXmlFile Table

Category	Description
Resolution:	The **ISXmlFile** table modifies XML files. If the modification of XML files is required in order for this application to operate properly, you need to use Repackager to repackage this application.

Error -9051: Package Decompression Canceled

The following table documents this message:

Table 10-125 • Error -9051: Package Decompression Canceled

Category	Description
Type:	Error
Message:	`Package decompression canceled by the user`
Cause:	The user cancelled the process of decompression of compressed MSI packages.

Error -9100: CreateInstance of Package Object Failed

The following table documents this message:

Table 10-126 • Error -9100: CreateInstance of Package Object Failed

Category	Description
Type:	Error
Message:	`CreateInstance of the Citrix package object failed.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9101: Create Operation of Package Object Failed

The following table documents this message:

Table 10-127 • Error -9101: Create Operation of Package Object Failed

Category	Description
Type:	Error
Message:	`Create operation on Citrix package object failed 'ObjectName'.`

Table 10-127 • Error -9101: Create Operation of Package Object Failed

Category	Description
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9102: Failed to Write Header Information

The following table documents this message:

Table 10-128 • Error -9102: Failed to Write Header Information

Category	Description
Type:	Error
Message:	`Failed to write package header information.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9103: Citrix Finalization Failed

The following table documents this message:

Table 10-129 • Error -9103: Citrix Finalization Failed

Category	Description
Type:	Error
Message:	`Citrix Finalization Failed`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9104: Citrix Save Failed

The following table documents this message:

Table 10-130 • Error -9104: Citrix Save Failed

Category	Description
Type:	Error
Message:	`Citrix Save Failed`
Cause:	Unexpected internal error. This error may sometimes occur when the profile is to be digitally signed.
Resolution:	Deselect the option to digitally sign the Citrix profile and then rebuild it.

Error -9105: Error Initializing Citrix Writer

The following table documents this message:

Table 10-131 • Error -9105: Error Initializing Citrix Writer

Category	Description
Type:	Error
Message:	`Unexpected error initializing Citrix writer`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9106: Error Initializing Citrix Package

The following table documents this message:

Table 10-132 • Error -9106: Error Initializing Citrix Package

Category	Description
Type:	Error
Message:	`Unexpected error initializing Citrix package`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9107: Error Writing Citrix File Entries

The following table documents this message:

Table 10-133 • Error -9107: Error Writing Citrix File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix file entries.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9108: Error Determining Source File Path

The following table documents this message:

Table 10-134 • Error -9108: Error Determining Source File Path

Category	Description
Type:	Error
Message:	`Unexpected error determining source file path for 'FileName'`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9109: Error Writing Citrix Folder Entries

The following table documents this message:

Table 10-135 • Error -9109: Error Writing Citrix Folder Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix folder entries`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9110: Error Writing Citrix Registry Entries

The following table documents this message:

Table 10-136 • Error -9110: Error Writing Citrix Registry Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix registry entries`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps and contact AdminStudio Technical Support.

Error -9113: Error Writing Citrix INI File Entries

The following table documents this message:

Table 10-137 • Error -9113: Error Writing Citrix INI File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix INI file entries`
Cause:	Unexpected internal error.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9114: Error Writing Citrix Shortcuts

The following table documents this message:

Table 10-138 • Error -9114: Error Writing Citrix Shortcuts

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix shortcuts`
Cause:	A catastrophic error has occurred while writing shortcuts to the profile.
Resolution:	Verify that shortcuts point to a valid file. Try to narrow down issue by only keeping one shortcut and then try to rebuild.

Error -9115: Error Saving Citrix Profile

The following table documents this message:

Table 10-139 • Error -9115: Error Saving Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error saving Citrix profile`
Cause:	A catastrophic error has occurred while saving the Citrix profile.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9116: Error Creating Empty Citrix Profile

The following table documents this message:

Table 10-140 • Error -9116: Error Creating Empty Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error creating empty Citrix profile`
Cause:	AdminStudio is unable to create a new internal instance of a Citrix profile.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9117: Error Creating Intermediate Folder

The following table documents this message:

Table 10-141 • Error -9117: Error Creating Intermediate Folder

Category	Description
Type:	Error
Message:	`Unexpected error creating intermediate folder`
Cause:	AdminStudio is unable to create the intermediate folder used for the build. This error could occur if the user does not have permission to write to **C:\TMP**.
Resolution:	Obtain write access to **C:\TMP** and then rebuild the profile.

Error -9118: Error Initializing Citrix Profile

The following table documents this message:

Table 10-142 • Error -9118: Error Initializing Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error initializing Citrix profile.`
Cause:	The initial values on the new profile could not be set.
Resolution:	Check the package name, description, version, and security settings for any possible causes.

Error -9119: Error Creating Default Target in Citrix Profile

The following table documents this message:

Table 10-143 • Error -9119: Error Creating Default Target in Citrix Profile

Category	Description
Type:	Error
Message:	`Unexpected error creating default target in Citrix profile`
Cause:	Initial target in the new profile could not be created.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9120: Error Deleting File From Profile

The following table documents this message:

Table 10-144 • Error -9120: Error Deleting File From Profile

Category	Description
Type:	Error
Message:	`Unexpected error deleting file 'FileName' from profile`
Cause:	Specified file could not be deleted from profile.
Resolution:	Check to see if the file exists and if the user has access rights to the file. If that did not resolve the problem, perform these additional investigational steps and then contact AdminStudio Technical Support.

Error -9121: Failed to Copy File into Citrix Profile

The following table documents this message:

Table 10-145 • Error -9121: Failed to Copy File into Citrix Profile

Category	Description
Type:	Error
Message:	`Failed to copy file into Citrix profile. Error: 'Name' File: 'Name'`
Cause:	Specified file could not be copied into profile.
Resolution:	Check to see if the file exists and if the user has access rights to the file. Also, when this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the Windows Installer Help Library to determine the cause of the problem.

Error -9122: Target Does Not Exist in Citrix Profile

The following table documents this message:

Table 10-146 • Error -9122: Target Does Not Exist in Citrix Profile

Category	Description
Type:	Warning
Message:	`The target for shortcut 'ShortcutName' does not exist in the Citrix profile. Excluding shortcut.`
Cause:	Actual file that shortcut points to is not included in the package.
Resolution:	Exclude the shortcut by clearing the selection on the Citrix Assistant **Profile Shortcuts** page, and then rebuild the profile.

Error -9124: No Shortcuts Created for this Profile

The following table documents this message:

Table 10-147 • Error -9124: No Shortcuts Created for this Profile

Category	Description
Type:	Error
Message:	`No shortcuts were created in the XenApp profile during the conversion because none were detected in the source package.`

Table 10-147 • Error -9124: No Shortcuts Created for this Profile

Category	Description
Cause:	A XenApp profile must include at least one valid shortcut.
Resolution:	Add a shortcut on the Citrix Assistant **Profile Shortcuts** page, and then rebuild the profile.

Error -9125: Error Writing Citrix File Type Associations

The following table documents this message:

Table 10-148 • Error -9125: Error Writing Citrix File Type Associations

Category	Description
Type:	Error
Message:	`Unexpected error writing Citrix file type associations`
Cause:	Unable to write file type associations.
Resolution:	Perform preliminary investigational steps and then contact AdminStudio Technical Support.

Error -9126: Failed to Sign Profile Using Certificate

The following table documents this message:

Table 10-149 • Error -9126: Failed to Sign Profile Using Certificate

Category	Description
Type:	Error
Message:	`Failed to sign the profile using the supplied certificate`
Cause:	The certificate that is being used in invalid.
Resolution:	Obtain a valid certificate and rebuild the profile.

Error -9127: Could Not Create Script Execution

The following table documents this message:

Table 10-150 • Error -9127: Could Not Create Script Execution

Category	Description
Type:	Error

Table 10-150 • Error -9127: Could Not Create Script Execution

Category	Description
Message:	`Could not create script execution for 'ScriptName'`
Cause:	The specified script contains invalid data.
Resolution:	On the Citrix Assistant **Build Settings** page, delete the script from the profile, re-add it, and then rebuild the profile. If you are still having problems, perform these additional investigational steps and then contact AdminStudio Technical Support.

Warning -9128: Duplicate Shortcut

The following table documents this message:

Table 10-151 • Warning -9128: Duplicate Shortcut

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists in the profile. Excluding duplicate shortcut.`
Cause:	There are multiple shortcuts defined in this profile that refer to different Start Menu locations or to other locations in the package.
Resolution:	These shortcuts are not needed. On the Citrix Assistant **Profile Shortcuts** page, unselect these shortcuts, and then rebuild the profile.

Warning -9129: Duplicate Shortcut Names

The following table documents this message:

Table 10-152 • Warning -9129: Duplicate Shortcut Names

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists in the profile, but with different command line parameters. A new unique shortcut 'NewShortcutName(1)' will be created in the profile.`
Cause:	There are two shortcuts defined in this profile that have the same name, even though they have different command line parameters.
Resolution:	On the Citrix Assistant **Profile Shortcuts** page, rename one of these shortcuts and then rebuild the profile.

Warning -9130: Duplicate Shortcut Targets

The following table documents this message:

Table 10-153 • Warning -9130: Duplicate Shortcut Targets

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists in the profile, but with different target. A new unique shortcut 'NewShortcutName(1)' will be created in the profile.`
Cause:	There are two shortcuts defined in this profile that have the same name, even though they have different targets.
Resolution:	On the Citrix Assistant **Profile Shortcuts** page, rename one of these shortcuts and then rebuild the profile.

Warning -9131: Unable to Resolve Installer Variable

The following table documents this message:

Table 10-154 • Warning -9131: Unable to Resolve Installer Variable

Category	Description
Type:	Warning
Message:	`Unable to resolve an installer variable in the string 'StringName'`
Cause:	Not all Windows Installer variables can be resolved at build time. This can result in errors if your application requires a specific value.
Resolution:	Repackage this application and rebuild the profile, or use a constant value in the Windows Installer package.

Warning -9132: 16 Color Shortcut Icon Not Found

The following table documents this message:

Table 10-155 • Warning -9132: 16 Color Shortcut Icon Not Found

Category	Description
Type:	Warning
Message:	`No 16 color icon found for 'ShortcutName' shortcut. Shortcut icon may look distorted when published.`

Table 10-155 • Warning -9132: 16 Color Shortcut Icon Not Found

Category	Description
Cause:	The icon used for this shortcut does not contain a 16-color image. Since Citrix currently does not support images with a higher number of colors, this icon may look distorted when shown and published in Citrix XenApp.
Resolution:	You can modify the shortcut to use a different icon or add a 16-color image to the one currently used.

Warning -9133: Shortcut Icon Not Found

The following table documents this message:

Table 10-156 • Warning -9133: Shortcut Icon Not Found

Category	Description
Type:	Warning
Message:	`No icon found for 'ShortcutName' shortcut. Using generic Windows application icon instead.`
Cause:	If no icon can be loaded for this shortcut, the generic Windows application icon is used. This can happen if the file used is corrupt or if extracting an image from it is not possible.
Resolution:	Modify the shortcut to use a different icon.

Warning -9134: Failure to Extract Icon from Executable

The following table documents this message:

Table 10-157 • Warning -9134: Failure to Extract Icon from Executable

Category	Description
Type:	Warning
Message:	`Failed to extract icon from executable 'filename'. Make sure the executable is not corrupt.`
Cause:	A corrupt icon file may cause this warning.
Resolution:	Modify the shortcut to use a different icon.

Error -9135: Shortcut Target is 16-Bit

The following table documents this message:

Table 10-158 • Error -9135: Shortcut Target is 16-Bit

Category	Description
Type:	Error
Message:	`The target for shortcut 'ShortcutName' is 16-bit. This application may not function properly in the Citrix Isolation Environment.`
Cause:	The file this shortcut points to is a 16-bit application.
Resolution:	Replace file with a newer 32-bit version. Can also test and see if the application works properly in the Citrix environment.

Warning -9136: Some Files May Not Be Decompressed

The following table documents this message:

Table 10-159 • Warning -9136: Some Files May Not Be Decompressed

Category	Description
Type:	Warning
Message:	`Some files may not be decompressed from this package because it contains features with a default install level of 0.`
Cause:	When installing a compressed Windows Installer package, the build engine runs an administrative installation of it to decompress it. One limitation of an administrative installation is that it does not decompress a file if the feature it is contained in has a default install level of **0**. If there are any files in any components contained within those features, AdminStudio will generate an error when it attempts to copy those files into the Citrix profile, because they will not exist in the source location.
Resolution:	To resolve this issue, edit the Windows Installer package and set the default install level of that feature to something other than **0**.

Warning -9137: Destination Directory Cannot Be Found

The following table documents this message:

Table 10-160 • Warning -9137: Destination Directory Cannot Be Found

Category	Description
Type:	Warning

Table 10-160 • Warning -9137: Destination Directory Cannot Be Found

Category	Description
Message:	`The destination directory for the 'FileName' file cannot be found. You should consider Repackaging this application before proceeding with the conversion process.`
Cause:	This is an internal error.
Resolution:	Contact AdminStudio Technical Support.

Warning -9138: Ignoring a DuplicateFile Table Entry

The following table documents this message:

Table 10-161 • Warning -9138: Ignoring a DuplicateFile Table Entry

Category	Description
Type:	Warning
Message:	`Ignoring a DuplicateFile table entry because unable to resolve the property used for the DestFolder: 'INVALIDPATH'`
Cause:	You might encounter this error when the Windows Installer package that you are converting includes one or more entries in the **DuplicateFile** table, and a property that is used in the DestFolder column for one of those entries in the **DuplicateFile** table cannot be resolved. For example, if the destination for a duplicate file is set by a custom action, that destination cannot be resolved during the conversion.
Resolution:	The **DuplicateFile** table contains a list of files that need to be duplicated during installation, either to a different directory than the original file or to the same directory but with a different name. Because a destination in this table cannot be resolved, you need to do one of the following to resolve this issue: • **Option 1: Edit the Windows Installer Package**—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the problematic entry in the **DuplicateFile** table by including any additional copies of that file. • **Option 2: Repackage the Application**—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package. • **Option 3: Write a Pre-Launch Script**—Write a pre-launch script that—upon application launch—performs the file copy operations for the problematic entry in the **DuplicateFile** table.

Error -9139: 64-Bit Executables (XenApp)

The following table documents this message:

Table 10-162 • Error -9139: 64-Bit Executables (XenApp)

Category	Description
Type:	Error
Message:	`The target for shortcut '[SHORTCUT_NAME]' is a 64-bit executable. XenApp does not support 64-bit applications.`
Cause:	XenApp does not support 64-bit applications.
Resolution:	This 64-bit application cannot be converted to XenApp format.

Error -9200: ThinApp Must Be Installed

The following table documents this message:

Table 10-163 • Error -9200: ThinApp Must Be Installed

Category	Description
Type:	Error
Message:	`A licensed or demo version of ThinApp must be installed on this machine in order to successfully build ThinApp applications. (www.vmware.com)`
Cause:	ThinApp is not installed.
Resolution:	Install ThinApp.

Warning -9201: Extension for Shortcut Files Must Be ".exe"

The following table documents this message:

Table 10-164 • Warning -9201: Extension for Shortcut Files Must Be ".exe"

Category	Description
Type:	Warning
Message:	`The extension for the target for shortcut 'ShortcutName' is not '.exe'. Excluding shortcut.`
Cause:	Shortcuts that do not have a filename extension of **.exe** are excluded.
Resolution:	No action is required.

Error -9202: No Applications Were Created

The following table documents this message:

Table 10-165 • Error -9202: No Applications Were Created

Category	Description
Type:	Error
Message:	`No applications were created during the ThinApp conversion because no shortcuts were detected in the source package.`
Cause:	Either the Windows Installer package had no shortcuts or all shortcuts were excluded.
Resolution:	Make sure that the source Windows Installer **.msi** package has at least one shortcut to an **.exe** file.

Error -9203: ThinApp Tool is Missing

The following table documents this message:

Table 10-166 • Error -9203: ThinApp Tool is Missing

Category	Description
Type:	Error
Message:	`ThinApp: 'ToolName' was not found`
Cause:	One of the ThinApp tools required to build a ThinApp application was not found.
Resolution:	Reinstall ThinApp.

Error -9204: Duplicate Shortcut

The following table documents this message:

Table 10-167 • Error -9204: Duplicate Shortcut

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists. Excluding duplicate shortcut.`
Cause:	The source package has two shortcuts that both point to the same **.exe** target.
Resolution:	No action is required.

Error -9205: Identically-Named Shortcut Already Exists, But With Different Parameters

The following table documents this message:

Table 10-168 • Error -9205: Identically-Named Shortcut Already Exists, But With Different Command Line Parameters

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists, but with different command line parameters. A new, unique shortcut will be created.`
Cause:	Two shortcuts in the package differed in arguments only.
Resolution:	No action is required.

Error -9206: Identically-Named Shortcut Already Exists, But With a Different Target

The following table documents this message:

Table 10-169 • Error -9206: Identically-Named Shortcut Already Exists, But With a Different Target

Category	Description
Type:	Warning
Message:	`'ShortcutName' shortcut already exists, but with a different target. A new, unique shortcut will be created.`
Cause:	Two shortcuts differed in the target pointed to only.
Resolution:	No action is required.

Error -9207: Error During Build Process (vregtool.exe)

The following table documents this message:

Table 10-170 • Error -9207: Error During Build Process (vregtool.exe)

Category	Description
Type:	Error
Message:	`An error occurred during the ThinApp build process (vregtool.exe).`

Table 10-170 • Error -9207: Error During Build Process (vregtool.exe)

Category	Description
Cause:	An unexpected error occurred while running the vregtool.exe step of the ThinApp build process.
Resolution:	The cause of this error may be discernible by the progress messages that were displayed just before this error occurred. Also, make sure none of the files/folders in the build folder hierarchy are locked.

Error -9208: Error Occurred During Build Process (vftool.exe)

The following table documents this message:

Table 10-171 • Error -9208: Error Occurred During Build Process (vftool.exe)

Category	Description
Type:	Error
Message:	`An error occurred during the ThinApp build process (vftool.exe)`
Cause:	An unexpected error occurred while running the **vftool.exe** step of the ThinApp build process.
Resolution:	The cause of this error may be discernible by the progress messages that were displayed just before this error occurred. Also, make sure none of the files/folders in the build folder hierarchy are locked.

Error -9209: Error Occurred During ThinApp Build Process (tlink.exe)

The following table documents this message:

Table 10-172 • Error -9209: Error Occurred During ThinApp Build Process (tlink.exe)

Category	Description
Type:	Error
Message:	`An error occurred during the ThinApp build process (tlink.exe)`
Cause:	An unexpected error occurred while running the tlink.exe step of the ThinApp build process.
Resolution:	The cause of this error may be discernible by the progress messages that were displayed just before this error occurred. Also, make sure none of the files/folders of the build folder hierarchy are locked.

Error -9210: 64-Bit Executables (ThinApp)

The following table documents this message:

Table 10-173 • Error -9210: 64-Bit Executables (ThinApp)

Category	Description
Type:	Error
Message:	`The target for shortcut '[SHORTCUT_NAME]' is a 64-bit executable. ThinApp does not support 64-bit applications.`
Cause:	ThinApp does not support 64-bit applications.
Resolution:	This 64-bit application cannot be converted to ThinApp format.

Error -9300: Unhandled Exception During AdviseFile Operation

The following table documents this message:

Table 10-174 • Error -9300: Unhandled Exception During AdviseFile Operation

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the AdviseFile operation for rule 'RuleName'`
Resolution:	Contact AdminStudio Technical Support.

Error -9301: Unhandled Exception During AdviseRegistry Operation

The following table documents this message:

Table 10-175 • Error -9301: Unhandled Exception During AdviseRegistry Operation

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the AdviseRegistry operation for rule 'RuleName'`
Resolution:	Contact AdminStudio Technical Support.

Error -9302: Unhandled Exception During Command Action

The following table documents this message:

Table 10-176 • Error -9302: Unhandled Exception During Command Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the command action with the description 'CommandActionName'`
Resolution:	Contact AdminStudio Technical Support.

Error -9303: Unhandled Exception During Alter File Action

The following table documents this message:

Table 10-177 • Error -9303: Unhandled Exception During Alter File Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the alter file action with the description 'FileName'`
Resolution:	Contact AdminStudio Technical Support.

Error -9304: Unhandled Exception During Alter Registry Action

The following table documents this message:

Table 10-178 • Error -9304: Unhandled Exception During Alter Registry Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the alter registry action with the description 'RegistryName'`
Resolution:	Contact AdminStudio Technical Support.

Error -9305: Unhandled Exception During Create Action

The following table documents this message:

Table 10-179 • Error -9305: Unhandled Exception During Create Action

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the create action with the description 'CreateName'`
Resolution:	Contact AdminStudio Technical Support.

Error -9306: Unhandled Exception During Execution of Rules Engine

The following table documents this message:

Table 10-180 • Error -9306: Unhandled Exception During Execution of Rules Engine

Category	Description
Type:	Error
Message:	`An unhandled exception occurred during the execution of the rules engine.`
Resolution:	Contact AdminStudio Technical Support.

Error -9401: Error Initializing App-V Writer

The following table documents this message:

Table 10-181 • Error -9401: Error Initializing App-V Writer

Category	Description
Type:	Error
Message:	`Unexpected error initializing App-V writer.`
Resolution:	Contact AdminStudio Technical Support.

Error -9402: Error Initializing App-V Package

The following table documents this message:

Table 10-182 • Error -9402: Error Initializing App-V Package

Category	Description
Type:	Error
Message:	`Unexpected error initializing App-V package.`
Resolution:	Contact AdminStudio Technical Support.

Error -9403: Error Writing App-V File Entries

The following table documents this message:

Table 10-183 • Error -9403: Error Writing App-V File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V file entries.`
Resolution:	Contact AdminStudio Technical Support.

Error -9404: Error Writing App-V Folder Entries

The following table documents this message:

Table 10-184 • Error -9404: Error Writing App-V Folder Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V folder entries`
Resolution:	Contact AdminStudio Technical Support.

Error -9405: Error Writing App-V Registry Entries

The following table documents this message:

Table 10-185 • Error -9405: Error Writing App-V Registry Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V registry entries.`
Resolution:	Contact AdminStudio Technical Support.

Error -9406: Error Writing App-V INI File Entries

The following table documents this message:

Table 10-186 • Error -9406: Error Writing App-V INI File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V INI file entries.`
Resolution:	Contact AdminStudio Technical Support.

Error -9407: Error Writing App-V Shortcuts

The following table documents this message:

Table 10-187 • Error -9407: Error Writing App-V Shortcuts

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V shortcuts.`
Resolution:	Contact AdminStudio Technical Support.

Error -9408: Error Writing App-V File Type Data

The following table documents this message:

Table 10-188 • Error -9408: Error Writing App-V File Type Data

Category	Description
Type:	Error
Message:	`Unexpected error writing App-V file type data.`
Resolution:	Contact AdminStudio Technical Support.

Error -9409: Error Saving App-V Data

The following table documents this message:

Table 10-189 • Error -9409: Error Saving App-V Data

Category	Description
Type:	Error
Message:	`Unexpected error saving App-V data.`
Resolution:	Contact AdminStudio Technical Support.

Error -9410: Error Determining Source File Path

The following table documents this message:

Table 10-190 • Error -9410: Error Determining Source File Path

Category	Description
Type:	Error
Message:	`Unexpected error determining source file path for 'FileName'.`
Cause:	The installation location of a file, which is determined by some run time property, cannot be determined by the App-V virtual converter.
Resolution:	Locate the file in InstallShield and provide a known directory.

Error -9411: OSD File Template Could Not Be Extracted

The following table documents this message:

Table 10-191 • Error -9411: OSD File Template Could Not Be Extracted

Category	Description
Type:	Error
Message:	`The Microsoft App-V OSD file template could not be extracted. The OSD file generation will not operate properly.`
Resolution:	Contact AdminStudio Technical Support.

Error -9412: OSD File Could Not Be Saved

The following table documents this message:

Table 10-192 • Error -9412: OSD File Could Not Be Saved

Category	Description
Type:	Error
Message:	`The Microsoft App-V OSD file could not be saved. The OSD file generation will not operate properly.`
Resolution:	Contact AdminStudio Technical Support.

Error -9413: App-V OSD Save

The following table documents this message:

Table 10-193 • Error -4313: App-V OSD Save

Category	Description
Type:	Error
Message:	`The Microsoft App-V OSD file could not be saved. The OSD file generation will not operate properly.`
Resolution:	Contact AdminStudio Technical Support.

Warning -9414: Local App-V Application Specified as a Dependency of the Primary Application

The following table documents this message:

Table 10-194 • Warning -9414: Local App-V Application Specified as a Dependency of the Primary Application

Category	Description
Type:	Warning
Message:	`A local App-V application was specified as a dependency of the primary application. The primary application may not run correctly if it is relocated to a different location.`
Cause:	The user specified a dependent App-V application that is either on the local drive or on a mapped drive. This is determined by examining the HREF attribute of the CODEBASE tag in the dependency application's OSD file.
Resolution:	Dependency applications should be referenced by a portable mechanism using either a non-FILE protocol or by using a network URL.

Error -9415: Dependency Application Was Not Found

The following table documents this message:

Table 10-195 • Error -9415: Dependency Application Was Not Found

Category	Description
Type:	Error
Message:	`Dependency application was not found: 'ApplicationName'.`
Cause:	A specified App-V dependency application file was not found.
Resolution:	Check the path of the specified App-V dependency application.

Warning -9416: Invalid Primary Application Directory

The following table documents this message:

Table 10-196 • Warning -9416: Invalid Primary Application Directory

Category	Description
Type:	Error
Message:	`The specified Primary Application Directory, 'DirectoryName', does not exist.`

Table 10-196 • Warning -9416: Invalid Primary Application Directory

Category	Description
Cause:	This may be caused if the directories specified in the Windows Installer package have changed after a valid Primary Application Directory was specified.
Resolution:	Specify a valid Primary Application Directory using the supplied browse folder in InstallShield.

Error -9417: Dependency Application's OSD File Contains an Invalid HREF Value

The following table documents this message:

Table 10-197 • Error -9417: Dependency Application's OSD File Contains an Invalid HREF Value

Category	Description
Type:	Error
Message:	`Dependency application OSD file contains an invalid value for the HREF field of the CODEBASE tag: 'HREF_Field_Value'`
Cause:	The CODEBASE tag of the dependency application's OSD file may have an empty or non-existent HREF attribute.
Resolution:	Make sure that the CODEBASE tag of the dependency application's OSD file has a valid HREF attribute.

Error -9418: Error While Privatizing Side-By-Side Assemblies

The following table documents this message:

Table 10-198 • Error -9418: Error While Privatizing Side-By-Side Assemblies

Category	Description
Type:	Error
Message:	`An error occurred while privatizing Side-By-Side assemblies.`
Cause:	When converting to an App-V package, files installed to the win32 Sxs assembly cache need to be privatized so that the App-V runtime can find them. This error occurs if there was an unexpected failure in that process.
Resolution:	Contact AdminStudio Technical Support.

Error -9419: Error Inserting Watermark

The following table documents this message:

Table 10-199 • Error -9419: Error Inserting Watermark

Category	Description
Type:	Error
Message:	`An error has occurred inserting the evaluation watermark into the App-V Package.`
Resolution:	Contact AdminStudio Technical Support.

Error -9420: Error During App-V Package Upgrade

The following table documents this message:

Table 10-200 • Error -9420: Error During App-V Package Upgrade

Category	Description
Type:	Error
Message:	`An error occurred while configuring App-V package upgrade.`
Cause:	This is a general failure to configure the new App-V package that is being built to be an upgrade for the previous one.
Resolution:	Verify that the previous App-V package is present and accessible at the location specified. Verify that the previous App-V package is not corrupt.

Warning -9421: 16-Bit Application

The following table documents this message:

Table 10-201 • Warning -9421: 16-Bit Application

Category	Description
Type:	Warning
Message:	`The target for shortcut '[SHORTCUT_NAME]' is 16-bit. This application will not function in 64-bit environments.`
Cause:	This warning helps to identify 16-bit applications. This is important for enterprises looking to deploy to 64-bit environments.
Resolution:	This warning can be ignored if the application will not be deployed to a 64-bit environment. Otherwise, it will be necessary to get a newer version of this application that is 32 or 64-bit.

Error -9422: Package Cannot Be Opened

The following table documents this message:

Table 10-202 • Error -9422: Package Cannot Be Opened

Category	Description
Type:	Error
Message:	`The previous package '[SFT_FILE_NAME]' could not be opened. Please verify that the package is a valid SFT file.`
Cause:	This error indicates that there was a problem reading information from the previous .sft file which is necessary to configure an upgrade. This could mean that the previous .sft file is corrupt, missing, or is not really an .sft file.
Resolution:	Verify that the file is present and accessible. Verify that the file is not corrupt. One way this could be done is by trying to deploy the App-V package on a machine with the App-V client.

Warning -9423: No Shortcuts Detected

The following table documents this message:

Table 10-203 • Warning -9423: No Shortcuts Detected

Category	Description
Type	Warning
Message	For App-V packages: `No shortcuts were detected in the source package. This can be a valid scenario for packages with file type association entry points and/or those that are meant to be dependencies of other App-V packages through the use of Dynamic Suite Composition functionality.` For XenApp and ThinApp packages: `This package contains no shortcuts. Shortcuts are necessary to define the entry point into the virtual application.`
Cause	Package contains no shortcuts. • **App-V**—For conversion to App-V packages, this issue is acceptable in some scenarios, such as packages which provide dependencies to others which dynamically suite it. However, if this package merely provides a plug-in to another application, it must contain a shortcut to launch that application in this package's virtual context. • **ThinApp and XenApp**—For conversion to ThinApp and XenApp formats, shortcuts are necessary to define the entry point into the virtual application.

Table 10-203 • Warning -9423: No Shortcuts Detected

Category	Description
Resolution:	One potential resolution to this issue is to use InstallShield Editor to add shortcut(s) to the Windows Installer package.

Error -9424: Windows 8 or Windows 2012 OS Required

The following table documents this message:

Table 10-204 • Error -9424: Windows 8 or Windows 2012 OS Required

Category	Description
Type	Error
Message	`Skipping conversion to Microsoft App-V version 5 because it is only supported on Windows 8 or Windows 2012 operating systems.`
Cause	Conversion of packages to App-V 5.x format using AdminStudio is only supported on Windows 8 or Windows 2012 operating systems.
Resolution:	Install AdminStudio on a machine with a Windows 8 or Windows 2012 operating system and try the conversion again.

Warning -9500: Shortcut Missing

The following table documents this message:

Table 10-205 • Warning -9500: Shortcut Missing

Category	Description
Type:	Warning
Message:	`The target for shortcut 'FileName' does not exist. Excluding shortcut.`
Cause:	The target file of a shortcut in the project does not exist.
Resolution:	Repackage this application and then rebuild the virtual package.

Error -9600: Error Initializing Symantec Writer

The following table documents this message:

Table 10-206 • Error -9600: Error Initializing Symantec Writer

Category	Description
Type:	Error
Message:	`Unexpected error initializing Symantec writer.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -9601: Error Writing Symantec Folder Entries

The following table documents this message:

Table 10-207 • Error -9601: Error Writing Symantec Folder Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Symantec folder entries.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -9602: Error Writing Symantec Shortcuts

The following table documents this message:

Table 10-208 • Error -9602: Error Writing Symantec Shortcuts

Category	Description
Type:	Error
Message:	`Unexpected error writing Symantec shortcuts.`
Cause:	Unexpected internal error.

Table 10-208 • Error -9602: Error Writing Symantec Shortcuts

Category	Description
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -9603: Error Creating Target File for Symantec Package

The following table documents this message:

Table 10-209 • Error -9603: XXXX

Category	Description
Type:	Error
Message:	`Unexpected error creating target file for Symantec package.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -9604: Error Writing Symantec File Entries

The following table documents this message:

Table 10-210 • Error -9604: Error Writing Symantec File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Symantec file entries.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -9605: Error Writing Symantec Registry Entries

The following table documents this message:

Table 10-211 • Error -9605: Error Writing Symantec Registry Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Symantec registry entries.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -9606: Error Writing Symantec INI File Entries

The following table documents this message:

Table 10-212 • Error -9606: Error Writing Symantec INI File Entries

Category	Description
Type:	Error
Message:	`Unexpected error writing Symantec INI file entries.`
Cause:	Unexpected internal error.
Resolution:	First check to see if the product was installed properly. Then, perform preliminary investigational steps, as described in Steps to Take Before Calling Technical Support, and contact AdminStudio Technical Support.

Error -10000: Process Cancelled By User

The following table documents this message:

Table 10-213 • Error -10000: Process Cancelled By User

Category	Description
Type:	Error
Message:	`Process cancelled by user.`
Cause:	User clicked **Cancel** to cancel the profile conversion process.

Warning -10001: Suite File Missing

The following table documents this message:

Table 10-214 • Warning -10001: Suite File Missing

Category	Description
Type:	Warning
Message:	`The suite MSI file 'FileName' is missing and will be excluded from the conversion.`
Cause:	An MSI file that is part of a suite conversion was not found.
Resolution:	Make sure the input file for the suite conversion process exists.

Warning -10002: Suite File is Duplicate

The following table documents this message:

Table 10-215 • Warning -10002: Suite File is Duplicate

Category	Description
Type:	Warning
Message:	`The suite MSI file 'FileName' appears to be the same as the main MSI file and we will exclude this file from the conversion process.`
Cause:	A suite conversion was attempted where the main Windows Installer file (.msi) and one of the additional Windows Installer files specified were the same.
Resolution:	Specify unique Windows Installer files as part of the suite conversion process.

Warning -10003: Application File Missing

The following table documents this message:

Table 10-216 • Warning -10003: Application File Missing

Category	Description
Type:	Error
Message:	`Application file not found 'ApplicationName'`
Cause:	A file referenced by the installation was not found by the App-V virtual converter. It is likely that the file reference is broken in the installation.
Resolution:	Use InstallShield to locate the file in the installation and either fix the link or delete it.

Warning -10004: INI File Missing

The following table documents this message:

Table 10-217 • Warning: -10004: INI File Missing

Category	Description
Type:	Error
Message:	`INI file not found 'INI_File_Name'.`
Resolution:	Contact AdminStudio Technical Support.

Fix 11000: Excluding TCPIP Registry Entries

The following table documents this message:

Table 10-218 • Fix 11000: Excluding TCPIP Registry Entries

Category	Description
Type:	Fix
Message:	`Excluding TCPIP registry entries from the Citrix profile.`
Action:	Automated Application Converter will exclude all TCPIP registry entries from the Citrix profile.

Fatal Error 11001: Fail on VMware

The following table documents this message:

Table 10-219 • Fatal Error 11001: Fail on VMware

Category	Description
Type:	Fatal
Message:	`VMware cannot be virtualized.`
Cause:	Conversion will fail when the application being virtualized is VMware.
Action:	This error message is displayed: `VMware cannot be virtualized.`

Warning 11003: Control Panel Applet - Citrix

The following table documents this message:

Table 10-220 • Warning 11003: Control Panel Applet - Citrix

Category	Description
Type:	Warning
Message:	`The Control Panel Applet [AppletName] will not appear in Control Panel.`
Action:	Automated Application Converter will display a warning when the application contains a control panel applet.

Fix 11004: Control Panel Applet - ThinApp

The following table documents this message:

Table 10-221 • Fix 11004: Control Panel Applet - ThinApp

Category	Description
Type:	Fix
Message:	`Generating shortcut for the Control Panel Applet located at 'DirectoryPath'`
Action:	Automated Application Converter will create a default shortcut for ThinApp Control Panel applets.

Fatal Error 11005: QuickTime 7.4.1 Causes Fatal Error

The following table documents this message:

Table 10-222 • Error 11005: QuickTime 7.4.1 Causes Fatal Error

Category	Description
Type:	Fatal Error
Message:	`QuickTime 7.4.1 is known to have errors when running from a virtual package. Use QuickTime 7.4.5 instead.`
Cause:	QuickTime 7.4.1 cannot be virtualized correctly.
Resolution:	Obtain QuickTime 7.4.5 and repeat the conversion process.

Fix 11006: Adobe Distiller Exclude AdobePDFSettings

The following table documents this message:

Table 10-223 • Fix 11006: Adobe Distiller Exclude AdobePDFSettings

Category	Description
Type:	Fix
Message:	`Excluding the registry key Software\Adobe\Acrobat Distiller\AdobePDFSettings. Adobe Distiller will recreate these settings on first use.`
Action:	Automated Application Converter will exclude the AdobePDFSettings registry settings.

Fix 11007: Exclude URL Shortcut

The following table documents this message:

Table 10-224 • Fix 11007: Adobe Distiller Exclude AdobePDFSettings

Category	Description
Type:	Fix
Message:	`Excluding shortcut to .URL file. App-V does not launch these files properly.`
Action:	Automated Application Converter will exclude the shortcut to the .URL file.

Steps to Take Before Calling Technical Support

Before contacting AdminStudio Technical Support, perform the following steps to attempt to clearly identify the problem you are having:

- **Check package**—To determine if this error is caused by a problem with the specific package you are converting, try to build a virtual package of a simple package that contains only one file.
- **Check machine and OS**—To determine if this error is caused by a configuration on a particular machine or operating system, attempt to build this virtual package on another machine or operating system.
- **Check prerequisites**—Check to make sure that the machine where you are performing the conversion has all of the required prerequisite software installed:
  - **App-V**—See Comparison of the App-V 5.0 Conversion Methods.
  - **VMware ThinApp**—See Prerequisites for Building a ThinApp Application.
  - **Symantec Workspace**—See Prerequisites for Building a Symantec Workspace Virtual Package.
- **Check individual files**—To determine if this is error limited to a specific item, find out if removing or excluding a particular item will build error free.

Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the application profile to run on Citrix XenApp.

One action you could take to try to include ignored features in a Citrix profile is to first repackage the application using the Repackaging Wizard, and then convert the repackaged application to a Citrix profile.

The following table lists the application features which require additional, manual conversion steps:

Table 10-225 • Application Features Ignored During Profile Conversion

Windows Installer Feature	Manual Conversion Steps
User-Defined Custom Actions	When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. For user-defined custom actions, a warning message is generated. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile. The resolution that you should perform depends upon the purpose of the custom action: ● If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning. ● If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue. To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application, by performing the following steps.  ***To successfully convert a package with user-defined custom actions:*** **1.** Use the Repackaging Wizard to repackage this application.The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project. **2.** Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.

Table 10-225 • Application Features Ignored During Profile Conversion

Windows Installer Feature	Manual Conversion Steps
Services	Citrix XenApp does not support any type of services. Therefore, to resolve this issue, you need to install any required services outside of the isolation environment on the user desktop machines. ***To successfully convert a package with services:*** **1.** If you have an application and a service bundled in the same Windows Installer package, you need to create a separate Windows Installer package containing just the service. **2.** Install the service on each of the user desktop machines. The Citrix profile of this application should now be able to run in an isolation environment on machines that already have the service installed.
COM+	While Citrix XenApp supports communicating with COM+ applications, it does not support *installing* COM+ services. Therefore, an application that contains COM+ services cannot be deployed on Citrix XenApp.

11

Using the Virtual Package Editor

The Virtual Package Editor is a powerful tool that lets you edit App-V packages and perform tasks such as the following:

- Customize your App-V applications.
- Resolve virtualization best practice issues and application conflicts.
- Fix run-time problems.

The Virtual Package Editor documentation contains the following sections:

Table 11-1 • AdminStudio Virtual Package Editor Documentation Sections

Section	Description
About Virtualization	Provides background information about virtualization.
About the Virtual Package Editor	Introduces some basic concepts to help you get started with editing a virtual package.
Getting Started with the Virtual Package Editor	Contains information to help you become familiar with the Virtual Package Editor, begin editing a virtual package, and customize the Virtual Package Editor user interface.
Editing Virtual Packages	Explains how to edit virtual packages and guides you through every step of the process.
Virtual Package Editor Reference	Contains comprehensive reference information for the Virtual Package Editor user interface.

Contacting Us

Flexera Software is headquartered in Itasca, Illinois, and has offices worldwide.

http://www.flexerasoftware.com

About Virtualization

Virtualization enables you to isolate an application in its own environment so that it does not conflict with existing applications or modify the underlying operating system.

Limitations of a Standard Installation Environment

A typical Windows-based application has dependencies on components that are shared by multiple applications. Applications access these shared system resources, such as the registry or Windows system files. When an installation author recognizes that their application references a shared system component, they include a merge module to install that component.

When one of these shared components is installed, it is possible that a previously installed version of the same component could be overwritten; this may cause the existing application to break. A similar problem could occur when one of these applications containing a shared component is uninstalled. Because of these possible problems, extensive compatibility testing needs to be performed before an application can be distributed in the enterprise environment.

The following diagram provides an example of two conflicting installed applications.

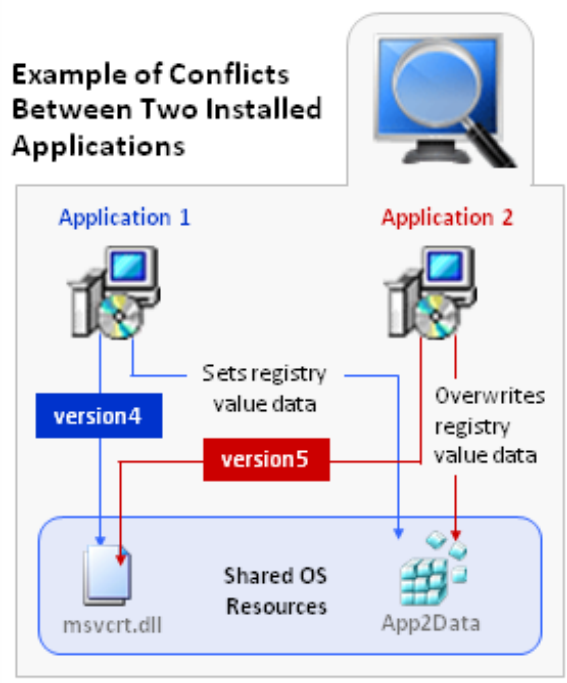

Figure 11-1: Example of Conflicts Between Two Installed Applications

Benefits of Application Virtualization

Virtual applications run in virtual environments that keep each application layer and the operating system layer separate. Each application includes its own configuration information in its virtual environment. As a result, many applications can run side-by-side with other applications on the same computer without any conflicts.

Even though virtual applications are not installed on the local machine, they exhibit the same functionality and access to local services as locally installed applications, and also nearly the same performance characteristics.

The following diagram provides an example of how application virtualization would solve the conflicts that are shown in the previous example.

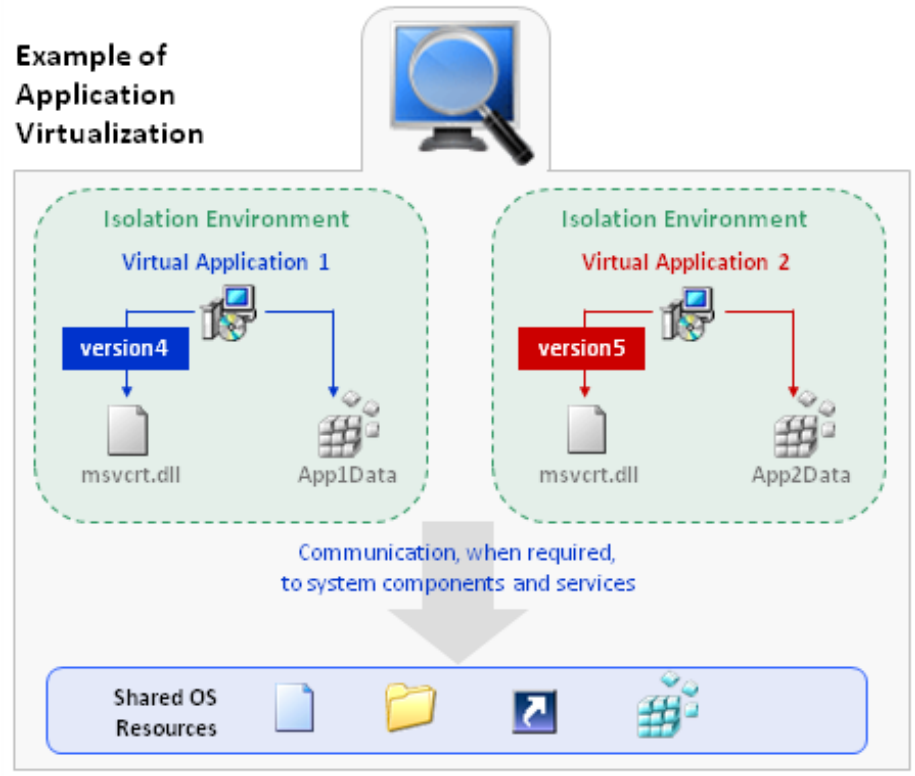

Figure 11-2: Example of Application Virtualization

Application virtualization allows the configuration of an application to be standardized to an isolation environment, rather than to an individual user's desktop machine. Application objects, files, and registry settings are contained within this isolation environment. Critical application resources are managed locally by the isolation environment, thus minimizing resource dependencies between applications.

Application virtualization greatly reduces the scope for conflicts between applications and, therefore, simplifies regression testing.

About the Virtual Package Editor

Microsoft Application Virtualization (App-V) enables you to deploy applications to end users without requiring the applications to be installed locally; only the App-V client needs to be installed on the client machines. Even though these virtual applications are never installed, they can communicate with the local operating system, middleware, plug-ins, and other applications. Using App-V enables you to centralize the deployment of applications and reduce application-to-application conflicts.

The Virtual Package Editor is a powerful tool that lets you edit App-V packages to customize your App-V applications, resolve virtualization best practice issues and application conflicts, and fix run-time problems. You can save your App-V packages as new packages that can be deployed alongside earlier versions of the virtual package in the same virtual environment; you can also create update packages that can upgrade earlier versions of your virtual applications.

Components of an App-V Package

The files that comprise an App-V package depend on the version of the App-V package.

Components of an App-V 5 Package (.appv)

The following table describes the main components of an App-V 5 package (.appv):

Table 11-2 • Components of an App-V 5 Package

File	Description
.appv	The .appv file is the compressed package file that contains all of the other parts of the package.
[Content_Types].xml	This file contains a list of file extensions that the package supports and the type of content to which each extension type maps.
AppxBlockMap.xml	This file contains a list of files with details such as header size and file size.
AppxManifest.xml	This file contains metadata about the package.
FilesystemMetadata.xml	This file contains information such as short file names, the directory-file hierarchy, and the mapping between the root folder and INSTALLDIR.
Registry.dat	This file contains registry data for the package.
StreamMap.xml	This file contains feature block 1 information.

Components of an App-V 4.x Package (.sft)

The following table describes the main components of an App-V 4.x package (.sft):

Table 11-3 • Components of an App-V 4.x Package

File	Description
.sft	The .sft file contains all of the files, registry information, and other configuration details of the package.
Manifest file	This file is an XML file that lists all of the .osd files in an App-V application.
.osd	The .osd files are XML-based files that describe the package's individual targets (or applications) that can be run.
.ico	The .ico files are icons files that are used for published shortcuts and file type associations.
.sprj	This file is the Microsoft App-V Sequencer project file. It contains references to the .sft and .osd files, and to a large number of settings related to the sequencing process.

Getting Started with the Virtual Package Editor

The Virtual Package Editor provides powerful features that make editing virtual packages easy. This section of the documentation contains information to help you become familiar with the Virtual Package Editor, begin editing a virtual package, and customize the Virtual Package Editor user interface.

Starting the Virtual Package Editor

Task ***To open the Virtual Package Editor, do one of the following:***

- On the **Tools** tab in AdminStudio, right-click **Virtual Package Editor** and then click **Launch Tool**.
- Launch **Application Manager**. On the **Products** tab, right-click an existing App-V package that you want to open, and then click **Edit with Virtual Package Editor**.

When you launch the Virtual Package Editor through the Tools tab, the Start Page opens. The Start Page provides access to product information, recently opened virtual packages, and product resources.

If you launch the Virtual Package Editor by opening a virtual package in the Application Manager, the Virtual Package Editor displays one of the views for the virtual package.

Opening an Existing Virtual Package

The Virtual Package Editor offers several ways to open an existing virtual package (.appv or .sft).

Task ***To open an existing virtual package:***

1. Do one of the following:
   - On the **File** menu, click **Open**.
   - Press CTRL+O.
   - On the toolbar, click the **Open** button.
   - On the **Start Page** in the **Package Tasks** area, click the **Open an Existing Package** link.

   The **Open** dialog box opens.
2. Browse to the virtual package (.appv or .sft), and then click the **Open** button.

The Virtual Package Editor opens the virtual package, enabling you to edit it as needed.

Tip *• As an alternative, you can open a recently opened virtual package. To do so, perform one of the following tasks:*

- *On the **Start Page** in the **Package Tasks** area, click the **Open an Existing Package** link.*
- *On the **File** menu, click a recently opened .appv or .sft file name.*

*You can also open a virtual package from within Application Manager: On the **Products** tab, right-click an existing App-V package that you want to open, and then click **Edit with Virtual Package Editor**. Application Manager lets you check out the file. When you save the virtual package in the Virtual Package Editor, your changes are saved in a temporary location. The version that is stored in Application Manager is updated when you check your changes in to the Application Manager.*

Saving a Virtual Package

The Virtual Package Editor offers several machine-wide, user-specific options for saving a virtual package (.appv or .sft). Before you save your virtual package as either a new package or an upgrade package, select the appropriate options.

Selecting the Appropriate Save Options

Task ***To select the appropriate save options:***

On the **File** menu, point to **Save Options**, and then click the appropriate command to select or clear an option. The following table describes each option. If an option is selected, its menu command includes a check mark.

Table 11-4 • Save Options

Command	Description
Include App-V Launcher	If you want to use the AdminStudio App-V Application Launcher to test a newly built App-V package locally before moving it to a deployment server, select this command. To learn more, see Using the App-V Application Launcher to Test the Virtual Package. This command is selected by default.
Append Package Version	If you want the Virtual Package Editor to append the package version number to the name of the file whenever you save an App-V package, select this command. This command is selected by default.
Build Wrapper MSI	If you want to build a Windows Installer package to assist in the distribution of each App-V package that you save in the Virtual Package Editor, select this command. If you enable this option, the Virtual Package Editor creates an InstallShield project (.ism file) and uses it to build an .msi package. If you run the .msi package, it "installs" the App-V application files in the local App-V client system cache. The wrapper .msi package can optionally include the App-V package, depending on whether the Include SFT in Wrapper MSI command is selected. ***Note*** • *The Microsoft Application Virtualization Client must be installed on the local machine before you can install an App-V application through a wrapper .msi package. The installation determines whether the App-V client is present; if it is not, the installation displays an error message and exits.* Building a wrapper .msi file simplifies the deployment of an App-V application by enabling you to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management. This command is cleared by default.

Table 11-4 • Save Options (cont.)

Command	Description
Include SFT in Wrapper MSI	If you want to include the App-V package in the Windows Installer package that you save in the Virtual Package Editor, select this command. If you enable this option, the Virtual Package Editor includes the .appv or .sft file in the wrapper .msi package that it builds when you save the open App-V package. If you run the .msi package, it "installs" the App-V application files, including the .appv or .sft file, in the local App-V client system cache. If you disable this option, the contents of the .appv or .sft file are streamed from the App-V server as requested by the client. This command is available only if the Build Wrapper MSI command is selected. This command is cleared by default.
Compress Wrapper MSI	If you want to compress the App-V package files into the wrapper .msi package, select this command. This command is available only if the Build Wrapper MSI command and the Include SFT in Wrapper MSI option are selected. If you enable the former command but disable the latter command, the .msi package that is generated is always compressed. This command is selected by default.

You can save a virtual package in either of the following ways:

- Save the package as a new package. You can deploy a new package alongside earlier versions of the virtual package in the same virtual environment.
- Save the package as an update package. An update package can upgrade earlier versions of the virtual application.

Tip • *If you are using the Virtual Package Editor to edit a virtual package that is part of your application catalog, the Virtual Package Editor saves your changes in a temporary location. To update your application catalog with the latest changes to your virtual package, use Application Manager to check in your virtual package.*

Saving a Virtual Package as a New Package

Task

To save a virtual package as a new package, do one of the following:

- On the **File** menu, click **Save**.
- Press CTRL+S.
- On the toolbar, click the **Save** button.

The Virtual Package Editor saves your virtual package as a new package. To open a Windows Explorer window that shows the App-V package, press CTRL+E, or on the View menu, click Show in Explorer.

Important • *If you want to deploy two copies of a package side by side, you must do some additional work before saving the package:*

- *In the General Information view, change the value of the Root Folder Name setting. This value must be unique because two packages with the same root folder name cannot be deployed simultaneously.*
- *In the General Information view, change the value of the Name setting. It is recommended that this value be different for each package.*
- *In the Shortcuts view, change the value of the Name setting, the Target Version setting, or both of those settings for each target in your package. The combination of the name and version must be unique for the targets in each new package; otherwise, the two packages cannot be deployed simultaneously.*

Saving a Virtual Package as an Update Package

Task ***To save a virtual package as an update package:***

1. On the **File** menu, click **Save As**. The **Save As** dialog box opens.
2. Click the **Save as a new package** option.

The Virtual Package Editor saves your virtual package as an update package. To open a Windows Explorer window that shows the App-V package, press CTRL+E, or on the View menu, click Show in Explorer.

Saving a Virtual Package (an Update Package or a New Package) with a New Name and Location

1. On the **File** menu, click **Save As**. The **Save As** dialog box opens.
2. In the **Virtual Package** box, enter the path and file name that you want to use for the .appv or .sft file. As an alternative, you can click the ellipsis button (**...**) to browse to the file.
3. Click the **Save as an update package** option or the **Save as a new package** option.

The Virtual Package Editor saves your virtual package as specified. To open a Windows Explorer window that shows the App-V package, press CTRL+E, or on the View menu, click Show in Explorer.

Closing a Virtual Package

Task ***To close a virtual package in the Virtual Package Editor:***

1. Select the tab of the file that you want to close.
2. Do one of the following:
   - On the **File** menu, click **Close**.
   - Click the tab's **Close** button.

Working with the Virtual Package Editor Interface

The Virtual Package Editor interface is a graphical user interface with conventional Windows-based elements such as a menu bar, a toolbar, and dialog boxes. This section includes topics that explain how to perform basic tasks using these elements and how to customize the interface.

Configuring the Value of a Setting for More Than One Item at a Time

In many views of the Virtual Package Editor, you can select multiple items—such as files, registry keys, file extensions, or virtual services—and then change the value for one of the settings. The Virtual Package Editor lets you use the same value in that setting for all of the selected items in that view. This feature may save you time by enabling you to make extensive changes to multiple items simultaneously, instead of requiring you to edit the setting for each item individually.

For example, in the Files and Folders view, you may want to change the value of the **Isolation** setting for a large number of folders. If all of the folders need to be configured the same way, you can simply select all of the pertinent folders, and then change the value of the Isolation setting as needed. Therefore, it is not necessary to separately select and configure each folder that you want to modify.

Note that the values of some settings may not be equivalent for each selected item. For example, your virtual package may contain one folder whose Isolation setting is **Override**, and another file whose Isolation setting is **Merge**. If you select both of those folders in the Files and Folders view, you will see the following unequal sign as the value of the Isolation setting, indicating that the selected items have different values:

In this example, you can select both folders and select the appropriate value—**Override** or **Merge**—to have the Virtual Package Editor use the same value for both folders.

In some cases, the Virtual Package Editor does not allow you to change unequal values for more than one selected item. For example, if you select two files that are in the same folder, you cannot change the value of the **Name** setting for both of those files simultaneously, since each file in a folder must have a different file name.

Note *• If you select two or more items and you want to delete the entry in a setting that shows the unequal sign to indicate different values, you must first enter a value in the setting; then you can delete that value. For example, if you want to delete the value of the* ***Description*** *setting for two selected file extensions, and those file extensions have different values in the* ***Description*** *setting, you must first enter a value, so that they both match. Then you can delete that value for both file extensions at the same time.*

The Virtual Package Editor provides several methods for selecting multiple items in a view.

Task ***To select multiple items in a view so that you can configure some of their settings simultaneously, do one of the following:***

- To select multiple consecutive items that are near each other, drag your mouse pointer to create a box that surrounds each item that you want to select. When you do this, ensure that you start dragging your mouse pointer in empty space; otherwise, you may drag one or more item to a new location.

- To select multiple consecutive files or folders, select the first file or folder, press and hold SHIFT, and select the last file or folder.
- To select multiple nonconsecutive files or folders, select one file or folder, press and hold CTRL, and select each additional file or folder.

Showing or Hiding the Start Page in the Virtual Package Editor

The Virtual Package Editor Start Page is a tab that provides quick access to product information, to recently opened projects, and to Virtual Package Editor resources. You can show or hide this tab as necessary.

Task ***To show the Start Page:***

On the **File** menu, click **Start Page**.

Task ***To hide the Start Page, do one of the following:***

- On the **Start Page** tab, click the **Close** button.
- Click the **Start Page** tab. On the **File** menu, click **Close**.

Rearranging the Start Page and Virtual Package Tabs

Each virtual package that you have open in the Virtual Package Editor is displayed on a separate tab. The Start Page is also displayed on a separate tab. The Virtual Package Editor lets you change the order of these tabs.

Task ***To change the order of the open tabs:***

Drag the tab that you want to move to the new location in the rows of tabs.

Showing or Hiding the Settings and Output Windows

The Settings window in the Virtual Package Editor contains a grid that lists information about the item that is selected in an open view. The Output window displays task-specific information such as details about the virtual package that you are opening. It also shows save information.

The Settings window and the Output window can be shown or hidden as necessary.

Task ***To show or hide the Output window or the Settings window:***

On the **View** menu, click **Output Window** or click **Settings**.

If the window was visible, the Virtual Package Editor hides it. If the window was hidden, the Virtual Package Editor shows it.

Note that closing the Output window clears its contents. The Virtual Package Editor automatically shows the Output window whenever a task—such as saving or opening a virtual package—generates output.

Moving the Settings, Output, and Script Windows

The Settings window, the Output window, and the Script window can be moved to any side of the workspace in the Virtual Package Editor.

If you drag the Settings, Output, or Script window to the edge of a different side of the Virtual Package Editor interface, it becomes a docked window in that location.

Task ***To move the Settings window, Output window, the or the Script window:***

Drag the title bar of the **Settings** window, the **Output** window, or the **Script** window to the new location. Resize the window as needed.

Showing or Hiding Toolbars

Task ***To show or hide a toolbar, do one of the following:***

- Right-click a toolbar and select the toolbar that you want to be displayed or hidden.
- On the **View** menu, point to **Toolbars**, and then click **Customize**. The **Customize** dialog box opens. Select the check box for each toolbar that you want to be displayed. Clear the check box for each toolbar that you want to be hidden.

Adding Buttons and Menus to a Toolbar

Task ***To add a button or menu to a toolbar:***

1. Ensure that the toolbar that you want to change is visible.
2. On the **View** menu, point to **Toolbars**, and then click **Customize**. The **Customize** dialog box opens.
3. Click the **Commands** tab.
4. In the **Categories** box, click the category for the button or menu that you want to add.
5. Drag the button or menu from the **Commands** box to the appropriate toolbar.

Tip • *To create your own custom toolbar, drag the button or menu to the empty gray area near the toolbars.*

Removing Buttons and Menus from a Toolbar

Task ***To remove a button or menu from a toolbar:***

1. Ensure that the toolbar that you want to change is visible.
2. On the **View** menu, point to **Toolbars**, and then click **Customize**. The **Customize** dialog box opens.
3. Right-click the button or menu that you want to remove, and then click **Delete**.

Creating a Custom Toolbar

Task ***To create a custom toolbar:***

1. On the **View** menu, point to **Toolbars**, and then click **Customize**. The **Customize** dialog box opens.
2. Click the **Tools** tab.
3. Click the **New** button. The **New Toolbar** dialog box opens.
4. In the **Toolbar name** box, enter a descriptive name for the toolbar, and click **OK**.
5. Customize the new toolbar by adding menus or buttons.

Editing Virtual Packages

Editing a virtual package involves performing some or all of the following tasks.

Table 11-5 • Editing Virtual Packages

Task	Description
Specifying Virtual Package Information	Basic information that you enter in the General Information view is used by the Microsoft Application Virtualization Client and the App-V server. The Dependencies view is where you specify other App-V packages that your App-V package requires. ***Version*** • *The Dependencies view is available for App-V 4.x packages.*
Organizing Virtual Application Data	The Virtual Package Editor lets you manage the folders and files that will be available in the virtual environment. It also lets you define registry keys, values, and data for your virtual package. In addition, you can use the Virtual Package Editor to define the targets for your virtual application, and define entry points such as shortcuts for each target. These entry points enable end users to launch an App-V application from within the virtual environment.

Table 11-5 • Editing Virtual Packages (cont.)

Task	Description
Configuring Virtual Services	The Virtual Package Editor enables you to configure services that you want to include in your virtual package so that they are available in the virtual environment.
Testing and Troubleshooting Virtual Packages	Once you have made the necessary changes for the files, folders, shortcuts, services, and other elements of your virtual package, you are ready to test the virtual package, and identify potential conflicts and best practice violations between different App-V packages, and between App-V packages and Windows Installer–based installations. The Virtual Package Editor lets you add to a virtual package shortcuts that launch the Command Prompt window and the registry editor in order to debug issues in the virtual environment.

Specifying Virtual Package Information

When you open an existing package in the Virtual Package Editor, you may need to view or specify important package information. This includes basic information such as the name of the virtual package and details such as the package GUID and version number. You may also want to see history information such as each date on which the package was saved.

Viewing History for a Virtual Package

Version • *This information applies to App-V 4.x packages.*

The Virtual Package Editor shows read-only history information such as the following:

- The date and time when the package was saved
- The GUID of each saved package
- The user name of the person who saved the package
- The name of the machine on which the package was saved
- The version of the Virtual Package Editor that was used to save the package
- The version of App-V that was used when saving the package
- The operating system of the machine on which the package was saved

Each time that you save your file, the Virtual Package Editor adds a new history entry to the History pane and shows such details.

Task ***To view history for your virtual package:***

1. In the View List under **Package Information**, click **General Information**.
2. Review the information in the **History** pane.

Configuring General Information for a Virtual Package

In the General Information view, you can view and, if appropriate, edit basic information about your virtual package.

Task ***To configure general information for your virtual package:***

1. In the View List under **Package Information**, click **General Information**.
2. In the **Settings** window, configure the settings as needed. For details about each setting, see General Information View.

Specifying a Virtual Package's Dependencies

Version • *This information applies to App-V 4.x packages.*

A virtual package may rely on one or more other virtual packages in order to function properly. The Virtual Package Editor lets you specify other App-V packages that the open App-V package (the primary package) requires. This capability, called *Dynamic Suite Composition*, enables your virtual package to interact with the other virtual applications in the virtual environment. Dynamic Suite Composition enables you to deploy common system components once on each client system, making them available for use by many App-V applications, rather than requiring you to include them with each of the App-V applications that are dependent on them. This reduces redundancy in the local App-V cache and simplifies the construction and testing of the primary App-V application.

If you add a new dependency to your primary package, the Virtual Package Editor automatically associates each of the targets that are defined in the Shortcuts view with that new dependency. Similarly, if you add a new target to your primary package, the Virtual Package Editor automatically associates that target with each dependency that is defined in the Dependencies view. Each .osd file that defines a target contains a list of the other .sft files on which it depends. The Application Virtualization Client may cache this list; therefore, in most cases all of the primary package's targets should be associated with each dependency.

Adding a Dependency to a Virtual Package

Version • *This information applies to App-V 4.x packages.*

The Virtual Package Editor lets you specify other App-V packages that the open App-V package (the primary package) requires.

Task ***To add a dependency to your virtual package:***

1. In the View List under **Package Information**, click **Dependencies**.
2. Right-click the **Dependencies** explorer and then click **Add Dependency**. The **Open** dialog box opens.
3. Browse to the .sft or .osd file for the required App-V package, and then click **Open**.

The Virtual Package Editor adds an .sft item to the Dependencies explorer. The .sft item may contain one or more targets. The targets are defined in the Shortcuts view of the primary package.

When a target with an associated dependency is launched, the Application Virtualization Client loads the dependency's environment and makes it available as part of the virtual environment of the target's package.

Configuring a Dependency in a Virtual Package

Version • *This information applies to App-V 4.x packages.*

The Virtual Package Editor lets you view and configure settings for the dependencies in your virtual package. The settings display information such as the GUID and the server URL for the dependency.

Task ***To configure a dependency in your virtual package:***

1. In the View List under **Package Information**, click **Dependencies**.
2. In the **Dependencies** explorer, click the dependency that you want to configure.
3. In the **Settings** window, configure the settings as needed. For details about each setting, see Dependencies View.

Associating a Package's Targets with a Dependency in a Virtual Package

Version • *This information applies to App-V 4.x packages.*

It is recommended that all of the targets in your virtual package be associated with each of the package's dependencies. If you add a new dependency to your primary package, the Virtual Package Editor automatically associates each of the targets that are defined in the Shortcuts view with that new dependency. Similarly, if you add a new target to your primary package, the Virtual Package Editor automatically associates that target with each dependency that is defined in the Dependencies view. If you remove a target from a dependency in the Dependencies view, you may want to add it back.

Task ***To associate a target with a dependency in your virtual package:***

1. In the View List under **Package Information**, click **Dependencies**.
2. In the **Dependencies** explorer, right-click the .sft file with which you want to associate a target, and then click **Associate Target**.

   If one or more targets in the package are not associated with the dependency, the **Associate Targets with a Dependency** dialog box opens. Select the targets that you want to associate with the dependency.

   If all of the targets in the package are associated with the dependency, the Virtual Package Editor displays a message box informing you that all of the package's targets are already associated with the dependency.

The Virtual Package Editor adds one or more targets to the dependency if appropriate.

Specifying Whether a Dependency is Mandatory for a Target in a Virtual Package

Version • *This information applies to App-V 4.x packages.*

The Virtual Package Editor lets you specify whether a dependency is mandatory in order for target in the primary package (the App-V package that you are editing in the Virtual Package Editor) to run properly. If the dependency is mandatory, the primary package cannot run without loading the required package. For example, a system DLL such as an MFC DLL is likely to be mandatory, but a reference to a document viewer such as Adobe Reader may not be mandatory.

Task ***To specify whether a dependency is mandatory for a target in your virtual package:***

1. In the View List under **Package Information**, click **Dependencies**.
2. In the **Dependencies** explorer, click the target that you want to configure.
3. In the **Settings** window, configure the **Mandatory** setting as needed.

Tip • *The Virtual Package Editor lets you configure the settings for more than one target at a time. To learn more, see* *Configuring the Value of a Setting for More Than One Item at a Time*.

Removing a Target from a Dependency in a Virtual Package

Version • *This information applies to App-V 4.x packages.*

Important • *It is recommended that all of the targets in your virtual package be associated with each of the package's dependencies.*

Task ***To remove a target from a dependency in your virtual package:***

1. In the View List under **Package Information**, click **Dependencies**.
2. In the **Dependencies** explorer, right-click the target that you want to remove, and then click **Remove**.

The Virtual Package Editor removes the target from the dependency.

Removing a Dependency from a Virtual Package

Version • *This information applies to App-V 4.x packages.*

The Virtual Package Editor lets you remove a dependency from an App-V package.

Task ***To remove a dependency from your virtual package:***

1. In the View List under **Package Information**, click **Dependencies**.
2. In the **Dependencies** explorer, right-click the .sft file dependency that you want to delete, and then click **Remove**.

The Virtual Package Editor removes the dependency from your App-V package.

Configuring Asset Intelligence Information

Asset intelligence is used to enhance the inventory capabilities of Microsoft System Center 2012 Configuration Manager by extending hardware inventory and adding license management functionality. The System Center 2012 Configuration Manager asset intelligence features can report application data such as digital PID, MSI product codes, and publisher names for each virtual application registered on a client computer.

In App-V 5 packages, asset intelligence information is incorporated into the package itself, with the information being captured during sequencing.

You can view and edit information identifying an App-V 5.0 application on the **Asset Intelligence** view. Typically these values are read in from the Add/Remove Programs Uninstall registry key.

In the **Asset Intelligence** view, you can view and, if appropriate, edit intelligence information about your App-V 5.0 virtual package.

Task ***To configure asset intelligence information for your App-V 5.0 virtual package:***

1. Open an App-V 5.0 package in Virtual Package Editor.
2. In the View List under **Package Information**, click **Asset Intelligence**.
3. In the **Settings** window, configure the settings as needed. For details about each setting, see Asset Intelligence View.

Organizing Virtual Application Data

The primary objective of a virtual package is to keep the application layer and the operating system layer separate. Each application includes its own configuration information in its virtual environment. As a result, many applications can run side-by-side with other applications on the same computer without any conflicts.

The Virtual Package Editor lets you manage the folders and files that will be available in the virtual environment. It also lets you define registry keys, values, and data for your virtual package. In addition, you can use the Virtual Package Editor to define the targets for your virtual application, and define entry points such as shortcuts for each target. These entry points enable end users to launch an App-V application from within the virtual environment.

Including Files and Folders

The Virtual Package Editor lets you manage the files and folders that are in your virtual package. This includes the files and folders in the root folder, the virtual file system (VFS) folder, and—if applicable—the SoftGridUserSettings folder. The Virtual Package Editor also lets you extract folders and files from the App-V package file (.appv or .sft) to a location that you specify.

Adding a Predefined Folder to the VFS Folder in an App-V Package

The Virtual Package Editor lets you add various folders that use a constant to the VFS folder. App-V 5 packages use system constants. App-V 4.x packages use CSIDL constants and SFT constants (such as CSIDL_APPDATA and SFT_PROGRAM_FILES_X64). At run time, the folder is mapped to the appropriate location in the virtual environment.

Task ***To add a predefined folder to the VFS folder in an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, right-click the **VFS** folder, point to **Add Predefined Folder**, and then click the appropriate folder.

The Virtual Package Editor adds the predefined folder to the VFS folder.

Adding a Folder to an App-V Package

The Virtual Package Editor lets you add folders to your virtual package.

Task ***To add a folder to an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. Do one of the following:
   - To add an existing folder and all of its contents to the package, in the **Files and Folders** explorer, right-click the location where you want to add a new folder and click **Add Folder**. The **Browse For Folder** dialog box opens, enabling you to select the folder that you want to add.
   - To add a new empty folder to the package, in the **Files and Folders** explorer, right-click the location where you want to add a new folder and click **Add New Folder**. The Virtual Package Editor adds a new folder.

The Virtual Package Editor adds the folder to your virtual package.

Tip *• To change the name of the new folder, do one of the following:*

- *In the **Files and Folders** explorer, click the name of the new folder and then press F2. The Virtual Package Editor highlights the name of the folder, enabling you to edit it as needed.*
- *In the **Files and Folders** explorer, right-click the name of the new folder and then click **Rename**. The Virtual Package Editor highlights the name of the folder, enabling you to edit it as needed.*
- *Select the new folder, and in the **Settings** window, change the value of the **Name** setting.*

Adding a File to an App-V Package

The Virtual Package Editor lets you add files to your virtual package.

Task ***To add a file to an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, right-click the location where you want to add a new file and click **Add Files**. The **Select files to add to the virtual package** dialog box opens.
3. Select the file that you want to add and then click **Open**.

Tip • *To select multiple files in a folder, hold down the CTRL key while clicking files.*

The Virtual Package Editor adds the file or files that you selected to the virtual package.

Configuring a File or Folder in an App-V Package

The Virtual Package Editor lets you configure settings for the files and folders in your virtual package. The settings set information such as file attributes, whether a file is part of feature block 1, and the file or folder data type (application data or user data).

Task ***To configure the settings for a file or folder in an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, click the file or folder that you want to configure.
3. In the **Settings** window, configure the settings as needed. For details about each setting, see Files and Folders View.

Tip • *The Virtual Package Editor lets you configure the settings for more than one file or folder at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.*

Setting the VFS Path for the Contents of a Predefined Folder in an App-V Package

If a file or folder should exist outside the App-V package's root folder on the virtual file system, the Virtual Package Editor lets you modify the VFS path for that file or folder.

You may want to specify a VFS path if your virtual application tries to access the files in a folder by referring to a system folder to find the files (for example, looking up the Programs File folder) instead of using a relative path. You may also want to specify a VFS path if end users need to be able to find files when using a file browse dialog box (for example, for templates that are stored in a common file folder).

You can modify a folder's **VFS Path** setting by changing its **Isolation** setting. Using the **Isolation** setting, you can specify whether you want the selected folder in the App-V package to override the corresponding folder on the client system. The available options are:

- **Override**—The App-V application sees only the file content of the folder that is inside the App-V package. For an App-V 5.x package, this setting is inherited by all subfolders. For App-V 4.x packages, selecting this option automatically sets the read-only **VFS Path** setting.

  Note • *Overriding the isolation setting is also referred to as "fully virtualized".*

- **Merge**—The App-V application sees a merged view of the file content inside the App-V package and of the file content of the corresponding folder on the physical client system. For App-V 4.x packages, selecting this option automatically clears the **VFS Path** setting.

To modify the VFS path for the contents of a folder in an App-V package, perform the following steps:

Task ***To modify the VFS path for the contents of a folder in an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, select the predefined folder that contains the files and folders whose VFS path you want to configure.
3. In the Settings window, set the folder's **Isolation** setting to **Override**. For App-V 4.x packages, the **VFS Path** setting will then be automatically set.

Moving a File or Folder in an App-V Package

The Virtual Package Editor lets you move files and folders in your virtual package from one location to another using drag and drop functionality.

Task ***To move a file or folder in an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, drag a file or folder that you want to move to the appropriate location.

Extracting Files and Folders from the App-V Package

When you are editing an App-V package in the Virtual Package Editor, you may want to extract one or more files and folders from the package and save them to a local or network location. Doing so enables you to view the physical files that are streamed within the App-V package. If you extract a folder that contains subfolders and files, the Virtual Package Editor uses the same folder structure when saving the folder and its contents.

Task ***To extract a file from an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, right-click the file that you want to extract, and then click **Extract**. The **Save As** dialog box opens.
3. Browse to the location where you want to save the file.

4. In the **File name** setting, enter a new name for the file if you want to use a different one.
5. Click the **Save** button.

The Virtual Package Editor saves the file in the location that you specified.

Task ***To extract a folder and its contents from an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, right-click the folder that you want to extract, and then click **Extract**. The **Browse for Folder** dialog box opens.
3. Select the folder that you want to contain the extracted folder and its contents.

The Virtual Package Editor saves the folder, its subfolders, and its files in the location that you specified.

Removing a File or Folder in an App-V Package

The Virtual Package Editor lets you remove files and folders from your App-V package. If you remove a folder, all of its contents—including any subfolders and files—are also removed.

Task ***To remove a file or folder from an App-V package:***

1. In the View List under **Application Data**, click **Files and Folders**.
2. In the **Files and Folders** explorer, right-click the file or folder that you want to remove, and then click **Remove**.

The Virtual Package Editor removes the file or folder from your virtual package.

Editing the Virtual Registry

The Registry view enables you to define registry keys, values, and data for your App-V package. This view also lets you configure isolation options for selected registry keys. Isolation options indicate how the isolation environment provides access to system resources that the application needs: you can choose to override one or more keys on the client system, or you can choose to create a merged view of one or more keys for the virtual environment.

Note that the registry entries that are configured in the Registry view affect only the application in your App-V package. They do not affect any other App-V packages that are streamed to the Application Virtualization Client, and they do not affect any products that are installed to the client system.

Keys, Value Names, and Value Data

The registry consists of machine data and user data. A key is a named location in the registry. A key can contain subkeys, a default value, and named values. A default value is a value without a name. All other values associate a name with some data: the value name identifies where to store it, and the value data is the data in that storage.

Note that the terms *key* and *subkey* are relative. In the registry, a key that is below another key can be referred to as a *subkey* or as a *key*, depending on how you want to refer to it relative to another key in the registry hierarchy.

Adding a Registry Key to a Virtual Package

The Virtual Package Editor enables you to add registry keys to your App-V package so that they are available in the virtual environment.

Task ***To add a registry key to your virtual package:***

1. In the View List under **Application Data**, click **Registry**.
2. Do one of the following:
   - To add machine registry data, expand the **MACHINE** node.
   - To add user registry data, expand the **USER** node. If your App-V package does not contain any user registry data, you may need to add the **USER** node. To do so, right-click the **Registry** explorer, point to **Add Predefined Key**, and click **USER**.
3. In the **Registry** explorer, right-click the registry entry that you want to contain the new key, and then click **Add Key**.

The Virtual Package Editor adds a registry key with a default REG_SZ value.

Tip *• To change the name of the new registry key, do one of the following:*

- *In the **Registry** explorer, click the name of the new registry key and then press F2. The Virtual Package Editor highlights the name of the key, enabling you to edit it as needed.*
- *In the **Registry** explorer, right-click the name of the new registry key and then click **Rename**. The Virtual Package Editor highlights the name of the key, enabling you to edit it as needed.*
- *Select the new registry key, and in the **Settings** window, change the value of the **Name** setting.*

Configuring a Registry Key in a Virtual Package

If your virtual package includes one or more registry keys, you can configure each key's settings to specify information such as the value data, as well as whether the key in the App-V package should override the corresponding key on the client system.

Task ***To configure a registry key in your virtual package:***

1. In the View List under **Application Data**, click **Registry**.
2. In the **Registry** explorer, click the registry key that you want to configure.
3. In the **Settings** window, configure the settings for the registry key as needed. For details about each setting, see Registry View.

Tip *• The Virtual Package Editor lets you configure the settings for more than one registry entry at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.*

*The **Isolation** setting lets you specify whether you want the selected registry key in the App-V package to either see only the registry content that is inside the App-V package for a key and all its subkeys, or see a merged view of the registry content inside the App-V package and of the registry content on the physical client system. If you want to change the value of this setting for all of a registry key's subkey simultaneously, see Configuring the Isolation Setting for All of the Subkeys Under One or More Keys.*

Configuring the Isolation Setting for All of the Subkeys Under One or More Keys

If your virtual package includes a registry key that has multiple subkeys whose **Isolation** setting should be configured with the same value, you can quickly change the value of the **Isolation** setting for all of that key's subkeys simultaneously.

You can also quickly configure the **Isolation** setting for all of the subkeys that belong to multiple parent keys.

Task ***To configure the Isolation setting for all of the subkeys under one or more keys:***

1. In the View List under **Application Data**, click **Registry**.
2. In the **Registry** explorer, click the registry key that you want to configure.

   If you want to configure the **Isolation** setting for all of the subkeys under multiple parent keys, select all of the applicable parent keys. To select multiple consecutive keys, select the first registry key, press and hold SHIFT, and select the last key. To select multiple nonconsecutive keys, select one key, press and hold CTRL, and select each additional key.
3. Right-click the selected key or keys and then click the appropriate command:
   - **Override Child Keys**—If you want to select **Override** for the **Isolation** setting of each subkey under the selected keys, select this option.

     The App-V application sees the registry content that is inside the App-V package for this key and all subkeys. Thus, the application does not see any registry content from the physical client system.
   - **Merge Child Keys**—If you want to select **Merge** for the **Isolation** setting of each subkey under the selected keys, select this option.

     The App-V application sees a merged view of the registry content inside the App-V package and of the registry content on the physical client system. If the registry key has subkeys on the physical client system but not in the App-V package, these keys are merged into the registry view that is available to the App-V application. However, registry values that are on the physical client system and that are in registry keys that also exist in the App-V package are not merged into the App-V application's registry view.

Adding a Registry Value to a Registry Key in a Virtual Package

The Virtual Package Editor enables you to add registry values to registry keys to your App-V package so that they are available in the virtual environment.

Task ***To add a registry value to a registry key in your virtual package:***

1. In the View List under **Application Data**, click **Registry**.
2. In the **Registry** explorer, right-click the registry key that you want to contain the new value, and then click **Add Value**.

The Virtual Package Editor adds a registry value.

Tip *• To change the name of the new registry value, do one of the following:*

- *In the **Registry** explorer, click the name of the new registry value and then press F2. The Virtual Package Editor highlights the name of the value, enabling you to edit it as needed.*
